From this period there has been no critical discussion of the fundamentals of Christology within the limits of orthodoxy. In the Greek theology there was a subordination of Christ to the Father, but even that was done away with for the Latin church in the so-called Athanasian creed, where Christ is put on an exact equality with the Father. In the Reformation the Protestant church maintained two natures in one person and jealously affirmed allegiance to the Christology of the historic creeds. The only new phase of the problem was the Socinian solution, which after some shifting finally held that Christ was a mere man. This had no influence on orthodox Protestantism.

During the past century there has been a great deal of interest taken in Germany, in particular, in the Christological problem, and three strenuous and distinct theories of Christ's person have been set forth, all within the bounds of the historic creeds. Professor Dorner of Berlin began, not with the person of Christ, but with the two natures, for, as the person resulted from the union of the natures, it could not be understood till the natures of which it was composed were understood. The humanity of Christ is the full human personality, with full self-consciousness and self-determination. The divine nature is unchangeably the same, possessing all its divine attributes, omnipotent and omniscient. But the humanity is neither of these; and hence the divinity cannot impart itself completely to the humanity. The incarnation is viewed as the gradual impartation of the Logos to the man Jesus, increasing with his development and perfect only after the ascension.

The second theory, that of the "kenosis," begins at the one person of Christ, which the kenotics make to be the eternal Logos of God. This person takes upon himself humanity, so that his consciousness is a truly human consciousness, while it is still the consciousness of the divine element in Christ. This can only be as the divine limits himself to the capacities of the humanity which he assumes. The theory of the kenosis therefore teaches that the eternal Logos, by a conscious divine act of self-limitation, "emptied" himself of his divine form of existence and took upon himself the human form of existence (Phil. ii. 7). Thus, while he was in essence unchanged, he had laid aside the divine attributes of omnipotence, omniscience, etc. This theory has had a considerable following among men of conservative and churchly tendencies.

A third theory is that of Ritschl. Weary of all the long ontological disputes of the centuries, Ritschl sought to render them all unnecessary by a strict limitation of theology to that which is of "interest" to men, i.e., that which furthers the religious life. While he held, therefore, to the divinity of Christ in the true sense, he refused to attempt the explanation of its consistency with His humanity, regarding it as great a mystery as the consistency of the divine government with human freedom. In Christ we have God, for only in Him do we come to know God. Our knowledge of His divinity rests on our recognition of His perfect unity with God. That is enough. What the nature of the Trinity is, does not "interest" us. If we knew all about the preëxistence of Christ, it would rather separate Him from us than render faith in Him easier or more sincere. We must give up definitely the two natures and all attempts to unite them. In the true humanity of Christ we have God. How, we do not know. This view, which falls in with the tendencies of the times to seek simplicity has also found favor, but it scarcely seems to offer substance enough to prove a final resting place for thought.

England and America have contributed little of permanent value to this subject. The Unitarian movement in America represented rather a rejection of the Nicene theology than any positive constructive theory. Sanday, in *Christologies, Ancient and Modern* (New York, 1910), has sought to use the modern theory of the subconscious in the explanation of the divinity of Christ, but the theory is itself still in need of proof. The field is open for a reinterpretation of the person of Christ in the light of the thought of the present, while still retaining the religious values of the ancient creeds.

CHRISTOPHE, krēs'tōf', Henri (1767–1820). A negro king of Haiti. He was born a slave in the island of Grenada, purchased his freedom, and settled in the French portion of Haiti, it would seem, either as a butcher or a plantation overseer. In the insurrection against the French he gained fame as one of the ablest lieutenants of Toussaint L'Ouverture. He held out bravely against General Leclerc for some time in 1802 and, after laying down his arms, took part with Dessalines in the successful rising of 1803. During the short-lived government of Dessalines, who was slain by a military conspiracy in 1806, Christophe was general in chief of the Haitian army. In February, 1807, he was appointed President of Haiti for life. A republic being about the same time organized at Port-au-Prince, with Pétion at its head, a protracted civil war ensued. In 1811 Christophe was proclaimed King of Haiti, by the name of Henry I, and was crowned June 2, 1812. By his power and skill Christophe was enabled to counteract the attempts made by France to regain its authority in the island. His avarice and cruelty led to an insurrection, which was aided by General Boyer, who had succeeded Pétion in 1818. The rebellion spread to the capital, and Christophe's deposition was proclaimed at the head of the troops. Deserted by his bodyguard and his nobles, he shot himself Oct. 8, 1820. He left a code of laws, which he called the Code Henri, in imitation of the Code Napoléon. Consult Hozard, *Santo Domingo, Past and Present: with a Glance at Haiti* (London, 1893), and Madiore, *Histoire de Haiti* (Port-au-Prince, 1897). See Haiti.

CHRIS'TOPHER, Saint (Lat. *Christophorus*, from Gk. *Χριστός, Christos*, Christ + *φέρειν, pherein*, to bear; so the Christ-bearer). A saint of the Roman Catholic and Greek churches. He is supposed to have suffered martyrdom about the middle of the third century. According to vulgar legend, Christopher, whose name was originally *Ἀδόκιμος, Adokimos* (the ignoble, base), was a native of Palestine, Syria, or Lycia, and a person of prodigious bulk and strength. His height was 12 feet. So proud was he of his gigantic frame that he would serve only the mightiest princes. Having attached himself to one who passed for the greatest of his day, Christopher stayed with him for a short time, but soon discovered that his master was terribly afraid of the devil, in consequence of which Christopher, with fearless consistency, passed into the service of the latter. One day, however, when the devil and he chanced to be walking through a wood, they came across an image of Christ. His new master exhibited such perturbation and alarm at the sight that Christopher entirely lost confidence in him and resolved to find out the Saviour and follow him. For a long while he searched in vain, but finally he fell in with a hermit, who showed him Christ and baptized him. Christopher despised the customary penances, and, in consequence, it was imposed on him to carry Christian pilgrims on his shoulders over a stream which had no bridge. One day a little child came to the stream; Christopher took it on his shoulders, but soon began to sink under the weight of his burden. The child was Christ himself, and to prove it, he commanded Christopher to thrust his staff into the ground. He did so, and next morning it had blossomed into a palm tree bearing fruit. This miracle converted thousands to Christianity. Christopher's success excited the enmity of Dagnus, the prefect of that region, who put him in prison, scourged him with red-hot rods, put a burning helmet on his head, and clapped him on a burning stool. Christopher still remained uninjured. Multitudes of poisoned arrows were now discharged against him, but they rebounded from his charmed body, and one even wounded the prefect himself in the eye. Christopher pitied his tormentor and freely offered his head to the executioner, that the prefect might be healed by the blood which should flow from it. This was done, and Dagnus and his family became Christians. The Greek church celebrates his festival on May 9; the Roman Catholic, on July 25.

St. Christopher was greatly invoked in times of pestilence, or when people were digging for treasures, to frighten away the spirits who watched over them. The formula used was called a *Christopher's prayer*. He was also the patron of an order of moderation, founded in Austria in 1517 for the purpose of checking excessive drinking and swearing, and called the Order of St. Christopher.

CHRISTOPHER NORTH. The pen name of Prof. John Wilson (q.v.).

CHRISTOPHLE, krē'stō'fl', Albert Silas Médéric Charles (1830–1904). A French jurist. He was born in Domfront (Orne) and studied law in Caen. In 1876 he became Minister of Public Works in the Dufaure cabinet and greatly improved the department under his charge, placing competent engineers at the head of every branch of the service. He retained the portfolio of public works in the Simon ministry, but resigned with the rest of the cabinet in May, 1877. He was appointed director of the Crédit Foncier in 1878. In 1877 he traveled through France and visited several foreign countries (notably Holland) for the purpose of studying railroad improvements.

CHRISTOPH'ORUS. Pope from November, 903, to June, 904. He thrust out of office and imprisoned his predecessor, Leo V, only shortly afterward to experience the same treatment.

CHRISTOPULOS, krĭs-tŏp'ŭ-lōŏs, Athanasios (1772–1847). A Greek poet, born in Kastoria in Macedonia. He studied in Buda in Hungary, and in Padua, and later became a judge successively in Jassy and Bucharest. In that capacity he prepared a legal code for Wallachia. He translated the fragments of Sappho and the first book of the *Iliad* into modern Greek and wrote a grammar of modern Greek (1805). His best-known work is his collection of Anacreontic songs (2 vols., 1833; in German, 1880), which has long continued popular in Greece. See Romaic Literature.

CHRIST, or CRISSCROSS, ROW. The alphabet arranged in the form of a cross, as the symbols of Christ's crucifixion, for the use of children, and so printed in old hornbooks or

primers. The letter A was at the top and Z at the foot of the cross. By extension, any mark of a cross, but more especially one made by an illiterate person in lieu of his signature. See HORNBOOK.

CHRIST'S COLLEGE. A college in Cambridge, England, founded in 1506 by Lady Margaret Beaufort, Countess of Richmond and Derby, and mother of Henry VII. There was an older foundation called God's House, which had been established by William Byngham, rector of St. John Zachary, London, in 1439, for the study of grammar and the training of grammar-school teachers. It had consisted of a proctor and 24 scholars, but had fallen on evil days, in spite of the support of Henry VI, its second founder in 1448. It had lost its original site by being moved to make room for King's College, and had sunk in numbers and standing. It was refounded for a master, 12 fellows, and 47 scholars, and liberally endowed. Various additions were made to its numbers by gifts of Edward VI, Sir John Finch, and Sir Thomas Baines. There were, in 1913, 15 fellowships, 30 scholarships, several sizarships, some studentships in divinity, and 218 undergraduates. Among those who studied at Christ's are Archbishops Grindal and Bancroft, and Latimer, Cudworth, Quarles, Paley, Milton, and Darwin. Consult J. Peile, *Christ's College* (London, 1900).

CHRIST'S HOSPITAL. An English educational institution better known as the Blue-Coat School. It was founded on the site of the Greyfriars' Monastery, Newgate Street, London, by Edward VI, in 1553, as a hospital for orphans and foundlings. It has been one of the largest and most important schools of its class in England, including a large preparatory school for boys at Hertford, the boys' school at Horsham, and a girls' secondary boarding school at Hertford since 1779. Boys are admitted between 7 and 10 and discharged at 15, except the "King's boys," who attend the mathematical school (founded in connection with Christ's Hospital in 1672, by Charles II), and the "Grecians," the highest class of scholars, of whom four are annually chosen by examination to be sent to each of the universities, Oxford and Cambridge, on scholarships. The right of "presentation," or giving a boy or girl a place in the school, is vested in the managing governors, consisting of the Lord Mayor of London, the aldermen, and 12 common councilmen, besides the "donation governors," consisting of all noblemen and gentlemen who donate £500 to the school. The dress which has been worn by the boys since the days of Edward VI, and from which the school takes its name, is most picturesque. It consists of a long blue woolen gown or coat, reaching nearly to the feet, with a narrow red leather girdle around the waist, knee breeches and yellow stockings, and clergymen's bands. Originally a blue worsted cap was worn, but nowadays the boys generally go about bareheaded. The original building, nearly destroyed by the great fire of London, 1666, was restored after the designs of Christopher Wren, and this building in turn, having fallen into decay, was replaced in 1825 by Mr. Shaw. The Newgate Street property was in 1889 ordered sold, and the corner stone of the new institution was laid at Horsham (about 34 miles from London, in Sussex) in October, 1897. On April 18, 1902, the Blue Coats, assembled in the quadrangle, heard the farewell address of the head master. The school, which is conducted on the usual lines of an English public school, is attended by about 820 boys, who are boarded in 16 houses. The school is divided into three departments, the Latin or classical school, the mathematical or modern language school, and the preparatory school. Pupils are admitted by presentation or by competition, a certain number of places being reserved for pupils from public elementary schools. In the past there have been many distinguished men connected with Christ's Hospital, notably Coleridge, Lamb, and Leigh Hunt.

CHRIST'S THORN. See JUJUBE.

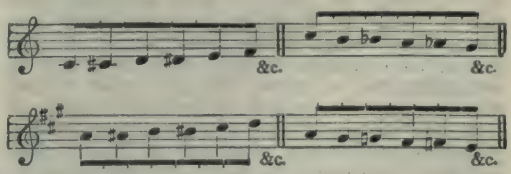
CHRISTY, krĭs'tĭ, HOWARD CHANDLER (1873–). An American painter and illustrator. He was born in Morgan Co., Ohio, and studied in New York at the National Academy and the Art Students' League under Chase. He first attracted attention with his illustrations of the Spanish-American War, published in *Scribner's* and *Harper's* magazines and in *Collier's Weekly*, gaining especial prominence with the series, "Men of the Army and Navy," and a portrait of Colonel Roosevelt. He is, however, best known for his charming illustrations of the works of such authors as Richard Harding Davis and has created a picturesque and romantic type of society women peculiarly his own. His work is characterized by great facility, a dashing but not exaggerated style, and a strong sense of values. He prefers black and white, but has also worked with success in color.

CHROBAK, krō'bȧk, RUDOLF (1843–1910). An Austrian physician, born in Troppau, Silesia. He studied in Vienna, where he became professor of obstetrics and gynæcology in 1879. His published writings include important works on anatomy and pathology within the domain of his specialty. These works form parts of the handbooks of Stricker (1869–72) and Pitha-Billroth (1885), and of Nothnagel's *Specielle Pathologie und Therapie* (1896).

CHROMÆSTHESIA, krōm'ĕs-thē'zĭ-ȧ. See COLORED HEARING.

CHRO'MATES. See CHROMIUM.

CHROMAT'IC (Fr. *chromatique*, It. *cromatico*, Lat. *chromaticus*, from Gk. *χρωματικός, chrōmatikos*, relating to color, from *χρῶμα, chrōma*, color, from *χρώζειν, chrōzein*, to touch, color, from *χροά, chroa, χροιά, chroia*, skin). In music, a term applied to a series of notes at the interval of a semitone from each other. Such a series is produced by dividing the whole tones of the diatonic (q.v.) scale into semitones, so that with the two diatonic semitones, already in the natural scale, the octave is divided into 12 semitones. Ascending chromatic passages are formed by the whole tones of the diatonic scale being raised or elevated by a sharp or a natural, according to key, and descending passages by their being lowered by a flat or a natural, thus:



CHROMATICS. See COLOR.

CHRO'MATIN (from Gk. *χρῶμα, chrōma*, color). In biology, a network of fine strands or aggregations of substance that occurs in the nucleus of the cell during its different phases

and has more avidity for staining agents than ordinary protoplasm. See CHROMOSOME; CELL.

CHROMAT'OPHORE (from Gk. *χρῶμα, chrōma*, color + *φόρος, phoros*, bearing, from *φέρειν, pherein*, to bear). A protoplasmic body in plants (see PLASTID), which contains or is capable of forming pigments. They are of three sorts, chloroplasts, chromoplasts, and leucoplasts (qq.v.).

CHRO'MATROPE (by haplology for **chromatotrope*, from Gk. *χρῶμα, chrōma*, color + *τροπή, tropē*, turn, from *τρέπειν, trepein*, to turn). An optical toy, consisting of a revolving disk on which are painted certain designs of various colors. These figures are so arranged that when the chromatrope is made to revolve rapidly streams of beautiful, brilliant colors seem to flow either to or from the centre of motion, according as the disk is made to rotate in one direction or the opposite. The same principle is utilized in the *chromatrope slide*, employed in magic-lantern exhibitions. In this, two circular disks of glass are placed face to face, each with a design radiating from the centre and painted with brilliant transparent colors. By a small pinion gearing in toothed wheels or endless bands, the disks are made to move in opposite directions in their own plane. The effect produced is a beautiful change of design and color.

CHROMATYPE. See CHROMOTYPE.

CHRO'MITE (from Gk. *χρῶμα, chrōma*, color), or **CHROME IRON ORE** ($FeOCr_2O_3$). An oxide of chromium and iron containing when pure 68 per cent chromic oxide and 32 per cent ferrous oxide. Commercial ores contain from 40 to 60 per cent of chromic oxide, together with alumina and magnesia. The color of the mineral is iron black to brownish black. In the United States commercial deposits have been found only in Pennsylvania, Maryland, North Carolina, Wyoming, and California. Statistics show a comparatively small production from the United States: 1880–95 the production averaged 2270 tons annually, valued at approximately $15 per ton; since 1895 the production in the United States has materially decreased; 1900–11 the production averaged about 244 tons annually, valued at $16 per ton. In 1912 the entire production came from California and amounted to 201 long tons, which was used locally for furnace linings. The chromo ore consumed in the United States is imported principally from New Caledonia, Greece, Canada, Great Britain, Asiatic Turkey, and Japan. The annual imports for four years ending in 1910 averaged 36,950 long tons and in 1911 amounted to 37,540 tons.

CHRO'MIUM (Neo-Lat., from Gk. *χρῶμα, chrōma*, color). A metallic element discovered by Vauquelin in 1797. It does not occur free, but is found in combination chiefly with iron as chromite, which is the principal ore of chromium, as crocoisite, a lead chromate, and as wolchonskoite, a native chrome ochre. Chromium is also a frequent constituent of meteoric iron, and the green color of emerald, serpentine, penninite, and other minerals, is due to this element. The metal is now best made by Goldschmidt's "thermit" process. A dry mixture of chromium oxide and powdered metallic aluminium is introduced into a crucible made of magnesia bricks, lined on the outside with iron, and capable of holding a charge of about 500 pounds. With the aid of a cartridge made of powdered aluminium and barium peroxide, the mixture in the crucible is "lighted" at the surface, whereupon the aluminium gradually burns up, withdrawing oxygen from the chromium oxide and reducing the latter to the state of pure metallic chromium. About 400 pounds of chromium can thus be obtained from a single crucible in the course of half an hour. It is in this manner that chromium is now made for the manufacture of chromium steel.

Chromium (symbol, Cr.; atomic weight, 52.0) is a grayish-white powder consisting of small, lustrous, very hard, brittle rhombohedral crystals which have a specific gravity of 6.92 at 20° C. (68° F.), and melt at a higher temperature than platinum. The metal itself has no important uses. But when added in quantities of less than 1 per cent to steel, it yields an alloy called *chromium steel*, which has a fine texture, great hardness, tenacity, and elasticity. An alloy of chromium with aluminium has also been described. With oxygen chromium forms two basic oxides, which yield, respectively, chromous and chromic compounds and an acid-forming oxide which yields chromates. Chromic oxide may be obtained by igniting the hydroxide or by heating a mixture of potassium bichromate and sulphur. It is a green pigment of great permanence that is known in commerce as *chrome green* and *ultramarine green*. The hydrated oxide, which is made by heating to dull redness 3 parts of boric acid and 1 part of potassium bichromate, is the pigment known as *emerald green, Guignet's green, Pennettier's green*, and *Veridian*. Of similar composition is the green pigment called *Arnaudon's green*.

Many of the chromates have considerable commercial value, especially those of potassium, sodium, and ammonium. Among the bichromates that of potassium is the most important, as it is used in the preparation of all other chromium salts. Potassium bichromate is prepared from chromite, the ore being, for this purpose, roasted, finely ground, and mixed with half its weight of potassium carbonate and twice its weight of lime; the mixture is heated to bright redness with an oxidizing flame in a reverberatory furnace, and, on cooling, the resulting mass is treated with hot water; to the solution thus obtained potassium sulphate is added for the purpose of precipitating the lime as sulphate, while the potassium chromate produced remains dissolved; finally, dilute sulphuric acid is added in order to convert the chromate into bichromate. Potassium bichromate crystallizes in the form of bright red prisms. It is used for the preparation of chrome pigments for the production of various colors in calico printing and dyeing; in the manufacture of safety matches; as a bleaching agent for tallow, palm oil, etc., with sulphuric acid; for the oxidation of anthracene to alizarin; in tanning leather; and in consequence of its property of rendering gelatin insoluble when mixed with that substance and exposed to light, it finds extensive application in photogelatin processes. *Lead chromate* is the bright yellow precipitate obtained when a solution of a lead salt is added to potassium bichromate; it is used as a pigment under the name of *chrome yellow*.

CHRO'MOLITH'OGRAPH. See LITHOGRAPHY.

CHRO'MOPLAST (from *χρῶμα, chrōma*, color + *πλαστός, plastos*, formed, from *πλάσσειν*,

plassein, to form). A protoplasmic body in plants which contains a pigment other than green, chiefly yellow or red. It is abundant in fruits and flower leaves. In shape the chromoplasts are rounded, fusiform, angular, or irregular, their form being often determined by the pigment they contain. Sometimes the pigment exists in minute droplets in the protoplasm, but more frequently it is crystalline; or both forms may be present together. The crystals vary from needle-like or rodlike to tabular. The slender crystals are sometimes curved and often occur in fascicles. Chromoplasts are derived from similar bodies by division. A plastid (q.v.), the primary undifferentiated body, may develop directly into a chromoplast, or it may be for a time a leucoplast (q.v.) or a chloroplast (q.v.), and only later produce the red or yellow pigment that characterizes a chromoplast. If the chromoplasts have any special function, it is not known. In a general way the color they impart may be useful, but the color is frequently due to products that hold no relation to further use. See CELL; COLOR IN PLANTS.

CHRO'MOSOME (from Gk. *χρῶμα, chrōma*, color + *σῶμα, sōma*, body). The name given to the loops or other aggregations of chromatin which collect in indirect cell division about the axis of the spindle and split into halves. The two halves move towards opposite poles of the spindle, where they aggregate and unite into the form of the chromatin of a new nucleus. See CHROMATIN; CELL; EMBRYOLOGY.

CHRO'MOSPHERE (Gk. *χρῶμα, chrōma*, color + *σφαῖρα, sphaira*, sphere). The envelope of incandescent gases which surrounds the body of the sun, or photosphere (q.v.), being separated from it by the reversing layer (q.v.). It consists principally of hydrogen, helium, and calcium, and varies in depth from 5000 to 10,000 miles. It was detected by observers of eclipses during the eighteenth and the early part of the nineteenth century, but it was not until 1842 that it was clearly recognized as a solar appendage and differentiated from the more diffused and fainter corona (q.v.) surrounding it. During a total solar eclipse the chromosphere is observed as a deep scarlet rim surrounding the moon's disk, but in broad daylight its brightness is overpowered by the greater brilliancy and whiteness of the light from the underlying photosphere. It is possible, however, to observe it at all times by means of the spectroscope. Its intense color, from which it derives its name, is due to incandescent hydrogen, its chief gaseous component. Many other gaseous elements, such as iron, chromium, magnesium, and titanium, are occasionally identified in the chromospheric spectrum, and it is supposed that these are due to the momentary injection into the chromosphere of the constituents of the reversing layer. Indeed, the chromosphere may be likened to a violently agitated ocean of red flame resting on the comparatively quiescent reversing layer. From the surface of this ocean jets and masses of glowing vapor rise from time to time, occasionally reaching an altitude of hundreds of thousands of miles, and form the "prominences" which are such a conspicuous feature during a total eclipse of the sun. These prominences were first noticed by Vassenius at Gothenburg in 1733, and were ascribed by him to the moon. Later observers agreed in supposing that they were a lunar phenomenon, and it was only in 1860 that Secchi and De la Rue demonstrated their solar origin, while their gaseous nature was not recognized until 1868. During the total eclipse of that year the bright lines due to hydrogen were seen, together with another in the orange, which was at first assumed to be the D line of sodium, but was afterward recognized as distinct, and attributed by Lockyer to a gas to which he gave the name "helium." This remained unknown as a terrestrial element until 1895, when Ramsay detected it in the mineral cleveite. Two kinds of prominences are recognized, cloud prominences and flame prominences. The former are quiescent and often continue without sensible change for several days, and, like the upper chromosphere, consist of hydrogen, helium, and calcium. They are frequently quite extensive in area and resemble huge cloud masses connected with the chromospheric surface by means of stemlike filaments. On the other hand, flame prominences are characterized by their jetlike form and by the extraordinary rapidity with which they spring up and disappear. They are usually associated with sun spots, and the presence of such elements as iron, titanium, sodium, scandium, barium, and titanium from the lower portions of the solar atmosphere indicates clearly their eruptive nature. Consult Clerke, *Problems in Astrophysics* (London, 1903); Schuster, *Solar Research* (London, 1909); Abbot, *The Sun* (New York, 1911). See SUN.

CHRO'MOTYPE, or CHRO'MATYPE (from Gk. *χρῶμα, chrōma*, color + *τύπος, typos*, type). A photographic process dependent upon the sensitiveness to light of certain chromium salts, especially the bichromates of the alkalies. The chromotype has been superseded by the photogelatin processes and is at present hardly ever used. (See AUTOTYPE.) The name is also applied to colored prints produced by "chromatic printing."

CHRON'ICLE (from *chronic*, Fr. *chronique*, It. *cronico*, Lat. *chronicus*, from Gk. *χρονικός, chronikos*, relating to time, from *χρόνος, chronos*, time). A species of historical record in which events are treated in detail and in the order of time. A chronicle is understood to differ from annals in being more connected and full, the latter merely recording individual occurrences under the successive years or other dates. A chronicle is not expected, however, to display either literary style or philosophic penetration. A great many of the older histories were called chronicles, such as the *Saxon Chronicle*, Holinshed's *Chronicle*.

CHRONICLE OF PA'ROS. An inscription discovered on the island of Paros in 1627, containing memoranda of much historic interest. It mentions various facts, especially the artistic ones, in Greek history. As a political and military history, the chronicle is faulty. See ARUNDEL MARBLES.

CHRONICLE OF THE KINGS OF ENGLAND, FROM THE TIME OF THE ROMANS' GOVERNMENT UNTO THE DEATH OF KING JAMES. An historical work by Sir Richard Baker, published in 1643, dedicated to Charles, Prince of Wales, containing a laudatory preface by Sir Henry Wotton. It was a very popular work for the century after its publication. It ran through seven editions before the close of 1684 and was translated into Dutch in 1649. In 1730 it was extended up to the reign of George II. It is, however, full of inaccuracies and was sharply criticized in 1672 by Thomas Blount, in a pam-

phlet published in Oxford. It was a favorite with Addison's Sir Roger de Coverley.

CHRON'ICLES (Heb. *Divrai hay-yamim*, events of the days, Gk. Παραλειπόμενα, *Paraleipomena*, omitted, sc. βιβλία, *biblia*, books). The name of two of the books of the Old Testament, which in the Hebrew canon form but one book, entitled "Book of Events of the Times." This appears to have been a designation commonly applied to special histories—such as, e.g., "Events of the Times of King David," or the like. The Greek translators divided the long Hebrew book into two and adopted the title "Things Omitted"—i.e., not recorded in the other historical books. Jerome suggested the title "Chronicon," whence comes the English name. The Book of Chronicles begins with Adam and ends abruptly in the middle of Cyrus's decree of restoration. The continuation of the narrative is found in the Book of Ezra, which repeats and then completes the fragment of the decree of the Persian King. Chronicles, in fact, formed originally one work with Ezra and Nehemiah, displaying throughout the peculiarities of a single author. The apparent separation of Ezra and Nehemiah from Chronicles proper is due to the insertion in the former of extracts from the memoirs of Ezra and Nehemiah and from other earlier documents. Of the authorship of Chronicles nothing is known except what can be determined by internal evidence. The language, and more particularly the syntax, implies that the book is one of the latest of the Old Testament. It is evident that the author lived a considerable time after Ezra and stood entirely under the influence of the religious institutions of the new theocracy. This point of view determined the nature of his interest in the early history of his people. The true importance of Hebrew history centres for him in the fact that this nation was the people of Yahwe. The tragic interest which distinguishes the annals of Israel from the forgotten history of Moab or Damascus lies wholly in that long contest which finally vindicated the reality of spiritual things and the supremacy of Yahwe's purpose by the political ruin of the nation which was the faithless depositary of these sacred truths. After the captivity it was impossible to write the history of Israel's fortunes otherwise than in a spirit of religious pragmatism. But within the limits of the religious conception of the plan and purpose of the Hebrew history, more than one point of view might be taken. The Book of Kings looks upon history in the spirit of the prophets. But before the Chronicler wrote, the older type of prophecy had become extinct. The Jerusalem of Ezra was organized no longer as a nation, but as a municipality and a church. The centre of religious life was no longer the prophetic word, but the ordinances of the Pentateuch and the liturgical service of the sanctuary. The religious vocation of Israel was no longer national, but ecclesiastical and municipal; and the historical continuity of the nation was vividly realized only within the walls of Jerusalem and the courts of the temple, in the solemn assembly and stately ceremonial of a feast day. These influences naturally operated most strongly on those who were officially attached to the sanctuary. To a Levite, even more than to other Jews, the history of Israel meant above all things the history of Jerusalem, of the temple, and of the temple ordinances. The author of Chronicles betrays in every page his essentially Levitical habit of mind. To such a mind there seemed to be room for a new history, which should confine itself to matters still interesting to the theocracy of Zion, keeping Jerusalem and the temple in the foreground, and developing the divine significance of the history in its causes and results, not so much with reference to the prophetic word as to the fixed legislation of the Pentateuch, so that the whole narrative might be made to teach that the glory of Israel lies in the observance of the divine law and ritual. For the sake of systematic completeness, the author of the Chronicles begins with Adam; but he had nothing to add to the Pentateuch, and the period from Moses to David contained little that served his purpose. He therefore contracted the early history into a series of genealogies, which were by no means the least interesting part of his work at a time when every Jew was concerned to prove the purity of his Hebrew descent. From the death of Saul the history becomes fuller and runs parallel with the books of Samuel and Kings. The limitations of the author's interest in past times appear in the omission, among other particulars, of David's reign in Hebron; of the disorders in his family and the revolt of Absalom; of the circumstances of Solomon's accession; and of many details as to the wisdom and splendor of that sovereign as well as of his fall into idolatry. In the latter history the 10 tribes are quite neglected, and political affairs in Judah receive attention, not in proportion to their intrinsic importance, but according as they serve to exemplify God's help to the obedient and His chastisement of the rebellious. That the author is always unwilling to speak of the misfortunes of good rulers is not to be ascribed to a desire to suppress the truth, but shows that the book was throughout composed not in a purely historic interest, but with a view to inculcate a practical lesson. The more important additions which the Chronicler makes to the old narrative consist partly of full details of points connected with the history of the sanctuary and the great feasts, or the archæology of the Levitical ministry, and partly of narratives of victories and defeats, of sins and punishments, of obedience and its reward, which could be made to point a plain religious lesson in favor of faithful observance of the law. The minor variations of Chronicles from the books of Samuel and Kings are analogous to the larger additions and omissions, so that the whole work has a consistent and well-marked character, presenting the history in quite a different perspective from that of the old narrative. It is still possible to determine within certain limits the nature of the sources which were employed by the author. He had before him the canonical books of Samuel and Kings, from which he made excerpts, but, in addition to these, had at his disposal "Midrashic" compilations, in which the past history was no longer told in sober fashion, but, embellished with more or less fanciful details, was intended as a means of illustrating religious ideas and of teaching moral lessons. He mentions such a Midrash of the Book of Kings (2 Chron. xxiv. 27), and also specifically refers to a Midrash of the prophet Iddo (2 Chron. xiii. 22), which appears to have been a separate work either attributed to Iddo or in which the prophet plays a prominent part. There were probably other works of a similar character in existence, and it is important to note that these compilations were based upon

the annals of the kings of Israel and Judah respectively, which also form the sources underlying the canonical books of Kings. The variations of the Chronicles from the latter, however, are due in most instances to his religious pragmatism. Everything is done to emphasize the ancient importance of the Levites, who are introduced at points and on occasions which are most inappropriate. He is also fond of high figures in enumerating sums and armies. The speeches introduced by him and put into the mouths of prominent personages also reflect entirely the Chronicler's peculiar point of view. Taking all this together, it is claimed by many that the historical value of Chronicles, where it varies from the books of Samuel and Kings, is small, and, except in some details, which have chiefly an interest as representing perhaps a more or less widespread tradition, there is a reluctance among modern critical scholars to depend upon it in the study of Hebrew history. From 1 Chron. iii. 19–24, where the genealogy of Zerubbabel is carried on through nine generations, as well as from the mention of Jaddua in Neh. xii. 11, 22, it has rightly been inferred that the Chronicles cannot have been written before the third century B.C.

CHRONICLES OF THE CANONGATE. A series of tales by Sir Walter Scott. The first set, including *The Highland Widow*, *The Surgeon's Daughter*, and *Two Drovers*, was published in 1827; and the second, containing *The Fair Maid of Perth*, appeared in the ensuing year. They are supposed to be told by a certain Mr. Chrystal Croftangry, who, he informs us, got them from a Mrs. Baliol. See CANONGATE, THE.

CHRON'OGRAM (from Gk. *χρόνος, chronos*, time + *γράμμα, gramma*, letter, from *γράφειν, graphein*, to write), or CHRONOGRAPH. A whimsical device of the later Romans, resuscitated during the Renaissance period, by which a date is given by selecting certain letters among those which form an inscription, and printing them larger than the others. The principle will be understood from the following chronogram, made from the name of George Villiers, first Duke of Buckingham:

GEORGIVS DVX BVCKINGAMIÆ

The date MDCXVVVIIII (1628) is that of the year in which the Duke was murdered by Felton at Portsmouth. Consult Hilton, *Chronograms* (1882).

CHRON'OGRAPH and **CHRON'OSCOPE** (Lat. *chronographus*, from Gk. *χρονογράφος, chronographos*, from *χρόνος, chronos*, time + *γράφειν, graphein*, to write; Fr. *chronoscope*, from Gk. *χρόνος, chronos*, time + *σκοπός, skopos*, watcher, from *σκοπεῖν, skopein*, to watch). Terms more or less interchangeable applied to instruments used in physics, physiology, psychology, and many departments of experimental and applied science, such as gunnery, for measuring very short intervals of time, as well as to instruments recording such measures. Chronograph watches, or pocket chronographs, will measure intervals of time down to fifths of a second, for use at horse races and other occasions where a seconds watch is not exactly suited. They have an ordinary quick-train lever movement, carrying hands which move over a dial. One of these is a seconds hand, very peculiarly made. The seconds hand is double, consisting of two distinct hands, one superposed on the other. As the double-seconds hand revolves, it is possible to stop one of its component halves by touching a spring at the side of the case. A record having thus been made of the exact fraction of a second marked by the position of the stopped hand, another pressure of the spring makes it fly back to its former position on the moving component. The instrument is then ready for another observation. There are numerous modifications of this form of instrument; they are sometimes called stop watches, or split-second fly-back watches.

The Astronomical Chronograph is used to record permanently the exact instants of time when certain astronomical observations are made. Such a time record is, of course, extremely important in almost all forms of astronomical work. As usually constructed, the instrument consists of a metal cylinder or drum, upon which is wound a sheet of paper to receive the record. The drum is connected with a clockwork apparatus which makes it turn on its axis once each minute. At the same time a fountain pen, or some other form of marking instrument, is pressed against the paper so that a line is traced around the drum as it turns. The pen is attached to an electromagnet, which in turn is moved very slowly by the clockwork along the axis of the drum. The result of these motions of the drum and pen is to trace a continuous spiral line on the paper around the drum. The electromagnet is connected with the astronomer's standard clock by wires, and once every second an electric signal is sent automatically by the clock into the magnet. This results in a short interruption or break in the line traced by the pen. Such a break, then, marks the beginning of each second on the chronographic time record. When the astronomer wishes to record the exact time of an observation, he has but to tap a telegraphic key held in his hand, and a signal similar to the clock signals will reach the chronographic electromagnet. The result is a break in the record line, similar to those due to the clock. It is then merely necessary to measure the position of the observer's break with reference to the clock breaks, to fix the exact fraction of a second corresponding to the observation. There is little difficulty in thus measuring a chronographic record to the twentieth part of a second of time. In the form of instrument known as the "printing chronograph," in-

vented by Professor Hough of the Dearborn Observatory, the minutes, seconds, and fractions of a second are actually printed on the record sheet. Another form of chronograph is the photochronograph, in which the trail of a star is photographed directly with the spider lines of the telescope on a photographic plate. To mark the time intervals, the plate is given a slight north and south displacement at the beginning of each second, so as to produce a break in the star trail. In this way the recording of the transit of a star becomes purely automatic, and the personal equation (q.v.) of the observer is avoided.

The first attempt to measure a very small period of time was made by Sir Charles Wheatstone in 1834, when he endeavored to ascertain the duration of the electric spark. This was accomplished by means of a revolving mirror; and as this apparatus was the first and simplest of a number of similar instruments, it may be described at some length. On a horizontal axis capable of being revolved at high speed, a mirror was fixed. The rays issuing from a luminous point, such as a small flame, were reflected from the mirror when at rest and reached the eye of the observer. If the mirror is slowly revolved, the image of the luminous point will be either raised or lowered, and if the speed of rotation is increased, instead of a succession of images there will be seen a continuous streak or band of light. If the given source of light be supplanted by an electric spark, and the mirror set in rotation, as long as the duration of the spark is less than is required by the mirror to reflect the rays across the field in the form of a band, then the spark will appear as a point; but, increasing the speed of the mirror, a stage will be reached where the image will be produced in the form of a bright streak. The time of the spark can then be calculated in the following way: First, the velocity of the mirror is observed; then, suppose that the image of the spark extends over what is equivalent to one-half a degree of arc. As the movement of the reflected ray is, from the laws of reflection, twice that of the reflecting mirror, it would follow that when the mirror was revolving at a velocity of 800 revolutions per second, the time consumed by the mirror in causing the spark to appear as a streak of light would be $\frac{1}{800} \times \frac{1}{2} \times \frac{1}{720} \times \frac{1}{2}$ or $\frac{1}{1152000}$ of a second.

Wheatstone also employed this apparatus to study the time consumed by an electric current in passing over a conductor, using for this purpose the sparks furnished at different lengths of the conductor and measuring the difference in time between their occurrences. A rotating mirror was also used by Feddersen in his researches on the electric spark, and again by Rood, the former employing a concave mirror, while the latter used a plane mirror in connection with a system of lenses.

To Wheatstone is due another form of chronoscope, which was used for measuring the velocity of a projectile from the time it left a cannon until any desired point was reached. (See BALLISTICS.) This apparatus in its essence consisted of a clock which was set in motion and stopped by the armature of an electromagnet. Across the muzzle of the gun a wire was placed which was broken at the exit of the projectile and the circuit opened, thus releasing the armature of the electromagnet and setting in motion the clockwork. When the shot reached the required distance, the circuit was closed, and the clock stopped in a similar fashion. Wheatstone did not claim a greater accuracy for this instrument than to $\frac{1}{60}$ of a second, but improvements by Hipp, who, keeping the clockwork in motion, used the magnets only to throw the indicating part of the apparatus into gear with the movement, made the instrument more serviceable.

W. Siemens used a rapidly rotating cylinder, on a paper covering of which sparks from a circuit containing Leyden jars made the record marks. The introduction of a seconds pendulum into the circuit gave a record of the time by causing spark punctures at regular intervals, and the desired times could be found by comparing the distances. With this apparatus the velocity of a projectile while in the bore of the cannon could be measured, it being only necessary to insert insulated conductors at different points where the circuit could be made or broken by the traveling shot. Siemens also used this form of chronoscope, or chronograph, to measure the velocity of the electric current. Helmholtz improved the instrument by providing mechanism to give a constantly increasing velocity, making his measurement when the desired rate of speed was reached, the regulation being effected by the action of centrifugal force. This form of instrument has been employed extensively in physiological work, and there are numerous modifications now in use.

Tuning forks (see TUNING FORK) are also employed extensively for measuring small intervals of time, as they furnish an extremely accurate means for making such determinations. A device used by Pouillet was a circular disk of glass on which was a smaller circle of tinfoil and a narrow strip extending to the circumference. This was used to complete an electric circuit with a galvanometer, the principle involved being that with a continuous current for an extremely brief space of time, the strength of the current and consequently the deflection of the galvanometer is proportional to the time it is flowing.

In the Noble chronoscope, extensively used in artillery tests, there are eight bronze rotating disks, each covered with a strip of blackened paper, on which a record is made by means of an electric spark. This instrument is used to measure both internal and external velocities, as is also the Schultz chronograph, which employs a tuning fork and electromagnets. The velocity of different distances is obtained by having the circuit opened or closed by means of the wires of a screen through which the projectile passes. In an instrument for a like purpose, the invention of Crehore and Squier, the record is obtained by means of a beam of polarized light falling on a rapidly revolving photographic plate. In this instrument the plane of polarization is shifted by the action of a magnetic field produced on closing the circuit. When a current flows, the beam is rotated so that it does not affect the plate, leaving a blank in the path traced by the beam. A tuning fork is used to keep track of the time, and by means of the wavy line traced by it the time between interrupted points on the tracing of the first beam may be ascertained.

The Boulengé chronograph, much used in artillery tests of velocity, depends upon the distance a body falls in a given interval of time. It will be found discussed and illustrated in

the article on BALLISTICS. The chronoscope and chronograph are also constructed in numerous other forms, in some of which, e.g., the principle of the pendulum is employed, and time can be measured with an extreme degree of accuracy.

The instruments of Fizeau and Foucault to measure the velocity of light must be considered among the early forms of those instruments. In the former a wheel with projecting teeth was used to interrupt a beam of light which was sent to a distant mirror and back. The speed of the mirror was so adjusted that the beam of light which is transmitted through the space between two teeth is received after reflection in the next open space, and the velocity determined by ascertaining the distance traveled by the beam and the time consumed in the fraction of a revolution of the toothed wheel. Foucault used a revolving mirror, as did also Michelson, whose determinations are considered most reliable and accurate.

CHRONOL'OGY (Fr. *chronologie*, from Lat. *chronologia*, from Gk. χρονολογία, *chronologia*, from χρόνος, *chronos*, time + λόγος, *logos*, account). The branch of science which treats of time as measured, computed, and recorded. Its object is to establish some method of defining time, to compute the intervals between important historical events, and to fix the dates of events uniformly with reference to some chosen point in the history of the world.

The familiar units of time are the year, the month, and the day. These are astronomical and are determined by recurring celestial phenomena. The epoch universally employed today, before which and after which events are said to have occurred, is the birth of Christ. The years before Christ are marked B.C. and those after A.D. (Anno Domini). The astronomical units, however, have not always been employed, and the epoch or reckoning point differed among various peoples. Thus, in early days, such vague periods as generations, or reigns of kings, were assumed as units; but finally, through the suggestion, it is said, of the philosopher Eratosthenes, who was in charge of the library in Alexandria, in the third century B.C., the year was introduced as the unit of time. The difference in epochs led to various suggestions which were gradually discarded with the spread of civilization and the closer intercourse of men. The systems used by the Greeks and Romans were the most important in antiquity. The Greeks calculated by Olympiads, beginning their era from the years of the victory of Corœbus in the Olympic games, which corresponds to the year 776 B.C. The Romans began their era from the founding of the city, generally accepted as the year 753 B.C.

The study of the astronomical units and the measurement of time belong to the department of mathematical astronomy. The historian employs chronology to enable him to transfer events in history located in time according to various eras to his own system, the Christian era.

The method of reckoning time by Olympiads was used by the historian Timæus about 240 B.C. and was generally adopted by other Greek historians. The Olympiads were determined by the Olympic games, which were held every four years in the summer time. The Olympic year therefore begins in the middle of our year, and the first and latter half of our year belong to different Olympiads. Thus, Socrates was put to death in the first year of the 95th Olympiad. The reckoning is as follows: $94 \times 4 = 376$; this subtracted from 776 gives 400, but his death took place in the eleventh month, hence 1 should be subtracted, so that 399 B.C. is the year of his death with reference to the Christian era. If the date falls after Christ, 776 must be subtracted from the Olympic year. The calculation by Olympiads lasted down to the fifth century of our era.

The date of the foundation of Rome is given by Fabius Pictor in a year corresponding to 747 B.C., by Polybius in 750 B.C., by M. Porcius Cato in 751 B.C., by Verrius Flaccus in 752 B.C., and by Terentius Varro in 753 B.C. Among Roman writers Livy follows Cato and at times Fabius Pictor. Cicero and Pliny follow Varro. The Varronian date is generally accepted by modern writers. The years were designated by the letters A.U.C. (*anno urbis conditæ* = in the year from the foundation of the city). In changing from the Roman to the Christian era, subtract the years of Rome from 754 if the date is before Christ, but if the date is after Christ, subtract 754 from the year of Rome.

The Greek and Roman methods continued in use long after Christ. Constantine the Great is said to have introduced the system known as indiction. This was a cycle of 15 years, which were denoted Indiction 1, Indiction 2, up to Indiction 15, when the series began anew. There are four kinds of indictions, which owe their difference merely to the fact that they are reckoned from different days. Thus the Indiction of Constantinople began with Sept. 1, 312 A.D.; the Imperial, on Sept. 24, 312 A.D.; the Roman or Pontifical, on Dec. 25, 312 A.D., or Jan. 1, 313 A.D. As 1 A.D. equals Indiction 4, add 3 to the year of the Christian era and divide by 15, and the remainder will be the number of the indiction. If there is no remainder the indiction is 15.

The year of the Christian era, as now arranged, like the Julian year, established by Julius Cæsar, extends from January 1 to December 31. The Christian era was first used by Dionysius Exiguus in 533 A.D. He regarded the birth of Christ as taking place in the year of Rome 754, although early Christians placed it in 750. The Dionysian year, however, dated from the Annunciation, March 25 of the preceding year. The commencement of the year was assigned to different days in different places.

Thus in England down to the Conquest it was counted from Christmas or from March 25; from the Conquest to 1155, from January 1; from 1155 to 1751, from March 25. In Scotland the beginning of the year was changed from March 25 to January 1 in 1600, but the change was not generally adopted until it was made in England also. In France the beginning of the year varied in different dioceses, being either Christmas or March 25, until 1564, when January 1 was selected. In the middle of the sixteenth century January 1 was determined upon in Germany, Italy, Spain, and Portugal.

The era of the creation of the world is obtained from the Old Testament, but varies in the different texts. The Hebrew version reckons 1656 years from creation to the flood and 4000 years from creation to the birth of Christ. The Samaritan makes the latter interval much longer, though it counts from the creation to the flood only 1307 years. The Septuagint version removes the creation of the world to 6000 years before Christ and 2250 years before the flood. It is now, however, universally admitted that the creation of the world cannot be placed at so recent a date as 6000 B.C., and the modern understanding of the first chapter of Genesis leaves the period of the creation quite indefinite, and one scheme of interpretation stretches out the days of creation into periods of indefinite length. Des Vignoles, a writer on the chronology of sacred history, collected more than 200 different estimates of the era of the creation, the shortest being 3483 and the longest 6984 years. If such or such a date from the creation means anything, it is probably to be read by the date fixed by Archbishop Ussher, which was 4004 B.C.

Various other eras are worthy of mention. The era of Constantinople dates the creation of the world 5508 years and 4 months before the beginning of our era, the civil years beginning September 1, the ecclesiastical March 21 or April 1. The era of Alexandria used by the Christians of that city placed the creation of Adam 5500 years before the birth of Christ. We must allow three years for the date assigned by the early Christians to the Incarnation. Hence we may change dates of this era to our own by subtracting 5502. When Diocletian became Emperor, 10 years were omitted, and after that date, which is 5786 according to the Alexandrian era, we must subtract 5492. The mundane era of Antioch, used by the Christians of Syria, is the same as the Alexandrians after the time of Diocletian. The Julian period should be mentioned here. It was invented by Joseph Justus Scaliger in 1582 to obviate the inconvenience of counting in two ways, before and after Christ. He estimated a period of 7980 Julian years, and the first year of the Christian era corresponded to 4714 of his era. The era of Nabonassar, which obtains its name from the founder of the Kingdom of Babylon, was used by astronomers. Its date is Feb. 26, 747 B.C., which was calculated from records of Ptolemy, based on celestial phenomena. The Macedonian era, known also as that of the Seleucidæ, began on September 1 of the Julian year, 312 years before our era. The era of Spain, used in Spain, Portugal, Africa, and parts of France, dated from the conquest of Spain by Augustus in 38 B.C. The era of Diocletian, or era of martyrs, still followed by the Copts and Abyssinians, is reckoned from Sept. 17, 284 A.D. The Mohammedan era of the Hejira (q.v.) dates from the flight of Mohammed from Mecca in 622 A.D. The following table gives the precise dates of the beginning of the eras just mentioned and of others of less importance:

		B.C.
Grecian, Mundane	September 1,	5598
Constantinople, Civil	September 1,	5508
Alexandrian	August 29,	5502
Antioch, Mundane	September 1,	5492
Julian Period	January 1,	4713
Mundane, Ussher	October	4004
Mundane, Jewish	October	3761
Abraham	October 1,	2015
Olympiads	July 1,	776
Rome, Foundation of	April 24,	753
Nabonassar	February 26,	747
Metonic Cycle	July 15,	432
Macedonian, or Grecian	September 1,	312
Tyrian	October 19,	126
Maccabean	November 24,	166
Sidonian	October	110
Cæsarian, of Antioch	September 1,	48
Julian Year	January 1,	45
Spanish Era	January 1,	38
Actian	January 1,	30
Augustan	February 14,	27

		A.D.
Christian	January 1,	1
Era of Diocletian	September 17,	284
Armenian	July 7,	552
Mohammedan, of the Hejira	July 16,	622
Persian, of Yezdegerd	June 16,	632

Various other systems of chronology may be found mentioned under the names of the nations by whom they were employed. Consult: Nicholas, *Chronology of History* (London, 1838); Woodward and Cates, *Encyclopædia of Chronology*, historical and biographical (Boston, 1872); Macdonald, *Chronologies and Calendars* (1897); Grotefend, *Taschenbuch der Zeitrechnung* (Leipzig, 1905); Arbuthnot, *The Mysteries of Chronology* (London, 1900). See also CALENDAR; YEAR; MONTH; DAY; CYCLE; ETC.

CHRONOM'ETER (Fr. *chronomètre*, It. *cronometro*, from Gk. *χρόνος, chronos*, time + *μέτρον, metron*, measure). The name given principally to such timekeepers as are used for determining the longitude at sea. The mechanism is essentially the same as that of a common watch, only the size is generally greater; the balance wheel is compensated for variations of temperature; and the whole instrument is hung in a frame of balancing rings called "gimbals." These prevent the ship's motion from influencing the chronometer's rate too much.

CHRON'OSCOPE. See CHRONOGRAPH.

CHRUDIM, krōō'dĕm. A town in the eastern part of Bohemia, Austria, situated on the river Chrudimka, 74 miles by rail from Prague. It has a number of churches, among them one dating from the thirteenth century. Its principal industries are the making of sugar, liquors, meal, leather, shoes, cloth, and agricultural machinery. Pop., 1890, 12,128; 1900, 13,017.

CHRYSALE, krĭ'zăl'. The henpecked husband of Philaminte in Molière's *Les femmes savantes*. He is the type of a *bon bourgeois*, and, though under the domination of his *précieuse* wife, is inspired by the love he bears his daughter Henriette to assert his authority and save her from the base Trissotin.

CHRYSALIS, krĭs'ă-lĭs. See BUTTERFLIES AND MOTHS.

CHRYSANDER, krē'sän-dĕr, FRIEDRICH (1826–1901). A German writer on the science of music. He was born in Lübtheen, Mecklenburg-Schwerin, and studied philosophy in Rostock, but later gave up his time entirely to musical study. He has contributed extensively to the literature of this subject and is especially

well known as the editor of Handel's works, his edition having been the first to be prepared from the original sources. The edition was really published by Chrysander as a private enterprise, more particularly after the death of his collaborator, Gervinus, in 1871, when, equipped with a simple hand press and assisted by only one printer and one engraver of music, he continued the publication of the work at his own expense, in this way completing all but three of the 100 volumes. This gigantic undertaking occupied the editor from 1859 to 1894, during which time he repeatedly visited England for the purpose of studying the autograph scores. Foremost among the striking improvements introduced by Chrysander into this famous edition are the following: a new German translation of the original English text, emphasizing the relation between word and tone; the concentration of the dramatic element; the restoration of the original ornamentation of the arias; and, most important of all, the restoration of the original Handelian orchestration. While working on this monumental edition of the master's works, Chrysander also embodied the wealth of information he had collected in an exhaustive biography, of which, however, only two volumes were completed. A portion of the third volume brings the life down to the year 1740. Unfortunately this greatest biography of Handel has never been completed, although the publishers have made several attempts to induce eminent scholars to undertake the task.

CHRYSAN'THEMUM (Lat. from Gk. *χρυσάνθεμον, chrysanthemon*, from *χρυσός, chrysos*, gold + *ἄνθεμον, anthemon*, flower). A genus of plants of the family Compositæ, comprising some 200 species, natives of Europe, Asia, and northern Africa. The plants of this genus are free bloomers in both the wild and cultivated state. The flower heads are either flat or hemispherical; solitary on long peduncles or in flat-top clusters. Usually the rays spread wide open and are conspicuously showy, white, yellow, or rose-purplish in tint, while the disk flowers are for the most part yellow.

The name "chrysanthemum" is popularly restricted to the many garden and greenhouse forms of Europe and America, all of which are the blended offspring of two distinct Chinese and Japanese species, *Chrysanthemum indicum* and *Chrysanthemum sinense*. Through a continued process of cross fertilization and selection a remarkable diversity of color, shape, and size has been developed in these flowers. They range all the way from the true pompon, or button form, to the huge head that measures nearly 8 inches in diameter, with ray florets 3 or 4 inches in length. In shape they are quilled, twisted, hairy, or plain, double, semidouble, and single, with florets erect, incurved, or reflexed. They are of nearly all colors and shades. The varieties are generally wanting in fragrance, although an occasional sweet-scented form occurs. The chrysanthemum has long held first place as an autumn garden and exhibition flower. In the cut-flower trade of America it is outranked only by roses and carnations. The national chrysanthemum societies of England and America, as well as numerous other horticultural and floral societies, have done much to direct the popular taste away from freakish and fantastic forms and to encourage the production and perpetuation of varieties of merit. The types correspond approximately both in Europe and America as also in Australasia. The many hardy dwarf or pompon types and the early large-flowering types are best for the garden. Many of the pompons retain their beauty until severe freezing weather sets in. Of the large flowers, the Japanese reflexing forms in many colors are rather favored in America, while in England these are slowly giving place to singles and semidoubles. Chrysanthemums are easily propagated from rooted ground shoots. Florists prefer to treat these shoots as cuttings. The plants will endure varied soil and cultural conditions. They grow best in a rich and well-tilled soil. The art of disbudding, practiced by professional florists to secure large well-formed flowers, should be accompanied by a knowledge of varietal tendencies as well as of the different flower buds and their qualities. Consult: Bailey, *Cyclopedia of Standard Horticulture;* Herrington, *The Chrysanthemum: Its Culture for Professional Growers and Amateurs* (New York, 1905); Powell, *Chrysanthemums and How to Grow Them* (Garden City, N. Y., 1911).

Chrysanthemum leucanthemum is the oxeye daisy of pastures in the Atlantic States. Another species, *Chrysanthemum segetum*, is the corn marigold of Europe. *Chrysanthemum frutescens*, known in France as marguerite, and widely cultivated in that country for ornamental purposes, has found its way into other lands and is grown either in pot culture or, where the climate will allow, in the open air.

CHRYSAOR, krī-sā'ôr *or* krīs'â-ôr (Lat., from Gk. Χρυσάωρ). 1. The son of Poseidon and Medusa, in Greek legend. He sprang from his mother's head when she was decapitated by Perseus. He was father of Geryon (q.v.). 2. The name of Artegal's sword in Spenser's *Faerie Queene*.

CHRYSAROBIN, krīs'â-rō'bĭn (Neo-Lat. *chrysarobinum*, from Gk. *χρυσός, chrysos*, gold + E. Ind. *aroba*, bark of leguminous trees). Goa powder (q.v.).

CHRYSE CHORA, krī'sē kō'rȧ (Gk. Χρυσῆ Χώρα, Golden Land). A name given by the ancients to a part of India comprising the present Burma and the northern part of Pegu.

CHRYSEIS, krī-sē'ĭs. In the *Iliad*, the daughter of Chryses, priest of Apollo at Chryse. When she fell to the share of Agamemnon in the distribution of spoils during the Trojan War, the ransom offered by her father was harshly refused by Agamemnon. Apollo, to punish the slight to his priest, sent a pestilence on the Greek camp, which was averted only by the return of Chryseis to her father. See ACHILLES.

CHRYSELEPHANTINE, krīs'ĕl-ē-fān'tĭn (from Gk. *χρυσελεφάντινος, chryselephantinos*, of gold and ivory, from *χρυσός, chrysos*, gold + *ἐλεφάντινος, elephantinos*, made of ivory, from *ἐλέφας, elephas*, ivory, elephant). The art which prevailed among the Greeks of covering some of their statues with ivory and gold. The body of these figures was usually of wood over which a thin plating of ivory was fastened, and certain portions of the garments were made of gold. The hair, also, was of gold. These garments and the hair were usually chased. (See CHASING.) The modeled body of these statues belonged to the art of sculpture, while the chasing and ornamentation of the draperies and hair was called toreutic art. The statues were mainly of religious character and used for the ornamentation of temples. Winckelmann has calculated that

about 100 statues of this kind are mentioned by the ancients. The colossal works executed by Phidias (q.v.) in the time of Pericles are the most famous of this class, the greatest being the Pallas of the Parthenon. It was 26 cubits high and represented the goddess in armor, covered with a long robe. Even grander was the famous Olympian Zeus, which was considered one of the seven wonders of the world. Another famous chryselephantine statue was that of Hera in her temple at Argos, by Polyclitus (q.v.).

CHRYSES, krī'sēz. See CHRYSEIS.

CHRYSIPPUS, krī-sĭp'pŭs (Lat., from Gk. *Χρύσιππος*) (c.280–207 B.C.). An eminent Stoic philosopher of Soli in Cilicia. He came to Athens when still a youth and eagerly devoted himself to philosophical pursuits, especially under Cleanthes, the successor of Zeno, although he is said to have studied also under the Academic teachers, Arcesilaus and Lacydes, and to have learned from them what were the objections urged by skeptics against the doctrines of the Stoics. He possessed an eager, facile, and catholic mind, and enjoyed the reputation of being the keenest disputant of his time; yet his discourses were clever and subtle rather than seriously argumentative. It was his common practice to take at different times opposite sides of the same question, so that he furnished his opponents, especially Carneades, with the means of convicting him of inconsistency. In philosophy he was an expounder, not an originator. His literary industry was great. He is said to have written no fewer than 500 lines each day, and Diogenes Laërtius speaks of over 705 books by him. These dealt with philosophy proper, logic, physics, ethics, grammar, and the interpretation of the poets; only fragments remain in the works of Plutarch, Ælian, Cicero, Seneca, and Aulus Gellius. These were edited by Petersen, 1827; Ritter and Preller (Gotha, 1886–88). Consult: Baguet, *De Chrysippi Vita, Doctrina et Reliquiis* (Paris, 1882); Zeller, *Philosophie der Griechen* (Leipzig, 1881); Hicks, *Stoic and Epicurean* (New York, 1910); Bevan, *Stoics and Sceptics* (Oxford, 1913).

CHRYS'OBER'YL (from Lat. *chrysoberyllus*, from Gk. *χρυσοβήρυλλος*, golden beryl, from *χρυσός, chrysos*, gold + *βήρυλλος, bēryllos*, beryl). A beryllium aluminate that crystallizes in the orthorhombic system. It has a vitreous lustre and is found in various shades of green and is sometimes red by transmitted light. The greenish varieties showing a chatoyant effect are called cat's-eye, while opalescent specimens are named *cymophane*. Chrysoberyl was known to the ancients and was called *Oriental chrysolite* or *Oriental topaz*. It is found in Brazil, Ceylon, and in the Ural Mountains. A variety of an emerald-green color, but red by transmitted light, is called *alexandrite*, in honor of the Czar Alexander II. In the United States chrysoberyl occurs at Haddam, Conn., and at Norway, Stow, and several other localities in Maine. The largest transparent crystals are frequently cut into gems.

CHRYS'OCOL'LA (Neo-Lat., from Gk. *χρυσόκολλα, chrysokolla*, gold solder, from *χρυσός, chrysos*, gold + *κόλλα, kolla*, glue). A hydrated copper silicate that is cryptocrystalline. Chrysocolla is found in green to blue masses with an enamel-like texture. Impure varieties often occur in earthy masses, green or dull brown in color. It occurs with other copper minerals, especially in the upper parts of veins. It is found in Cornwall, England; Hungary; Siberia; Australia; Chile; and, with other copper ores, in New Jersey, Pennsylvania, Wisconsin, Michigan, Arizona, and elsewhere in the United States. When found in sufficiently abundant quantities, it is a valuable ore of copper, as it contains when pure 45 per cent of copper oxide. The name "chrysocolla" was applied by the ancients to any green mineral, as malachite, containing copper and capable of being used as a pigment.

CHRYS'OLITE (from OF. *crisolite*, Fr. *chrysolithe*, from Lat. *chrysolithos*, Gk. *χρυσόλιθος, chrysolithos*, from *χρυσός, chrysos*, gold + *λίθος, lithos*, stone). A magnesium-iron silicate that crystallizes in the orthorhombic system. It is of a green color, varying from yellow to brown, with a vitreous lustre, and when cut is prized as a gem stone, the gem varieties being known as *olivin* and *peridot*. Chrysolite is frequently found in lava as at Vesuvius, and in the volcanic rocks of Sicily, the Azores, the Hawaiian Islands, and elsewhere; it is also a frequent and important rock constituent. In the United States it is found in the form of small, olive-green, pitted grains or pebbles, with garnet, in Arizona and New Mexico, where the grains are called "Job's tears" on account of their pitted appearance. It also occurs in basalt near Montreal, and elsewhere in Canada. The so-called chrysolite of the jeweler is usually chrysoberyl, and the *chrysolithus* mentioned by Pliny is supposed to have been topaz. It is said that many of the so-called emeralds in European churches, as those of the "Three Magi" in the cathedral of Cologne, are chrysolites, and not emeralds. See GEMS.

CHRYSOLOGUS, krī-sŏl'ō-gŭs (Lat., from Gk. *χρυσόλογος*, from *χρυσός, chrysos*, gold + *λόγος, logos*, speech; referring to his oratorical powers), PETER (406–450). Bishop of Ravenna in 433. He opposed Arianism and Eutychianism. About 100 genuine sermons of his have come down to us, though there are 76 others attributed to him. They do not bear out his reputation for eloquence, but show an earnest and spiritually minded nature. His works are in Migne, *Patrologia Latina*, lii. There is a partial translation into German by M. Held (Kempfen, 1874). For his life, consult H. Dapper (Cologne, 1867) and F. V. Stablewski (Posen, 1871).

CHRYSOLORAS, krĭs'ō-lō'ras, MANUEL (c.1355–1415). A Byzantine Greek scholar, the first important teacher of Greek of the Renaissance. His scholarship became famous in Italy, so that Guarino da Verona went to Constantinople to learn Greek from him. About 1393 he was sent by the Byzantine Emperor, Manuel Palæologus, to the West to ask assistance from Italy and England against the Turks. While on this mission he became known to many Italians, and in 1396, being invited by the Florentine Republic, he settled in Florence as a teacher of Greek literature. Within the next two years Chrysoloras had among his pupils Niccolò Niccoli, Leonardo Bruni, Manetti, and others.

In 1400 he left Florence, and two years later was teaching in Pavia, where he translated Plato's *Republic* into Latin. During the next decade he seems to have traveled in France, Spain, and England, and to have been engaged in teaching Greek in a number of Italian cities. He was employed by Pope Gregory XII in an attempt to bring about the union of the Greek and the Roman churches. He accompanied John

XXIII to the Council of Constance and died while it was in progress.

His most important work was his *Erotemata*, the first Greek Grammar published in western Europe (Venice, 1484), which was for many years the standard work for Greek teaching in Italy and elsewhere. Another interesting work was his comparison of ancient and modern Rome (*Σύγκρισις παλαιᾶς καὶ νεᾶς Ρώμης*). Consult Voigt, *Die Wiederbelebung des klassischen Alterthums*, i (Berlin, 1895), and Symonds, *Renaissance in Italy*, ii (London, 1877).

CHRYS'OPRASE (from Lat. *chrysoprasus*, Gk. *χρυσόπρασος*, *chrysoprasos*, from *χρυσός*, *chrysos*, gold + *πράσον*, *prason*, leek). A variety of chalcedony, the apple-green color of which is due to the presence of a small quantity of nickel oxide. It is found in Silesia, Germany, and near Riddles, Oregon, where it occurs in nickel ore in veins over an inch thick; also in Tulare Co., Cal. Chrysoprase was formerly much sought after as a gem stone, but as it loses its color if kept in a warm place, it is no longer much prized. It is mentioned in the Bible, and by the ancients was described as a gem of a yellowish-green color, the identity of which has never been definitely established. *Chrysoprase earth* is the name given to an apple-green variety of pimelite from Silesia.

CHRYSOSTOM, krĭs'os-tom *or* krī-sŏs'tom (from Gk. *Χρυσόστομος*, *Chrysostomos*, golden-mouthed, from *χρυσός*, *chrysos*, gold + *στόμα*, *stoma*, mouth; so named from the splendor of his eloquence), JOHN, SAINT (c.345–407). One of the greatest fathers of the early Church. He was born in Antioch in 345 or 347 A.D. He came of a patrician family. His father, Secundus, died soon after Chrysostom's birth. His mother, Anthusa, was a pious woman, wholly devoted to her son, who grew up under her loving instructions into an earnest, gentle, and serious youth, passing through none of those wild, dark struggles with sinful passions which left an ineffaceable impress on the soul of Augustine and gave a sombre coloring to his whole theology. He studied oratory under Libanius, a heathen rhetorician, as he at first intended to be a jurist, and soon excelled his teacher; but, feeling called to give up worldly pursuits, he abandoned legal for biblical study. About 368 he was baptized and was ordained a reader. He practiced the strictest asceticism while still living at home, and on his mother's death, about 375, he retired to the desert around Antioch. After six years the ascetic severity of his life and studies brought on an illness which forced him to return to Antioch, where he was ordained deacon by Bishop Meletius in 381 and presbyter by Bishop Flavianus in 386. The eloquence, earnestness, and practical tone of his preaching excited the attention of Jews, heathens, and heretics, and secured for him the reputation of the chief orator of the Eastern church. In 398 the eunuch Eutropius, minister of the Emperor Arcadius, who had been struck by the bold and brilliant preaching of Chrysostom, elevated him to the episcopate of Constantinople. Chrysostom immediately began to restrict the episcopal expenditure in which his predecessors had indulged and bestowed so large a portion of his revenues on hospitals and other charities that he gained the surname of "John the Almoner." He also endeavored to reform the lives of the clergy and sent missionaries into Scythia, Persia, Palestine, and other lands. His faithful discharge of his duties, especially in reproof of vices, excited the enmity of the Patriarch of Alexandria, of Theophilus, and of the Empress Eudoxia, who succeeded in deposing and banishing him from the capital (403). He was soon recalled, to be banished again shortly afterward (404). He was taken during July and August to Nicæa, now Isnik, in Asia Minor, the place where the famous Nicene Council was held, and there, to his great disappointment, he learned that his place of banishment was to be Cucusus, a little town in the Armenian highlands, now called Gozene. It was a weary journey, but he finally arrived there. The Bishop of Cucusus received him kindly, and the climate agreed with him. So his zeal was not abated. He labored for the conversion of the peoples in the neighborhood and wrote the 17 letters (or rather moral essays) to Olympias, to whom he also addressed a treatise on the proposition, "None can hurt the man who will not hurt himself." The Emperor, enraged by the general sympathy expressed towards Chrysostom by all true Christians, gave orders that he should be banished to the remote Pityus, on the northeast coast of the Black Sea at the foot of the Caucasus, a most desolate spot, involving a journey of hundreds of miles on foot. It was at the very verge of the Eastern Roman Empire. The march was begun and for three months kept up, but when he reached the chapel of the martyr Basiliscus, about 6 miles from Comana, in Pontus, he could go no farther and there died, Sept. 14, 407, blessing God with his dying lips. The news of his death excited much sorrow among all pious Christians, for Chrysostom was a man who drew the hearts of his fellows after him; a lovable, manly Christian, hating lies, worldliness, hypocrisy, and all manner of untruthfulness, with that honest warmth of temper which all vigorous people relish. A sect sprang up after his death, or martyrdom as they conceived it, called *Johannists*, who refused to acknowledge his successors; nor did they return to the general communion till 438, when the Archbishop Proclus prevailed on the Emperor Theodosius II to bring back the body of the saint to Constantinople, where it was solemnly interred, the Emperor himself publicly imploring the pardon of heaven for the crime of his parents, Arcadius and Eudoxia. The Greek church celebrates the festival of Chrysostom on November 13; the Roman, on January 27. In his *Homilies* (Thomas Aquinas said he would not give those on St. Matthew in exchange for the whole city of Paris) Chrysostom displayed superior powers of exegesis. In general, he rejects the allegorical system of interpretation and adheres to the grammatical, basing his doctrines and sentiments on a rational apprehension of the letter of Scripture. He is, however, far from being a bibliolater. He recognized the presence of a human element in the Bible as well as a divine; and instead of attempting, by forced and artificial hypotheses, to reconcile what he thought irreconcilable in Scripture statements, he frankly admitted the existence of contradictions and shaped his theory of inspiration accordingly. But his greatest and noblest excellence lay in that power, springing from the fervor and holiness of his heart, by which the consciences of the proud, the worldly, and the profligate were awakened, and all were made to feel the reality of the gospel message. The surname "Chrysostom" was first applied some time after his death, and, as it is supposed, by the Sixth Ecumenical Council in 680. Chrysostom's works are very numerous, and consist

of, 1st, *Homilies*, on parts of Scripture and points of doctrine; 2d, *Commentaries*, on the whole Bible (part of which have perished); 3d, *Epistles*, addressed to various people; 4th, *Treatises*, on different subjects (such as Providence, the Priesthood, etc.); and 5th, *Liturgies*. Of these the most valuable, as well as the most studied, are the *Homilies*, which are held to be superior to everything else of the kind in ancient Christian literature.

The best Greek edition of Chrysostom's works is that by Henry Savil (8 vols., Eton, 1613); and the most complete Greek and Latin edition is that by Montfaucon (13 vols., Paris, 1718–38; republished in 1834–40). There is an Eng. trans. in the first series of the *Nicene and Post-Nicene Fathers* (London and New York, 1889–90). For his biography, consult: Stephens (3d ed., London, 1883); Bush (London, 1885); Chase (London, 1887); Marshal (Paris, 1898).

CHRYS'OTILE. A fibrous variety of serpentine, which, owing to its susceptibility of division into fine threads, is used in the manufacture of fireproof fabrics.

CHRYS'OTYPE (from Gk. *χρυσότυπος, chrysotypos*, wrought of gold, from *χρυσός, chrysos*, gold + *τύπος, typos*, impression). A photographic process invented by Sir John Herschel, which depends on the reduction of a ferric salt to a ferrous salt by the action of light, and the subsequent precipitation of metallic gold on the ferrous salt. The process is now hardly ever used.

CHRZANOW, KZHÄ'NŎV. A town in the Austrian Crownland of Galicia, 27 miles west-northwest of Cracow, the centre of an important mineral region. Lead, zinc, coal, and cadmium are mined. There is considerable trade in agricultural products, and brandy and chicory are manufactured. Pop., 1900, 10,200, mostly Poles.

CHRZANOWSKI, KZHÄ-NÔF'SKÊ, WOJCIECH (1788–1861). A Polish general, who participated in Napoleon's Russian campaign and in the battles of Leipzig, Paris, and Waterloo. After Napoleon's final defeat he served in the national army of Poland, and was under Diebitsch in Turkey in 1828–29. In the Polish revolution of 1830 he served with distinction under the provisional government, rose to the rank of general of division, and in 1831 was made Governor of Warsaw. He was suspected of being friendly to the Russians and was for a long time under a sort of ostracism. In 1849 he was chosen by Charles Albert commander in chief of the Sardinian forces in his second war against Austria. Ramorino and Chrzanowski were charged with treachery, and the former was put to death. Chrzanowski lived for a number of years in Louisiana, but died in Paris. He published several works in Polish.

CHTHONIAN (thŏn'ĭ-*an*) **GODS.** In Greek mythology, the deities connected with the lower world, as HADES, PLUTO, PERSEPHONE, DEMETER, and HERMES.

CHUB (variant of *cub*). A fish (*Leuciscus cephalus*) of the family Cyprinidæ, bluish black on the upper parts, passing into silvery white beneath, with the cheeks and gill covers golden yellow. The chub is plentiful in many rivers of England and continental Europe, rarely reaches a weight of 5 pounds, spawns in April and May, and affords sport to anglers. In the United States the name is applied to several species of this family, most familiarly to the horned dace. (See DACE.) The river chub (*Hybopsis kentuckiensis*) measures 9 inches and is found on both sides of the Alleghanies. The chub of the Columbia River is *Mylochilus caurinus*, 12 inches long. See Plates of CARP AND ALLIES, and of DACE AND MINNOWS.

CHUBB, PERCIVAL (1860–). An American educator, born at Devonport, England. He was educated at the Stationers' School, London, and for 10 years was in the service of the Local Government Board. After removal to this country he was, in succession, lecturer on literature, Brooklyn Institute of Arts and Sciences; instructor in pedagogy, Pratt Institute; head of the English department of the Manual Training High School, Brooklyn; and principal of the high school department of the Ethical Culture School, New York. For a time he was also associate leader of the Society for Ethical Culture in New York, and in 1911 he became leader of the Society in St. Louis. He edited *Emerson's Selected Writings* (1888), *Dryden's Palamon and Arcite* (1899), *Select Writings of Lincoln* (1909), and wrote *The Teaching of English* (1902) and *Festivals and Plays in Schools and Elsewhere* (1912).

CHUB MACKEREL. A mackerel (*Scomber colias*), widely distributed throughout both oceans in temperate latitudes, and a food fish of some importance, though smaller than and inferior to the common mackerel. Its form is shown in the Plate of MACKERELS; the color is blue with about 30 wavy blackish streaks across the back. It is locally known by many names, as "linker," "easter," and "thimble-eyed" mackerel and in England as "Spanish" mackerel. It is extremely numerous in the Mediterranean Sea.

CHUB SUCKER. A small brown sucker (*Erimyzon sucetta*), called also "creekfish," numerous in lakes and quiet streams throughout the central United States and along the Atlantic coast. The sexual difference is strong, males in spring usually having three large tubercles on each side of the snout and the anal fin much swollen.

CHUBUT, chŏŏ-bo͞ot'. A territory of Argentina, occupying the northern portion of Patagonia, and bounded by the Territory of Rfo Negro on the north, the Atlantic on the east, the Territory of Santa Cruz on the south, and Chile on the west (Map: Argentine Republic, D 12). Its area is over 93,000 square miles. It is only slightly elevated in some parts, is traversed by the rivers Chubut and Senguer, and contains a number of lakes. Pop., 1905, 12,417. The chief settlement is Rawson, a colony of Welsh, near the east coast, with a population of about 500. Towards the close of 1907 petroleum was discovered at a depth of 1768 feet in the southern part of Chubut.

CHUCKWAL'LA. A large, stout-bodied iguanid lizard (*Sauromalus ater*) of the desert region of the southwestern United States. It is the largest lizard of the Colorado River plateaus, except the heloderma. "The broad body is black or blackish, and the large blunt tail is usually marked with white, or entirely white. It was generally found on lava or other dark rocks, with which its coloration harmonizes. It is a vegetarian, feeding entirely on the buds and flowers of plants, with the addition sometimes of a few leaves." It is much prized by the local Indians as an article of food, and when well cooked is liked by white men, its flesh resembling chicken. A name for it in southern California is "alderman lizard."

CHUCK-WILL'S-WIDOW (imitative of its cry). A large nightjar (*Antrostomus carolinensis*) of the southern United States, whose call note resembles its name, is articulated with great distinctness, and reiterated like that of its congener, the whippoorwill. It is a much larger bird than the whippoorwill, being a full foot in length, but has the same pattern of plumage. The mouth is enormous. The rictal bristles have prominent lateral branches, and both humming birds and sparrows have been found in the stomach, though insects are its usual food. It lays its two eggs on the ground, making no nest.

CHU'FA (Sp.). A name applied to *Cyperus esculentus*, a perennial sedge that spreads extensively by its underground rootstocks. It bears numerous small tubers, on which account it is also often called "nut grass," or "ground almond." The tubers are edible and are eagerly sought after by hogs, which are frequently allowed to pasture upon them at will. Chufas grow well upon light, sandy soils, producing large crops. Upon land required for general farming they are liable to become a serious pest on account of the difficulty of their eradication. When dried or parched, the "nuts" have a fine flavor. They contain considerable amounts of oil, starch, and sugar, the proportions of which vary considerably. The oil is sometimes expressed and for culinary purposes is said to be unsurpassed. A similar species is *Cyperus rotundas*, to which the name "nut grass" more properly belongs. Both are met with in a wild state in many parts of the United States, especially in the South.

CH'Ü FOU. See KIUH FOW.

CHUFU. Another name for Cheops (q.v.).

CHUGACH FOREST RESERVE. See ALASKA.

CHU HI, chōō'hē' (1130–1200). The modern apostle of Confucianism in its philosophical form, whose writings are the recognized standard of orthodoxy and the creed of educated men in China. He has been officially approved by successive Imperial dynasties and even canonized. His father was a government officer and he was born in Fu-kien. Precocious from childhood, he took his second degree before he was 20 years old. He devoted his leisure time when in office to studying Buddhism and Taoism, but throwing these aside after a few years, he became an enthusiastic student of the writings of the schoolmen of the Sung dynasty (960–1126 A.D.). Confucianism, under the analysis and exposition of the scholars Chou Tun-i and the brothers Cheng, had received a new statement, emerging as something like a philosophical system, instead of the ancient simple ethics and ritual. Chu Hi, expanding and expounding the doctrines thus set forth a century before his day, won fame all over the Empire, and was summoned by the Emperor to the court for consultation in regard to things literary and political. He elucidated the doctrines of Confucius and Mencius, more especially with reference to the nature of man, the origin of good and evil, and the principles of creation. In 1180, as governor of a city in Kiang-si, he applied his principles and greatly improved public morals. His study room was the White Deer Grotto, on the hills near Lake Po-yang. Not content with philosophy, he summoned around him famous scholars, who were his pupils and worked over the great historical annals of Ssī-ma Kuang, and thus furnished the standard history of China; for Chu Hi's work, having been many times since reprinted with commentary and continuation, has been widely read in all Chinese Asia. Nearly all the histories and biographies (apart from annals) written since his time in China, Korea, Japan, etc., have been powerfully influenced by Chu Hi's model—i.e., on the plan of philosophy and edification, being less consecutive narratives of events than appraisals of men and their actions as righteous and unrighteous, according to Chu Hi's standards.

Chu Hi extended his labors in every direction of metaphysical speculation, and his commentaries on the ancient writings of the sages have held the intellect of learned men of China and surrounding countries almost without challenge or criticism, until about the beginning of the second half of the seventeenth century, when they began to be vigorously assailed in China and later in Korea and Japan. In Japan Chu Hi's system is called Tei-shu, which is the Japanese pronunciation of the names of the Cheng brothers and of Chu-(Hi). It was officially encouraged by Iyeyasu and his successors very much as a state church, and to oppose it openly was at first politically dangerous. Its most famous Japanese expounders were Kyuso, Seiga, and Arai Hakuseki, the opponents of this orthodox school and the critics of Chu Hi being Jinsai, Sorai, Togai, and others. The latter, forming the Kogahu school, was noted for its doubt of the truth of the teachings of Chu Hi. Chu Hi's philosophy in Japan, as well as in China, profoundly influenced the form and spirit of literature, both scholastic and popular; but in Japan the Chinese teachings, becoming amalgamated in a common cause with Shinto, served powerfully to stimulate the national sentiment and feeling which overthrew the Shogun and Yedo government and restored the Mikado to supreme power. Especially in the Province of Mito was this union of Chinese philosophy and Shinto teaching successfully carried out, powerfully influencing the minds of the gentry and scholars in bringing about the great revolution of 1868. Thus one of the strangest phenomena in history was witnessed in that the rule of the Tokugawa family (1604–1868) was first shaken and then overthrown by the very doctrine "which generations of able shoguns and their ministers had earnestly encouraged and protected."

In China Chu Hi's philosophy held its own until near the close of the Ming dynasty (1368–1644), when Chinese scholars began to feel that Chu Hi's system was too narrow to hold all the truth. As a result of the profound thinking stimulated by the Manchu conquest, a school of criticism and opposition arose whose demand was for a study of the ancient texts in their purity. By continuation and expansion of philosophical labor, and especially by coming into contact with Occidental science and speculation, modern reformers have become prominent, but their activity and aims have been much obscured to Western minds by the Boxer uprising (1900) and the necessary foreign invasion.

In brief, the system promulgated by Chu Hi is a body of thought which may be called the result of Chinese reflection during 1500 years, put into logical Chinese form indeed, but in reality an amalgamation of the three systems or religions of China. It is the ethics of Confucius transfused with the mystical elements of Taoism and the speculations of Buddhism, though very little acknowledgment is made to

any thought originating outside of the Confucian cycle. It is less rationalistic than pantheistic, for the cultivated Confucians believe in heaven as a bundle of laws and forces, or at least an orderly system of abstract principles and regulated energy, but with no clear expression of personality. Their voluminous discussions of Spirit, Way, Reason, Law, deal with what is formless and invisible. When a term for Creator is used, it is a rare word and found only in the vocabulary of scholars. There is no clear grasp of the idea of a personal Creator. Man is the highest expression of the forces of the universe, and even gods and devils fear his determined mind. The ultimate realities are force and law. Man has no immortal soul; he is highest in the scale of existence, yet he is only one in the endless series. The station, duty, or position in life is greater than the individual, and it determines him. Hence, in Japan, while loyalty (not filial piety, as in China) is the root of the system, the high sense of honor and willingness of self-effacement is the line of duty. Hence, also, in China the determination at all hazards to "save the face" of everything, and the making of form and ritual equal to substance and containing it. In Japan in the twentieth century Chu Hi's system is but a memory, or at most an evanescent shadow; in Korea it is powerful, yet rather as an adjunct to political economy; in China it still holds its own, but precariously, against the assaults of the modern radical reformers, of whom Kang Yu-wei, who in 1899 emerged into notice as adviser to the Emperor, is the most conspicuous example and best known in the Occident.

CHUKCHI, chōōk'chē'. See TCHUKTCHI.

CHU-KIANG, chōō'kyäng' (Chinese, pearl river), called also the CANTON RIVER. A river of south China, in the Province of Kwang-tung (Map: China, D 7). It is formed by the North and West rivers, which unite about 30 miles from Canton, which is situated at the head of its extensive delta. The estuary is very wide. The total length of the river is about 100 miles. The Si-kiang is connected with the delta of the Chu-kiang. See BOCA TIGRIS.

CHUKOR, chu-kōr', or **CHICKORE,** chī-kōr' (Hind. *cakōr*, Skt. *cakōra*, partridge). The Anglo-Indian name of the common red-legged hill partridge (*Caccabis chukor*), a favorite game bird in northern India and westward to the Black Sea. See PARTRIDGE.

CHULALONGKORN, chōō'là-lŏng'kōrn, SOMDETH PHRA PARAMINDA MAHA (1853–1910). A king of Siam. He was born in Bangkok, the son of King Paraminda Maha Mongkout, and was elected to succeed his father upon the latter's death in 1868. He assumed full royal powers in 1873. By introducing reforms and modernizing the government he became known as a progressive ruler: slavery was practically abolished during his reign, internal taxes reduced, canals and roads opened, postal telegraph and telephone services established, and lighthouses erected along the coast. One of his first reforms was to modify the ceremony which surrounded the approach to the King. He also established a new code of laws, improved the educational system, proclaimed religious freedom, and built hospitals and museums. At his request General Grant, while on his tour of the world, visited him for six days.

CHUMBUL, chŭm'bŭl, or **CHAMBAL,** chŭm'bal (Skt. *Carmanvati*, having hides, from *carman*, hide). An unnavigable river of British India, rising in the Vindhya Mountains, which form the southern limit of the basin of the Ganges. Its source, at a height of 2019 feet above sea level, is in lat. 22° 26′ W. and long. 75° 45′ E. In its generally northwestern course of 514 miles it receives many tributaries on both sides, till, in lat. 26° 30′ N. and long. 79° 19′ E., it enters the Jumna from the right with such a volume of water that, when flooded, it has been known to raise the united stream 7 or 8 feet in 12 hours.

CHUN, kōōn, KARL (1852–1914). A German zoölogist, born in Höchst-am-Main. He studied the natural sciences in Göttingen and Leipzig from 1872 to 1875. In 1878 he became a privatdocent in Leipzig; in 1883 professor of zoölogy in Königsberg, then in Breslau in 1889, and in Leipzig in 1898. He has written: *Das Nervensystem und die Muskalatur der Rippenquallen* (1878); *Die Ktenophoren des Golfs von Neapel* (1880); "Cœlenterata," in Bronn's *Klassen und Ordnungen des Thierreichs* (1891 et seq.); and many less important works.

CHUNAM' (Tamil *cunnam*, Hind. *cūnā*, lime, from Skt. *cūrṇa*, powder). A very fine kind of quicklime made from calcined shells or from very pure limestone, and used for chewing with betel (q.v.) and for plaster. It is very white and takes a high polish. Both fresh and fossil shells are used for making chunam. Extensive beds of fossil shells employed for this purpose occur in the south of India, particularly in low, marshy places near the seacoast. The chunam from Madras is among the best made. The shells used are in the first place very carefully cleaned; they are then calcined in kilns, with wood charcoal. When chunam is to be used for plaster, it is mixed with fine river sand and thoroughly beaten up with water. The name is applied also to a weight for gold used in northern India.

CHUNCHO, chōōn'chō, or CHONCHO. A group of savage and warlike tribes living in the forests at the extreme headwaters of the Ucayali River, central Peru. They have communal houses, cultivate corn, bananas, and pineapples, and range the forests for game. They bury their dead in their houses and are said to be afraid to be at any time in utter darkness for fear of evil spirits. On account of their ferocity, very little is definitely known of them. By some they are believed to be closely related to the Anti (q.v.), who are of Arawakan stock; but Rivet records Chonchos, of the region about Noyobamba, as belonging to his Cahuapana (i.e., Mainan) stock.

CHUNGA, chŭŋ'gà, or **CHUN'NIA** (Neo-Lat., from the native name). A cranelike bird (*Chunga burmeisteri*) of Argentina, closely related to the cariama (q.v.), but smaller, darker, and more addicted to wooded districts. It is shy, has a barking note, feeds largely upon locusts, and nests on the ground; but the young are easily and commonly domesticated.

CHUNG-KING, chōōŋ'kĭng' (Chinese, middle city). A city of China, the commercial capital of the Province of Sze-chuan and one of the most important commercial centres of west China (Map: China, C 6). It is situated in lat. 29° 33′ N. and long. 107° 2′ E., on a small elevated peninsula at the confluence of the rivers Kia-ling and Yang-tze-kiang. It is surrounded by a strong stone wall, about 5 miles in circumference and pierced with nine gates. The climate is neither pleasant nor healthful. Chung-

king was opened to foreign trade in 1891 and has since become the centre from which the imports for west China are distributed through the affluents of the Yang-tze-kiang. Pop., 1910 (est.), 598,000.

CHU'PRA. See CHAPRA.

CHUQUET, shy'kâ', NICOLAS (c.1445–c.1500). A French mathematician. He was born in Paris and died in Lyons. His work, entitled *Le triparty en la science des nombres* (1484), has been copied many times, but was first printed in Boncompagni's *Bullettino di bibliografia e di storia delle scienze matematiche e fisiche* (Rome, 1880), from a manuscript in the Bibliothèque Nationale. The work consists of three parts: (1) treatment of rational numbers; (2) treatment of irrational numbers; (3) treatment of equations. Chuquet used the successive convergents of a continued fraction to approximate roots of numbers (the method used by Etienne de la Roche), and called it *ediocion entre le plus et le moins.* In the Triparty appear not only the signs d and m̄ for plus and minus, but also expressions like

$$B^4 \cdot 10,\ B^3 \cdot 17 \text{ for } \sqrt[4]{10},\ \sqrt{17}.$$

Chuquet used the Cartesian exponent notation $a_0, a^1, a^2 \ldots$ for $a, ax, ax^2 \ldots$; $a^{1\bar{m}}$ for ax^{-1}, the expressions "equipolence" and "equipolent" for "equivalence" and "equivalent," and the words "byllion, tryllion, quadrillion, quyllion, sixillion, septyllion, ottyllion, nonyllion," as well as "million." Consult Boncompagni, *Bullettino XIII* (Rome, 1880), and Cantor, *Vorlesungen über Geschichte der Mathematik,* vol. ii (Leipzig, 1900).

CHUQUISACA, chōō'kê-sä'kȧ, **CHARCAS,** chär'kȧs, or **SUCRÉ,** sōō-krâ (So. Amer. Indian, place of gold). A department in the southeastern part of Bolivia, bounded by the Department of Santa Cruz on the north, Brazil on the east, Paraguay and the Department of Tarija on the south, and of Potosí and Oruro on the west (Map: Brazil). Its area is 26,417 square miles. The western part is mountainous and has a good climate. The eastern part is mostly flat and very sparsely inhabited. The forests are extensive, and plenty of grazing as well as agricultural land is found. The chief mineral deposit is silver, which is mined to some extent and exported. The civilized population was officially estimated in 1890 at 125,000, including 85,000 Indians and about 7500 whites; according to the census of 1900 it amounted to 204,434, including 8000 uncivilized Indians; in 1906 it was estimated at 228,966. Capital, Sucré (q.v.), which had formerly been the capital of the republic.

CHUR, kōōr (Fr. *Coïre,* It. *Coira,* Lat. *Curia Rhætorum*). The capital of the Swiss Canton of Grisons, and an episcopal city, situated on the Plessur, 60 miles southeast of Zurich in the valley of the upper Rhine, in a fertile plain about 2000 feet above sea level, and surrounded by high mountains (Map: Switzerland, D 2). The town stands on uneven ground and has narrow streets. The bishop's palace and the quarter around it, inhabited by Roman Catholics, occupy the summit of an eminence and are separated from the rest of the town by walls and battlements, closed by double gates. In the same quarter stands the old cathedral, called the church of St. Lucius, a Romanesque edifice, founded in the eighth century and containing interesting paintings by Dürer and Holbein. The episcopal palace, in the Renaissance style, displays two old Roman towers and has rich archives and library. Behind it is the monastery of St. Lucius. In the lower city are the town hall, with fine painted windows, the Rhætian antiquarian museum, the cantonal library, and two theological seminaries. Chur was formerly an important trade centre on the road from Germany to Italy before the construction of the St. Gotthard Railroad. It flourishes still, owing to throngs of tourists, and to the traffic in wine, fruit, and agricultural products. Pop., 1905, 12,284; 1910, 14,485. The town was settled by the Romans, who named it Curia Rætorum, and from 451 it was an episcopal see. It was ruled by its bishops down to about the close of the Middle Ages. It entered the Confederation in 1498. Consult Planta, *History of the City of Chur in the Middle Ages* (Chur, 1879).

CHURCH (AS. *circe,* Ger. *Kirche,* from Gk. *κυριακόν, kyriakon,* church, from *κύριος, kyrios,* lord). The word has the same double meaning as its Græco-Latin equivalent, *ecclesia;* it signifies both the ecclesiastical body of believers and the building for worship.

Building. There were at first, among the Christians, no separate buildings for worship. The faithful met in the large room of a private house during the first and possibly the whole of the second century. The gatherings at the cemeteries to celebrate the anniversaries of the deaths of martyrs probably gave rise to the earliest special buildings for services, in chapels connected with the cemeteries outside the city walls, often built also at the entrance to the catacombs. The catacomb chapels were also used as churches. In the third century there were separate churches of considerable size. Then and during the two succeeding centuries there were two main classes of churches: cemeterial churches outside the walls, consecrated to martyrs; parish churches inside the walls, for more regular worship. Then came two further distinctions: (1) the episcopal church or cathedral, in which the bishop had his seat, among the parish churches; (2) the conventual church, attached to a monastery or nunnery, also called an abbey church. Rarely, and chiefly in England, an abbey church served also as a cathedral, the abbot being the bishop of the diocese. (See CATHEDRAL.) A subclass of the episcopal is the metropolitan church, that of the archbishop or patriarch of a diocese; still higher was the pontifical church—like the Lateran basilica. A subclass of the conventual church is a priory, belonging to a monastery governed only by a prior. A numerous class of churches is formed of the rural or country churches, in charge of the country curate. Palatine churches and chapels belong to Imperial, royal, or private palaces and castles.

The strict definition of a church is an ecclesiastical building for worship in which full service can be performed and the sacraments administered; in this it differs from oratories and chapels, where only prayers can be offered and the sacraments cannot be given, except occasionally, as on the patron saint's day. There was always a certain ceremony required for the consecrating and licensing of a church. The most famous early instance was that of the basilica at Tyre early in the reign of Constantine, when Eusebius pronounced his celebrated oration before a great assemblage of

bishops and the court and people. Mediæval chronicles are full of descriptions of the magnificent reunions and festivals on such occasions. Often the popes were present with the college of cardinals at the consecration of cathedrals or large monastic churches. In every case the bishops of the neighboring dioceses gathered. No church could be built and opened without being consecrated by the local bishop or his representative. No early written formulas of consecration have survived, but there are a number dating from the period between the tenth and the thirteenth centuries, which show the development of an elaborate symbolism. The consecration was often recorded in a special inscription, with the names of the attending bishops.

A church consists of two essential parts: the *nave*, for the congregation, and the *sanctuary*, for the clergy. As distinguished from pagan methods of worship, the mass of believers was gathered within, not kept outside the place of worship. In fact, the *agapæ*, which were the original form of the Christian gathering, had so slight a liturgy as not to call for separation of clergy and people. The third and fourth centuries, however, with the development of Church organization and liturgy, witnessed the enrichment of church architecture. The semicircle of the *apse* held the presbyters and bishop; and in front of it was placed the *altar;* beyond the altar the *choir* held the readers and singers, separated from the body of the church, or nave, by a parapet, which inclosed the pulpits or ambones. The nave itself was at first generally single, the men being placed in front and the women behind; but very soon the form of the basilica with its side aisles separated by columns was adopted, and the men were placed in one aisle, the women in the other, in order of rank and condition. In the Orient, however, the separation of the sexes, which was always considered necessary, was made even more effective by constructing galleries over the side aisles, in which the women were placed. The use of martyrs' relics, soon required by Church regulations in every church, led to the construction of a shrine to contain them in or beneath the altar. This shrine, called the *confession* (q.v.), developed, between the sixth and eighth centuries, into a monumental *crypt* (q.v.), sometimes filling the entire space beneath the church, but more often only that under the choir, whose pavement was thus raised above the level of the nave. This arrangement, almost universal in monastic and other Romanesque churches, went out of fashion in the Gothic cathedrals.

Churches are generally oriented, i.e., are placed so that the apse faces the east (*ex oriente lux*), while the façade faces west. But the earliest practice was the reverse, the apse facing west, and the priest officiating with face towards the altar and the congregation. This was a part of Christian symbolism which bears a curious analogy to Old Testament (Garden of Eden) and ancient Oriental ideas, especially sun worship. Over the door of the church was often an inscription such as "I am the Door," etc. The world was left outside. The wheel of fortune so often represented on the façade figured the vicissitudes of carnal life. Inside was the spiritual life. The church was consecrated to the people of God, "Plebs Dei"; its walls were covered with paintings or mosaics expressing all the themes of Christian history and belief necessary for the Christian people to know—the book of the unlearned. In the Orient, especially, but often also in the West, there was a strict order in the arrangement of sacred themes throughout the church, so that the people should be led gradually from the more elementary figurative subjects near the doors to the most fundamental and sacred ones in the sanctuary or apse, generally filled with the figure of the triumphant Christ and His attendant apostles and saints.

Speculation as to the origin of the form of the church is more or less idle. The connection with the already existing halls of the public and private basilicas is self-evident. The building was oblong, with a semicircular east end, on either side of which was a small room used to keep the treasures of the church and as a vestiary for the clergy. These sacristies were afterward thrown into the church as side apses. In some large early churches the form of a T was given to the plan by the addition of a cross arm between apse and nave. (See BASILICA.) The nave itself was flanked by one aisle on each side; sometimes by two aisles; sometimes also by lines of side chapels, though this was not done until the later Middle Ages. The façade, usually at the west end, sometimes took the outline of the nave and aisles, sometimes was a mere screen whose outline was not determined by the structure behind it: this was the case in Italy, but rarely in the West. Near it or connected with it was a bell tower, while, as the Middle Ages progressed, towers were multiplied, especially in northern and central Europe, and became an integral part of the architectural composition. It was in the Carolingian period, under monastic influence, that the plan of churches was changed into the form of the cross (see ARCHITECTURE; GOTHIC ART; ROMANESQUE ART), thus bringing in the *transept*, and still later that the choir was so enlarged as almost and sometimes quite to rival the nave in size, as was the case in many Gothic cathedrals. Other forms, however, were sometimes in use: Concentric churches, either round or polygonal, such as San Stefano Rotondo in Rome, Nimeguen, Ottmarsheim, etc.; Greek crosses, as San Marco in Venice; single-nave churches, sometimes domed, as in Byzantine architecture, sometimes vaulted or roofed, as in Dominican and Franciscan churches, whose hall form was invented for the sake of the sermon.

Accessory Structures. There were many accessory structures connected with churches. The most usual were the *episcopal palace*, or the *parish house;* the *cloister* for the canons or monks attached to its service; the *chapels* dedicated to special saints and martyrs; the *baptistery*—in the case of churches where baptism was allowed; the *atria* or cloistered courts in front or beside the main building. The cathedral of Parenzo shows a typical grouping. In front, the episcopal residence; then the baptistery, on the axis of the church; then the rectangular atrium surrounded by colonnades; then the church itself. This was the type from the fourth to the ninth century. The cathedrals of the twelfth and thirteenth centuries show the perfecting of quite a different plan: all the structures in front of the church have disappeared, and it fronts directly on the city street or square. This scheme has ever since been retained, except in monastic churches, which were within the conventual walls. These monastic

and conventual churches were often of great size and formed the dominant element of a group of imposing extent and often of great splendor (see MONASTERIES), with their cloisters, dormitories, refectories, hospitals, storehouses, and chapels.

Church furniture and decoration were always a very important feature. A church was not regarded as completed in the Middle Ages unless it was covered with instructive sculptures or paintings, through which it carried out a large part of its mission. These decorations were not left to the artist, but planned by the ecclesiastical authorities. (See ICONOGRAPHY.) Mosaics, frescoes, tapestries, and painted-glass windows within, sculptured reliefs and statuary without, were used in profusion even in the times when art had fallen lowest. Thrones for bishop and priests, choir stalls for the singers, altars and altarpieces, pulpits, tombs, hanging lamps, and tapestries—all gave ample opportunity for rich display of color and form. St. Bernard's anger was excited by the very profusion of this ecclesiastical art; and he carried on a crusade for simplicity, which was successful only within his own order of Cistercian monks. A second reaction against church magnificence came with Protestantism, which destroyed so many churches, and in building its own often showed the most rigid simplicity, to the great loss of art. But with the growth of Protestantism has come progress in church building. Wren's cathedral of St. Paul in London and his many parish churches were early examples: the types he devised were followed in a measure in American Colonial and early Republican churches. Since the Gothic revival of the last century many beautiful parish churches have been built in that style, both in Europe and America, though few of great size, because the emphasis on preaching in most Protestant bodies necessarily limits the size of the building. Modern churches are built in various styles, both mediæval and neoclassic. Among modern examples may be mentioned Brompton Oratory and Westminster Cathedral, both Roman Catholic, in London; Sacré-Cœur de Montmartre (Roman Catholic), at Paris; cathedral at Berlin; Trinity Church, New York; Trinity Church, Boston; St. Patrick's Roman Catholic Cathedral, New York; All Saints, Albany; St. John the Divine (Episcopal Cathedral) and St. Thomas, New York.

Bibliography. Up to the time of the Renaissance the history of architecture is the development of the church building. The most complete work covering the whole ground is Dehio and Von Bezold, *Die christliche Baukunst des Abendlandes* (Stuttgart, 1887–1901; 5 vols. plates, 2 vols. text). See also Hübsch, *Altchristliche Kirchen* (Karlsruhe, 1862–63); Lübke, *Vorschule zur Geschichte der Kirchenbaukunst des Mittelalters* (Leipzig, 1873); C. E. Norton, *Church Building in the Middle Ages* (New York, 1880); Quast, *Entwickelung der Kirchenbaukunst des Mittelalters* (Berlin, 1858); Clausse, *Monuments du Christianism au moyen âge* (Paris, 1893); Hasak, *Einzelheiter des Kirchenbaues* (Stuttgart, 1903). For Germany, consult Schäfer, *Mustergiltige Kirchenbauten des Mittelalters in Deutschland* (Berlin, 1886); for France, Viollet-le-Duc, "De la construction des édifices religieux en France," in *Annales archéologiques*, i–iv (Paris, 1844–46); and "Architecture" and "Cathédrale" in his *Dictionnaire raisonné de l'architecture française*. For the lesser church buildings, see Braudot, *Eglises de bourgs et villages* (Paris, 1867); Brandon, *Parish Churches* (London, 1848). For Protestant church architecture, consult Schultze, *Das evangelische Kirchengebäude* (Leipzig, 1885), and especially *Der Kirchenbau des Protestantismus* (Berlin, 1893), published by the Vereinigung Berliner Architekten, and treating the entire period from the Reformation till the present date. For Colonial churches, Everett, *Historic Churches of America*.

CHURCH. An organization of Christians, generally defined by Western theologians in substantial accord with the Articles of the Church of England—"a congregation of faithful men, in which the pure word of God is preached, and the sacraments be duly administered in all those things that are of necessity requisite to the same." The Roman Catholic church emphasizes in addition the "rule of legitimate pastors," and especially subjection to the Bishop of Rome as Vicar of Christ. Under these general definitions a great variety of forms of outward organization are recognized. The *papal* government makes all authority finally dependent upon the Pope, who is the Bishop of Rome. The *episcopal* government is administered by bishops, who are all essentially equal in honor and authority, although there may be archbishops who have a certain priority and jurisdiction over other bishops in definite particulars. (See BISHOP.) The *presbyterian* government puts authority in the hands of elders, ministerial and lay, elected ultimately by the congregation. (See PRESBYTERIANISM.) The *congregational* government puts the entire authority over each local congregation of believers in that congregation alone. (See CONGREGATIONALISM.) All Protestants understand by the true Catholic Church (invisible) the whole number of the truly regenerated. Various theories are held as to the manner in which the life of the Church is perpetuated—that maintained by the great majority of Christians, the members of the Roman Catholic, Eastern, and Anglican churches, being known as the theory of apostolic succession (q.v.), while the Protestant churches in general, agreeably to the definition quoted above, postulate no formal system of handing down the Church from age to age. For the discipline of the Church, see DISCIPLINE, ECCLESIASTICAL. See also CREEDS AND CONFESSIONS; SACRAMENT; WORSHIP; CIVIL CHURCH LAW.

CHURCH, A(LEXANDER) HAMILTON. An English efficiency engineer. He became known as one of the pioneers in reducing the commercial organization of factories to the basis of a science, a work in which he was early associated with J. Slater Lewis. His writings include *Production Factors in Cost Accounting and Works Management* (1910), and *The Proper Distribution of Expense Burden* (1908; 2d ed., 1913), both of which had previously appeared as series of articles in the *Engineering Magazine*. He also published a series of papers entitled "Practical Principles of Rational Management" in the same periodical in 1913.

CHURCH, ALFRED JOHN (1829–1912). A prolific English author and scholar, born in London. He was educated at King's College, London, and at Lincoln College, Oxford; ordained (1853); assistant master of Merchant Taylors' School, London (1857–70); head master of Henley Grammar School (1870–72) and

of Retford Grammar School (1873–80); professor of Latin in University College, London (1880–88); rector of Ashley, Tetbury, Gloucestershire (1892–97). He has done much to diffuse a knowledge of ancient culture and is best known for his retellings of classical tales and legends for young people, many of which are published both in England and America. Among his works are a translation of Tacitus, in conjunction with W. J. Brodribb (1862–77); stories from Homer, Vergil, Livy, the Greek tragedians, and Herodotus; *Roman Life in the Days of Cicero* (1883); *Two Thousand Years Ago* (1885); *To the Lions*, a tale of the early Church; *Carthage* (1886); *Pictures of Roman Life and Story* (1892); and the following between the last-named date and 1913: *Early Britain; Heroes of Chivalry; Helmet and Spear; Memories of Men and Books* (1908). Church also edited a collection of translations from Tennyson into Latin verse, under the title *Horæ Tennysonianæ* (1868).

CHURCH, Sir Arthur Herbert (1834–1914). An English chemist, born in London. He received his education at King's College, London, the Royal College of Chemistry, and Lincoln College, Oxford. In 1863 he was appointed professor of chemistry in the Royal College of Agriculture, Cirencester, and from 1879 to 1911 he held the corresponding chair in the Royal Academy of Arts. He lectured at Cooper's Hill from 1888 to 1900, and presided over the Mineralogical Society from 1898 to 1901. He was created K.C.V.O. in 1909. Besides several new minerals, including *churchite*, he discovered the animal pigment *turacin;* and he also carried out a number of interesting researches in organic, inorganic, physiological, and industrial chemistry. His published works include: *Precious Stones* (1883; 5th ed., 1905); *English Earthenware* (1884; 6th ed., 1911); *English Porcelain* (1886); *Food Grains of India* (1886); *Color* (2d ed., 1887); *The Laboratory Guide* (1894; 8th ed., 1906); *Food* (1901); *Chemistry of Paints and Painting* (3d ed., 1901); *Josiah Wedgwood* (2d ed., 1902); *Classified Papers and Letters and Papers in Royal Society Archives* (1907–08); *Guide to Corinium Museum* (10th ed., 1910).

CHURCH, Benjamin (1639–1718). An early New England soldier, famous as an Indian fighter. He was born in Duxbury, Mass., founded the town of Little Compton, Mass., in 1674, and took an active part in the war against King Philip, who was finally defeated and killed by a force under Church in 1676. In 1689 he commanded a futile expedition against the Indians in the Kennebec region, and in the following year was again sent into Maine, where he captured several Indian forts along the Androscoggin. In 1704 he commanded a force of about 700, which, in retaliation for the French and Indian attack upon Deerfield, destroyed Grand Pré and Beaubassin in Acadia. From memoranda kept by him, his son, Thomas Church, published in 1716 a book entitled *Entertaining Passages Relating to Philip's War—as also of Expeditions more lately made against the Common Enemy and Indian Rebels in the Eastern Parts of New England*—"a soldier's bluff narrative of his own dangerous and enticing adventures," which was widely read during the Colonial period, appeared in numerous editions, and was reprinted in Boston under the editorship of H. M. Dexter in 1865–67.

CHURCH, Frederick Edwin (1826–1900). An American landscape painter, of the so-called Hudson River school (q.v.). He was born in Hartford, Conn., May 4, 1826, and was a pupil of Thomas Cole, with whom he worked until the latter's death. He first derived prominence by his "View of East Rock, near New Haven," and "Scenes in the Catskill Mountains." He traveled extensively in South America (1853 and 1857), Labrador (1863), Ecuador, New Granada (1866), the Holy Land and Europe (1868). The subjects of his paintings were largely taken from sketches of these different countries. Church had a fine pictorial sense and good feeling for correct composition, and in spite of his minute execution and infinite detail, the effect of these large panoramas is often impressive and nearly always interesting. He conceived the proper subject of landscape painting to be the most striking and wonderful scenes of nature, and thus his work depended largely on scenic interest for its popularity. During his own day his reputation was very great both in the United States and Europe. Good examples of his work are "The Ægean Sea" (Metropolitan Museum, New York), "Cayambe, South America" (Public Library, New York), "Landscape, South America" (Academy of Design Gallery, New York), "Chimborasso" (1876), "Weltausstellung" (Philadelphia), "Eise Berge" (London). Others are "The Parthenon," "Heart of the Andes," "Cotopaxi," "Horse-Shoe Fall, Niagara," "Damascus," "Jerusalem." Consult Isham, *American Painting* (New York, 1905).

CHURCH, Frederick Stuart (1842–). An American animal and figure painter, illustrator, and etcher. He was born in Grand Rapids, Mich., and studied with Shirlaw in Chicago and Wilmarth in New York. He is a member of the National Academy and American Water-Color Society. Among his pictures are "Weirdness," "Mad as March Hares," and "The Sea Princess," in oil; and "Hard Times" and "The Phantoms," in water colors. He exhibited "St. Cecilia" in 1896. He also exhibited, in the National Academy of Design, 1901, "The Sea Serpent," "Companions" (1909), "The Were Wolf" (1910), "St. Cecilia" and "Summer" (1911), "The Stowaway" and "Refuge" (1912), "Conquered" (1913). Church has a sensitive and delicate feeling for color which he realizes more fully through his use of water color than in the medium of oil. His conceits partake somewhat of the German order of fancy and are quaint, sometimes humorous, and sometimes philosophic. His sense of composition and line is graceful and decorative.

CHURCH, Sir Richard (1784–1873). A British soldier, born in Cork, the son of a Quaker. He served for many years in the British army and in 1809 and 1812 raised two regiments of Greek light infantry, in vain attempts to free the Peloponnesus. In 1817 he entered the Neapolitan army. In 1827 he was chosen generalissimo of the land forces of the Greek patriot army. Thereafter he lived in Athens. He wrote *Observations on an Eligible Line of Frontier for Greece* (1830). Consult Poole's biography (London, 1890) and E. M. Church, *Sir Richard Church in Italy and Greece* (Edinburgh, 1905).

CHURCH, Richard William (1815–90). An English author and ecclesiastic, nephew of the preceding. He was born in Lisbon, studied in Oxford, was appointed a fellow of Oriel in

1838, was a friend of the more prominent Oxford Tractarians, started the *Guardian* in 1846, became a rector near Frome in 1852, and was dean of St. Paul's from 1871 until his death. Dean Church was a liberal High-Churchman. He was a scholar with a masterly style and wrote: *Essays and Reviews* (1854); *Civilization and Religion* (1860); *University Sermons* (1868); *The Beginning of the Middle Ages* (1877); able volumes on *Bacon* (1879) and *Spenser* (1879), in the "English Men of Letters Series"; a posthumous work on *The Oxford Movement* (1891); and *Occasional Papers* (1897). Consult his daughter's memoir (1895) and a biography by Lathburg (1907).

CHURCH, William Conant (1836–1917). An American editor, born at Rochester, N. Y. He was educated in the Boston Latin School. While still a youth he engaged with his father in editing and publishing the New York *Chronicle*. In 1860 he became publisher of the New York *Sun* and in 1861–62 was Washington correspondent of the New York *Times*. He resigned this position on his appointment as captain in the United States Volunteers in 1862. He served for one year, receiving brevets of major and lieutenant colonel. In 1863, with his brother, he established the *Army and Navy Journal* and in 1866 founded the *Galaxy Magazine*. He was government commissioner to inspect the Northern Pacific Railroad in 1882. With George W. Wingate he established the National Rifle Association and was its first president; he was one of the founders of the Metropolitan Museum of Art, an original member of the Military Order of the Loyal Legion, and became a life member and director of the New York Zoölogical Society.

CHURCH ALE. An annual festival, held in England in a churchyard or near a church, at which much ale was used. It is said by some to have celebrated some anniversary, as the dedication of a church, or Easter or Whitsuntide. The profits were used for church repairs. Church ales are now represented by village fairs, wakes, etc.

CHURCH ASSOCIATION FOR THE ADVANCEMENT OF THE INTERESTS OF LABOR, The. An organization founded in 1887, in New York City, by communicants of the Protestant Episcopal church. Its object is to interest the clergy and the laity of the church in problems of the laboring man and to show sympathy with laboring classes in their struggle for justice. Bishop Huntington was the first president, and over 60 bishops are honorary members. Communicants of the church are eligible for membership and others for honorary membership. There are standing committees on strikes, sweatshops, etc. The organ of the association is the *Hammer and Pen*.

CHURCH CALENDAR. A table of holy days, saints' days, church festivals, and the like. The earliest now existing, which contains the Christian festivals, is that of Silvius, 448 A.D. A fragment of a Gothic calendar remains, which probably belongs to the fourth century. The name is applied also to the *fasti*, or catalogues for particular churches, of the saints most honored by them, such as bishops, martyrs, etc. At the Reformation the German Lutheran church retained the Roman calendar. The full calendar of the Church of England contains nine columns, giving the golden number, days of the month, the dominical or Sunday letter, the calends, nones, and ides, the daily Scripture lessons, and the holy days of the Church, together with some of the Roman festivals which have been retained, not as having any religious value, but because the practice of the courts or popular customs had become interwoven with them. The calendar of the Protestant Episcopal church in the United States retains only the festivals which are referable to a scriptural origin.

CHURCH CONGRESS. The name of free gatherings of ministers and laymen of the Established church of England, annually convened for the discussion of ecclesiastical and religious questions. The first church congress was held in 1861 in Cambridge and in the following years successively in Oxford, Manchester, Bristol, York, etc. The attendance is usually very large and comprises many bishops and lower dignitaries. Full reports of the proceedings of each session are published. Such meetings, having the advantage of free interchange of views, but with no claim to ecclesiastical authority, have been found very profitable; and in the Protestant Episcopal church of the United States they have been held since 1875 in the years when the General Convention does not meet.

CHURCH DIET. The free gathering of ministers and lay members of German Protestant churches. Such meetings arose in consequence of the revolutionary movement of 1848, which threatened to endanger the influence of the Evangelical church upon society. Members of the Lutheran, Reformed, the United Evangelical, with the High Church "confessionals," participated in the earlier meetings; but after 1860 only the evangelical parties were represented. Annual reports are published.

CHURCH DISCIPLINE. The means employed by the Christian Church, besides the ministration of word and sacraments, to secure on the part of its office bearers and members a faithful adherence to their profession and a corresponding blamelessness of life. It rests upon the authority of Christ and at the same time necessarily arises in some form out of the very constitution of the Church as a society. Among the early Christians it soon assumed forms of great severity towards offenders, especially towards the *lapsed* (q.v.). At a later period the discipline of the Church was chiefly exercised with respect to persons accused of heresy and schism. The penances of the Church of Rome have long formed an important part of its discipline, and therewith its *indulgences* are closely connected, as well as its doctrine and rule of *auricular confession*. (See Confession.) In the Protestant churches public confession of sins by which public scandal has been given, and submission to public rebuke, are sometimes required. Practices more analogous to those of the primitive Church were established in many churches after the Reformation, but in general have fallen greatly or entirely into disuse. The power of exclusion from the Lord's Supper, and from the rights and privileges of church membership, is, however, generally retained and exercised, until, by profession of repentance and by reformation of life, the cause of such exclusion is removed; and ministers or other office bearers are, upon offense given in their doctrine or conduct, suspended from their functions or altogether deposed from their office. The exercise of church discipline belongs more or less exclusively to a hierarchy,

or to the office bearers assembled in church courts, or to the members of each congregation, according as the church is Episcopalian, Presbyterian, or independent in its church government.

Legality of Church Discipline. In the United States church discipline is administered exclusively by church officials and judicatories. The complete separation of church and state deprives the civil tribunals of all power to revise or question ordinary acts of church discipline, or of exclusion from church membership. Secular tribunals have to do only with the rights of property and of personal liberty. If these are illegally invaded, under pretext of administering church discipline, the civil courts have authority to afford redress. See CIVIL CHURCH LAW.

Whether a church member is amenable to ecclesiastical punishment is to be determined by the proper officers or judicatories of the particular church, in accordance with its rules of government and discipline. From their final decision no appeal lies to a civil court. In the language of the United States Supreme Court: "The law knows no heresy and is committed to the support of no dogma, the establishment of no sect. The right to organize voluntary religious associations to assist in the expression and dissemination of any religious doctrine, and to create tribunals for the decision of controverted questions of faith within the association, and for the ecclesiastical government of individuals, congregations, and officers within the general association is unquestioned. All who unite themselves to such a body do so with an implied consent to this government and are bound to submit to it." The disciplinary authority of such bodies, and the rights and duties of their members, are governed by the same general rules of law that control in case of social or political clubs or other private organizations. See RELIGIOUS SOCIETIES; and cf. CANON LAW and CLUB.

CHURCHES OF ASIA, THE SEVEN. The churches addressed in the opening chapters of the Book of Revelation, under the following names: Ephesus, Smyrna, Pergamum, Thyatira, Sardis, Philadelphia, and Laodicea. These churches represented groups into which the churches of the Province of Asia had come to be organized before the Book of Revelation was written. These groups were not so much of territorial character, marked off by geographical limits, as postal districts, having respectively, as their distributing centres, one of these seven cities lying on the main route which forms an inner circle around the most important part of the province. Ephesus would be the distributing point for the Cayster and lower Mænander valleys and the coast; Smyrna for the lower Hermus valley and the North Ionian coast; Pergamum for the north; Thyatira for the inland district to the northeast and east; Sardis for the middle valley of the Hermus; Philadelphia for upper Lydia; Laodicea for the Lycus valley and for central Phrygia—the whole of the province being thus compassed through supplementary messengers who would proceed from these distributing cities through the secondary districts which they represented.

From the qualities assigned these churches in the above chapters, Smyrna, in spite of her poverty, possessed the most commendable spiritual life, being designated in its message as "rich" (ii. 9). This was perhaps due to its continued exposure to persecution, which later (c.155) resulted in the martyrdom of its bishop, Polycarp, at the instigation of the hostile Jews of the city. In its Byzantine period its bishopric was originally subject to Ephesus, though it afterward became independent and was finally raised to metropolitan rank. Its endurance remained a characteristic of its life, though it was largely its strategic position, as well as its commercial relations with the West, which made it the last Christian city in Asia Minor to yield to Turkish rule (1402). On the other hand, in spite of its great wealth, Laodicea possessed the least commendable spiritual life and is spoken of as in the unendurable condition of lukewarmness (iii. 16). Little is known of its later Christian life beyond the fact that it seems to have been beset with a spirit of compromise. In the ecclesiastical organization the city came to be the leading bishopric of Phrygia.

Of the remaining churches, Philadelphia is commended in terms similar to those addressed to Smyrna, though betraying, along with its fidelity, a lack of strength in its religious living, doubtless due to the smallness of the church's numbers (iii. 8). It rose to the first place among the bishoprics of Lydia, and with an endurance almost equal to that of Smyrna, resisted until the very close of the fourteenth century (c.1390) the Turkish conquest. Sardis, on the other hand, is rebuked almost as severely as Laodicea (iii. 1), though a reservation is made of a few names in the church which are worthy (verse 4). At the time these letters were written, it was a city whose greatness belonged to a barbarous civilization that had passed away. In the organization of the churches, however, its bishopric was of metropolitan rank within the Province of Lydia, though it finally yielded its primacy to Philadelphia (1316 A.D.).

With the life of the churches of Pergamum and Thyatira fault is found chiefly because of failure to separate the religious life clearly and distinctly from the life of the irreligious world; the blame of Ephesus is that it had lost its first enthusiasm. Ephesus continued for centuries the first ecclesiastical centre of western Asia, being the place of the Council of Ephesus (431 A.D.). And though at the time of these letters its importance was shared with Pergamum, which was the historical and still remained the official capital, and at the first was the sole metropolis of Asia, yet in these letters it stands as representing the whole province, as the province represents the whole Church. Of the later history of the churches of Pergamum and Thyatira little or nothing is known. Pergamum, however, became a bishopric and so continued through the Byzantine period.

CHURCH GOVERNMENT. See CHURCH; CHURCH DISCIPLINE; BISHOP; INDEPENDENTS; PRESBYTERIANISM.

CHURCH HISTORY. The history of the Christian religion and Church. With much diversity on minor points, there is a general agreement in dividing the history of the Church into three great periods: the first, from the birth of Christ to the time of Constantine; the second, from that epoch to the Reformation; and the third, from the Reformation to the present day. The earliest facts of Church history

are to be learned only from the New Testament and from the brief hints in the letters and other writings of the primitive fathers. Hegesippus, a Jewish Christian of the latter half of the second century, put together some memorials of these early times; but his work has survived only in a few quotations. The real father of ecclesiastical history is Eusebius of Cæsarea (died c.350). His work was continued to the fifth century by three important historians—Socrates, Sozomen, and Theodoret. In the West attempts were made to translate, combine, and complete these Eastern histories by Rufinus, Sulpicius Severus, and Cassiodorus. In the sixth century Theodorus Lector, Zacharias, and Evagrius were of some importance. But the stagnation which came over Eastern theology was felt in the historical department, and only one Greek author is worthy of mention throughout the whole of the Middle Ages—Nicephorus Callistius, a priest of Constantinople who wrote in the early fourteenth century, and who drew his materials from the library of the church of St. Sophia, of which he had charge. In western Europe, on the other hand, the stirring religious life which found expression in so much development of doctrine and discipline also led to the careful recording of important events. The product of this literary activity falls into three main classes—histories of separate peoples; attempts at universal histories; and the mass of annals, chronicles, and bibliographies. The most prominent names in the first class are: Isidore of Seville, for the Goths and Vandals; Gregory of Tours, for the Franks; Bedè, for the Anglo-Saxons; and Paulus Diaconus for the Lombards. The earliest mediæval attempt at a general Church history was made by Haymo of Halberstadt (died 853); another followed in 872, by Anastasius, the librarian of the Roman church. Ordericus Vitalis produced a notable work about 1412. But the greatest general history written in the Middle Ages was that of the Dominican Antoninus, Archbishop of Florence from 1446 to 1459. In places, especially in his account of the donation of Constantine, he shows an awakening of the critical spirit which was fostered by Laurentius Valla and Nicolas of Cusa. The third class is far too large to treat in detail. A *catalogue raisonné* of it may be found in Potthast, *Bibliotheca Historiæ Medii Ævi* (Berlin, 1862), or in Chevalier, *Répertoire des sources historiques du moyen âge, Bio-bibliographie* (Paris, 1886).

A new era began for ecclesiastical history about the end of the fifteenth century. The critical tendency aroused by the revival of letters, the bringing to the West of early Greek texts, the rendering of sources accessible by the invention of printing, and the controversial spirit of the Reformation, which forced both sides to attempt to justify their position by history—all these made great changes in the method. About the middle of the sixteenth century the Magdeburg Centuriators (q.v.) undertook their great work with a view of proving the utter iniquity of all that had ever been done by the papacy, which to them was Antichrist, and though they had unusual scholarship and knowledge of sources, their polemical bias detracted much from the value of their work. It called forth a counterblast from the Catholic side in the *Annals* of the Oratorian Baronius, who had access to an immense number of valuable documents. He produced a work far in advance of any previous attempt, and accepted so generally that a century passed before any other work of the same scope was undertaken. The next important works from the Roman Catholic standpoint came from France, as part of the general efflorescence of the reign of Louis XIV. The names of Godeau (died 1672), Maimbourg (died 1686), Fleury (died 1724), and still more Natalis Alexander (died 1724) and De Tillemont (died 1698), deserve to be remembered. Of modern French Roman Catholic works, the best are Rohrbacher (died 1856), Darras, and Guettée. Italy does not supply many names of excellence in the general field; the most notable are Orsi (died 1761), De Graveson (died 1733), and Berti (died 1766). The Italians distinguished themselves more in special studies, particularly Mansi, Muratori, De Rossi, Moroni, and Tiraboschi. In Germany there has been since the Reformation a continuous tradition of apologists for that movement and its principles. Special histories of it were composed by Sleidan and Seckendorf. In the seventeenth century Calixtus distinguished himself in this department, and, after him, Illig, Rechenberg, and Thomasius. In the general field, from the Lutheran point of view, are the mystic Arnold (died 1714), Mosheim (died 1755), and his pupil, Schröchk (died 1808); Semler (died 1799), who led the way to a more rationalistic treatment; and Planck (died 1833). In modern times the first great name is Neander (died 1850). F. C. Baur, who followed out the impulse of Semler, has had much influence, and his work was continued by his son, F. Baur, and his son-in-law, Zeller. Hase (died 1890) holds a middle ground between Baur and the more orthodox; and later still in time come Harnack, Hauck, and Loofs. Other historians in the Reformed churches have been largely specialists, such as Pearson, Dallæus, Dodwell, Beveridge, Bingham, Ussher, Cave, and Blondel. The Church of England, to which some of these names belong, and which produced in the middle of the nineteenth century Milman's *History of Latin Christianity* and the work of Robertson, has later been adorned by the learning of Stubbs and Creighton. A succession of learned German writers in the Roman Catholic church dates from Count von Stolberg (died 1819), whose work was continued by Von Kerz, Brischar, and Katerkamp. Others of this school are Hortig (died 1847), Ritter (died 1857), Alzog (died 1878), Hefele (died 1893), Cardinal Hergenröther (died 1890), and Pastor. In America Church history has not been much cultivated, but the best general historian is Philip Schaff. Others who have done good service are G. P. Fisher, J. H. Hurst, and H. C. Sheldon. The modern tendency everywhere, as in other branches of learning, is towards specialization rather than an attempt to cover the entire field; and a multitude of works bearing on the history of particular churches and periods will be found referred to in the bibliography of the articles on those subjects. For bibliography of a more extended nature, consult: Hagenbach, *Encyklopädie und Methodologie der theologischen Wissenschaften* (12th ed. by Reischle, Leipzig, 1889); Crooks and Hurst, *Theological Encyclopædia* (New York, 1884), which is based upon Hagenbach; and, for the names of Roman Catholic works, Hurter, *Nomenclator Literarius* (5 vols., Innsbruck, 1871–86). A review of the development of Church history may be found in

the introduction of vol. i, Schaff, *History of the Christian Church* (5th ed., New York, 1890).

CHURCHILL, Charles (1731–64). An English poet, born in Westminster, where his father became a curate. He was educated at Westminster School and two years later, at 17, made a clandestine marriage. In 1756 he was ordained and soon afterward succeeded his father as curate of St. John's, Westminster. In 1761 he published anonymously (at his own risk, the booksellers having offered him only five guineas for it) *The Rosciad*, a satire on theatrical managers and performers. Its success was instant, and he avowed himself the author. Later in the same year he brought out *The Apology*, a bitter attack on his critics, which added alike to his purse and to his notoriety. He now totally neglected the duties of his office and led a most dissolute life. His parishioners were scandalized, and his dean remonstrated; whereupon, to show his utter contempt for the ministerial profession, Churchill appeared in a blue coat, gold-laced hat and waistcoat, and large ruffles. He was obliged, however, to resign his preferment. A friend of John Wilkes (q.v.), he contributed to the *North Briton*. Among his other poems, all more or less satirical, are: "Night"; "The Prophecy of Famine: A Scot's Pastoral"; the "Epistle to Hogarth"; "The Author"; "The Candidate"; "The Ghost"; "Gotham"; and "The Duelist." He died Nov. 4, 1764, while on a visit to Wilkes in Boulogne. Consult *Genuine Memoirs of Charles Churchill* (London, 1765), and the Aldine edition (London, 1892) of his works, containing notes by Tooke, and a memoir by Hannay.

CHURCHILL, John. See Marlborough, John Churchill, Duke of.

CHURCHILL, Lord Randolph Henry Spencer, usually called Lord Randolph Churchill (1849–95). An English Conservative statesman. The third son of the seventh Duke of Marlborough, he was born at Blenheim Palace, Feb. 13, 1849. He was educated at Eton, and Merton College, Oxford, and entered Parliament in 1874 as member for Woodstock. The same year he married the brilliant Miss Jennie Jerome of New York, who, as a prominent member of the Primrose League, gave him valuable assistance throughout his political career. He was a quiescent member until 1880, when the Conservative defeat roused him to action as the leader of the Fourth party—a small band of keen-minded Conservatives. He distinguished himself as a ready, unconventional debater, attracting particular attention by his audacious criticism of Gladstone's foreign and domestic policy. At the same time he was so fearless a critic of various Conservative leaders that his group gained the nickname of the "Fourth party." He became still more prominent as chairman of the Conservative Union (1884) and in 1885 unsuccessfully attempted to defeat Mr. Bright in Birmingham, but was returned for South Paddington, which was kept in reserve for him. From June, 1885, to January, 1886, he was Secretary of State for India, his period of office being marked by the annexation of Burma. For six months in 1886 he was Chancellor of the Exchequer, but resigned, expressing the resolve "to sacrifice himself on the altar of thrift and economy." Thenceforward he incisively criticized governmental expenditure, although always voting with his party. He was the exponent of Tory democracy and had a considerable following of young Conservatives. "Congenital causes" suddenly occasioned a failing of power; and in 1892 he sought recuperation by travel and hunting in South Africa, sending interesting descriptions of his tour to the *Daily Graphic*, and publishing *Men, Mines, and Animals in South Africa* (1892). During his absence he was reëlected, but died in 1895. His *Life* (London and New York, 1906) was written by his son, Winston Spencer Churchill. Consult also Rosebery, *Lord Randolph Churchill* (London, 1906).

CHURCHILL, William (1859–1920). An American Polynesian ethnologist and philologist, born in Brooklyn, N. Y. He was educated at Yale University. In 1896 he became Consul General to Samoa, where he also served as judge of the consular court, as senior member of the consular board under the Berlin General Act, and as adviser to Malietoa Laupepa, King of Samoa. He was also receiver and custodian of the Samoan revenues and president of the Municipality of Apia. In 1897 his commission was extended, making him also Consul General to Tonga. Later he became a member of the editorial staff of the New York *Sun*. He was elected a fellow of the Royal Anthropological Institute in 1912 and an honorary member of the Polynesian Society in 1913. He is author of *A Princess of Fiji* (1892); *The Polynesian Wanderings*, *Tracks of the Migration Deduced from an Examination of the Proto-Samoan Content of Efaté and Other Languages of Melanesia* (1910); *Beach-la-Mar, the Jargon or Trade Speech of the Western Pacific* (1911); *Eastern Island, Rapanui Speech and the Peopling of Southeast Polynesia* (1912); *The Subanu, Studies of a Sub-Visayan Mountain Folk of Mindanao* (1913), with Col. John Park Finley. He was also editor of the Malayo-Polynesian section of the *Standard Dictionary* (1913), and a contributor of articles to the second edition of the New International Encyclopædia (1914–15).

CHURCHILL, Winston (1871–). An American novelist. He was born in St. Louis, Mo., and graduated at the United States Naval Academy in 1894. He wrote *The Celebrity* (1898), a novel, but first became widely known through *Richard Carvel* (1899). This was followed by, notably, *The Crisis* (1901), *The Crossing* (1904), and *Coniston* (1906), all remarkably successful novels, and the last named considered by some his best effort. Later books of his are *Mr. Crewe's Career* (1908); *A Modern Chronicle* (1910); and *The Inside of the Cup* (1913). As an historical novelist and as a novelist of contemporary American life, Winston Churchill has done good and substantial work. He writes slowly and carefully, and the texture and structure of his novels are evidence of this commendable characteristic, which honorably distinguishes him from too many gifted and popular writers whose literary methods are more perfunctory. He made his home at Cornish, N. H., and in 1906 took an active part in that State's politics, practically forcing upon the Republican convention his programme for various reforms. See also American Literature.

CHURCHILL, Rt. Hon. Winston Leonard Spencer (1874–). Statesman and author, son of Lord Randolph Churchill. He was educated at Harrow and Sandhurst, entered the army in 1895, served with the Spanish army in Cuba, and fought with distinction in India (1897) and the Sudan (1898). On the out-

break of the Boer War (1899) he went to the Transvaal. On November 15 he was taken prisoner by the Boers while acting as correspondent for the *Morning Post*. He was imprisoned at Pretoria, but escaped later in the year. In September, 1900, he was elected Conservative member of Parliament for Oldham. He opposed Mr. Chamberlain's tariff reform proposals and in the sessions of 1904–05 acted with the Liberals. He became Parliamentary Secretary for the Colonies under the Campbell-Bannerman ministry in December, 1905, and in the general election of the following month was chosen as a Liberal from Manchester, Northwest. He then became Undersecretary of State for the Colonies, was promoted to the cabinet in 1908 as President of the Board of Trade, made Home Secretary in 1910, and First Lord of the Admiralty in 1911. An excellent orator, brilliant in repartee, fearless on the platform, Churchill, with the possible exception of Lloyd-George (q.v.), has become the foremost popular parliamentary speaker in the country. In his administrative work he has been tireless; as President of the Board of Trade he took an active part in the settlement of trade disputes; as First Lord of the Admiralty he has descended to the ocean bottom in submarines and has ascended in aëroplanes, holding, indeed, in person, an aviator's license. Although making tentative offers to Germany in 1913 for the declaration of a so-called "Naval Holiday," or an agreement for a year's respite from new armaments, Churchill has insisted on a consistently accelerated naval programme. He wrote: *The Story of the Malakand Field Force* (1898); *The River War* (1899); *Savrola* (1900); *London to Ladysmith via Pretoria* (1900); *Ian Hamilton's March* (1900); *Lord Randolph Churchill* (2 vols., London, 1906); *Free Trade in its Bearing on International Relations* (1908); *My African Journey* (1908); *Liberalism and the Social Problem* (1909).

CHURCHILL RIVER. A tributary of Hudson Bay from the west, its waters being discharged into Churchill harbor at Fort Churchill (Map: Northwest Territory, K 3). This river is in water connection with a large series of lakes in Keewatin, Athabasca, and Saskatchewan, and itself consists of a series of lakes and intervening narrower river channels. Through Reindeer or Caribou Lake the Churchill River appears to be in connection with Wollaston or Great Hatchet Lake, a portion of the water of which flows into the Mackenzie River. The general course of the Churchill River is at first east and then northeast; the distance from the source to the mouth is about 925 miles.

CHURCHING OF WOMEN. A religious usage prevailing in the Christian Church from an early period, of women, on their recovery after childbearing, going to church to give thanks. See Lev. xii. 6. In the Greek and Roman Catholic churches it is still frequent. In the Church of England, also, a service for the churching of women finds its place in the liturgy. It takes place after the fortieth day from parturition.

CHURCH OF ENGLAND. See ENGLAND, CHURCH OF.

CHURCH OF ENGLAND, FREE. See REFORMED EPISCOPAL CHURCH.

CHURCH or CHURCHES OF GOD. A religious denomination in the United States, sometimes called Winebrennerians, whose doctrines agree generally with those of the Baptists. It originated in revivals which took place under the preaching of the Rev. John Winebrenner, a German Reformed pastor, at Harrisburg, Pa. Mr. Winebrenner's views having undergone some change, he met with other ministers, in 1830, and they adopted a basis of church organization, the leading points of which were that the believers in any given place are, under the divine order, to constitute one body; that division into sects and parties under human names and creeds is contrary to the spirit of the New Testament; that the believers of any community, organized into one body, constitute God's household or family, and should be known as the Church of God; that the Scriptures, without note or comment, constitute a sufficient rule of faith and practice, while creeds and confessions tend to divisions and sects; and that the ordinances of immersion in water in the name of the Trinity, the washing of the saints' feet, and the partaking of bread and wine in commemoration of the suffering and death of Christ, are binding upon all believers. The organization of the church consists of 17 annual elderships, covering districts in 16 States, Oklahoma, and the Indian Territory, and a general eldership, composed of delegates from the annual elderships, meeting every four years, which has charge of general concerns, with various boards serving four years. The words "Church of God" in the titles of the general and annual elderships were changed in 1896 to "Churches of God." No official statistics are compiled. The ministerial register for 1905 contained 479 names. Other estimates for 1905 give 580 churches and 38,000 communicants. The denomination has a college at Findlay, Ohio, with an endowment approaching $100,000, a collegiate institute at Fort Scott, Kans., and an academy at Barkeyville, Pa.; has a large bookstore and publishing house at Harrisburg, Pa.; sustains four missionaries in India, in part of the territory assigned to the Free Baptist church, and is also represented by missionaries working in other foreign fields and under other boards; and has, further, an active Woman's Missionary Society. It is interested in beneficiary education for the ministry and is making progress in educational matters generally. Its organs are: *The Church Advocate*, weekly; *The Workman Quarterly, The Sunday School Gem, The Sunbeam, The Primary Quarterly.* Consult: Winebrenner, *A Brief View of the Church of God* (Harrisburg, Pa., 1840); id., *Practical and Doctrinal Sermons* (ib., 1860); a *History and Doctrines of the Churches of God* is in preparation by J. H. Forney.

CHURCH OF GOD IN CHRIST. See MENNONITES.

CHURCH OF JESUS CHRIST OF LATTER-DAY SAINTS. See MORMONS.

CHURCH OF THE BRETHREN, THE. A considerable body of Christians, also known as DUNKERS, or DUNKARDS, and among themselves as Brethren, whose faith and practice are not generally known outside of the localities in which they live. Thus the reiterated statements that they are celibates, that they discourage marriage, that they do not marry outside of their own fraternity, that they keep the seventh day as the Sabbath, that they live in communities, and other similar errors set forth in the books, always have been without foundation. The movement which resulted in the closer organization of the Church of the Brethren grew out of the great religious awakening which

occurred in Germany in the latter part of the seventeenth century, when large numbers, becoming dissatisfied with the lack of spirituality in the state church, withdrew from its communion. They organized at Schwartzenau, Germany, in 1708, with Alexander Mack as their first minister; but in no way do they regard him as the founder of the church.

Driven by persecution to Wittgenstein, they rejected all human creeds and accepted the gospel of Jesus Christ as their rule of faith and practice. The church suffered from persecution and finally emigrated (1719–29) to America, settling near Germantown, Pa., where the first church in this country was organized in 1723. Among the early emigrants was Christopher Saur, who was the first in America to print the Bible in a European tongue. From this nucleus the church spread southward and westward, and flourishing congregations are now to be found in most of the States. They are, however, most numerous in Pennsylvania, Maryland, Virginia, Ohio, Indiana, Illinois, Iowa, Missouri, Nebraska, Kansas, and North Dakota. At the annual conference held in 1913, 30 States and several foreign countries were represented. They now number about 120,000 communicants, have 1240 congregations, with 3485 ministers, who, as a rule, serve without salary. They are largely engaged in agricultural pursuits, though in recent years the denomination has expanded to include many prosperous city churches, with pastorates filled by men of liberal education. The denomination supports 10 colleges. They are: Juniata College, Huntingdon, Pa.; Mt. Morris College, Mt. Morris, Ill.; Bridgewater College, Bridgewater, Va.; McPherson College, McPherson, Kans.; Botetourt Normal College, Daleville, Va.; Lordsburg College, Lordsburg, Cal.; North Manchester College, North Manchester, Ind.; Elizabethtown College, Elizabethtown, Pa.; Blue Ridge College, New Windsor, Md.; Bethany Bible School, Chicago, Ill. Missions have been established in Denmark, Sweden, Asia Minor, and India. There are about 60 missionaries in India and China, with 1500 converts. A theological school has been opened at Bulsor, India. The Missionary Society has an endowment fund of nearly $500,000. A large and well-appointed publishing house, located at Elgin, Ill., is owned by the church. The *Gospel Messenger*, the church paper, has a circulation of over 24,000.

In doctrine the Brethren are strictly orthodox. They hold the Bible to be the inspired and infallible word of God, and accept the New Testament as their only rule of faith and practice. They believe in the Trinity, in the divinity of Christ, in the Holy Ghost, and in future rewards and punishments. In the subtleties of speculative theology they take but little interest. Faith, repentance, and baptism are held to be the conditions of salvation. These three constitute true promise of the forgiveness of sins and the gift of the Holy Ghost. In practice they follow closely the Scripture teaching and observe the primitive simplicity of the apostolic church; hence they regard nonconformity to the world as an important principle. They enjoin plainness of dress, settle their difficulties among themselves without going to law, affirm instead of taking oath, refrain from taking a prominent part in politics, are opposed to secret societies, advise against the use of tobacco, and have a rule more than a century old against the manufacture, sale, and use of intoxicants. As early as 1782 they prohibited slavery and pronounced in strong terms against the slave trade. They baptize believers only, dipping them face forward at the mention of each name in the Trinity given in the baptismal formula in Matt. xxviii. 19. Communion is observed in the evening, after a full meal called the Lord's Supper. Before the supper the ordinance of foot washing is observed, the brethren washing one another's feet, and the sisters performing the same service among themselves. After supper, before the communion is taken, the sexes extend the right hand of fellowship and exchange the kiss of peace. Bishops, or elders, ministers in the first and second degree, and deacons, are elected by the congregations. Ministers are advanced from the first to the second degree, and bishops are chosen from the latter and ordained by the imposition of hands. Congregations are organized into State districts, and both elect delegates to the annual conference, which is the chief ecclesiastical body. Here the fullest and freest discussion of all questions coming before the assembly is permitted. The final decisions are rendered by a two-thirds vote of the churches. Women are eligible to serve as delegates in conference.

In 1881–83 the church suffered the loss of about 8000 communicants by a division in its ranks, resulting in the secession of two parties, known as the Old-Order and Progressive Brethren. The former objected most seriously to the advance the church was making in educational, missionary, and Sunday-school work, while the latter insisted strenuously that the church was too conservative, that the rules laid down by the annual conference were oppressive, and that greater liberty should be enjoyed in matters of dress. After some years of contention these parties withdrew from the mother church and formed separate organizations. The Old-Order Brethren in 1913 had 222 ministers and about 3500 members. They determinedly oppose higher education, missionary work, Sunday schools, and revival services. They publish a paper, the *Vindicator*. In 1890 the Progressive Brethren numbered 8000 and have since then increased, claiming 22,000 members and 300 ministers in 1914. They have a college at Ashland, Ohio, where their publishing house is located. The *Evangelist*, their church paper, circulates generally among the members of their body. For the German Seventh-Day Baptists, an early offshoot of the German Baptist Brethren, see BAPTISTS.

CHURCH OF THE NEW JERUSALEM. See SWEDENBORGIANS.

CHURCH RATES. In England, a tax or assessment laid on the parishioners and occupiers of land within a parish, by a majority of their own body in vestry assembled, for the purpose of upholding and repairing the fabric of the church and the belfry, the bells, seats, and ornaments, the churchyard fence, and the expenses (other than those of maintaining the minister) incident to the celebration of divine service. The parishioners are convened for this

purpose by the churchwardens. The chancel being regarded as belonging peculiarly to the clergy, the expense of maintaining it is laid on the rector or vicar, though custom frequently lays this burden also on the parishioners, as in London and elsewhere.

The church rates were anciently a charge on the tithes of the parish, which were divided into three portions—one for the structure of the church, one for the poor, and the third for the ministers of the church. This distribution is said to have originated with Pope Gregory I, who enjoined St. Augustine thus to divide such voluntary offerings as might be made to his missionary church in England. A canon of Archbishop Ælfric in 970, and an Act of the Witenagemote in 1014, in Ethelred's time, have been quoted in proof of the recognition of this rule by our Saxon fathers. It seems to have been their custom, also, to devote to the repair of each church a portion of the fines paid for offenses committed within the district attached to it; and every bishop was bound to contribute to the repair of his own church from his own means. A third of the tithes thus originally devoted to the repairs of churches continued to be applied to that purpose under the Normans down to the middle of the thirteenth century; and the manner in which this burden came to be shifted to the parishioners has been a subject of much discussion among legal antiquarians. Lord (then Sir John) Campbell, who published a pamphlet on the subject in 1837, is of opinion that the contributions of the parishioners were at first purely voluntary, and that, the custom growing, it at last assumed the form of an obligation and was enforced by ecclesiastical censures. The care of the fabric of the church and the due administration of its offices are laid upon the ministers and the churchwardens conjointly, and the latter may be proceeded against by citation, in the ecclesiastical courts, should they neglect these duties. But there is no legal mode of compelling the parishioners as a body to provide the rate; and this circumstance has occasioned much difficulty in imposing the tax in parishes in which dissent is prevalent and led to many churches falling into a partially ruinous condition. The proper criterion for the amount of church rates is a valuation of the property within the parish, grounded on the rent that a tenant would be willing to pay for it. Glebe land, the possessions of the crown in the actual occupation of the sovereign, and places of public worship, are not liable for church rates; but there is no other exception as regards immovable property, and in some parishes custom even extends it to stock in trade. It has been often decided in the courts that a retrospective church rate—i.e., a rate for expenses previously incurred—cannot be validly imposed. Much difficulty has been experienced in recovering the rates imposed by the parish on individuals refusing to pay. Previous to 53 Geo. III, c. 127, the only mode was by suit in the ecclesiastical court. That statute, however, in all cases under £10, empowered the justices of the peace of the county where the church was situated, on complaint of the churchwardens, to inquire into the merits of the case and order payment. Against the decision of the justices an appeal lies to the quarter sessions. In 1868 an end was put to all parochial contentions by enacting that no suit or proceeding should thereafter be allowed in any court to enforce or compel payment of a church rate, except where a local act authorized this rate. But, except so far as related to the compulsory payment of these rates, the churchwardens might, as before, make, assess, receive, and deal with such rates. In each district parish the inhabitants may treat their own church as if it were their parish church and make and receive rates for the repair of the same. A body of trustees may now be appointed in each parish to receive contributions for ecclesiastical purposes in the parish.

CHURCH, States of the. See Papal States.

CHURCH TEMPERANCE SOCIETY. A national organization of the Episcopal church in the United States for the promotion of temperance. It was founded in New York in 1881, on the lines which the Church of England Temperance Society had been pursuing for 10 years previously. Its president is the presiding bishop of the church. The society stands for a policy of high license as opposed to prohibition and has done effective work through legislative channels. It conducts the Squirrel Inn Free Reading Room on the Bowery in New York City and maintains the Longshoreman's Rest. Among other agencies are ice-water fountains, lunch wagons, coffee-houses, workingmen's clubs, and other attractive, wholesome resorts. In connection with the society's work there is a Church Temperance Legion, which provides moral, civic, and military training for boys.

CHURCH TRIUMPHANT, The. A church founded by George Schweinfurth, who was born in Marion, Ohio, in 1853. He left the ministry of the Methodist Episcopal church soon after entering it and became a follower of a Mrs. Beekman, who professed to be "the spiritual mother of Christ in His second coming." Before her death, in 1883, she declared Schweinfurth to be "the Messiah of the New Dispensation," and her followers adhered to him. He claimed to have received the same spirit as Christ and to be equal with Him and sinless, and to have power to perform miracles, to bestow the spirit upon others, and to free from the curse and save from the commission of sin. The Church Triumphant does not believe that Christ was essentially divine, but that He was a man who had experienced freedom from the power and curse of sin and then received the spirit of God and became divine. The religious services are without rites, ceremonies, or forms of worship, and consist chiefly of the reading of the sermons prepared by Schweinfurth. The principal centre of this church is at a place called Mount Zion, near Rockford, Ill., where it has a special building. According to the latest published enumeration, it has 12 societies, with 384 members, in the States of Colorado, Illinois, Kentucky, Michigan, and Missouri. Consult H. K. Carroll, *The Religious Forces of the United States* (New York, rev. ed., 1912).

CHURCHWARDENS. In England, ecclesiastical officers, elected sometimes by the parishioners and ministers jointly, sometimes by the minister alone, and sometimes by the parishioners alone, for the purpose of protecting the edifice of the church, superintending the celebration of public worship, and to form and execute other parochial regulations. They are generally two in number. (See Church Rates; Parish; Vestry.) In the Protestant Episcopal church of the United States wardens are annually elected by each parish in Easter week; their duties, which are regulated by diocesan

and not by general canons, being the same as those of the corresponding English officials, omitting only such as relate to a church established by the state.

CHURCH'YARD, THOMAS (?1520–1604). An English author, born at Shrewsbury. He was a servant in the household of the Earl of Surrey, and a soldier of fortune in Ireland, the Low Countries, and France, and from 1560 poured forth an amazing number of broadsides, pamphlets, and other more pretentious works. Disraeli (*Calamities of Authors*) says that "he was frequently employed to supply verses for court masques and pageantry," and he composed such pieces for the entertainment of Queen Elizabeth at Bristol and Norwich. He died in poverty and neglect. His best effort is *The Worthiness of Wales* (1587; reissued in facsimile in 1876 by the Spenser Society), a national poem of some interest to the antiquarian and historian. Consult Collier's edition of *Churchyard's Chippes* (1870) and a memoir by Adnitt (1884).

CHURL. See CEORL.

CHURN (AS. *cyrin*, Icel. *kirna*, Dan. *kjærne*, churn, dialectic Ger. *Kern*, NIcel. *kjarna*, cream). A machine for agitating milk or cream for the production of butter. The principle of the operation is considered in the article on BUTTER MAKING (q.v.). The oldest form of churn was a bag of skins, in which the cream was agitated. The upright or plunger churn was laborious and was superseded by the dash churn, and by a form in which the cream was agitated by means of floats or paddles. There were many kinds of these, with arrangements for cooling or heating the cream. But these injured the texture of the butter, because of the effect of the stirring motion on the grain of the first particles of butter formed. Barrel churns and rectangular churns, hung upon the shorter axis, have come into very general use, and box churns which are oscillated, often called swing churns, are much used, especially in small dairies.

The best churns are entirely hollow vessels of the barrel or box shape, which agitate the cream through concussion of the particles upon the sides of the churn. The churn should not be entirely filled; it should be left half, or preferably only one-third, full. Although the yield of butter is not much diminished by increasing the amount churned at one time, the time required for churning is increased, and the temperature is raised at the end of churning, which is decidedly injurious to the butter, making it softer and more difficult to handle. Too rapid churning gives the cream the motion of the churn, and the particles of butter fat are not brought into contact with each other. The labor of churning has been very greatly decreased in the modern churn, and forms have been made in which dog power, horse power, and steam power are employed. The power churns, of immense size, are usually employed in creameries. The combined churn and butterworker has been described under BUTTERWORKER (q.v.). The butter extractor is essentially a cream separator and continuous churn combined. The butter made with this machine is, of course, sweet-cream butter.

CHURN OWL, or CHURR OWL. A name in Great Britain for the nightjar (q.v.).

CHUROYA, chōō-rō'yȧ. A tribe living in eastern Colombia. They are of low physical type, very ugly, and go generally naked, decorating their bodies with tattooing, in default of clothing. With several other tribes of the same region, they constitute a distinct linguistic stock, to which belongs also the Guahibo (q.v.), formerly considered independent. Rivet and Chamberlain prefer to term the stock "Guahiban." Consult Chamberlain in *Journ. de la Soc. des Amer.*, N. S., vol. vii, 1910, p. 186, and Rivet in *L'Année Linguistique*, vol. iv (1908–10), 1912, pp. 128–131.

CHURRIGUERESQUE (chur'rĭ-gâ-rĕsk') **ARCHITECTURE.** This style derives its name from Don José Churriguera (died 1725), a Spanish architect and sculptor. In 1689 he executed the catafalque for the obsequies of the Queen Maria Louise. After 1690 he was employed on various royal works—a portal for S. Gaetano, a palace for a prince, and various altars and works of sculpture. The Churrigueresque style marks the last stage of the baroque period in Spain. In it the original classic motives have become utterly degenerate, and nothing is considered except picturesqueness of effect in composition and decoration.

The style of Churriguera is one of the most important elements of Mexican architecture, which derived additional picturesqueness from the Indian workmen, who had not lost the Aztec traditions. Many picturesque Mexican portals, altarpieces, and interiors exhibit the style.

CHUR'RUS. See HEMP.

CHURUBUSCO, chōō'rōō-bụs'kō. A village 6 miles south of the city of Mexico, on the river Churubusco, connected with the capital by an elevated paved causeway. Before the conquest by Spain it was the capital of a powerful native kingdom, and is said to have had as many as 50,000 dwellings, and many temples and lofty towers. But by 1642 it had become a miserable village. Here, on Aug. 20, 1847, immediately after the battle of Contreras, occurred one of the most important battles in the war between the United States and Mexico. The Mexicans, under the command of Santa Anna, numbered about 30,000, most of whom were stationed in a strongly fortified *tête-de-pont*, and in the large convent or church of San Pablo. The Americans, numbering about 9000, and commanded by Gen. Winfield Scott, attacked with the greatest gallantry, and finally, after three hours of fighting, drove the Mexicans from their position. The Mexicans lost, in killed, wounded, and prisoners, fully 7000; the Americans, in killed and wounded, about 1100. Consult: Wilcox, *History of the Mexican War* (Washington, 1892); General Scott, *Autobiography* (New York, 1864); and Bancroft, *History of Mexico*, vol. v (San Francisco, 1885).

CHUSAN, chōō'sȧn (Chinese, Boat Island). An archipelago off the coast of China, consisting of the island of the same name and a few smaller islands (Map: China, F 5). The island of Chusan is situated about 40 miles northeast of Ning-po, lat. 30° N., long. 122° E., is of an oblong shape, and about 50 miles in circumference. Its surface is mountainous; but there are many fertile valleys with a plentiful supply of water, and the soil is very carefully cultivated by the hardy and independent people who inhabit the island. The flora is of remarkable richness. Azaleas clothe the mountains; clematis, roses, and honeysuckle grow in great luxuriance. The camphor and tallow tree, and many varieties of bamboo, are found in the valleys. Tea is cultivated to some extent on

the hillsides. Among the minor islands the most interesting is Putu, an islet covered with temples and inhabited by numerous monks, and consecrated entirely to religious purposes. Administratively the group belongs to the Province of Che-kiang. Population is estimated at (1910) 250,000. The chief settlement is Ting-hai, a fortified town, with a population of about 30,000. The island of Chusan was an important commercial entrepôt of the Japanese occupation during the Ming dynasty. It was occupied by the British from 1840 to 1846 and again in 1860.

CHUTIA NAGPUR, chōō'tê-ȧ nȧg-pōōr'. See CHOTA NAGPUR.

CHUT'NEE, or CHUTNY (Hind. *chatnī*). An East Indian condiment, a compound of mangoes, chillies or capsicum (q.v.), and lime juice, with other native fruits, such as tamarinds, the flavor being heightened by garlic.

CHUTTA NAGPUR. See CHOTA NAGPUR.

CHUZZLEWIT, MARTIN. The hero of Dickens's novel of the same name. He is, at first, an unsuccessful apprentice to a hypocritical architect named Pecksniff. He leaves the latter in contemptuous anger, goes to America, and, after making various amusing acquaintances there, falls ill, and is brought back by his faithful follower, Mark Tapley. He is finally reconciled with his exacting grandfather, also named Martin, and marries a protégée of the latter, with whom he has long been in love.

CHWI. See SUDAN.

CHWOLSON, kvôl'sôn, DANIEL ABRAMOVITCH (1819–1911). A famous Russian archæologist. Born of Jewish parentage at Vilna, he received his education at Breslau, Vienna, and St. Petersburg, mastering German, French, and Russian, and then devoting himself to the study of Oriental languages, especially Arabic. In 1850 the University of Leipzig conferred the doctor's degree upon him for a scholarly dissertation on Semitic religious history. Five years later, having returned to Russia and embraced Christianity—a thing frequently done by intellectual Jews in Russia as an indispensable means to recognition—he was appointed professor of Oriental languages at St. Petersburg University and of Hebrew and biblical archæology at the ecclesiastical academy in the same city. So great was his scholarship in his special field, that only a year after these appointments (in 1851) the Russian Imperial Academy published his first long work at its own expense—an unusual honor. The publication of this book—an elaboration of his doctor's dissertation already referred to—at once established its author's reputation. The works that followed made him one of the foremost authorities on the history of Oriental religions, and gave him considerable prestige in his defense of the Jews, whose cause he ever championed. Chwolson's principal works, devoted chiefly to Oriental ethnography, are: *Die Ssabier und der Ssabismus* (2 vols., 1856), a source book indispensable to students of religious history; *Concerning Some Mediæval Accusations Against the Jews* (in Russian, 1859); *Ibn Dasta's Accounts of the Kharzars, Burtassi, and Bulgarians* (in Russian, 1867); *Die semitischen Völker* (1872); *The Lord's Last Supper and the Day of the Crucifixion* (in Russian, 2d ed., 1880; German, 2d enlarged ed., 1908), in which he aims to shatter the traditional views concerning Christ's death, etc.; and *Die Blutanklage und sonstige mittelalterliche Beschuldingungen der Juden* (1901), a most scholarly historical study of "ritual-murder" accusations against the Jews.

CHYLE, kīl (from Neo-Lat. *chylus*, from Gk. *χυλός, chylos*, juice, from *χεῖν, chein*, to pour). A product of the digestion of food in the alimentary canal. On remaining for some time in the stomach, food is partially dissolved, forming a thick, grayish, turbid liquid called *chyme*. The chyme, which passes onward into the small intestine, is acted upon by the bile, pancreatic fluid, and intestinal juice, and separated into *chyle*, which is absorbed or sucked up by the lacteals (q.v.), and into waste matters, which ultimately find their way out of the system through the lower bowel. The manner in which chyle is taken up by vessels distributed over the small intestines, and the changes it undergoes before it is absorbed into the blood, are described in the articles LACTEAL, THORACIC DUCT, and NUTRITION. When obtained from the thoracic duct of an animal during the process of digestion, chyle is a white milky-looking or yellowish fluid, with a faintly alkaline reaction. Like the blood, it coagulates after its abstraction from the body of the animal; and a small but distinct gelatinous clot is separated from the serous fluid of the chyle. On examining chyle under a microscope, we find that it contains numbers of white corpuscles, oil globules of varying sizes, and fatty granules. Each oil droplet is enveloped in an albuminous envelope. The chemical constituents of chyle are neutral fats, some fatty acids, lecithin, cholesterin, serum albumin, globulin, fibrin, sugar, urea, leucin, sodium chloride, phosphates, and traces of iron. See DIGESTION.

CHYME, kīm. See CHYLE; DIGESTION.

CHYTRÄUS, kê-trā'ōōs (Neo-Lat., from Gk. *χυτραῖος, chytraios*, made of earthenware, from *χύτρα, chytra*, pipkin; a translation of his family name *Kochhafe*, lit. cooking pot), DAVID (1531–1600). A Lutheran theologian. He was born at Ingelfingen, Württemberg, studied at Tübingen and Wittenberg; was a pupil of Melanchthon, and became professor of theology at Rostock (1551). His learning and talents gave him a high position, and he was employed by Maximilian II to arrange the affairs of the Evangelical church in Austria. He was the principal author of the statutes of Helmstedt, and one of the authors of the *Formula of Concord*. He left a number of important theological works. His biography has been written by Bressel (1863) and Krabbe (1870).

CIALDINI, chȧl-dē'nê, ENRICO, DUKE OF GAETA (1811–92). An Italian general, politician, and diplomat. He was born at Castelvetro, near Modena, and studied in the University of Parma. He took part in the insurrection of 1831, and was forced to escape to Paris. In 1833 he fought in Portugal, and in 1835 joined the Spanish army. At the outbreak of the revolution of 1848 Cialdini took command of a regiment of Piedmontese infantry, and subsequently was captured by the Austrians. In the Crimean War he commanded the third division of the Sardinian contingent, and took a distinguished part at the battle of the Tchernaya. At the beginning of the War of 1859 he was intrusted by Cavour with enlisting the famous corps of sharpshooters known as the Cacciatori delle Alpi ('Hunters of the Alps'), afterward commanded by Garibaldi. The fourth division of the army was led by Cialdini, who won the victory of Palestro, but further progress of the Italians was stopped by the Peace of Villafranca.

In 1860 Cialdini defeated the papal army under General Lamoricière, at Castelfidardo. On Feb. 13, 1861, Gaeta yielded to Cialdini. He was now made general of the army and Duke of Gaeta, and Reggio elected him deputy. He became senator in 1864, and took a prominent part in the campaign against Austria in 1866, replacing Lamarmora as chief of the general staff. In 1876–79 and 1880–81 he was Ambassador to France. Consult Misco, *Cialdini e i suoi tempi* (Naples, 1893).

CIAMICIAN, Giacomo (1857–). An Italian chemist, born at Triest, Austria-Hungary. He was educated at the University of Vienna. In 1880 he became assistant at the Chemical Institute of Rome, in 1887 professor of general chemistry at Padua, and after 1889 was ordinary professor of general chemistry at Bologna University, Italy. In 1910 he became a member of the Italian Senate. Besides his contributions on pyrrols, on plant substance, and on photochemistry, he is author of *I problemi chimici del nuovo secolo* (1903; 2d ed., 1905); *Organico e fisiologico chimica* (1908); *Cooperazione delle scienze* (1911); *Fotochimica nell' avenire* (1912).

CIAMPI, chäm'pē, Ignazio (1824–80). An Italian poet and historian, born in Rome. He studied law there, attained considerable reputation as an attorney, and became a member of the Roman Council of State. From 1874 until his death he was professor of modern history at the University of Rome. Among his poetical works are imitations of Pushkin (1855), *Serena* (1857), the collection *Poesie varie* (1857), the epic *Stella* (1858), and a complete edition entitled *Poesie* (1880). His valuable historical studies include *La città etrusca* (1866), *Innocenzo X e la sua corte* (1878), and, most important, the *Storia moderna della scoperta dell' America alla pace di Westfalia* (2 vols., 1881–83, ed. by Castagnola).

CIAMPI, Sebastiano (1769–1847). An Italian author, born at Pistoja. From 1803 to 1818 he was a professor in the University of Pisa, and from 1818 to 1822 at Warsaw. His publications include *Memorie della vita di Messer. Cino da Pistoja* (1808), *De Usu Linguæ Italicæ saltem a Sæculo Quinto* (1817), and a *Bibliografia critica delle antiche reciproche corrispondenze dell' Italia colla Russia, Polonia,* etc. (1834–43). He did much to further the study of art history and translated Pausanias.

CIAMPOLI, chäm'pō-lē, Domenico (1855–). An Italian author, born at Atessa, in the Abruzzi. He was called to the chair of the history of literature in the Lyceum of Ancona, and later became librarian at the Victor Emmanuel Institution in Rome. He wrote chiefly stories of Apennine life. The *Fiabe abruzzesi* (1877) and *Cicuta* (1884) are examples. As a critic of Slavic literature he published *Melodie russe* (1881) and other volumes, including some versions of Dostoyevski. He also wrote *Nuovi studi letterarii e bibliografici* (1899).

CIANCA, thē-än'thä, Andrés de (c.1500–?). A Spanish judge, born at Peñafiel. He went to Peru with Pedro de la Gasca in 1546, became a member of the royal audience, and was president of the audience in 1550–51, from the departure of Gasca for Panama until the arrival from Spain of Don Antonio de Mendoza, the second Viceroy. He was a judge of the court-martial which, after the battle of Sacsahuana, in 1548, condemned to death Gonzalo Pizarro (q.v.) and Francisco de Carbajal (q.v.).

CIARDI, chär'dē, Guglielmo (1844–). An Italian painter. He was born in Treviso and studied at the Academy of Venice under Bresolin and at Florence, Rome, and Naples. After extensive travels in Europe he settled in Venice in 1874. His representations of the Dolomites and mountainous regions about Treviso, his views of Venice and the lagoons, with their remarkable light effects, have gained universal favor and been widely and successfully exhibited. His fine landscape, "Messidoro" (1883, Galleria Moderna, Rome), made him the recognized leader of the Venetian *plein air* painters. Other works are: "Morning in the Alps" (Moriza), "Grand Canal" (Berlin, 1896), "October in the Venetian Campagna" (Glasgow, 1904), "Lake of Weissenfels" (Luxembourg, 1909). Consult Willard, *History of Modern Italian Art* (London, 1902).

CIBAO, sē-bä'ō. A picturesque mountain range of Santo Domingo, Haiti (q.v.), in the central part. It extends 20 miles from northwest to southeast and attains an altitude of over 7000 feet in the highest peaks of the island. The chief rivers of Haiti rise in the range; between the mountains and along the north coast extend the fertile valley and plain of Santiago, watered by the Yaqui. Columbus supposed the range to be part of the Cipango (Japan) of Marco Polo. Gold in considerable quantities has been found here since Ojeda's first expedition of discovery in 1494.

CIBBER, sĭb'bĕr, Caius Gabriel (1630–1700). A Danish-English sculptor, born at Flensburg, in Schleswig. He was sent to Rome to study, and then went to England with the sculptor Stone. Among his works are the strong and decorative figures of "Melancholy" and "Raving Madness," once over the entrance to the Bethlehem Hospital, but now in the South Kensington Museum; the phœnix above the south door of St. Paul's Cathedral, and one of the bas-reliefs on the monument commemorating the fire of London. His son was Colley Cibber, the actor and dramatist.

CIBBER, Colley (1671–1757). An English actor and dramatist, born in London. In 1682 he was sent to the free school at Grantham, in Lincolnshire. Five years thereafter he returned to London, and in 1688 was a volunteer in the forces raised by the Earl of Devonshire in support of the Prince of Orange. He afterward turned to the stage, and after performing gratuitously for several months, he obtained an engagement at 10s. per week, which was raised to 15s.; and on the commendation of Congreve, who had witnessed his performance of Lord Touchwood, five additional shillings per week were added. Cibber now began to take the leading parts in many comedies, and soon established his reputation as an actor. In the meantime he was writing comedies. *Love's Last Shift* was produced in 1696, and thereafter followed 29 more plays. As a dramatist Cibber claims to have done much towards the reformation of the stage. However immoral individual scenes in his plays may be, the libertines are reclaimed in the last act. As playwright and comedian he was closely connected with Drury Lane Theatre, of which he became manager in 1710. He retired from the stage in 1733, though after that date he occasionally reäppeared. Three years before he had been appointed Poet Laureate. The poems he

now wrote were worthless, and exposed him to scathing ridicule. Pope made him the hero of the new *Dunciad* (1742). After retiring from the stage, Cibber began his famous *Apology*, which appeared in 1740 (an edition by Bell-chambers, London, 1822; and another by Lowe, London, 1889). This book is not only an important history of the Queen Anne stage—it is one of the most amusing autobiographies ever written. Cibber died Dec. 12, 1757. His *Dramatic Works* with a biography appeared in 1760; new ed., 1777. Consult Cibber, *Apology*, ed. by Lowe (London, 1888), and the same editor, *Bibliographical Account of English Theatrical Literature* (1895).

CIBBER, Susannah Maria (Arne) (1714–66). An English actress. She received instruction in music from her brother, Dr. T. A. Arne (q.v.); first appeared publicly in 1732, and rose to great public favor in opera and oratorio. She was an especial favorite with Handel and was the first Galatea in his *Acis and Galatea*. He wrote the contralto songs in the *Messiah* and the part of Micah in *Samson* expressly for her. Two years after her marriage to Theophilus, son of the dramatist Colley Cibber, which took place in 1734 and proved very unhappy, she appeared as an actress, especially in tragedy, excelling as Constance of Bretagne in *King John* and as Ophelia in *Hamlet*. She played with Garrick at Drury Lane after 1753.

CIBOL, sĭb'ŏl. See Onion.

CIBO'RIUM (Lat., from Gk. κιβώριον, *kibōrion*, shell, cup). A term used mainly in two distinct senses: (1) for an altar canopy, and (2) for a vase to contain the reserved Sacrament, from which communion is ordinarily given in the Roman Catholic church. From the earliest times after Christianity emerged from the catacombs (fourth century) the high altar in a Christian church or basilica was surmounted by a canopy resting on columns, and made of gold, silver, bronze, or marble. These canopies were among the richest pieces of church furniture and were decorated with reliefs, statues, and a variety of architectural details. The earliest metal ciboria, of which many superb examples were given by the popes to Roman churches, have not survived the melting pot. The marble ones of the sixth century, at Ravenna and Parenzo, are among the earliest. That given by Justinian (sixth century) to St. Sophia, in Constantinople, was the most sumptuous. Of mediæval marble examples, there are many in Rome; of the classic type, at San Lorenzo in Campo Verano and San Giorgio in Velabro; of the Gothic type, at Santa Cecilia and the Lateran, decorated with mosaics and sculpture. A remarkable Lombard example is at Sant' Ambrogio, Milan; another at San Marco, Venice. Many others are in the churches of southern Italy (eleventh to fourteenth century). This custom was abandoned throughout Europe, except in Italy, after the thirteenth century, the altar being left uncovered. Since the sixteenth century the ciborium, in this sense, has been called in Italy a baldachin (q.v.). See Altar; Canopy.

The second meaning, which is now the more usual, designates a closed vase to contain the Host. Such receptacles were originally (fourth to eighth century) in the form of a dove, made of gold, silver, or gilt copper, suspended over the high altar from the ciborium. Sometimes they were inclosed in a tabernacle in the shape of a tower. Then the dove-shaped receptacles were, in the ninth century, replaced by pyxes (q.v.) or small cylindrical boxes of gold, silver, ivory, etc. These were suspended over the altar or placed in a small niche in the wall near the altar, in churches where there was no ciborium over the altar. The primitive connection between the constructive ciborium and this receptacle for the reserved Sacrament caused the name ciborium to be applied to the latter in late mediæval times, when the use of the constructive ciborium had ceased; but the term pyxis is the more correct name. The wall niche in which the ciborium is placed was also called ciborium; it had decorative architectural door-reliefs and a frontispiece; and some of those executed during the Italian Renaissance are exquisitely sculptured.

CIBRARIO, chē-brä'rē-ō, Gianni Antonio Luigi, Count (1802–70). An Italian historian and politician. He was born in Turin, studied at the university of that city, and took his degree of doctor of laws in 1824. King Charles Albert of Sardinia, with whom he was a great favorite, sent him in 1848, when Italy rose against the Austrians, as royal commissioner to Venice. During the same year he was created a senator of the kingdom. When Charles Albert—after the unfortunate issue of the war—went to live in voluntary exile at Oporto, Cibrario was sent by the Sardinian Senate to induce him to return. In 1850 he was appointed Superintendent General of Customs, and negotiated a treaty of commerce with France. In 1852 he was made Minister of Public Instruction by Victor Emmanuel, and in 1855 he became Minister of Foreign Affairs in Cavour's cabinet. He resigned his position in the following year, and he thenceforth devoted himself mainly to historical research. In the capacity of a mediator he negotiated a treaty which guaranteed the liberties of the Republic of San Marino with the Italian government in 1860. He died at Salò, in the Province of Brescia, 10 years later. His fame as an historian rests on the following works: *Notizie sulla storia dei principi di Savoia* (1825); *Delle storie di Chieri* (1827); *Dell' economia politica del medio evo* (1839); *Storia della monarchia di Savoia* (1843); *Storia di Torino* (1847); *Della schiavitù e del servaggio e specialmente dei servi agricoltori* (1868). Consult Odorici, *Il Conte Luigi Cibrario* (Florence, 1872).

CICA'DA. One of the Cicadidæ, a family of homopterous bugs, composed, for the most part, of large insects, very few measuring less than one inch across the opened wings, while many are as large as seven inches. The fore wings are usually transparent, but in some forms are highly pigmented, especially with black and yellow. About 800 species are known, mostly tropical.

Habits, etc.—The life of an adult cicada is noisy and short. These are, indeed, the noisiest insects in the world. Darwin heard them while on the *Beagle*, when it was anchored a quarter of a mile from shore. Only the males give the note. "Happy," said the Greek poet Xenarchus, "the cicadas' lives, for they all have voiceless wives." As no special auditory organs have been detected, it has been suggested that cicadas are capable of feeling rhythmical vibrations only. The sound-making organs which the males possess fully developed, and the females only partly, are peculiar to the cicadas. They consist of

enlargements of the metathoracic epimera, in the form of an opercular covering beneath which there is a very complicated apparatus. The sound is made by the rapid vibration of one of the membranes called the timbal. The other two membranes probably are set in vibration by the first and, in connection with the opercula, the three stigmata, and the whole skeleton of the insect, intensify the sound. The females are provided with powerful ovipositors. The eggs are deposited in the twigs of trees or shrubs or in the stems of herbs. The young hatch out in a few weeks, drop to the ground, and begin there a long subterranean existence. They feed on the sap from the roots of trees. The larvæ may penetrate as deep as 20 feet below the surface of the ground, where it is difficult to make out their life history. The manner of transformation from the larva to the pupa we do not know. The pupa is incased in a hard shell and when about ready to emerge from the ground may construct a chimney of earth several inches in height, but whether this is a purposeful act or not we do not know. When the pupa crawls out of the ground it fastens itself to some firm object, such as a wooden fence or a tree trunk, the skin splits along the dorsal line of the thorax, and through this the adult winged insect emerges. The pupal skin when dried still retains the shape of the pupa, and may be found attached to the support several days after the adult has flown away.

In the United States the two commonest forms are the dogday harvest fly (*Cicada tibicen*) and the periodical cicada or 13 to 17 year locust (*Cicada septendecim*). The harvest fly is the black-and-green one that appears every year in midsummer and gives out its prolonged, shrill, and to many persons nerve-racking, cry from tree tops during the heated hours of the day; this form matures in two years, but since there are two different broods, one appears every year.

The Periodical Cicada.—This species requires from 13 to 17 years for development, according, mainly, to the temperature of the locality in which it breeds. Heat hastens its development, hence the 13-year forms occur in the South; but in each locality there are always some individuals that come out a year or two ahead of the main brood and others that lag a few years behind. This form has the greatest longevity of all insects. The time of its periodicity has been made out by noting its appearance in certain localities for a considerable number of years, 22 broods having thus been determined. Several of these broods, which are dimorphic, may coexist in the same locality. Hence larvæ of different ages, of several generations, may be found in the ground at one and the same time, and they will appear as adults in different years. The sound made by these insects is peculiar, very loud, and closely resembles the humming of a resonant telegraph pole when its wires are vibrating in a strong breeze.

Consult Woodworth, "Synopsis North American Cicadidæ," in *Psyche*, vol. v (Cambridge, Mass., 1888). For the 17-year locust, see "The Periodical Cicada," an illustrated monograph of 148 pages, by C. L. Marlatt, *Bulletin 14 of the United States Department of Agriculture* (Washington, 1898). See LOCUST.

CICADA KILLER. See SAND WASP.

CIC'ATRIZA'TION (from Fr. *cicatrisation*, from *cicatriser*, to scarify, from Lat. *cicatrix*, a scar). The process of healing or skinning over of an ulcer or broken surface in the skin or in a mucous membrane, by which a fibrous material, of a dense, resisting character, is substituted for the lost tissues. The new tissue is called the cicatrix, and consists of fibrous connective tissue, having a tendency to contract, a lack of elasticity, and a white, shining appearance. The glands and other special structures of the original tissue are wanting in the cicatrix. See INFLAMMATION; ULCER.

CICCIONE, chē-chō'nā, ANDREA, properly ANDREA DA FIRENZE, or ANDREA NOFRI (1388–c.1453). A Florentine sculptor and architect of the early Renaissance. He was born in Florence, studied under unimportant masters, and later imitated Donatello. His principal surviving work is in Naples—the large tomb of King Ladislas (1415), the unfinished half-Gothic tomb of Ser Gianni Caracciolo—both in the church of San Giovanni a Carbonare, and the richly decorated tomb of Count Fernando da San Serverino in the convent of Santa Monica. His work is somewhat heavy in character, and his style shows the transition from the Gothic to the Renaissance. He is supposed to have been architect of the monastery and church of Monte Oliveto and the cloisters of San Severino.

CICELY, sĭs'ē-lĭ (corruption of *seseli*, from OF., Lat. *seselis*, from Gk. σέσελι, *seseli*, cicely) (*Myrrhis*). A genus of umbelliferous plants, nearly allied to chervil. One species, sweet cicely (*Myrrhis odorata*), is common in the central and southern parts of Europe and in similar climates in Asia, but in Great Britain it appears to have been introduced. It is sometimes called myrrh in Scotland. It is a branching perennial 2 feet high or upward, with large, triply pinnate leaves and pinnatifid leaflets, somewhat downy beneath; the whole plant is powerfully fragrant, the smell resembling that of anise. The seeds, roots, and young leaves are used in Germany and other countries in soups, etc. The plant was formerly much in use as a medicinal aromatic. In the United States sweet cicely is the name given to the species of *Osmorrhia*, a genus closely related to *Myrrhis*.

CICELY. See CHERVIL.

CI'CER. See CHICK-PEA.

CIC'ERO, MARCUS TULLIUS (106–43 B.C.). The greatest orator of Rome, and one of the most illustrious of her statesmen and men of letters. He was born at Arpinum, Jan. 3, 106 B.C., of an ancient family, of the equestrian order. His father, himself a man of culture, and desirous that his son should acquire an eminent position in the state, removed him at an early age to Rome, where, under the direction of the orator Crassus, he was instructed in the language and literature of Greece and in all the other branches of a liberal education. In his sixteenth year he assumed the *toga virilis*, or manly toga, and was introduced to the public life of a Roman citizen. He now acquired a knowledge of law, and underwent a complete course of training in oratory. At the same time he studied philosophy under instructors of the Epicurean, Academic, and Stoic schools, and neglected no mental exercise, however arduous, which might conduce to his future eminence, being thus early of the opinion, which he afterward maintained in his treatise *De Oratore*, that an orator should possess almost universal knowledge. With the exception of a brief campaign under Sulla, in the Social War, he passed his time in these preliminary studies until his twenty-sixth year, when he began to plead in

public. In one of his earliest causes he distinguished himself by defending the rights of Sextus Roscius of Ameria, a private citizen, against one of the favorites of Sulla, who was then dictator.

Soon after, for the benefit of his health, and to pursue his oratorical and philosophical studies, he traveled to the chief seats of learning in Greece and Asia, and on his return was regarded as second to no orator at the Roman bar. Having been elected quæstor (76 B.C.), he was assigned by lot to Sicily, a post which he filled with ability, and to the satisfaction of those whom he governed. Some years after his return he laid the Sicilians under still greater obligation by his successful prosecution of their prætor, Verres, against whom he prepared no fewer than six orations, although the first had the effect of disheartening the accused so effectually that he voluntarily retired into exile. This was Cicero's first great triumph, for Verres had as his counsel and advocate the famous pleader Hortensius, who was at that time the acknowledged head of the Roman bar. In 69 B.C. Cicero filled the office of ædile, and in 66 that of prætor. Supported by Pompeius, whose favor he had gained by his advocacy of the Manilian Law, giving to that general the command of the Mithridatic War, Cicero was at length elected, by an overwhelming majority, to the consulship (63 B.C.). His tenure of office was rendered memorable by the conspiracy of Catiline, which he frustrated with admirable skill and promptitude. (See CATILINE.) The highest praises were showered upon him; he was hailed by Cato and Catullus as the "father of his country"; and public thanksgivings in his name were voted to the gods. But his popularity did not last long after the expiration of his consulship. His enemies charged him with a public crime in having put the Catilinarian conspirators to death without a formal trial, and he found it necessary to leave Rome and to take up his residence in Thessalonica (58 B.C.). A formal edict of banishment was pronounced against him, but he was recalled from exile in about 16 months, and on his return to Rome was received with great enthusiasm. See CLODIUS PULCHER.

His recovered dignity, however, soon excited the envy of the very party in the Senate with which he had desired to make common cause; while Pompeius and Cæsar, the greatest powers in the state, from whose enmity he had most to dread, courted his alliance and coöperation. Thus, while preserving an appearance of independence, he was betrayed into many actions which he could not but regard as humiliating, and which, by increasing the power of the triumvirs, led indirectly to the ruin of the Republic. A remarkable exception to this trimming policy is to be found in his assisting Milo when suing for the consulship. Against the wish of Pompeius, and in spite of the hostile feeling of the populace, he defended him after he had slain Clodius in an accidental encounter. During this period he composed his works *De Oratore*, *De Republica*, and *De Legibus*. After a year's administration of the Province of Cilicia (51–50 B.C.), he returned to Italy on the eve of the Civil War. With the convictions which he avowed, there was but one course which it would have been honorable for him to pursue—to enlist, at all hazards, on the side of Pompeius and the Republic. But instead of this he hesitated, balanced the claims of duty and of interest, blamed Pompeius for his want of preparation, and criticized the plan of his campaign, even after he had joined the army of the Senate, so that Pompeius found his coöperation more annoying than his opposition. After the battle of Pharsalus had wrecked the Pompeian cause Cicero abruptly quitted his friends and resolved to throw himself upon the generosity of the conqueror. After nine months' miserable suspense at Brundisium he was kindly received by Cæsar, whom he followed to Rome. During the years which ensued he remained in comparative retirement, composing his principal works in philosophy and rhetoric, including those entitled *Orator*, *Hortensius*, *De Finibus*, *Tusculanæ Disputationes*, *De Natura Deorum*, *De Senectute*, *De Amicitia*, and *De Officiis*. On the death of Cæsar he was disposed to unite his interests with those of Brutus and the other conspirators, but was restrained by dictates of prudence. In the civil disturbances which followed he espoused the cause of Octavianus, and composed his denunciatory orations against Antonius, which are known as the Philippics. These orations were the occasion of his death. When Octavianus and Lepidus joined with Antonius in a triumvirate, Cicero was among the proscribed, and his life was relentlessly sought. The soldiers of Antonius overtook him while his attendants were bearing him, now old and in an infirm state of health, from his Formian villa to Caieta, where he intended to embark. Forbidding his attendants to make any resistance, he offered his neck to the sword of his executioners. He died on Dec. 7, 43 B.C.

As a man Cicero was high-minded, generous, and possessed at all times of excellent intentions; yet he was lacking in moral courage; he was intensely egoistic and so unstable that he failed to impress his ideas upon those about him. His very sensitiveness and his high-strung, emotional nature, which made him so successful as an orator and as an interpreter of literary themes, were fatal to his ambition as a statesman. He lacked the intense conviction of a man like Cato, and he lacked also the cool, haughty courage and unshaken nerve of Cæsar. He always saw with fatal facility the strength of each side of every question, so that he was continually wavering between one position and another, swayed by the impulses of the moment and utterly devoid of that grim tenacity of purpose which holds fast to the end. This is the reason why, in the stormy times which attended and followed the death of Cæsar, Cicero hesitated and temporized and so miscalculated the attitude and the intentions of the conflicting parties that, in the end, both of them conceived for him an enmity mingled with contempt. See ANTONIUS; AUGUSTUS; CÆSAR; POMPEIUS.

In his oratory Cicero represents a mean between the Attic simplicity of Demosthenes and the so-called "Asiatic" floridity of his own former rival, Hortensius. Ancient rhetoricians classified him as belonging to the Rhodian school of eloquence. He had, indeed, all the gifts of nature and of training which go to make the perfect orator—an impressionable nature, a vivid imagination, and a mastery of language such as has never been surpassed. The one defect in Cicero's oratory is the defect that has been already noted in his character, and which may be defined as a lack of sincerity, of genuine conviction, of the ring of truth. This strain of insincerity makes him almost always seem to be

the special pleader who praises or denounces, as the case may be, more from a certain sympathetic facility for working up a temporary interest in almost any cause, than from the impelling force of a master mind which takes its stand upon the rock of principle, from which neither self-interest nor flattery nor danger can shake it free. Hence there is nothing in all Cicero's oratorical effort worthy to be set beside the one sublime masterpiece of Demosthenes without appearing by comparison light and hollow and almost trivial. This defect, however, is wholly moral and psychological. On the linguistic side it is impossible to set Cicero's rank too high. The perfect harmony of his periods, the exquisite choice of his words, the delicate balance of his cadences, whose sound keeps up an ever-running accompaniment to sense, and the majestic roll of his wonderful perorations are absolutely without counterpart in Greek, or English, or any other language whatsoever, and they make reasonable and true the judgment of Quintilian, that "Cicero is now less the name of a man than of eloquence itself."

As a man of letters Cicero has also left to posterity a mighty name. He created a prose style which for richness and refinement has never been surpassed, and which became at once the standard by which all other Latin prose is now tested and compared. He added, indeed, very largely to the vocabulary of his own language, giving currency to striking and picturesque words and phrases which had hitherto not entered into the diction of formal literature, but which were exceedingly expressive, and needed only the authority of a genius like Cicero to gain universal currency. Likewise, when necessary, and especially when paraphrasing in Latin the philosophical writings of the Greeks, he struck out new words to express new ideas, and these newly minted words were so thoroughly in accordance with the analogies of the Latin language as to be at once accepted and approved. Cicero was a facile writer, and he dealt with many subjects in many departments of intellectual interest. Nearly all of his philosophical books were borrowed almost wholly from Greek sources and are therefore entirely unoriginal in matter; but the manner is most attractive and has a lucidity and grace such as the Greek philosophical writers seldom attained. They have been of great service to the modern world, because they have preserved much of Greek philosophy otherwise unknown to us or known only imperfectly. His rhetorical works, written in the dialogue form, are of great value, first as being the production of one who was himself an accomplished rhetorician, and in the second place for the richness of the historical material which Cicero scattered through them with a lavish hand. Among the minor works of Cicero two, a treatise on old age (*De Senectute*) and one on friendship (*De Amicitia*), have always been admired, both for their exquisite charm of style and for their urbane and cultivated tone. Highly important among the Ciceronian remains are four collections of letters written by Cicero to various acquaintances and friends, and numbering in all 774 pieces; there are, besides, 90 letters addressed to Cicero. These letters were not collected by Cicero himself, nor did he ever intend that they should be published. They represent, therefore, an unstudied, unconscious, spontaneous self-revelation of their author, and they are, besides, an inexhaustible treasure house of information, often of a very intimate character, concerning Cicero's contemporaries and the political history of his time. This correspondence was preserved and edited by Cicero's amanuensis, Tullius Tiro, and also in part by Cicero's familiar friend, Pomponius Atticus, to whom very many of the letters were addressed. Cicero likewise, in his early years, composed poetry, little of which has survived and none of which was favorably judged by his own countrymen.

The extant orations of Cicero are 57 in number, of which the most famous are the four against Catiline, the 14 so-called Philippics against Antony, the oration on behalf of Archias, and two legal orations, one on behalf of L. Murena and the other on behalf of Marcus Cælius. It should be remembered always in reading these orations that they are not now in the actual form in which they were delivered, but that Cicero edited them freely, as Webster edited his famous speech in reply to Hayne. Some of the Ciceronian orations, in fact, were not delivered at all, and this was especially the case with most of the Philippics, which were in reality political tracts or pamphlets. Of the speeches which have been mentioned above, the first oration against Catiline is the most highly wrought and splendidly rhetorical; the one in behalf of Archias is the most graceful, easy, and refined; the two legal orations are the neatest and wittiest; the second Philippic is the most elaborately violent in the severity and at times the coarseness of its denunciation.

The best complete text edition of Cicero's works is that of Müller (Leipzig, 1878 ff.). A new text is under way in the *Oxford Classical Text Series*. The best edition of the letters with a commentary is that of Tyrrell and Purser (6 vols., London, 1885–99). For excellent editions of other works, consult Reid, *Academica* (London, 1885); Wilkins, *De Oratore* (Oxford, 1888–92); Sandys, *Orator* (Cambridge, 1892); Mayor, *De Natura Deorum* (Cambridge, 1883–1891); Seyffert-Müller, *Laelius* (= *De Amicitia*, Leipzig, 1876). The letters are translated by Shuckburgh (London, 1899) and by Winstedt (London, 1912–14). There are no good translations into English of the rest of Cicero's works. There is a German lexicon to the philosophical writings (1895) and to the orations (1884), both by Merguet. On Cicero's language and style, see especially Norden, *Die Antike Kunstprosa* (Leipzig, 1898); Lebreton, *Etudes sur la langue et la grammaire de Cicéron* (Paris, 1901). For a general discussion of his writings, consult Duff, *A Literary History of Rome*, pp. 349–397 (New York, 1909). For rhythm in Cicero, a subject which he makes much of in his rhetorical writings, consult Th. Zielinski, *Das Clauselgesetz in Ciceros Reden* (Leipzig, 1904); F. W. Shipley, "The Heroic Clausula in Cicero and Quintilian," in *Classical Philology*, vi, 139–156 (1911); Shipley, "The Treatment of Dactylic Words in the Rhythmic Prose of Cicero," in *Transactions of the American Philological Association*, xli, 139–156 (1910); Shipley, "Preferred and Avoided Combinations of the Enclitic *Que* in Cicero," in *Classical Philology* (1913). For an account of Cicero's career, see Middleton, *Life of Cicero* (London, 1741), very old-fashioned and extreme; Forsyth, *Life of Cicero* (London, 1864); Strachan-Davidson, *Life of Cicero* (New York, 1894); and Boissier, *Cicéron et ses amis* (5th ed., Paris, 1895). An uncritical but

interesting book is Trollope, *Life of Cicero* (New York, 1880). For an unfavorable view of Cicero, see Mommsen, Eng. trans., *History of Rome*, vol. iv (New York, 1886), while the strongest plea for Cicero is that of Gerlach (Basel, 1864). On Cicero as a philosopher, consult Levin, *Lectures on the Philosophy of Cicero* (Cambridge, 1871), and the introduction to Reid's edition of the *Academica;* on his legal merits, Gasquy, *Cicéron jurisconsulte* (Paris, 1884); on his rhetorical and oratorical gifts, Causeret, *Sur la langue de la rhétorique dans Cicéron* (Paris, 1886), and the introduction to Wilkins's edition of the *De Oratore* and that to Sandys's edition of the *Orator;* Thiele, *Hermagoras* (Berlin, 1893); and Sears, *History of Oratory* (Chicago, 1896). Regarding the letters of Cicero, consult Nisard, *Notes sur les lettres de Cicéron* (Paris, 1882), and the introduction to Tyrrell and Purser's edition, in vol. i. An important work on Cicero by E. G. Sihler is soon to be published.

CICERO, QUINTUS TULLIUS (c.102–43 B.C.). A Roman commander, younger brother of Cicero, the orator. He served as prætor in 62 B.C., and was governor of Asia for three years. As legatus he accompanied Cæsar to Britain in 55 B.C. He commanded a legion in winter quarters in 54 B.C., and showed skill and courage in defending his camp against vast forces of the Gauls under Ambiorix (q.v.). In 51 he served as legate to his brother, Marcus Tullius, in Cilicia. After the battle of Pharsalus, in which he had fought on the side of Pompeius, he was proscribed by the triumvirs and put to death by the emissaries of Antonius. Quintus was perhaps the author of the *Commentariolum Petitionis*, a missive addressed to his brother and usually printed with Cicero's letters to him, and of several tragedies, which have been lost. Eighteen lines by him are printed in Bücheler, *Quinti Ciceronis Reliquiæ* (Leipzig, 1869). Consult "The Commentariolum Petitionis ascribed to Quintus Cicero," in *Chicago University Decennial Publications*, vol. vi (1903).

CICERONE, sĭs'ê-rō'nê, *It. pron.* chē'châ-rō'-nâ (It., from *Cicero*, on account of his learning or eloquence). A guide, usually for the purpose of showing strangers the curiosities and works of art in a town. Ciceroni are of all degrees, from distinguished archæologists, who undertake the office as a favor, to the humble *guide-interprête.*

CICHORIUM, sĭ-kō'rĭ-ŭm. See CHICORY.

CICINDELIDÆ, sĭs'ĭn-dĕl'ĭ-dē. See TIGER BEETLES.

CICISBEO, chē'chês-bā'ô (It., whence Fr. *cicisbée, sigisbée*, probably from Fr. *chic*, Sp. *chico*, small + *beau*, It. *bello*, beautiful; i.e., a minor gallant). A name given in Italy to the professed gallant or constant attendant upon a married lady. In the higher ranks of Italian society it was at one time considered unfashionable for the husband to associate with his wife anywhere save in his own house. In society or at public places of amusement the wife was accompanied by her cicisbeo, who attended at her toilet to receive her commands for the day. This custom, which was once universal and which naturally gave rise to much scandal, has now almost disappeared. Cicisbeo is synonymous with *cavalière servente.* See Byron's poem *Beppo.*

CICOGNARA, chē'kô-nyä'rä, LEOPOLDO, COUNT (1767–1834). An Italian archæologist, art historian, and painter. He was born in Ferrara, studied in Modena under Vestri and in Rome under Cannucini, and became successively Ambassador of the Cisalpine Republic to Turin and a Councilor of State. In 1808 he left the government service and became president of the Academy of Fine Arts in Venice. He traveled extensively and made valuable collections of art objects and works on art history. His chief publication is the *Storia della scultura dal suo risorgimento in Italia sino al secolo di Napoleone* (3 vols., 1813–18; 2d ed., 7 vols., 1824), a critical study of remarkable completeness and accuracy, which obtained for him a European reputation. Consult: Becchi, *Elogio di Leopoldo Cicognara* (1834); Zanetti, *Cenni biografici di Leopoldo Cicognara* (Venice, 1834); and Callari, *Storia dell' arte contemporanea italiana* (1909).

CICONI, chē-kō'nê, TEOBALDO (1824–63). An Italian dramatist, born in San Daniele (Friuli). He studied in Padua, and in 1848 participated in the insurrection in Tuscany, Venice, and Rome. His comedy *Le pecorelle smarrite* (1857) was his first important popular success. Other dramatic works, such as *Le mosche bianche* and *La rivincita*, confirmed his reputation. He was a clever journalist and wrote lyrics with some success.

CID, THE, or CID CAMPEADOR, *Sp. pron.* thĕD käm'pâ-â-dōr' (Sp., Lord Conqueror). The name given in histories, traditions, and songs to the most celebrated of Spain's national heroes. There is so much of the mythical in the history of this personage that hypercritical writers, such as Masdeu, have doubted his existence; but recent researches, more particularly those of Dozy, and the investigation of newly discovered Arabic sources, have succeeded in separating the historical from the romantic. The following is the result of these inquiries: Rodrigo or Ruy Diaz (Roderic the son of Diego), generally known as Ruy Diaz de Bivar, was descended from one of the proudest families of Castile. His name first appears in a document written in 1064, during the reign of Ferdinand the Great of León. Under Sancho II, son of Ferdinand, he became standard bearer and commander of the royal troops. In a war between the two brothers, Sancho II and Alfonso VI of León, it was a stratagem of Roderic's—which, according to modern notions, was anything but honorable—that secured the victory of Sancho at Llantada over his brother, who was forced to seek refuge with the Moorish King of Toledo (1071). He appears at this time to have already been called the *Campeador*, a word supposed to answer to our "champion."

Upon the assassination of his friend and patron, King Sancho, he required the next heir, Alfonso, to clear himself by oath of any participation in his brother's murder ere the nobles of León and Castile should do homage to him. By this act he incurred the new monarch's enmity; an enmity which, however, the politic King concealed in the hour of danger, even consenting to Roderic's marriage with his cousin Ximena, daughter of Diego, Count of Oviedo. But when the King thought the services of Roderic no longer necessary to his own safety, he lent a willing ear to the latter's personal enemies, and banished him in 1081. Roderic then joined the Moorish King of Saragossa, in whose service he fought against both Moslems and Christians. He frequently defeated the King of Aragón and the Count of Barcelona, the latter of whom, Berenguer Ramón II, he took prisoner.

He was again reconciled to the King, but only for a short time, when he was condemned to a

second exile. In order to support his family and numerous followers, he now saw himself forced to carry his sword against the Moors, over whom he gained a victory, and established himself as sovereign or lord of Valencia (1094). He retained possession of Valencia five years, during which time he took many neighboring fortresses. The Cid, with only his own lance and his small band of faithful followers, had made better headway in the reconquest of Spain from the Moors than had Alfonso with the powerful Kingdom of Castile to support him; and not only Spain, but the rest of Christendom knew it. The doughty warrior died of grief in 1099, on learning that his relative and comrade in arms, Alvar Fañez, had been vanquished by the Moors, and that the army which he had sent to his assistance had been defeated near Alcira. After the Cid's death his widow held Valencia till 1102. When at last she was obliged to capitulate to the Almoravides, and flee to Castile, where she died in 1104, she set fire to the city, and took with her the embalmed body of the Cid, mounted on his war horse Babieca. So ran a legend that gained currency some time after the event. As a matter of fact, Ximena, after holding the city for nearly three years, was obliged to call upon her cousin the Emperor for aid. He went with a strong army, but having no man able to hold the city, he set fire to it, took Ximena with him, and carried away the remains of the Cid, surrounded by his former vassals as a guard of honor. Ximena's remains were placed by those of her lord in the monastery of San Pedro de Cardeña, near Burgos. We have no historical evidence in support of the Santiago Genealogía and Crónicas which state that the Cid had a son, who was slain by the Moors in a battle near Consuegra in 1081. But he did leave behind him two daughters, one of whom was married to the Count of Barcelona, the other to the Infante of Navarre, through whom the kings of Spain claim kindred with *"Mio Cid el Campeador,"* as do also the British royal family (through Eleanor of Castile), and the French Bourbons and the Hapsburgers. Relics of the "Blessed Cid," as he is still called in Spain, such as his sword, shield, banner, and drinking cup, are still held in great reverence by the populace.

About 1140, hence only about 40 years after the Cid's death, a poem was composed in his honor, the *Poema del Cid*, also called the *Cantar de Mio Cid*. This is the oldest of the great Spanish epics that has reached us practically complete. It has survived in a single manuscript, which is incomplete at the beginning; but from other sources we know practically what the missing part contained and about how long it was. As we have it the *Poema* amounts to 3735 verses, which compares favorably in length with the 4001 verses of the *Chanson de Roland*. It has a unity of composition and spirit which makes it evident that the poem is not a pastiche of many smaller poems more or less dexterously woven into one, but that it is one great composition, carefully thought out and planned so that the various parts balance properly. It represents the Cid as immutably faithful to an unjust sovereign. It has been thought by some that the character of the Cid of the *Poema* is largely antihistorical. This is true only in part. And yet the unknown poet who gave us this masterpiece was dexterous enough to create a type of character which, although in some respects antihistorical, none the less so thoroughly harmonizes with the spirit of the nation that the type which he created, and not the rigidly historical type, has become the universally accepted type for the Spanish national hero. Most epic poems contain a vast amount of the supernatural or the marvelous. The only supernatural incident in the *Poema* is the consoling dream in which the angel Gabriel appears and promises success the night before the Cid leaves Christian territory and enters the land of the enemy; and the incident is related in eight verses. And the marvelous is entirely absent from the account of the deeds of valor of the various knights in the Cid's band. English readers are fortunate in possessing more than one English rendering. John Hookam Frere, sometime British Minister to Spain, made a verse translation of six passages, prefacing each one with a brief synopsis of what leads up to the selection. Later John Ormsby made a condensed translation in prose of the less poetic passages, and a ringing verse translation of all the others. In 1901 Archer Milton Huntington published a complete line for line translation, the merits of which vary in accord with the merits of the original. The numerous Cid romances that were first published in the sixteenth century contain the most romantic improbabilities concerning the life and deeds of the Cid. Consult *Silva de varios romances* (1550) and *Romancero general* (1604). These romances were taken from the ancient *cantares* (national songs) and *poemas*, most of which are entirely lost.

The most important of modern works on this subject are: Dozy, *Recherches sur l'histoire politique et littéraire de l'Espagne pendant le moyen âge* (3d ed., Leyden, 1881); Huber, *Geschichte des Cid*, etc. (Bremen, 1829); Southey, *Chronicle of the Cid* (London, 1808); Willemaers, *Le Cid* (Brussels, 1873); Milá y Fontanals, *De la poesía heróico-popular castellana* (Barcelona, 1874); Menéndez Pidal, *Cantar de Mio Cid: texto, gramática y vocabulario* (3 vols., Madrid, 1908–11); Huntington, *Poem of the Cid* (text, translation, and notes, 3 vols., New York, 1897–1903; popular edition with same contents except for illustrations, 3 vols., New York, 1909); Fitzmaurice-Kelly, *Chapters on Spanish Literature* (London, 1908); B. P. Bourland, *El Cantar de Rodrigo* (in *Revue Hispanique*, 1911, vol. xxiv, pp. 310–357); *El Cantar de Rodrigo* (facsimile reproduction of the MS. in the Bibliothèque Nationale, edited by Archer M. Huntington, New York, 1904); Menéndez Pidal, *L'Epopée castillane à travers la littérature espagnole* (Paris, 1910); Menéndez Pidal, *El Romancero español* (The Hispanic Society of America, 1910); H. Butler Clarke, *The Cid Campeador, and the Waning of the Crescent in the West* (London, 1902); and for the translations, other than Huntington's, mentioned above, John Hookham Frere, *Works* (2d ed., London, 1874), and John Ormsby, *The Poem of the Cid* (London, 1879).

CID, Le. A famous tragedy by Pierre Corneille (q.v.).

CID, Le. An opera by Massenet (q.v.), first produced in Paris, Nov. 30, 1885; in the United States, Feb. 12, 1897 (New York).

CID'ARIS. A genus of sea urchins (q.v.).

CI'DER (from OF. *cidre*, from Lat. *sicera*, from Gk. *σίκερα*, *sikera*, from Heb. *shēkār*, strong drink, from *shākar*, to be intoxicated). The sweet or fermented juice of apples, and some-

times other fruits, as pears (perry cider), oranges, etc., used as a beverage and for making vinegar. The apples are first ground or grated in a mill, and the pulp is then made into a cheese by mixing with straw to hold it in shape, or in some cases is placed in forms made of reed grass. It is then subjected to pressure, and yields a dark-colored sweet liquid. The pomace remaining is sometimes wet and pressed again, yielding an inferior cider. Green or rotten apples should not be used; the former make cider deficient in sugar and turbid from the suspended particles of starch, while rotten fruit is sure to impair the flavor of the cider. Early apples make a much poorer quality of cider than do fall and winter apples, as the latter contain about 2.5 per cent more of sugar. Fresh cider contains 85 to 88 per cent of water, 12 to 15 per cent of total solid matter, consisting mostly of sugar, and a little malic acid, the natural acid of the apple. The "working" or fermentation of cider, by which alcohol is produced, is due to certain kinds of yeasts, which decompose the sugar into alcohol and carbonic acid, the latter passing into the air. In some countries pure cultures of yeasts are, with advantage, now employed for the fermentation. After the first or main fermentation the clear liquid is racked off into clean casks, which are placed in a cool cellar for the second or still fermentation. An acetic fermentation may take place by which acetic acid is produced and the cider becomes "hard," or quite sour, unless properly handled. The fermented cider contains only 2 or 3 per cent of solids (instead of 12 to 15 per cent as in the apple juice) and from 4 to 8 per cent of alcohol. By again racking off the cider, after the second fermentation, and placing it in casks tightly bunged or in closely stoppered bottles, it can be kept for a considerable time without souring.

Cider brandy, or applejack, is a product derived by distillation from fermented cider. It contains very much more alcohol. For cider vinegar, see VINEGAR.

CIÉNEGA, sē-ā'nā-gȧ, *Sp. pron.* thē-. A name used in the Southwest for swamp (q.v.).

CIÉNEGA (lagoon, Sp. form Ciénaga), or SAN JUAN DE LA CIÉNAGA. A town in the Department of Magdalena, Colombia, at the mouth of a lagoon on the northwest coast, 10 miles south of Santa Marta, with which it is connected by rail. Its inhabitants, estimated at 7000, are chiefly engaged in fisheries.

CIENFUEGOS, syĕn-fwā'gōs (Sp., hundred fires), or JAGUA. A city of Cuba, in the Province of Santa Clara, situated on the south coast, about 190 miles southeast of Havana (Map: Cuba, E 4). Cienfuegos has one of the finest harbors in the world, inclosing an area of about 6 square leagues, with a depth of 27 feet at the anchorage. The city's streets are wide and straight, and one of the plazas is considered the finest in the island. Cienfuegos is lighted by gas and electricity, and has a good water supply. Its commerce is largely with the United States, the principal exports being sugar, molasses, cacao, and tobacco. Cienfuegos is connected by rail with Havana and a few other important points. The harbor is supposed to have been visited by Columbus on his first voyage, but the first settlement was made by refugees from Santo Domingo in 1819. During the Spanish-American War the port was blockaded by Admiral Schley, then in search of Cérvera's fleet. Pop., 1899, 30,038; 1907, 30,100; of municipal district in 1907, 70,416.

CIENFUEGOS, NICASIO ÁLVAREZ DE (1764–1809). A Spanish poet and publicist. He was born in Madrid, was educated at Salamanca, and published his first collection of poems in 1798. The editorship of the government journals *El Mercurio* and *La Gaceta* was granted him the same year, and subsequently he obtained an appointment in the Foreign Office. For participation in the popular demonstration against the French at Madrid on May 2, 1808, and an article against Napoleon, he was condemned to death; but on petition of some powerful friends the sentence was changed and he was deported to France, where he died. His dramas are to later taste stilted and ill contrived, on the pseudo-classic French model, and yet he was the most original of the writers who towards the end of the eighteenth century tried to reform the Spanish drama, and it was his *Pitaco* that won him his election to the Royal Academy. His lyric verse, however, is still read. An edition of his *Obras poéticas* appeared at Paris in 1821 (2 vols.). His dramas were collected and issued at Barcelona, 1836. Consult: "Poesías," in *Biblioteca de Autores Españoles*, vol. lxvii; Piñeyro, "Cienfuegos," in *Bulletin Hispanique*, vol. xi (Bordeaux, 1909).

CIESZKOWSKI, tsē'ȧsh-kŏv'skē, AUGUST, COUNT (1814–94). A Polish philosopher and political economist, born at Sucha, Podlachia, and educated at the University of Berlin. He was one of the founders of the *Biblioteka Warszawska*, and in 1848 settled in Posen, whence he was for years sent as a deputy to the Prussian Chamber of Deputies. He was president of the Society of the Friends of Science in Posen, and repeatedly, but vainly, endeavored to bring about the establishment of a university in that city. In 1872 he became a member of the Cracow Academy. In philosophy he was an anti-Hegelian, and wrote against the pantheistic system of that German philosopher, developing his own supernaturalistic theories concerning God, the immortality of the soul, and the divinity of Christ. His works, written in German, French, and Polish, include the following: *Prolegomena zur Historiosophie* (1838); *Gott und Palingenesie* (1842); *De la pairie et de l'aristocratie moderne* (in French, 1844); *Du crédit et de la circulation* (2d ed., 1847); *Ojcze-Nasz* (1848), a philosophical exposition of the Lord's Prayer; *O drogach ducha* (1863 and 1869).

CIEZA, thē-ā'thȧ. A town of Spain, in the Province of Murcia, situated on the left bank of the Segura, 26 miles northwest of Murcia (Map: Spain, E 3). It lies in a fertile region, amid olive groves, and contains several chapels and hermitages, in addition to the parish church. In its vicinity are the ruins of an old Roman fortress. Pop., 1900, 13,590; 1910, 14,393.

CIEZA DE LEÓN, thē-ā'thȧ dā lā-ōn', PEDRO DE (1518–60). A Spanish soldier and historian, born in Llerena. He accompanied Pizarro, and up to 1552 fought much and traveled widely. He wrote a *Crónica del Perú* (in four parts), a valuable authority on the geography and early history of Peru, as well as on Peruvian civilization under the Incas. For this work, imperfectly edited as it is, the Royal Academy included Cieza de León in the official *Catálogo de las autoridades de la lengua*. Parts i and ii of his narrative have been translated

into English by Sir Clements R. Markham for the Hakluyt Society. Cieza wrote two other works: *Libro de las cosas sucedidas en las provincias que confinan con el mar Océano*, and *Historia de la Nueva España*.

CIGAR, CIGARETTE. See TOBACCO.

CIGARETTE BEETLE. A small ptinid beetle (*Lasioderma serricorne*), closely related to the deathwatch, which attacks stored tobacco. It is a great pest in tobacco warehouses in both Europe and America. See TOBACCO PESTS.

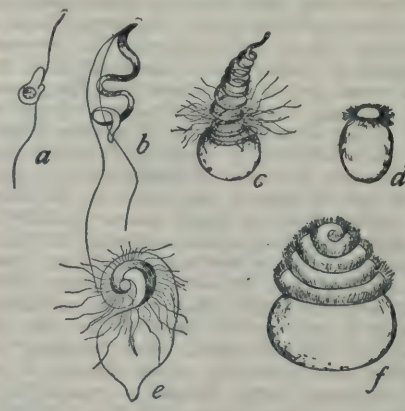
CIGAR FISH. See SCAD.

CIGNANI, chē-nyä'nē, CARLO, COUNT (1628–1719). An Italian painter, born in Bologna. He was the pupil of Francesco Albani, whose influence is visible in such earlier works as the frescoes in the Palazzo Pubblico, Bologna. Later he was influenced by the Carracci, Correggio, and Guido Reni, as may be seen in his frescoes in Rome. His masterpiece is the "Assumption of the Virgin," a fresco in the dome of the cathedral of Forli, on which he worked twenty years; his best oil paintings are "Joseph and Potiphar's Wife" (Dresden), and "Pera and Cimon" (Vienna). Cignani is the most important representative of the later baroque painting in Italy. Consult Frati, *La Familia Cignani* (Rome, 1910), and Riegl, *Die Entstehung der Barockkunst in Rom* (Vienna, 1908).

CIGOLI, chē'gō-lē, LUDOVICO C. DI (1559–1613). A Florentine painter and architect. He was born in Castelvecchio and was a pupil of Allessandro Allori, Buontalenti, and later of Santo di Tito. Cigoli was influenced by the different tendencies which mark a transitional stage of art, and his works vary in style. Good examples of his earlier period are frescoes in the cloisters of Santa Maria Novella, Florence (1581), and the "Martyrdom of St. Stephen" (Florence Academy, 1587). The "Awakening of Lazarus" (1592) and numerous pictures of the life of St. Francis (Museo di San Marco) show much progress, and the "Miracle of St. Anthony" (Cortona, 1597) is entirely free from the traditions of the Mannerists, and in the new baroque style. He was employed by Pope Paul V in various works in Rome and painted for St. Peter's a fresco which is now destroyed and an "Ecce Homo." His best paintings in Rome are "Joseph and Potiphar's Wife" (Borghese Gallery), and the frescoes of "Cupid and Psyche" (Palazzo Rospigliosi, 1613). Cigoli was the originator of baroque (q.v.) painting in Florence. Among his pupils was Christoforo Allori (q.v.). Consult Busse, *Manierismus und Barockstil* (Leipzig, 1912).

CILIA, sĭl'ĭ-ȧ, OF PLANTS (Neo-Lat. nom. pl., from Lat. *cilium*, eyelid). The cilia of plant cells are exceedingly delicate protoplasmic fibrils, whose rapid vibratile movement in the water propels the body. Some of the lowest unicellular algæ (Volvocales, see ALGÆ) are provided with cilia, generally a pair for each cell, throughout the entire vegetative life of the organism. But in the higher algæ and some fungi this motile condition is only present in reproductive cells, as swarm-spores (zoöspores, q.v.), and motile sexual cells (gametes). The ciliated cell is represented in groups above the algæ and fungi (thallophytes) only by the motile sperms, characteristic of the mosses and ferns. It makes its last appearance in the cycads and certain other primitive gymnosperms.

Cilia are developed from cytoplasmic elements in the protoplasm (see CELL), and in some types are known to be formed by a definite protoplasmic body termed a "blepharoplast" (q.v.), which is probably related to the structure generally called a "centrosphere."



CILIA.

a, Sperm of Alga; *b*, sperm of Chara; *c*, sperm of Marsilea; *d*, spore of Œdogonium; *e*, sperm of fern; *f*, sperm of cycad.

CILICIA, sĭ-lĭsh'ĭ-ȧ (Lat., from Gk. Κιλικία, *Kilikia*, Assyr. *Khilakku*). An ancient country occupying the southeastern portion of Asia Minor (Map: Turkey in Asia, E 4). The Taurus Range, which separated it from Cappadocia and Lycaonia, bounded it on the north, the Gulf of Issus and the Cilician Sea on the south, while the Amanus Mountains and Pamphylia bounded it respectively on the east and the west. It was watered by the Pyramus, Sarus, and Calycadnus. The eastern portion of Cilicia was fertile in grain, wine, etc.; while the western and more mountainous portion furnished to the ancients inexhaustible supplies of timber. The passes into Syria are easy of access, but those through the Taurus are very difficult, the easiest being the "Cilician Gates," through which Cyrus the Younger and Alexander the Great entered the country. The chief city was Tarsus.

The early inhabitants of Cilicia appear to have been of Semitic stock. At the time of the rise of the Persian monarchy the country was ruled by a native dynasty bearing a title or name which the Greeks reproduced as Syennesis. These princes became vassals of the Persian kings. In the period of Greek rule in the East Cilicia became the seat of dreaded pirates. When they carried on their depredations too close to the shores of Italy, the Roman arms were turned against them, and they were subdued by Pompeius (67 B.C.), and Cilicia was made a Roman province (64 B.C.), though the mountainous western portion was never thoroughly subjugated.

CILICIAN (sĭ-lĭsh'ȧn) **GATES.** The ancient name of a pass through the Taurus from Cappadocia to Cilicia. The city of Tyana was situated at the northern foot of the Taurus, at the Cappadocian opening of the pass.

CILLI, tsĭl'lē. The capital of a district in Styria, Austria, picturesquely situated amid hilly scenery on the Sann, 38 miles northeast of Laibach (Map: Austria, D 3). The town is of great antiquity, and with the remains of its fortified walls and castle, containing the throne of the counts of Cilli, gabled houses, a Romanesque church, Gothic chapel, and fourteenth-century parish church, retains a mediæval aspect. The municipal museum contains numerous Ro-

man antiquities and relics of the town's early history. It is an increasingly popular summer resort, owing to the warm river baths at Neuhas 10 miles distant. Coal and iron mines, smelting furnaces, chemical works, furniture, leather, and pottery manufactories are among its chief industrial establishments, and there is an extensive trade carried on in coal, iron, zinc, timber, cereals, cattle, leather, and wine. The Roman Colonia Claudia Celeja, mentioned by Pliny the Elder, was taken by the Emperor Claudius 15 B.C. and subsequently formed part of Aquileia. It was the capital of the Slavonian District of Zellia from 1146 to 1331, and from 1339 to 1456 of the County of Cilli. Pop., 1890, 6264; 1900, 6743.

CIMA, chē'mȧ, GIOVANNI BATTISTA, called DA CONEGLIANO (c.1459–1517). A Venetian painter of the Renaissance. He was born in Conegliano and probably studied with Alvise Vivarini, or, according to others, with Giovanni Bellini, who undoubtedly influenced his earlier works. Many of these represent the "Madonna with Saints," good examples of which are in the Museo Civico, Vicenza, the Brera, Milan, the cathedral at Conegliano, and the galleries of Bologna, Venice, Vienna, Munich, and Berlin. "The Healing of Ananias" (Berlin Museum, 1499), "Annunciation" (Hermitage, St. Petersburg), "David and Jonathan" (National Gallery) are also deserving of mention. But Cima's best work corresponds to the great change of style in Venetian painting, induced especially by Giorgione. To this period belong "The Baptist with Four Saints" (Santa Maria dell' Orte, Venice); "Adoration of the Shepherds" (Santa Maria del Carmine, ib.); "Tobias with the Angels" (Venice Academy); "Madonna" (Louvre); and his masterpiece "The Glorification of St. Peter, Martyr" (Brera, Milan). He is represented in the Metropolitan Museum, New York, by "Saints Anthony, Roche, and Lucy." Cima was a conservative, whose art marks the close of an era rather than transition. But while preserving his own individuality he sought to adopt the ideas of the younger generation. His pictures are naïve, fresh, joyous, and free from affectation. Consult: Berenson, *Venetian Painters of the Renaissance* (New York, 1894); the biographies by Botteon e Aliprandi (Conegliano, 1893) and Burckhardt (Leipzig, 1905); Richter, *The Mond Collection* (London, 1910).

CIMABUE, chē'mȧ-bōō'ȧ, GIOVANNI, properly Cenni di Pepo (?–c.1302). A Florentine painter and mosaicist, the greatest of his day, and the first to break the Byzantine tradition. The traditional account of his life, based upon the narrative of Vasari, has been critically analyzed by modern authorities with reference to the sources from which it was drawn, and has proved almost entirely untrustworthy. The name Cimabue is not that of a noble Florentine family (as Vasari thought), but a nickname meaning "bull's head." The only reliable data of his life are gleaned from contemporary documents. It is of course probable that he was born and spent the greater part of his life in Florence, and that he studied there with native or imported masters of the Byzantine school. He was certainly active in Rome where he attested a document in 1272. In Pisan documents he is recorded as chief master of the mosaics of the apse of the cathedral in 1301–02, and as having painted an altarpiece of the Madonnas for Santa Chiara, Pisa. In 1302 he is likewise mentioned in Florentine documents as being a member of a guild in Pisa, and it is probable that he died soon after this. The painting by which he was most widely known was the "Madonna" which, according to Vasari, Charles of Anjou visited in state, and which was carried in triumphal procession to its place in the Rucellai Chapel, Santa Maria Novella, Florence. But recent criticism has shown that this painting is not Florentine but Sienese in manner and was probably the work of Duccio (q.v.), who we know painted a Madonna for Santa Maria Novella in 1485. The well-known Madonna in Paris is probably an atelier piece, and the example in London is not by him, but a Sienese painting of the early fourteenth century. His only work authenticated by documentary evidence is the mosaic figure of St. John in the apse of the Pisa Cathedral; but there are several paintings which authorities are agreed in assigning to him. They are: "The Madonna of Santa Trinità," now in the Academy of Florence; the "Crucifix of Santa Croce"; the frescoes in St. Francis of Assisi. In the decoration of this important church, whose frescoes are a museum of the painting of the later thirteenth and early fourteenth centuries, he took a very important part. He was possibly in charge of the decorations of the Upper Church, in which he painted the frescoes in the choir—five scenes from the life of the Virgin, others depicting St. Michael and the scenes from the Apocalypse, and the Crucifixion—the gallery of the left transept, and the four evangelists in the vaulting where the nave and transept cross. The other decorations of the left transept are either early paintings of Cimabue, or more probably the work of an assistant. He also painted an admirable "Madonna with Angels and St. Francis" in the Lower Church of Assisi. All these frescoes show the influence of the Roman school; they are also by far his best and most important productions.

From the above paintings, as well as from the celebrated contemporary passage of Dante (Purgatorio, xi, 94–96), and the testimony of subsequent Florentine authorities, it is certain that Cimabue was the most important painter of Florence, and the undisputed head of the school before Giotto. His art is a culmination of the tendencies which had been leavening Italian painting since the middle of the thirteenth century, rather than an innovation. Though thoroughly mediæval in their solemn majesty and hieratic splendor, his figures show incipient life and movement. They bear greater resemblance to actuality and are far more expressive than those of his predecessors. Aubert, *Die malerische dekoration der San Francesco Kirche in Assisi* (Leipzig, 1907); Venturi, *La basilica di Assisi* (Rome, 1908); Frey's notes to his edition of Vasari (Munich, 1911).

CIMAROSA, chē'mȧ-rō'zȧ, DOMENICO (1749–1801). An Italian composer of operas, born as the son of a poor mason, at Aversa, near Naples. He studied music at the Conservatory of Santa Maria di Loreto, under Manna, Sacchini, Fenaroli, and Piccinni. His first opera, *Le stravaganze del conte* (1772), achieved fair

success, and in two years he had a reputation in all the leading theatres of Italy, having composed half a dozen operas, and surpassing in popularity all composers then living, Paisiello and Mozart among them. In 1779 his *L'Italiana in Londra* was given in Rome, and other operas followed in rapid succession. He accepted a call to go to St. Petersburg as composer, and conductor of the Italian opera, but the severe climate compelled him to leave this lucrative post after three years (1789–92). Vienna received him with distinguished honors, and *Il matrimonio segreto*, produced there, had remarkable success. In Naples it had an unprecedented run of 67 nights in 1793. Of the operas written subsequently, the most famous was *Le astuzie feminili* (1794). In 1799 he joined a secret revolutionary society in Naples; the plot was discovered, and Cimarosa was sentenced to death, but this decree was commuted to exile. He died suddenly in Venice, and his friends accused the government of poisoning him. However, an autopsy proved the allegation unfounded. In all, he wrote about 80 operas, of which number *Il matrimonio* has not entirely disappeared from the stage. The greater number are comic operas, which picture the lightheartedness and gayety of life of the last quarter of the eighteenth century. In his serious operas, such as *Gli Orazi e Curiazi* and *Artaserse*, Cimarosa displays some power of characterization, coupled with original orchestral effects, masterly handling of dramatic situations, and tragic force, fully equal to his rich vein of comedy. Besides these operas he also wrote 5 oratorios, 2 requiems, several masses, 10 dramatic cantatas, and numerous smaller vocal pieces. Consult P. Cambiasi, *Notizie sulla vita e sulle opere di Domenico Cimarosa* (Milan, 1901).

CIM'BRI. An ancient tribe of warriors, who, with the Teutones, were the first Germans that forced their way into Roman territory. We hear of them first in 113 B.C., when they moved south through the German forests, joined with other northern tribes, and wandered through Noricum and Illyricum. The Romans sent against them the consul Papirius Carbo, but he met with a signal defeat at Noreia (113 B.C.), and the road to Italy was left open to the enemy. Fortunately for Rome, the Cimbri chose to migrate to the Rhine, which they crossed, and proceeded southward to Gaul. By 109 they were again on the Roman boundaries, and Junius Silanus, who was sent against them, also suffered a defeat. His successors were no more fortunate; at Arausio (Orange), in 105, the Romans lost 80,000 troops. The news of this disaster created a panic in Rome. The constitution was disregarded, and Marius, the successful general in Africa, was made consul for five years, in the hope that he might crush the "Gallic" invaders. While he was gathering great forces, the hordes of Cimbri and Teutones poured into northern Italy. The skillful generalship of Marius now put an end to their depredations. The Teutones were crushed at Aquæ Sextiæ (Aix) in Transalpine Gaul (102 B.C.), and in the following year a fearful battle was fought with the Cimbri in the Campi Raudii, near Vercellæ (Vercelli), and the entire nomad race was annihilated. The men were killed or captured, and the women slew themselves and their children (101 B.C.). The name Cimbric Chersonese was given by the ancients to the peninsula of Jutland, which they regarded as the original home of the Cimbri.

CIMICIDÆ, sĭ-mĭs'ĭ-dē (Neo-Lat. nom. pl., from Lat. *cimex*, bug). The family of bugs represented by the bedbugs (genus *Cimex*). See BEDBUG.

CIMICIFUGA, sĭ'mĭ-sĭf'û-gȧ (Neo-Lat., from Lat. *cimex*, bug + *fugare*, to rout, from *fugere*, to flee), or BUGBANE. An herb of the family Ranunculaceæ. Black snakeroot or black cohosh (*Cimicifuga racemosa*) is found in all the northern United States, and is much used in rural districts as a medicine, chiefly in the form of a decoction. It contains a crystalline principle, two resins and tannin, and has strong alterative and sedative properties. It is sometimes used in cases of dyspepsia, bronchitis, amenorrhœa, and certain other diseases. The medicinal dose of the officinal extract of cimicifuga is from one to five grains. See Plate of BLOODROOT, under SANGUINARIA.

CIMME'RIANS (Gk. Κιμμέριοι, *Kimmerioi*). 1. In Homer, a mythical people, living in the Far West, on the shores of the ocean, where the sun never shines and perpetual darkness reigns. 2. An historical people, whose country lay along the northern shore of the Black Sea, including the Tauric Chersonese. These latter at an early period made inroads into Asia Minor and laid waste the country. There were presumably several such incursions, but the accounts are confused. It was probably in the seventh century B.C. that they were driven from their homes by the Scythians and overran Asia Minor. They on this occasion plundered Sardis and destroyed Magnesia, but failed in an attempt on Ephesus, and were finally driven back by Alyattes of Lydia. See CALLINUS.

CIMOLITE, sĭm'ô-līt. See FULLER'S EARTH.

CIMON, sī'mŏn (Lat., from Gk. Κίμων, *Kimōn*) (c.500–449 B.C.). An Athenian commander, the son of Miltiades, the conqueror at Marathon. His first achievement was the paying of the fine imposed on his father for his proceedings at Paros. In conjunction with Aristides he was placed over the Athenian contingent to the allied fleet, which, under the supreme command of the Spartan Pausanias, continued the war against the Persians (477 B.C.). He effected the important conquest of Eïon, a town on the river Strymon, then garrisoned by the Persians. Later (c.466 B.C.), he encountered a Persian fleet of 350 ships at the river Eurymedon, destroyed or captured 200, and defeated the land forces on the same day. He drove the Persians from Thrace, Caria, and Lycia, and expended much of the money which he had obtained by the recovery of his patrimony in Thrace upon the improvement of Athens. At this period he appears to have been the most influential of the Athenians. The hereditary enemy of Persia, he made it his policy to advocate a close alliance with Sparta; and when the Helots revolted, he led an army upon two occasions to the support of the Spartan troops; but on the second occasion, having lost the confidence of his allies, he was ignominiously dismissed. After his return to Athens his policy was opposed by the democracy, headed by Pericles, who procured his banishment by ostracism (c.461 B.C.). He was presently recalled and was instrumental in obtaining a five years' armistice between the Spartans and the Athenians (c.450). He died in the year 449 B.C., while besieging the Persian garrison of Citium in Cyprus. For a translation of his life by Plutarch, consult Perrin, *Plutarch's Cimon and Pericles* (New York, 1910).

CINCHONA, sĭn-kō'nȧ (Neo-Lat., prop. *Chin-*

Copyright by F. L. Seely.

1. CINCHONA TREES. 2. TAKING BARK FROM YOUNG TREE STEMS.

chona, from the Countess del Chinchón, wife of the Viceroy of Peru). An important genus of trees of the family Rubiaceæ. They yield the bark, so much valued in medicine, known as Peruvian bark, Jesuits' bark, china bark, quina, quinquina, cinchona bark, etc., from which the important alkaloids quinia or quinine and cinchonia or cinchonine are obtained. The properties of the alkaloids are astringent, tonic, antiperiodic, and febrifugal. The species of this genus are sometimes trees of considerable size; but, an aftergrowth springing from their roots when they have been felled, they often appear only as large shrubs, and some of them in the highest mountain regions in which they are found are low trees with stems only 8 or 10 feet in height. They exist naturally only in South America, between latitudes 20° S. and 10° N., and chiefly on the eastern slope of the second range of the Cordilleras. All the cinchonas, of which there are about 50 species, are evergreen trees, with laurel-like, entire, opposite leaves, stipules which soon fall off, and panicles of flowers which, in general appearance, are not unlike those of lilac or privet. The flowers are white, rose colored, or purplish, and very fragrant. The calyx is small and five toothed; the corolla tubular with a salver-shaped five-cleft limb. In the true *cinchona* the capsule splits from the base upward.

Great difficulty has been found in determining the species by which the different varieties of cinchona bark known in commerce are produced. The common commercial names are derived partly from the color of the barks, and partly from the districts in which they are produced, or the ports where they are shipped. It appears that calisaya bark, also called "royal" or "yellow" bark, one of the very best kinds—mostly shipped from Arica, Chile—is chiefly the produce of *Cinchona calisaya*, a large tree growing in hot mountain valleys of Bolivia and the south of Peru. Other kinds met with in the trade are crown, loxa, or pale bark, derived from *Cinchona officinalis* and its varieties; red bark, from *Cinchona succirubra;* Colombia bark, from *Cinchona cordifolia;* and pale bark from *Cinchona nitida* and *Cinchona micrantha*. Yellow bark is also produced by the variety ledgeriana of *Cinchona calisaya*. The varieties of this and *Cinchona succirubra* are the ones most met with in cultivation.

In South America the cutting and peeling of cinchona trees is carried on by Indians, who go in parties and pursue their occupation during the whole of the dry season. The trees were formerly felled as near the root as possible, that none of the bark might be lost. The bark, being stripped off, is carefully dried; the quilled form of the thinner bark is acquired in drying. The bark is made up into packages of various sizes, but averaging about 150 pounds weight, closely wrapped in woolen cloth, and afterwards in hides, to be conveyed on mules' backs to the towns. These packages are called "drums" or "seroons," and are exported in this form. At present less wasteful methods are employed, and the bark is removed so as not to destroy the trees. Strips of bark are sometimes removed and the wounds covered with moss, thus increasing the total yield.

A number of spurious kinds of Peruvian or cinchona bark are either sent into the market separately, or are employed for adulterating the genuine kinds. They are bitter barks and have, in greater or less degree, febrifugal properties, but are chemically and medicinally very different from true cinchona bark. They are produced by trees of genera very closely allied to *Cinchona*. While cinchona trees have been becoming every year more scarce in their native regions, little attempt has been made to cultivate them there, notwithstanding the constantly increasing demand for the bark; the Dutch have recently made extensive plantations of them in Java, and the same has been done in British India, from seeds and plants obtained from South America by Mr. Clements Markham. Cinchona is also cultivated extensively in Jamaica, Japan, Ceylon, etc. For the cultivation of cinchona a good soil and open subsoil are necessary. It seems to thrive best at a considerable elevation above the sea, where the temperature ranges from 55° to 65° F. It will endure slight frost or a temperature of 100° where shaded. In a wild state, the bark often contains 5 per cent or less of total alkaloids; but in cultivation, where only part of the bark is removed and the denuded area covered and kept moist, the young bark yields a much greater percentage of total alkaloids, a large proportion of which is quinine.

The Indians of Peru call the cinchona trees "kina," whence are derived the names "china," "quina," etc. It is not certain that they knew the use of the bark before the arrival of the Spaniards. It is a medicine of great value in the cure of intermittent fevers, etc., and diseases attended with much febrile debility; also in certain forms of neuralgia, and other diseases of the nervous system. It seems to have been first imported into Europe in 1639 by the Countess del Cinchón or Chinchón, the wife of the Viceroy of Peru, who had been cured of an obstinate intermittent fever by means of it. The Jesuit missionaries afterward carried it to Rome, and distributed it through their several stations, and thus it acquired the name of "Jesuits' bark." Cardinal Juan de Lugo having been particularly active in recommending and distributing it, it was also known as "Cardinal de Lugo's powder." It attained great celebrity in Spain and Italy, being sold at high prices by the Jesuits, by whom it was lauded as an infallible remedy. Its mode of action not being well understood, and the cases to which it was applicable not well defined, it seems, in the first instance, to have been employed without due discrimination, and to have fallen very much into the hands of empirics. Falling into disuse in Europe, it was again brought into notice by Sir Robert Talbor, or Talbot, an Englishman, who brought it to England in 1671 and acquired great celebrity through the cure of intermittent fevers by means of it, and from whom Louis XIV purchased his secret in 1682. A pound of bark at that time cost 100 louis d'or. Talbor seems to have had the acuteness to discern and systematically to avail himself of the healing virtues of the neglected Jesuits' bark, which he mixed with other substances, so as to conceal its taste and odor. Soon afterward, both Morton and Sydenham, the most celebrated English physicians of their time, adopted the new remedy; and its use, from this period, gradually extended, both in England and France. As it came into general use, it became a most important article of export from Peru; but for a long time the value of the bark to be procured in New Granada (now Colombia) remained unknown, and in order to maintain a commercial

monopoly, extraordinary methods were employed to prevent it from becoming known at a comparatively recent period of Spanish rule in America. The discovery of the alkaloids on which its properties chiefly depend was made early in the nineteenth century.

The chief active principles are the alkaloids, quinine, cinchonine (qq.v.), quinidine, cinchonidine, and quinamine. The relative proportion of the different alkaloids varies widely with the kind of bark and its age when taken from the tree. Some species produce a large amount of quinine and little of other alkaloids, and vice versa. Cinchona bark itself has in later times fallen into comparative disuse, owing to the discovery of the alkaloid quinine, which is now extensively in use in medicine in the form of sulphate or disulphate of quinine, and is given in doses of from 1 to 20 grains in almost all the cases to which the bark was supposed to be applicable. For notes on the production, cultivation, etc., of cinchona, consult: Mueller, *Extra-Tropical Plants* (Melbourne, 1895); Markham, *Peruvian Bark* (London, 1880); King, *Manual of Cinchona Cultivation in India* (Calcutta, 1876); Lambert, *Description of the Genus Cinchona* (London, 1897); Kuntze, *Chinchona; Monographische Studie* (Leipzig, 1878).

CINCHONIDINE, sĭn-kōn'ĭ-dĭn. See CINCHONINE.

CINCHONINE, sĭn'kō-nĭn (from Neo-Lat. *cinchona*), $C_{19}H_{22}N_2O$. An alkaloid occurring in cinchona bark along with quinine, and having much the same, though by far less powerful, physiological effects as quinine. It is a white crystalline substance, having neither odor nor taste, but leaving a bitter aftertaste in the mouth. It is insoluble in water, and but sparingly soluble in alcohol, ether, or chloroform. It melts at 264.3° C. (507.7° F.). The sulphate of cinchonine, $(C_{19}H_{22}N_2O)_2H_2SO_4 + 2H_2O$, is a crystalline substance with a strong bitter taste, and is moderately soluble in water, alcohol, and chloroform.

The alkaloid cinchonidine, occurring together with cinchonine, has the same chemical composition as the latter, though a much more pronounced physiological effect. It differs from cinchonine in certain of its physical properties, and its sulphate, $(C_{19}H_{22}N_2O)_2H_2SO_4 + 3H_2O$, is much less soluble in alcohol and practically insoluble in chloroform. See ALKALOIDS.

CINCINNATI, sĭn'sĭn-nă'tĭ. The county seat of Hamilton Co., Ohio; in 1910 the second city in the State, and thirteenth in the United States in population, on the right bank of the Ohio River, in lat. 39° 6′ 30″ N. and long. 84° 30′ W. (Map: Ohio, A 7). It lies 116 miles southwest of Columbus, 270 miles southeast of Chicago, 752 miles from New York, and 830 miles by rail from New Orleans, and is the nearest large city to the centre of population.

The city is built upon two plateaus, surrounded by a semicircle of hills which approach the river above and below the inclosed plain, the ends of the semicircle being only 2½ miles apart. The Ohio River, which here forms a grand curve from east to west, is at low-water mark 431.29 feet above sea level. The first plateau varies from about 65 to 120 feet above low water; a more abrupt rise to the hills at the east, north, and west produces an elevation at the second plateau of about 420 feet above low water, which at the highest point reaches 957 feet above sea level. The summits of the hills—Mount Adams, Mount Auburn, Fairview Heights, Price Hill, and College Hill—accessible by roads and by inclined-plane railways, command superb views of the river, of the Kentucky shore, and the rolling country surrounding the city. Pierced by ravines, these thickly wooded highlands give a picturesque aspect to the city and are covered with the beautiful residences of wealthy citizens, the Clifton, Avondale, Rose Hill, Vernonville, and East Walnut Hills districts being especially noteworthy for their scenic beauty and magnificent homes. The climate is equable. The average temperature in summer is 75.63°; in fall, 56.87°; in winter, 34.37°; in spring, 54.07°; the yearly mean being 55.23°.

Cincinnati covers an area of 70 square miles and has a river frontage extending nearly 22 miles. Brick and the freestone found near at hand, and the blue limestone quarried within the city limits, are largely used for building material. The streets and avenues, averaging 66 feet in width, cross each other at right angles in the old portion of the city and conform to the surface conditions in the new. A public landing or levee extends along Front Street, the sloping shore being paved and lined with floating docks and wharf boats. As three terraces constituting the ascent rise one above another from the river level, the streets become more irregular, and the buildings with extensive grounds spread out. The lowest, or "bottom," streets, sometimes inundated by unusual floods of the Ohio River, are mainly devoted to the manufacturing and the wholesale trades; they also contain the few remaining slum quarters. The central and business portion of the city, with numerous fine stores, is compactly built, and almost the whole plain is filled up; numerous former villages have been absorbed by the extending city. There are more than 50 street-railway lines, all of which converge at or near Fountain Square (mentioned below) as a common starting and terminal point. The city has 608 miles of paved and 350 miles of unpaved streets, 321 miles being of macadam, 41 miles of cobblestones, 182 miles of granite, brick, and wood blocks, and 42 miles of asphalt. There are 497 miles of sewers, and the street railways aggregate 226 miles.

Beautiful suburban villages cluster about Cincinnati and are rendered easily accessible by the street and interurban railroads. Covington, Newport, Dayton, Ludlow, Bellevue, Norwood, Latonia (with its well-known race course), Glendale, Wyoming, Milford, Terrace Park, and Fort Mitchell are some of these near-by towns. Norwood and St. Bernard (qq.v.) are entirely surrounded by the larger city. Fort Thomas, a picturesque hill station above Newport, Ky., and one of the most important posts of the United States army, is 40 minutes distant by electric car. The large wire suspension bridge across the Ohio, completed in 1867 at a cost of $1,800,000 and reconstructed in 1895–98 at a cost of $500,000, connects with Covington, Ky. It is 2763 feet long, has a span of 1057 feet, and is 106 feet above low-water mark. Two bridges of wrought iron, resting upon stone piers, connect Cincinnati with Newport, Ky. A fourth bridge, uniting the city with Ludlow, Ky., is that of the Cincinnati Southern Railroad. It cost $3,348,675 and has one of the longest truss spans in the world. A new bridge for this railway is projected. A fifth bridge, the Chesapeake and Ohio, connecting Cincinnati with West Covington, is a cantilever.

Buildings. Among the fine and substantial edifices is the United States Government Building, which contains the post office, customhouse, court rooms, and various offices, erected at a cost of $5,000,000. It is of sawed freestone, three stories high, in the Roman-Corinthian style. The City Hall is equally fine. The county courthouse, with the jail, occupies a whole square; it is built in the Romanesque style. A two million and a half bond issue for a new courthouse to occupy two squares has been authorized by a vote of the people.

The old City Hospital, consisting of eight distinct buildings arranged around a central court, occupies a square of nearly four acres and accommodates 700 patients. The new City Hospital, completed in 1914 at a cost of $4,000,000, and considered to be the largest and most complete municipal hospital in the country, is built upon the ward unit plan and comprises 24 buildings with accommodation for 850 patients. It is located on the suburban hills, occupying a tract of 27 acres. There are also new tuberculosis and contagious hospitals located in open territory. The Chamber of Commerce is located in the new 34-story skyscraper, the tallest in the world outside of New York. The City Workhouse has cells for 700 prisoners, with workshops and grounds for their employment. The new House of Refuge, with separate farms for boys and girls, on the community-cottage plan, located 12 miles from the city, accommodates 225. Longview Asylum for the Insane, at Carthage, 10 miles from the city, is of brick, in the Italian Renaissance style. St. Peter's Roman Catholic Cathedral is an immense structure, in the Grecian style, with a stone spire 224 feet high. The altarpiece is Murillo's original "St. Peter Delivered." St. Paul's Methodist Episcopal Church, the First and Second Presbyterian churches, St. Paul's Protestant Episcopal Pro-Cathedral, the Jewish Synagogue, and St. Frances de Sales Catholic Church on Walnut Hills are all worthy of note. A beautiful structure of classic design is the new Memorial Hall. The numerous newly erected skyscrapers give the city a very striking skyline, while several fine bank buildings are of the highest order of architecture. Cincinnati is the seat of a Roman Catholic archbishop and of a Protestant Episcopal bishop and contains over 300 churches.

Parks. The fine parks, well wooded and picturesque, cover an area of more than 2000 acres. In 1907 a comprehensive plan for a general park, playground, and boulevard system was prepared by George E. Kessler, and since that date over 1500 acres have been added to the parks by purchase and gift, so that the system represents to-day an original investment of $5,000,000 in addition to large donations. The famous Eden Park, or "Garden of Eden," on Mount Adams, has 209 acres inclosed and contains the Art Museum and Art School. The Elsinore Gateway is a striking mediæval reproduction; and from the lofty water tower, a prominent object, the finest view of the surrounding country is obtained. The chief reservoir of the city's water works in the park is a fine, ornamental sheet of water. Burnet Woods, another delightful park, embraces 165 acres. Among the larger of the recent additions are Ault Park (172 acres), Blackly Farm (114 acres), Bloody Run Parkway (84 acres), Mount Airy Forest (800 acres), Mount Echo (51 acres), Mount Storm (67 acres), and Parker's Woods (32 acres), many of them heavily wooded and very hilly. The entire park system is to be connected by parkways and boulevards. The Zoölogical Garden, containing 60 acres of hills, valleys, and ravines, is well stocked with wild animals of all kinds. There are 26 cemeteries; Spring Grove, the best known, has 600 acres of land, lies 6 miles from Fountain Square, and is approached by an avenue 100 feet wide. Among its costly monuments are many private mausoleums, and a bronze statue commemorating the soldiers who died in the Civil War. The most noted piece of ornamentation in the city is the Tyler-Davidson Fountain, on the esplanade of Fountain Square, Fifth Street. It was cast at the Royal Foundry in Munich and cost $200,000. The Garfield statue, at Eighth and Race streets, and the equestrian statue of Gen. W. H. Harrison, first Governor of Ohio, at Eighth and Vine streets, are works of great merit.

Institutions. The educational advantages of the city are unsurpassed. There are four high schools—Hughes, Woodward, Walnut Hills, and Madisonville—and over 60 grammar and intermediate schools. The higher institutions include the municipally owned University of Cincinnati, an outgrowth of McMicken University, with collegiate buildings in Burnet Woods Park and an astronomical department with an observatory at Mount Lookout; Hebrew Union College; St. Joseph's College, and St. Xavier's (Jesuit); the Lane Theological Seminary, at Walnut Hills; the Franklin and University schools; several medical, musical, and commercial colleges; and colleges of law, pharmacy, and dentistry.

The Ohio Mechanic's Institute, housed in a fine new building containing also the Emery Auditorium, is a strong factor in the education of the masses. It has many pupils who attend the day and night classes, where they are instructed in literature, science, manual training, and mathematics. The Art Museum and Art School in Eden Park, founded by the women of Cincinnati, has three large buildings modeled after the South Kensington Museum of England. The museum contains a fine collection of paintings, statues, and works of art; and the school is attended by hundreds of students. There are many libraries, including the Young Men's Mercantile, the Law, the Historical, the Mechanic's, and the Public Library. The last is situated in a commodious building on Vine Street, is well equipped, containing over 300,000 works, with numerous reading and circulating branches in outlying districts. The Cuvier Club and the Museum of the Natural History Society, on lower Broadway, have fine collections which are open to the public. The latter is rich in relics of aboriginal mound dwellers, discovered in the vicinity and especially at Madisonville.

Besides the public charities already mentioned, there are numerous benevolent institutions, embracing almost every conceivable need and supported by private munificence.

Hotels, Theatres, and Pleasure Resorts. The chief hotels are the Sinton, Gibson (entirely rebuilt in 1914), Havlin, Metropole, Lackman, Savoy, Alms, Grand, Burnet House, Emery (with a fine commercial arcade), Palace, Honing, and Dennison. There are several good clubs; the Country Club House, with its well-laid-out grounds, is an elaborate suburban establishment of world-wide fame. Among the social clubs are the Queen City, University, Business Men's, and Phœnix. The Literary Club, dating from 1849, is the oldest club of the character in the coun-

try. Among the buildings devoted to amusement the splendid Music Hall, founded and mainly endowed by Reuben Springer, is justly celebrated. It is used also as an exposition building. It is 300 by 500 feet, will seat 5400 persons, and has one of the largest organs in the United States. The Grand Opera House, Lyric Theatre, Emery Auditorium, Walnut Street Theatre, Keith's Theatre, Greenwood Hall, Houck's Opera House, and Olympic Theatre are also noteworthy structures. Owing to the large number of German residents, the city has become noted for its musical societies, while it is also taking rank as a literary and art centre. The biennial musical festivals are distinctive features of its art life. A permanent symphony orchestra ranks with the best in the country. "Over the Rhine," the designation of that part of the city which lies between the canal and the hills, is inhabited almost exclusively by Germans and is famous for its concert and beer gardens. The elaborately installed summer pleasure resorts include Coney Island, 10 miles up the river, reached by hourly excursion steamers; the Lagoon, on the Kentucky side; and Chester Park, near Spring Grove Cemetery.

Industries and Transportation. The commanding position of Cincinnati permits of admirable commercial relations with the Mississippi and Ohio valleys. The Miami and Erie Canal connects with Lake Erie. The commerce by water has diminished since the advent of railroads, but the damming and deepening of the Ohio River channel is expected to result in a great increase of river traffic. Cincinnati is an important railroad centre. The Central Union Depot is a converging station for the Cleveland, Cincinnati, Chicago, and St. Louis, the Baltimore and Ohio, the Chesapeake and Ohio, the Queen and Crescent, the Louisville and Nashville, and other lines. The Cincinnati, Hamilton, and Dayton, the Pennsylvania, and some minor local railways have separate stations. The Cincinnati Southern, with a length of 338 miles, was built and is owned by the city. It is operated, under lease, by the Queen and Crescent system.

According to the thirteenth census (1910) there were 2184 industrial establishments in the city, employing 72,488 persons and representing a total capital of $150,254,000. The value of the combined output was $194,516,000. Among the leading manufactures are those of men's factory clothing, distilled liquors, malt liquors, foundry and machine-shop products, carriages and wagons, boots and shoes, furniture, tobacco and cigars, soaps and candles. Printing, publishing, and playing cards are also important industries. Slaughtering and pork packing are carried on extensively, the value of the output in 1909 being $19,320,000. The last named was formerly the chief industry, giving the nickname "Porkopolis" to the city. Other products comprise all kinds of tanned and curried leather goods, wirework, scales and balances, brick and tile, bridges, cutlery, hosiery and cotton goods, cheese and butter, compressed yeast, biscuits, brooms, brushes, articles representing the wood-turning and wood-carving industries, etc. The Rookwood Pottery, on the crest of Mount Adams, a prominent structure in an Elizabethan style of architecture, produces purely American wares of high artistic merit, which are widely known even beyond the limits of this country.

Government. The city government is organized in accordance with the Ohio Municipal Code of 1902. The council consists of one member from each of the 26 wards of the city, and of six members elected at large. The mayor, auditor, treasurer, solicitor, and council are all elected for two years. The director of public service controls the streets, sewers, water works, markets, public bathhouse, city electrician's and city engineer's departments, and all municipal buildings. The director of public safety is the head of the police and fire departments and a department of charities and corrections. The mayor and his cabinet, composed of the two directors mentioned, form the board of control. The elections are in charge of a bipartisan board of deputy State supervisors and inspectors, appointed by the Secretary of State. The water works completed in 1908 cost over $10,000,000 and are self-supporting.

The city budget for the first half of the year 1914 shows a grand total of $3,162,347.14 to cover the expenses of government. The principal items are: public safety (fire, police, etc.), $930,000; hospitals, health, etc., $242,000; public service (streets, sewers, lighting, etc.), $787,000; water works, $717,000; university and observatory, $150,000 (approximated). Of the above, $1,767,679.32 is provided for by taxation. The bonded debt, Jan. 1, 1914, aggregated $64,775,250.01. Neither the water bonds nor the bonds issued for Southern Railway purposes are a charge upon the taxpayers, and this fact, together with the large and carefully maintained sinking fund of approximately $10,000,000, makes the net amount of bonds taken care of by taxation $25,519,518.36. The Southern Railway income to the city by reason of the rents, sinking fund, and interest paid by the lessee company during the year 1913, was $1,217,750. The sinking-fund levy for redemption and interest purposes for the year 1914 is $1,250,817.

Population. The population in 1810 was 2540; 1850, 115,435; 1870, 216,239; 1880, 255,139; 1890, 296,908; 1900, 325,902; 1910, 363,591; 1914, 402,175; 1920, 401,247. The Cincinnati metropolitan census district approximates 600,000. In 1910 of the total population 15.6 per cent was foreign born, about half being German. The native born of native parentage was 58.7 per cent. There were 19,639 negroes.

History. On his way to attack the Indians at Chillicothe, in 1780, George Rogers Clark stopped at the present site of Cincinnati and erected two small blockhouses, which, however, were soon abandoned. The permanent settlement dates from 1788, when a company from New Jersey and Kentucky settled on part of the land bought from the government in the same year by John Cleves Symmes (q.v.). The village, which early in the following year was laid out by Col. Israel Ludlow, was pedantically called "Losantiville"—a hybrid word, signifying 'the city opposite the mouth of the Licking.' In June, 1789, Fort Washington was built here, and in 1790 the little village was made the capital of the newly erected Hamilton County and was renamed "Cincinnati" by General St. Clair, in honor of the Society of the Cincinnati. For some years it was only a straggling village, inhabited for the most part by typical frontiersmen, and in 1800 it had a population of but 750. In 1802 it was incorporated as a town; and in 1819, with a population of about 7500, it became a city. The opening of steamboat navigation on the Ohio in 1816, the completion of the Miami Canal in 1830, and of the first section of the

Little Miami Railroad in 1843, with the gradual establishment of manufactures, coupled with the advantageous situation for purposes of trade—all tended to make the growth of the city very rapid and gave it the name "The Queen City of the West." Between 1845 and 1860 German immigrants came in considerable numbers. Cincinnati's close commercial and social relations with the South led its citizens for the most part to oppose all antislavery agitation, and the Philanthropist press, established by James G. Birney, was destroyed by mobs in 1836, on the ground that the city's trade with the South could not be maintained if abolitionist papers were tolerated. Cincinnati was, however, the rendezvous for fugitive slaves escaping to Canada, and during the Civil War its sympathies were predominantly with the North. In 1862, during the so-called "siege of Cincinnati," the city was threatened by a Confederate force under Gen. Kirby Smith and for a time was put under martial law. Cincinnati has suffered severely from floods, the most destructive of which occurred in 1832, when the lower part of the city was submerged; in 1883, when more than 150 business houses were inundated; and in 1884 and again in 1913, suffering slightly in a far-reaching disaster. In 1884 (March 28–31) occurred the famous "Cincinnati Riot." A mob, infuriated by the lax administration of the law, broke into the jail and attempted to lynch some murderers who had received light sentences from the courts; but, being frustrated, they burned the courthouse and other buildings. The militia was called out; but before order could be restored, 45 persons had been killed and 148 wounded. The completion (1911) of the Fernbank dam, at a cost of $1,300,000, the largest movable dam in the world at the time of its building, is an important event in the recent history of the city and is expected to increase its commerce very materially.

CINCINNATI, Society of the. An hereditary patriotic society, organized on May 13, 1783, by the American and foreign officers of the Continental army, assembled in their cantonment on the Hudson River, near Fishkill, N. Y. The original meeting was held in the Verplanck House, then the headquarters of Baron Steuben, where the objects of the society were thus formulated: "To perpetuate as well the remembrance of this vast event [the War of the Revolution] as the mutual friendships which have been formed under the pressure of common danger, and in many instances cemented by the blood of the parties, the officers of the American army do hereby, in the most solemn manner, associate, constitute, and combine themselves into one society of friends, to endure as long as they shall endure, or any of their closest male posterity, and in failure thereof, the collateral branches who may be deemed worthy of becoming its supporters and members." And as the officers of the Revolution were now returning to their farms, which they had left to fight the battles of the Republic, they named their society the Society of the Cincinnati, after their Roman prototype, Lucius Quinctius Cincinnatus. The emblem chosen was an eagle, on which appears as the principal figure Cincinnatus receiving a sword and other military insignia presented by three senators, while in the background his wife is standing at the door of their cottage, near which are a plow and other instruments of husbandry. Surrounding this is the motto, *Omnia Relinquit Servare Rempublicam;* on the reverse is shown a sun rising, a city with open gates, and vessels entering the port, and Fame is represented as crowning Cincinnatus with a wreath bearing the inscription, *Virtutis Præmium;* while below are hands joined supporting a heart with the motto, *Esto Perpetua*—the whole suspended from a light blue ribbon edged with white, suggesting the union of France and America.

Membership was accorded to all Continental officers who had served with honor and resigned after three years' service, or who had been honorably discharged for disability, and in turn to the eldest male posterity of such officers. In failure of direct male descent, the honor passed to male descendants through intervening female descendants, and in failure of all direct descent, the collateral descendants who should be judged worthy of becoming members. The society was organized into 13 State societies. The first general meeting was held in Philadelphia, on May 7, 1784, at which delegates from the original States were present, and an amended constitution was adopted, under which a society was authorized and organized in France. Although General Washington was the first president of the society and held office until his death, the society was immediately and continuously unpopular throughout the country. Many persons claimed that it was the beginning of an hereditary aristocracy, and others discerned the formation of an armed league to seize all the military and civil offices in the new Republic. Even so conservative a statesman as Benjamin Franklin questioned the society's influence; while John Adams, Samuel Adams, and Thomas Jefferson were avowedly hostile towards it. The Massachusetts Legislature declared the society to be "dangerous to the peace, liberty, and safety of the Union"; and Ædamus Burke, an Irishman who was a judge of the Supreme Court in South Carolina, published a pamphlet under the pseudonym of "Cassius," which attained a wide circulation, and in which he endeavored to show that the society was subversive of nearly every principle of human rights for which the War of the Revolution was fought. The fact that many members of the French nobility who had served with the Americans, including the Marquis de Lafayette, were members of the society, gave some reason for the popular impression against the Cincinnati; and opposition did not cease until after the "critical period" of American history had passed and the Union was firmly established. One of the most interesting results of the feeling against the society was the founding of Tammany Hall (q.v.) in New York, on the alleged basis of "pure democracy." The State societies of Georgia, North Carolina, Virginia, Delaware, Connecticut, Rhode Island, and New Hampshire soon ceased to exist, and although a temporary interest in the society was revived by the visit of Lafayette to the United States in 1824, still it was not until 1893 that Connecticut, as the first of the revived State societies, was admitted into the general society,

and one by one the other State societies were restored, until, at the triennial convention held in 1902, Georgia, the last of the original 13, was provisionally readmitted. The State societies meet annually, and the general society once in every three years. The presidents general have been: George Washington, Alexander Hamilton, C. Cotesworth Pinckney, Thomas Pinckney, Aaron Ogden, Morgan Lewis, William Popham, H. A. S. Dearborn, Hamilton Fish, William Wayne, and Winslow Warren. Many of the State societies, such as Delaware, Maryland, Massachusetts, New York, and North Carolina, have published State books, in which is given a history of the society. The living hereditary members number about 980.

CINCINNATI, UNIVERSITY OF. An educational institution in Cincinnati, Ohio, the only municipal university in America. The university was founded on bequests made by Charles McMicken in 1858, and by tax levies subsequently authorized by the city of Cincinnati. By Mr. McMicken's will somewhat over $1,000,000 was given the city to found a college; but the State of Louisiana, in which was situated real estate amounting to nearly one-half of the entire bequest, refused to recognize the validity of the will, and the income from the remainder of the estate was insufficient for the desired purpose. The matter, therefore, lapsed until 1870, when the Legislature passed a special bill under which the University of Cincinnati was organized. Bonds were issued by the city to provide funds for buildings. Later, a special tax of three-tenths of a mill for maintenance was authorized. Instruction was first given in 1873, and in 1874 the academic department was organized. In 1896 the Medical College of Ohio, founded in 1819, was reorganized as the medical department of the university. The departments of the university include liberal arts, engineering, medicine, the college for teachers, graduate school, the Clinical and Pathological School of the Cincinnati Hospital (affiliated), and the College of Commerce and evening academic classes. The buildings, grounds, and equipment are valued at $1,807,039; the endowment aggregates $1,500,000; and the total annual income is, approximately, $299,000. The library collections number approximately 96,600 bound volumes, and 79,000 pamphlets. In 1913 there was a faculty of 186 (excluding the clinical staff), and a student body of 1866.

CINCINNATI GROUP. See ORDOVICIAN SYSTEM.

CINCINNATI MUSICAL FESTIVAL. Established by Theodore Thomas in 1873, the festivals were afterward held biennially, under his direction. Hitherto the festival had lasted five days—from Tuesday till Saturday, inclusive—within which period there were given seven concerts, five in the evenings and two in the afternoon (Thursday and Saturday); but in 1902 the season was reduced to four days and five concerts. The music is supplied by the Chicago Orchestra (q.v.), augmented for the occasion by a local chorus of about 500 voices, and well-known soloists. The festival has been an invariable artistic success, but has frequently entailed considerable financial sacrifice on the part of those responsible for the undertaking. After the death of Mr. Thomas in 1905 the festival was under the direction of Frank van der Stucken (q.v.) until 1912. Beginning in 1914 the orchestral part was furnished by the Cincinnati Symphony Orchestra (q.v.), and its regular conductor, Dr. Ernst Kunwald (q.v.), became the conductor of the festival.

CINCINNATI SYMPHONY ORCHESTRA. One of the great orchestras of the United States. In 1893 the "Cincinnati Orchestra Association," with Mrs. William H. Taft as president, was organized for the purpose of assuring to the music lovers of Cincinnati adequate and regular symphony concerts. Previous to that time an orchestra of 40 musicians under Michael Brand had for some years been giving concerts devoted to serious music. In the spring of 1895 the association engaged this orchestra for nine preliminary concerts directed by Anton Seidl, Frank van der Stucken, and Henry Schradieck, chiefly for the purpose of selecting a regular conductor. As a result, the orchestra was strengthened by the addition of a dozen musicians from New York, Van der Stucken was chosen conductor, and Josef Marien concert master. A guarantee fund of $15,000 was pledged, and in the fall of the same year the first regular season of 10 subscription concerts began. The season extends from November to April. The concerts take place on Saturday nights, preceded by a public rehearsal on Friday afternoon. In 1906 the official name of the association was changed to "Cincinnati Symphony Orchestra Association Company." Friction between the Musical Union and Van der Stucken led, in 1907, to the latter's resignation and the disbanding of the orchestra. Under the auspices of the association a number of symphony concerts were given by visiting orchestras during the season of 1907–08. In the following season no concerts were given, but the association was at work perfecting arrangements for the reëstablishment of the orchestra on a permanent basis. When an annual guarantee fund of $50,000 for five years had been pledged by a number of public-spirited citizens a new orchestra of 80 performers, with Leopold Stokowski as conductor, was organized in 1909. The number of subscription concerts was increased from 10 to 12, and a series of eight concerts at popular prices on Sunday afternoons was added. Under the energetic leadership of Mr. Stokowski the orchestra soon rose to the level of the foremost symphony orchestras in the United States, and greatly extended its activities by frequent concert tours to other cities. When Mr. Stokowski resigned in 1912 Dr. Ernst Kunwald of the Berlin Philharmonic was chosen his successor. The original president of the association, Mrs. William H. Taft, was succeeded in 1900 by Mrs. C. R. Holmes. Since 1913 Mrs. Charles P. Taft has been president.

CIN'CINNA'TUS, LUCIUS QUINCTIUS. A hero of the semilegendary period of Roman history, regarded by the later Romans as the model of antique virtue and simple manners. Cincinnatus appears to have been an uncompromising patrician. About 460 B.C. he was chosen consul, and two years later was made dictator. The story says that when the messengers from Rome came to tell Cincinnatus of his new dignity, they found him plowing on his small farm on the Tiber. He soon rescued the Consul Lucius Minucius, who had been defeated and surrounded by the Æqui. After a dictatorship of 16 days, Cincinnatus returned to his farm. When 80 years old, he was once more made dictator (439 B.C.), and suppressed a threatened plebeian insurrection.

CINCIUS (sĭn'shĭ-ŭs) **AL'IMEN'TUS, LU-**

CIUS. A Roman annalist of some note, prætor in Sicily in 210–208 B.C. He wrote in the Greek tongue a number of works, chief among which is his *Annales*, containing the history of Rome from the earliest times to his own day. During this war he himself was imprisoned by Hannibal, who graciously gave him an account of the Carthaginian march through Gaul and across the Alps. His work was more carefully critical than that of most historical students of his time. Consult: Plüss, *De Cinciis Rerum Romanorum Scriptoribus* (Bonn, 1865); Peter, *Veterum Historicorum Romanorum Reliquiæ* (Leipzig, 1870); Schanz, *Geschichte der Römischen Litteratur* (3d ed., Munich, 1907).

CIN'DEREL'LA (from *cinder*, with dim. termination *-ella;* cf. Fr. *Cendrillon*, and Ger. *Aschenbrödel*, or *Aschenputtel*, of similar meaning). An old fairy tale of Oriental origin. It existed in Egypt in a legend of Rhodopis and Psammetichus. It appears in German lore in the sixteenth century, and is among the fairy tales of Grimm. Perrault and Madame d'Aulnoy popularized it for seventeenth-century France. It deals with the marriage of a household drudge to a prince who discovers her by finding her marvelously small glass slipper, which excites his curiosity as to the owner, and which no court lady is able to wear. The "glass" slipper is an error, arising from the confusion of *verre*, 'glass,' with the old *vair*, 'fur.'

CIN'EAS (Lat., from Gk. *Κινέας, Kineas*). A Thessalian, the chief adviser of Pyrrhus, King of Epirus. He was an eloquent orator and a skilled diplomatist; Pyrrhus declared that Cineas had won more cities by his words than he himself had won by his arms. He visited Rome to arrange for peace after the defeat of the Romans in 280 B.C. While in Rome he learned in a single day, it is said, the name of every man of importance in the city. He was not successful in securing peace, and when he returned he told Pyrrhus that Rome was a temple, and its Senate an assembly of kings.

CIN'EMAT'OGRAPH. See MOVING PICTURES.

CIN'ERA'RIA (Neo-Lat. nom. pl., from Lat. *cinerarius*, ashy, from *cinis*, ashes). A genus of plants belonging to the family Compositæ, and related to *Senecio* (q.v.), from which the species are separated by some minor characters. As commonly understood, the species are numerous and widely distributed; but as recently limited, there are only about 25 species, all of which are indigenous to South Africa. The other species are mostly grouped with *Senecio*. The most common garden *Cineraria* by this classification becomes a *Senecio*. The plants are annual or perennial herbs, with simple-toothed or sinuate-lobed leaves, and many are notable on account of the ashy appearance of their lower leaves; hence the name (Latin *cinis, -eris*, ashes). The cinerarias are popular greenhouse plants; and on account of the ease of cultivation, free blooming, and lasting qualities they are much grown. There has been much discussion regarding the species most cultivated, *Cineraria cruenta*, many strains of which are known. By some it is claimed as a development from the wild species, while others maintain it is a hybrid between *Cineraria cruenta* and other species, all of which are natives of the Canary Islands. The single-flowered forms are the most popular.

CIN'ERARY URNS. Urns used by the nations of antiquity to contain the ashes of the dead when gathered from the funeral pile. Among both Greeks and Romans the urn was buried as we bury a coffin. Among the Romans it was frequently placed in a niche in the family mausoleum or in one of the great columbaria (q.v.). See BURIAL; CREMATION.

CINGALESE, sĭŋ'gȧ-lēz', or SINGHALESE. See CEYLON.

CING'ULUM. See GIRDLE.

CIN'NA, GAIUS HELVIUS. See HELVIUS CINNA, GAIUS.

CIN'NA, LUCIUS CORNELIUS. A Roman noble, one of the principal supporters of Marius. Sulla, after driving Marius from Rome, and before setting out on his expedition against Mithridates, allowed Cinna to be elected to the consulship. At once, as consul (87 B.C.), he impeached Sulla, endeavored to advance the political status of the citizens who had been added to Rome after the Social War, and agitated for the recall of Marius. On Marius's return, after a cruel massacre of Roman citizens, in which some of the most eminent statesmen and orators were slain, Marius and Cinna declared themselves consuls. On the death of Marius, which occurred within a few days of his usurpation, Cinna made Valerius Flaccus his colleague for that year and Papirius Carbo his associate for the two succeeding years. In 84 B.C. he prepared to meet Sulla, who was then on his way from the East to take vengeance upon his enemies, but was slain by his disaffected troops at Brundisium. His daughter Cornelia married Julius Cæsar.

CIN'NABAR (Lat. *cinnabaris*, from Gk. *κιννάβαρι, kinnabari*, vermilion, from Pers. *zinjarf*, Hind. *shangarf*). A name originally applied to the red "dragon's blood" that came from India, and subsequently to other substances of a similar color, but now exclusively used to designate the mercuric sulphide that crystallizes in the hexagonal system. The Romans were familiar with it, and both Pliny and Vitruvius described the use of an ore of mercury for amalgamating gold. It is found both crystallized and massive, and is bright red to brown in color. Cinnabar is the most important ore of mercury, and is mined in Almaden, Spain; at Idria, in Carniola, Austria; and at New Almaden and elsewhere in Santa Clara Co., Cal. It is also found in southern Russia, China, Peru, New South Wales, New Zealand, and South Africa. At Sulphur Bank, Cal., and Steamboat Springs, Nev., it is said to be still forming by solfataric action. The native cinnabar is not of sufficient purity to be used directly as a pigment, but the artificial mercuric sulphide constitutes the vermilion of commerce. "Hepatic cinnabar" is a liver-brown granular or compact variety of cinnabar, which is found at Idria, Austria.

CINNAM'IC (from *cinnamon*) **ACID,** $C_6H_5.CH:CH.COOH$. A chemical compound of carbon, hydrogen, and oxygen. It crystallizes in colorless prisms, which are sparingly soluble in cold water, but dissolve readily in boiling water, alcohol, and ether. It melts at 133° C. and boils, with or without decomposition, according to the manner in which it is heated, at about 300° C. It exists naturally in a free state in liquid storax, in the balsams of Tolu and Peru, and in gum benzoin, and is often deposited in large crystals from old samples of oil of cinnamon (*Cinnamic aldehyde*) and from cinnamon water. It is always formed from oil of cinnamon when the latter is exposed to the action of the air. Cinnamic acid is usually made by heat-

ing 3 parts of benzaldehyde with 10 parts of acetic anhydride and 3 parts of dehydrated sodium acetate, its formation taking place according to the following equation:

$$\underset{\text{Benzaldehyde}}{C_6H_5CHO} + \underset{\text{Sodium acetate}}{CH_3COONa} =$$

$$\underset{\text{Cinnamic acid (Sodium salt)}}{C_6H_5CH:CHCOONa} + \underset{\text{Water}}{H_2O}$$

This method of preparation, known as Perkin's Reaction, is used for the preparation, not only of cinnamic, but of other unsaturated aromatic acids as well, the sodium salt and anhydride of acetic acid being replaced in the process by the sodium salts and anhydrides of other fatty acids. When fused with caustic potash, cinnamic acid breaks up into benzoic and acetic acids. When heated with lime, it splits up into styrolene (a hydrocarbon) and carbonic acid. By the action of nitric acid it may be converted into ortho-nitro-cinnamic acid, which is related to indigo. Being an unsaturated compound, cinnamic acid readily forms additional compounds with bromine, hydrochloric, hydrobromic, and hydriodic acids, etc. (See CARBON COMPOUNDS.) The substance known as allo-cinnamic acid is stereo-isomeric with cinnamic acid and may be readily converted into the latter.

CIN'NAMON. The dried bark of several species of *Cinnamomum*, belonging to the family Lauraceæ. The leading species, *Cinnomomum zeylanicum*, indigenous to Ceylon, where it may be found growing at an altitude of 3000 feet above sea level, has developed seven or eight well-marked varieties, some of which are ranked by botanists as species. From biblical times the forests supplied the market, but its cultivation was commenced by the Dutch. It is now grown in Brazil, the West Indies, Egypt, the district about Tellicherry (Malabar Coast), and Java, which last two places most nearly approach Ceylon in the quality of their cinnamon; but in none of which, owing to differences of soil, climate, methods of cultivation, or of exposure to sunlight, it produces bark of so high a quality as in its home. Cinnamon plantations are in less favor than formerly, coffee culture being in the ascendant. In the wild, the tree attains the height of about 30 feet and a diameter of 12 to 18 inches, but when cultivated it is made to form stools of four or five stems. When the bark begins to turn brown, usually in less than two years, these stems, which may be 8 feet tall and 2 inches in diameter at the base, are harvested and replaced by fresh ones. After being stripped of leaves and twigs, which latter yield "cinnamon chips," they are girdled transversely and slitted longitudinally, and the bark stripped off with a *mama* or knife similar in form to a nurseryman's budding knife. The pieces are then laid flat and the outer bark removed by scraping or planing. As the bark dries it forms rolls called quills, the smaller of which are inserted into the larger, which when fully dry are tied in bundles for shipment. Cassia cinnamon, cultivated in India and southeastern China, is the bark of *Cinnamomum cassia*. Cassia cinnamon, which is exported to America from China and India, is not, as is often supposed, the same as Chinese cinnamon, none of which reaches our ports, because of the steady demand and high prices paid for it in China. The Cassia variety is cultivated; the Chinese is not, but is obtained from old trees growing, not in Chinese forests, but in those of Annam. These trees die, their bark being stripped from trunks and twigs. Saigon cinnamon is derived from an undetermined species of cinnamon which appeared in commerce about 1875 and which has annually increased in importance. Ceylon cinnamon is yellowish brown, has a peculiar, fragrant odor and sweetish, aromatic, pungent taste. In quality it surpasses the bark obtained from the same species grown in other countries, and also that of the other two species imported into America. Cassia cinnamon is reddish brown, and has a less delicate taste and odor than the preceding. The Saigon variety, from which the outer bark is not removed, has a gray or grayish-brown exterior, with whitish blotches, warts, and wrinkles. All three kinds contain a volatile oil (*Oleum cinnamomi*), tannin, sugar, and mannit, and are recognized in the Pharmacopœia of the United States. The oil, which is given in doses of from one to five drops, is credited with aromatic, stomachic, stimulant, and carminative qualities when taken internally, and with rubefacient properties when applied locally. The bark, due to its tannic acid, has some astringent properties, and is commonly used to flavor astringent powders and mixtures which do not contain iron. From very early times cinnamon has been used as a spice in many culinary preparations. For illustration, see Colored Plate of FLAVORING PLANTS.

CINNAMON FERN. See OSMUNDA.

CINNAMON STONE. The yellow variety of grossularite, or calcium aluminum garnet, called *essonite*, or more properly *hessonite*. The best cinnamon stones come from Ceylon; but specimens of a good quality have been found in Oxford Co., Me., and elsewhere in the United States, some of which would cut into gems of over a carat in weight. See GARNET.

CINNA, OU LA CLÉMENCE D'AUGUSTE, sē'nâ, ōō là klâmäns' dō'güst'. A tragedy by Pierre Corneille, produced in Paris in 1640, and published in the collected edition of his works in 1644. It is supposed to be his masterpiece and deals with the temporary perfidy of a Roman citizen, friend to Augustus, who is drawn into a conspiracy against his Imperial master by his wife and friends. The conspiracy is discovered, and Augustus pardons the offenders.

CINO DA PISTOJA, chē'nō dâ pēs-tō'yȧ (originally GUITTONCINO SINIBALDI) (1270–1336). An Italian jurist and poet, born at Pistoja. He began the study of law there and then went to Bologna, where his masters were Lamberto di Ramponi and Franciscus Accursius. On his return, he held a civil position in his native city. Being a partisan of the Ghibelline faction, he became involved in the Guelph and Ghibelline disputes; and as the Guelph faction was triumphant, he had to leave Pistoja, and in the course of his travels visited Rome and journeyed in France. When the death of the Emperor Henry VII left the Ghibelline cause in an apparently hopeless state, he withdrew from party strife, studied law, received the degree of doctor at Bologna (1314), and taught jurisprudence at Treviso, Siena, Florence, Perugia, and Naples. He is the author of two books on law, often reprinted, *Lectura in Codicem Justiniani* (1483) and *Lectura in Digestum Vetus* (1527). Among his pupils were the celebrated Bartolus and Joannes Andreæ. Cino is best remembered now for his friendship with Dante, who speaks of him with enthusiasm in *De Vulgari Eloquio*. Like Dante, he had an ideal lady, to whom he

addressed his sonnets—a certain Selvaggia di Vergiolesi; so there is significance in his verses comforting Dante on the loss of Beatrice. Petrarch called him "Nostro Amoroso Messer Cino." By Carducci he is ranked midway between Cavalcanti and Dante. His works were printed in Rome in 1559. Consult: the edition of his poems by Bindi and Fanfani, *Le rime ridotte a miglior lezione* (Pistoja, 1878); Chiappelli, *Vita e opere giuridiche di Cino da Pistoja* (Turin, 1881); Rossetti, *Dante and his Circle* (London, 1874); Corbellini, *Cino da Pistoja, amore ed esilio* (Pavia, 1898).

CINQ-MARS, săn'mär', Henri Coiffier Ruzé d'Effiat, Marquis de (1620–42). A French nobleman and conspirator, the favorite of Louis XIII. He was the son of d'Effiat, marshal of France (1581–1632). Cinq-Mars came to court as a protégé of Richelieu in 1635, receiving a commission in the Royal Guards. In 1637 he became master of the robes to the King, and in 1639 was advanced by Richelieu, for political reasons, to the high office of grand equerry of France. Cinq-Mars, however, was not content to be Richelieu's tool, and had ambitions of his own. He distinguished himself before Arras in 1640 and desired a high military command. Richelieu would advance him no further, and in 1641 Cinq-Mars allied himself with the Orléans faction and became one of the chief opponents of the Cardinal. In 1642 he accompanied the King to the siege of Narbonne, and seemed high in the royal favor; but Richelieu had unearthed particulars of a conspiracy, in which Cinq-Mars was the chief, which included a treaty with Spain, and after the incriminating documents had been laid before the King, Cinq-Mars and his accomplices were arrested. Gaston d'Orléans saved his own life by confessing and implicating others. Cinq-Mars was imprisoned, tried, and executed with De Thou, at Lyons, Sept. 12, 1642. A romantic novel by Alfred de Vigny, *Cinq-Mars, ou une conjuration sous Louis XIII*, is founded on the alleged relations between the conspirator and Maria de Gonzaga, afterward Queen of Poland, and there is an opera by Gounod (1877) based on the story. An English translation of this work has appeared (New York, 1861). For historical accounts, consult Basserie, *La conjuration de Cinq-Mars*, preface by Alfred Mézières (Paris, 1896), and Bazin, *Histoire de France sous Louis XIII* (Paris, 1846).

CINQUECENTO, chēn'kwâ-chēn'tô. An Italian technical term, which has been borrowed by other languages, meaning "five hundred," and used to designate the art, literature, or any other form of culture flourishing between 1500 and 1600. Roughly speaking, it is the "Developed Renaissance," "High Renaissance," "The Golden Age," from Leonardo da Vinci to Paolo Veronese, though its second half was almost everywhere, except in Venice, a period of decadence.

CINQUEFOIL, sĭŋk'foil'. See Potentilla.

CINQUE (sĭŋk) **PORTS** (Fr., five ports). The ancient collective name of the five English Channel ports—Sandwich, Dover, Hythe, Romney, and Hastings—which were enfranchised by Edward the Confessor. William the Conqueror subsequently granted them the privileges of an almost independent state, under command of a warden, with a court at Dover Castle. Winchelsea and Rye were added later. Up to the reign of Henry VII their chief function was the supply of the country's naval contingent. In the time of Edward I they provided 57 fully equipped ships and frequently extended their powers by equipping piratical expeditions. Dating from the revolution of 1688, their privileges were gradually abolished, the Lord Warden's jurisdiction ceasing in 1835. The appointment of Lord Warden with residence, and the ancient privilege of carrying the canopy over the sovereign's head at a coronation, still exists. The official residence, Walmer Castle, near Deal, dates from the time of Henry VIII. There, as Warden, the Duke of Wellington lived each autumn from 1829, and he there died in 1852. Noteworthy wardens of recent date are Earl Granville, the Right Honorable W. H. Smith, the Marquis of Dufferin, and the Marquis of Salisbury. Consult Burrows, *Cinque Ports* (2d ed., London, 1888).

CINTIO, or **CINTHIO,** chēn'tê-ō. See Giraldi, Giovanni Battista.

CINTRA, sēn'trâ. A small but picturesquely situated town in Portugal, in the Province of Estremadura, about 15 miles west-northwest of Lisbon (Map: Portugal, A 3). It stands on the declivity of the Sierra de Cintra, and contains a palace of Moorish and Christian architecture, anciently occupied by the Moorish kings, and subsequently a favorite residence of the Christian monarchs. A charming view of the town and of the sea is to be had from the top of a hill crowned with the ruins of a Moorish castle. On another hilltop stands La Pena, once a convent, afterward a residence of the King of Portugal, who restored it and gave it the outward appearance of a feudal castle. In the neighborhood, also, is what is called the Cork Convent, named so on account of its cork-lined cells. Cintra is a favorite summer resort with the residents of Lisbon. It is celebrated for the convention concluded, Aug. 22, 1808, between the British, the Portuguese, and the French, by which the latter were allowed to evacuate Portugal without interference. Pop., 1890, 4846; 1900, 5918.

CIONE, chê-ō'nâ, Andrea di. See Orcagna.

CIOTAT, syô'tà', La (Prov. *Cioutat*, from Lat. *civitas*, state, city). A seaport town of France, in the Department of Bouches-du-Rhône, on the west shore of a bay in the Mediterranean, about 15 miles southeast of Marseilles, in the midst of olive, orange, and pomegranate plantations (Map: France, S., K 5). It is well built and has a good and commodious harbor, formed by a mole, and well defended. One of its shipyards alone employs 2000 men. It has a school of maritime instruction, large fisheries, cotton manufactories, and sea baths. There is an active trade in the produce of the district. Pop. (commune), 1901, 11,622; 1911, 9975.

CIPARIU, chê-pä'rĭ, Timoteo (1805–87). A Rumanian ecclesiastic and philologist, born in Transylvania. As professor in the theological seminary of Blasendorf he founded in 1867 the *Organul Luminarei* ('Organ of Light'), the first Rumanian journal to be printed in Latin characters. He was the most celebrated representative of the Latinist school in Transylvania, and was the author of the following important works: *De Latinitate Linguæ Valachicæ* (1855); *De Nomine Valachorum Gentili* (1857); *De Re Litteraria Valachorum* (1858); *Grammatica Limbei-Romîne* (2 vols., 1859–69). The latter work was honored by a prize from the Rumanian Academy.

CI'PHER (from OF. *cifre*, Ger. *Ziffer;* from ML. *cifra, zifera*, Ar. *sifr, safr*, cipher, from *safara*, to be emptied). An ornamental arrangement of the initial letters of a name by which

they become also a private mark, adopted by artists and architects as distinctive of their work. A well-known example is the cipher of Albrecht Dürer (q.v.), reproduced in the article on this artist. That of the American painter Whistler also is well known—a conventionalized yellow butterfly. Any complex arrangement of letters which an individual employs as his signature becomes his own property.

CIPHER. See CRYPTOGRAPHY; SIGNALING AND TELEGRAPHING, MILITARY.

CIPRIANI, chē'prē-ä'nē, GIOVANNI BATTISTA (1727–85). An Italian painter, draftsman, and engraver. He was born in Florence and studied there under Gabiani and Ignatius Hugford, an Englishman. In 1750 he went to Rome, where he met his lifelong friend and coworker, Bartolozzi (q.v.), and English artists who invited him to England. There he spent the remainder of his life. He executed pictures and mural decorations for English private residences and public buildings, and played a leading part in the history of the Royal Academy, of which he was one of the original members. He is chiefly important, however, as a draftsman for Bartolozzi's engravings and mezzotints. By his skillful and elegant drawing he did much to form the style of the English mezzotint engravers of the eighteenth century. The British and South Kensington museums and those of Florence, Lille, and Orléans contain most of his drawings. Cipriani died at Hammersmith, and was buried in the Chelsea burial ground, where Bartolozzi erected a monument to his memory. Consult Tuer, *Bartolozzi and his Works* (London, 1882), and Fincham, *Art of British and American Book Plates* (New York, 1897).

CIRCASSIA, sĭr-kăsh'ĭ-ȧ. A region of the northwestern Caucasus (q.v.) (Map: Russia, F 6), extending approximately from the Taman Peninsula and the Kuban River to the Abkaz district along the eastern coast of the Black Sea. It lies within the Ekaterinodar and Kutais governments and comprises the administrative district known as the "Black Sea Circle." Circassia has been nominally a part of Russia since 1829. It was only after a struggle of 35 years, however, that Russian sway was fully established. The region contains numerous oil fields.

CIRCASSIANS, sĕr-kăsh'ȧnz, or **TCHERKES'SES.** A term applied in general to the northwestern group of peoples inhabiting the region of the Caucasus, and in particular to the Adighe or Tcherkesses (the first is their own name; the second, from which the word *Circassian* comes, is that by which they are known to the Turks and Russians), the most noteworthy of these tribes. Other Circassian tribes are the Abkhasians on the Black Sea, the Kabardians, Shapsukhs, Abadzeh, etc., all related more closely by language than by race; for all are more or less mixed with Tatar, Asiatic, Aryan, and other intrusive elements. Except the Abkhasians (the difference may be due to artificial lateral compression), the Circassian tribes tend to be brachycephalic, and of average rather than tall stature. The Abkhasians are darker skinned, and not so well formed or featured as the Circassians proper; and of the latter those of Kuban are the least attractive. The Kabardians, who formerly laid claim to greater purity of blood, are now less pure than some of the Adighe. The Circassians have produced many men and women of great physical beauty, and Circassian girls, famous for their good looks, have long adorned the harems of Turkish sultans, pashas, and men of wealth, refining to no little extent their Mongolian blood—many of them, indeed, being ready enough to change their mountain home for a Turkish or Persian palace. According to Professor von Luschan, however, the number of such intermarriages has been greatly exaggerated in popular literature. The ethics of the Circassians have always been of a primitive type, and *Cherkess* is said to signify as much as "brigand"; but over against this may be set their hospitality and brave struggle for liberty against the Russians. When the Russian conquest was completed in 1864, more than 300,000 of them left the Caucasus for various parts of Asiatic and European Turkey, and they are said later to have had a share in the Bulgarian massacres. Those who are still in the old habitat number about 150,000, and are losing more and more of their racial purity. The higher classes of the Circassians have adopted Islam, while among the lower exists a certain kind of Christianity or Islamism in combination with survivals of ancient heathenism. The languages of the Circassian tribes are thought by some authorities to be incorporating rather than agglutinative. Since Neumann's *Russland und die Tscherkessen* (1840), the literature about the Circassians has grown considerably. Especial reference may be made to R. von Erckert's *Der Kaukasus und seine Völker* (Leipzig, 1887), and the fourth volume of Chantre's comprehensive *Recherches anthropologiques dans le Caucase* (Lyons, 1885–87).

CIRCE, sĕr'sē (Lat., from Gk. Κίρκη, *Kirkē*). In Homer, the sister of Aeëtes, and daughter of Helios and the ocean nymph Perse. She lived in a valley of the island of Ææa, surrounded by human beings whom she had transformed into wolves and lions. Here she transformed into swine the companions of Odysseus, and when the hero came to her palace she sought to exercise the same enchantment upon him. Protected by the magic herb, *moly* (q.v.), which Hermes had given him, he withstood her sorceries, and forced her to disenchant his followers. He then remained with her a year, and learned from her how to converse with Tiresias (q.v.) in the land of shades about his future, and how to avoid the dangers that still beset his homeward way. A Cyclic epic told of Telegonus, the son of Circe and Odysseus, who, landing in Ithaca, unwittingly killed his father in battle. Later writers, possibly even Hesiod, placed the island of Circe in the Tyrrhenian Sea, and still later it was identified with the Circean promontory (see CIRCEI). In the Alexandrian writers Circe also appears in the story of the Argonauts, and to the same period belongs the story that, in jealousy of Scylla, she transformed her into a monster, by pouring her magic drugs into the water where Scylla bathed. See PICUS.

CIRCE'I, or CIRCEI'I. A town of ancient Latium, situated on the commanding promontory known as Mons Circeius (Monte Circeo), about 80 miles southeast of Rome. Though of ancient date, Circei was never very famous, though Tiberius and Domitian had villas there. The oysters of Circei were much esteemed by the Romans. On the hill, about 3 miles from the sea, are remains of early walls of polygonal masonry, part of an ancient acropolis. Consult Ashby, "Monte Circeo," in *Mélanges de l'école française de Rome*, xxv, pp. 157 ff. (1905). See CIRCE.

CIRCENSIAN (sĕr-sĕn'shan) **GAMES.** See CIRCUS.

CIR'CINATE (Lat. *circinnus*, pair of compasses, from Gk. *κίρκος, kirkos*, circle). A name given to the peculiar vernation (leaf-bud condition) of ferns. When a fern leaf unfolds it resembles a crozier or shepherd's crook, as if it had been rolled from the tip. This characteristic vernation of ferns is also observed among the Cycads, the most fernlike of living gymnosperms.

CIR'CLE (from Lat. *circulus*, dim. of *circus*, Gk. *κίρκος, kirkos, κρίκος, krikos*, circle). The locus (q.v.) of all points in a plane at an equal finite distance from a fixed point in that plane. The fixed point is called the centre, and the space inclosed, or, more properly, its measure, the area of the circle. The segment of any straight line intercepted by the circle (*AB* in Fig. 1) is called a chord. Any chord passing through the centre, *O*, is called a diameter, as *A'B'*. The centre bisects any diameter, and the halves are called radii. Any line drawn from an external point cutting the circle in two points, as *PQ*, is called a secant; and any line which has contact with the circle, but does not intersect it when produced, as *B'T*, is called a tangent. Any portion of the area limited by two radii, as *OA* and *OB*, is called a sector; and any portion of the circle, *BA'A*, is called an arc. A chord is said to divide the area into segments; the segments are equal if the chord is a diameter. A plane passing through the centre of a sphere cuts the surface in a circle called a great circle of the sphere. Circles of longitude are great circles. Other circles of a sphere are called small circles. Ancient writers usually called the circle, as above defined, a circumference, the word "circle" being applied to the space inclosed. In modern geometry, at least above the elements, the word "circumference" is not used, and the word "circle" applies to the curve.

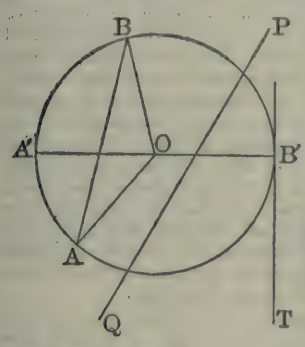

FIG. 1.

In coördinate geometry (see ANALYTIC GEOMETRY), the circle ranks as a curve of the second order (see CURVE) and belongs to the conic sections; the section of a right circular cone, perpendicular to the axis of the cone, being a circle. The Cartesian equation of the circle, taking its centre as the origin, is $x^2 + y^2 = r^2$. The constructions of Euclidean geometry being limited to the use of two instruments, the straightedge and the compasses, the circle and the straight line are the two basal elements of plane geometry. A few of the leading properties of the circle are:

1. The ratio of the circumference to the diameter is a constant; this is designated by the symbol π. This ratio is approximately 3.141592; 3.1416 and even $3\frac{1}{7}$ are sufficiently accurate for ordinary purposes; thus the area of a circle of radius 5 inches is 3.1416×5^2 square inches, or 78.54 square inches. The ratio π has an interesting history. The papyrus of Ahmes (q.v.), dating from before 1700 B.C., contains the value $(\frac{16}{9})^2$ or 3.1605; Archimedes (287–212 B.C.) described it as lying between $3\frac{1}{7}$ and $3\frac{10}{71}$; the Almagest (q.v.) gives it as

$$3 + \frac{8}{60} + \frac{30}{60 \cdot 60} = 3.14166;$$

the Romans often used $3\frac{1}{8}$; Aryabhatta (q.v.) gave 3.1416; Bhaskara (q.v.), 3.14166; and the Chinese of the sixth century A.D., $\frac{22}{7}$. Ludolph van Ceulen (q.v.) about 1586 computed π to 35 decimal places, and in recent times it has been carried to over 700 places. In 1794 Legendre proved that π is an irrational number. Furthermore, it is not only incommensurable—that is, not expressible as the quotient of two integers—but it has been proved by Lindemann (1882) to be transcendental. This means that π cannot be a root of an algebraic equation with integral coefficients. Certain irrational (incommensurable) numbers may be represented by elementary geometric lines; e.g. $\sqrt{2}$ is represented by the diagonal of a square of side 1; but π, being transcendental, cannot be represented by any construction depending solely upon the straightedge and compasses. It requires a transcendental curve, such as the integraph of Abdank-Abakanowicz.

Thus, through labors like those of Gauss, Hermite, and Lindemann, the true nature of π has been determined, and efforts at circle squaring by the instruments of elementary geometry have been proved futile. Modern analysis has shown π to be expressible by certain infinite series; e.g.,

$$\pi = 4\left(1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \ldots\right) \text{ (Leibnitz);}$$

or in the form of a continued fraction, as in

$$\pi = \cfrac{4}{1 + \cfrac{1^2}{2 + \cfrac{9}{2 + \cfrac{25}{2 + \cfrac{49}{2 + \ldots}}}}} \text{ (Brouncker);}$$

or of a continued product, as

$$\frac{\pi}{2} = \frac{2 \cdot 2 \cdot 4 \cdot 4 \cdot 6 \cdot 6 \cdot 8 \cdots}{1 \cdot 3 \cdot 3 \cdot 5 \cdot 5 \cdot 7 \cdot 7 \cdots} \text{ (Wallis).}$$

The method of approximating this ratio commonly used before the introduction of calculus (q.v.) consisted in computing the perimeters of the circumscribed and inscribed polygons of a circle of diameter 1. For, since the length of the circumference in this case is the desired ratio, the value of π lies between the values of the perimeters of the given polygons. A history of the development of this important problem of geometry will be found in Rudio, *Archimedes, Huygens, Lambert, Legendre: vier Abhandlungen über die Kreismessung* (Leipzig, 1892).

2. The centre of the circle is a centre of symmetry, and any diameter is an axis of symmetry (q.v.).

3. The perimeter of a circle of radius r is $2\pi r$, and its area πr^2. The area is greater than that of any plane figure of the same perimeter.

4. Concentric circles—that is, those having the same centre—never intersect.

5. Circles are similar figures (see SIMILARITY), and their areas are proportional to the squares of their radii or diameters.

6. Arcs of a circle are proportional to the angles subtended at the centre, and conversely. This property forms the basis of angular measure.

Circular Measure. The supposed number of days in the year early led to the division of the circle into 360 equal parts, for use in astronomical instruments. A knowledge of the regular hexagon probably led to the further division of 360 degrees into six parts of 60 degrees each. The Babylonians divided each degree into 60 equal parts, and each subdivision into 60 equal parts, thus producing the sexagesimal scale. (See NOTATION.) Thus the circumference of a circle is divided into 360 equal parts, called degrees; each degree into 60 equal parts, called minutes; and each minute into 60 equal parts, called seconds. Further divisions are better represented by decimal fractions. The circle is also commonly divided into four equal parts of 90 degrees each, called quadrants. By connecting the centre of a circle with the points of equal division on the circumference, equal angles are formed, whose magnitude is independent of the length of the radius; thus producing an angle measure, the basis of the protractor (q.v.). For scientific purposes, however, it would be more convenient to divide a quadrant into 100 equal parts, called grades, and each of these into 100 equal parts, called centesimal minutes, and each of these into 100 equal parts, called centesimal seconds. This plan, attempted in France as part of the metric system, is known as the centesimal division of the circle. For example, 3^g, 45′ 17″ (read 3 grades, 45 centesimal minutes, and 17 centesimal seconds) may be written 3.4517. To translate this into sexagesimal notation, 3^g equals $3 \times \frac{90}{100}° = 2.7°$, 45 centesimal minutes $45 \times \frac{0.9}{10000}° = 0.405'$ or $0.00675°$; and so on. The sexagesimal system is, however, so well established that the centesimal has only very recently, in France, come to take important rank.

Radian Measure. In higher mathematics, especially in the calculus, another unit of angular measure, called the *radian*, is in general use. This is defined as the angle subtended at the centre of a circle by an arc equal in length to the radius (Fig. 2). The relation of the radian to other angular units is as follows:

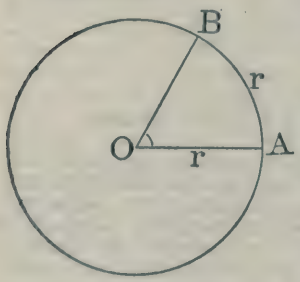

FIG. 2.

$$\frac{\text{The radian } AOB}{4 \text{ right angles}} = \frac{\text{arc } AB}{\text{circumference}} = \frac{r}{2\pi r} = \frac{1}{2\pi}.$$

Therefore, the radian equals $\frac{1}{2\pi} \times 4$ right angles $= \frac{2}{\pi} \times 1$ right angle. In degrees one radian is

$$2 \cdot \frac{90°}{\pi} = 57.29°+,$$

or, more nearly,

$$57° 17' 44.6666''+.$$

$\frac{\pi}{2}$ radians = a quadrant; π radians = 180°, and

$$2\pi \text{ radians} = 360°.$$

Since 1 radian $= \frac{180°}{\pi}$, $1° = \frac{\pi \text{ radians}}{180}$ and

$$n° = \frac{n\pi}{180} \text{ radians}.$$

The word "radian" is commonly omitted in discussions of angles; e.g., π radians $= 180°$ is expressed $\pi = 180°$.

A few of the modern theories concerning the circle are suggested by the following:

1. *Coaxal Circles.*—The radical axis XX_1 (Fig. 3) of two circles of radii r_1, r_2 is the line perpendicular to their centre line C_1C_2, and dividing

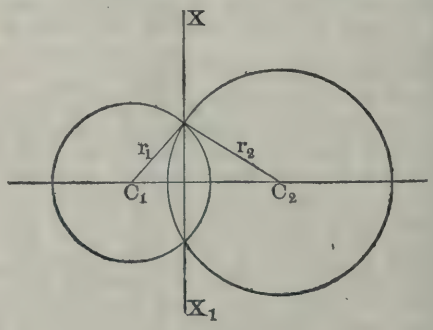

FIG. 3.

this line so that the difference of the squares on the segments equals the difference of the squares on the radii. The common chord of two intersecting circles is a segment of their radical axis. All circles having a common radical axis pass through two real or two imaginary points, and such a group of circles is called a coaxal system. If two circles are concentric, their radical axis is the line at infinity. The radical axis of two circles is also the locus of points from which tangents to the two circles are equal. If a variable polygon inscribed in a circle of a coaxal system moves so that all the sides but one touch fixed circles of the system, the last side also touches, in every position, a fixed circle of the system (Poncelet's theorem).

In analytic geometry, all circles must be regarded as having in common two infinitely distant imaginary points called the circular points at infinity. A system of coaxal circles has then really four common points, counting imaginary as well as real intersections.

2. *Inversion.*—Let O (Fig. 4) be the centre of a circle of radius r, and P, Q two points on

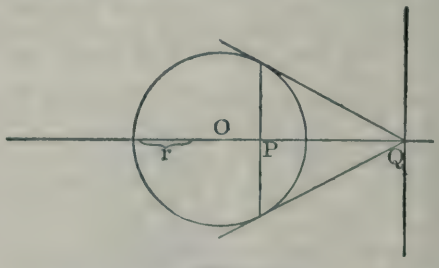

FIG. 4.

a line through O, such that $OP \cdot OQ = r^2$. P and Q are called inverse points with respect to the circle. Either point is said to be the inverse of the other. The circle and its centre are called the circle and centre of inversion, and r the constant of inversion. If every point of a plane figure be inverted with respect to a circle, or every point of a space figure with respect to a sphere, the resulting figure is called the inverse image of the given one. The inverse of a circle is either a straight line or a circle, according as

the centre of inversion is or is not on the given circle. The centre of inversion is then the centre of similitude of the original circle and its inverse; and the circle, its inverse, and the circle of inversion are coaxal. The theory of inversion was invented by Stubbs and Ingram in 1842, and has been made use of by Lord Kelvin in several important propositions of mathematical physics.

3. *Pole and Polar.*—The polar of any point P, with respect to a circle, is the perpendicular to the diameter OP drawn through the inverse point. Hence the polar of a point exterior to a circle is the chord joining the points of contact of the tangents drawn from the external point. Any point P lying on the polar of a point Q has its own polar passing through Q. The polars of any two points, and the line joining the points, form a triangle called the *self-reciprocal* triangle with respect to the circle, the three vertices being the poles of the opposite sides.

4. *Involution.*—Pairs of inverse points, P, P'; Q, Q'; etc., on the same straight line, form a system in involution, when the relation between them is $OP \cdot OP' = OQ \cdot OQ' = \ldots = r^2$. Here the inverse points are usually called *conjugate points*. Any four points whatever of a system in involution on a straight line have their anharmonic ratio (q.v.) equal to that of their four conjugates.

5. *Nine-Points Circle.*—The intersection of the three altitudes of a triangle is called the orthocentre. The mid-points of the segments from the orthocentre to the vertices constitute three points, the feet of the altitudes three more, and the mid-points of the sides of the triangle three more—all nine lying on the circumference of a circle, called the *nine-points circle*.

In Fig. 5, O is the orthocentre and K, L, G, D, M, E, H, N, F are the nine points.

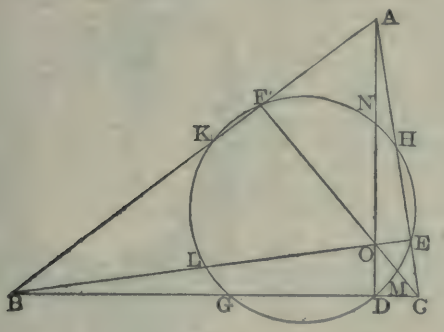

FIG. 5.

6. *Seven-Points Circle* (Brocard circle).—Point S in Fig. 6, so placed that its distances from the sides of the triangle ABC are proportional to the lengths of the respective sides, is called the symmedian point of the triangle. Lines through this point parallel to the sides cut them in six points, D, E', E, F', F, D', which lie on a circle called the triplicate-ratio or Tucker circle. If lines were drawn through A, B, C, parallel to the sides of the triangles DEF, $D'E'F'$, they would intersect one another and $F'E$, DE', FD' in P, P', L, M, N. These five points, together with S and the circumcentre of the triangle, lie on a circle called the seven-points or Brocard circle. P, P' are called the Brocard points.

CIRCLE, MAGIC. A space in which sorcerers were wont, according to the ancient popular belief, to protect themselves from the fury of the evil spirits they had raised. This circle was usually formed on a piece of ground from 7 to 9 feet square, in the midst of some dark forest, in a churchyard, vault, or other lonely and dismal spot. The circle was described at midnight in certain conditions of the moon and weather. Inside the outer circle was another somewhat less, in the centre of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines that inclosed the larger one, were filled "with all the holy names of God," and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this circle, the magician, it was believed, would have been carried off by the spirits, as he would have been had he by chance got out of the charmed space.

CIRCLE, MERIDIAN. See MERIDIAN CIRCLE.

CIRCLE, MURAL. See MURAL CIRCLE.

CIR'CLEVILLE. A city and the county seat of Pickaway Co., Ohio, 25 miles (direct) south of Columbus; on the Scioto River, the Ohio and Erie Canal, and the Cincinnati and Muskingum Valley and the Norfolk and Western railroads (Map: Ohio, E 6). It was laid out in 1810, on the site of a prehistoric circular fortification (described in Howe's *History of Ohio*), from which the name is taken. Circleville contains a county infirmary, a children's home, and a home and hospital for old ladies. The surrounding country is very fertile, and the city has extensive strawboard works, canneries, and flour and corn-meal mills. Settled in 1806, Circleville was incorporated as a village in 1814, and as a city in 1853. It is now governed, under the Ohio Municipal Code of 1902, by a mayor, elected biennially, and a council. One of the city's historic places is the Logan Elm, where John Logan

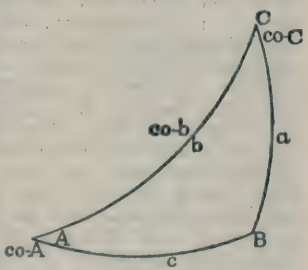
(q.v.), the Indian chief, made his celebrated speech. A park has been laid out at the place. Pop., 1890, 6556; 1900, 6991; 1910, 6744.

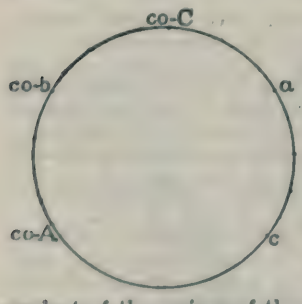
CIR'CUIT (Fr. *circuit*, from Lat. *circuitus*, from *circuire*, *circumire*, to go around; from *circum*, around + *ire*, to go). A territorial division, within which a court of justice is held at stated times and places. The practice of dividing England into circuits, and assigning to each division judges whose duty it is to hold court therein at prescribed places and terms, became settled during the reign of Edward I. As early as the first Magna Charta, in 1215, it was provided that certain *assizes* (q.v.) for the recovery of lands should always be taken in the counties in which the lands were situated, and that two justices of the King should be sent to each county four times a year for that purpose. But the evils arising from the remote and irregular sittings of the King's court (*curia regis*) were not obviated until the end of that century. This early arrangement of circuits has been modified from time to time, and it is now regulated by the Judicature Act of 1875 and an order in council of 1876. In the United States there are two classes of circuits—one belonging to the judicial system of the Federal government, the other to that of the State. For a description of the several courts designated as circuit courts, see COURT.

CIR'CULAR NOTES. See CREDIT, LETTERS OF.

CIRCULAR NUMBERS. Numbers whose powers end with the same figure as do the numbers themselves: thus, the numbers ending with 0, 1, 5, 6; for any power of any one of these also ends with 0, 1, 5, 6 respectively.

CIRCULAR PARTS. The five elements involved in a rule for solving right-angled spherical triangles, formulated by John Napier (q.v.). The five parts, *c*, *a*, complement of *A*, complement of *C*, and complement of *b*, as indicated in the triangle, when arranged on the circumference of a circle, admit of the following selection: Any part, as *co-C*, has two adjacent parts, as *co-b*, *a*, and two opposite parts, as *co-A*, *c*. The rules of Napier connect these by the following mnemonic: The sine of the middle part equals the product of the tangents of the adjacent parts, and the sine of the middle part equals the product of the cosines of the opposite parts.





CIR'CULAT'ING DECIMALS. Decimals in which one or more figures are continually repeated in the same order, e.g., 0.333 . . . ., 0.25666 . . . . , 0.3172172 . . . . , are circulating decimals. These are sometimes called repeating decimals, and the figure or set of figures repeated is called the *repetend*. If the repetend begins at the decimal point, the decimal is called a pure circulate; otherwise the decimal is called a mixed circulate; e.g., 0.2727 . . . . is a pure circulate, but 0.25999 . . . . is mixed. If the repetend contains but one figure, it is called simple—otherwise, compound. If the first figures of repetends are of the same order, the repetends are said to be similar; and if they end with figures of the same order, they are said to be conterminous; e.g., 0.639292 . . . . and 0.253232 . . . . are both similar and conterminous. Periods over the first and last figures of the repetend serve to indicate that a decimal is a circulate; thus, $0.2\dot{7}\dot{3}=0.27373\ldots$. Operations with circulating decimals may be performed in the usual way, or the circulates may be reduced to common fractions. This is usually done by applying the formula for the sum of an infinite geometric progression. (See SERIES.) Thus, $0.\dot{3}\dot{5}$ is the same as $0.35 + 0.0035 + 0.000035 + \ldots$, in which the first term is 0.35 and the rate 0.01; hence, the sum is

$$\frac{0.35}{1-0.01} = \frac{0.35}{0.99} = \frac{35}{99}.$$

That this fraction is the same as the decimal 0.35 may be seen by division.

CIRCULATING MEDIUM. See MONEY.

CIR'CULA'TION (Lat. *circulatio*, circular course, from *circulus*, circle, dim. of *circus*, circle). A term used in anatomy and physiology to designate the course of the blood through the blood vessels. A knowledge of the heart, arteries, capillaries, and veins is essential to a complete understanding of the subject of circulation; but by means of a diagram (Fig. 1) we can indicate the circulation of the blood in a general way. The shaded part of Fig. 1 represents the vessels carrying the venous blood, which has given up its oxygen to the body and taken in exchange carbonic-acid gas. The unshaded diagram represents the vessels filled with oxygenated or arterial blood. The heart is shown here as composed of four chambers, of which the two right belong to the circulation of venous blood and the two left to that of arterial blood. The blood from the whole body is brought to the right auricle of the heart (*c*) by two large veins, the superior vena cava and the inferior vena cava, both represented by *d*. By the contraction of this chamber the blood is forced through the right auriculo-ventricular opening into the second chamber of the right side of the heart, the right ventricle (*v*). and this by its contrac-

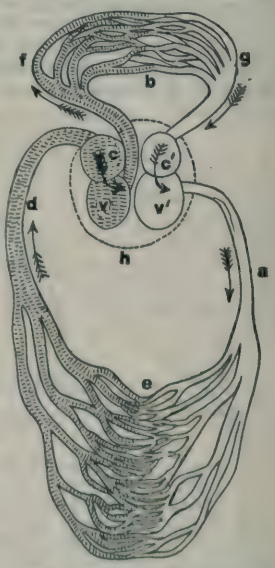

FIG. 1. Circulation of the blood: *h*, heart; *v*, right ventricle; *v'*, left ventricle; *c*, right auricle; *c'*, left auricle; *a*, aorta; *d*, vena cava; *e*, greater circulation; *b*, smaller circulation; *f*, pulmonary artery; *g*, pulmonary veins.

tion drives the blood to the lungs in the direction of the arrow pointing to *f*. The blood is prevented from returning into the auricle by the tricuspid valve, which completely closes the auriculo-ventricular opening during the contraction of the ventricle. In its passage through the lungs the blood is purified and oxygenated, and then is brought back to the heart by the four pulmonary veins, entering the auricle on the left side. When this contracts, the blood is forced into the left ventricle, and then by ventricular contraction into the aorta. The mitral valve prevents regurgitation into the left auricle, and the semilunar valve at the beginning of the aorta stops any reflux into the ventricle. Similar valves are present in the pulmonary artery. The aorta divides into branches, and these in turn into smaller ones, until the

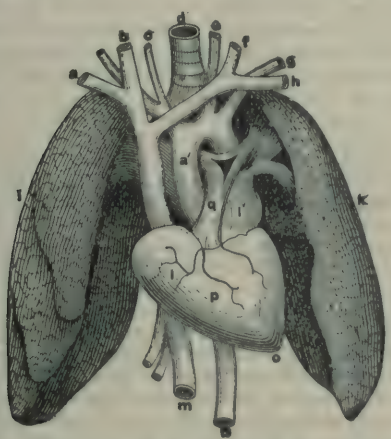

FIG. 2. The lungs, heart, and principal blood vessels in man: *a*, *h*, veins from right and left arms; *b*, *f*, right and left jugular veins, returning the blood from head and neck. These four veins unite to form a single trunk, the superior vena cava, which enters the right auricle, *l*; *c*, *e*, the right and left carotid arteries, the latter rising directly from the arch of the aorta, *a'*; the former from a short trunk called the arteria innominata; *g*, the left subclavian artery, rising directly from the aorta, while the right subclavian artery rises from the arteria innominata; *d*, the trachea or windpipe; *i*, *k*, right and left lungs; *l*, *l*, the right and left auricles; *p*, the right ventricle; *o*, the apex of the ventricle; *m*, the inferior or ascending vena cava; *n*, the descending aorta, emerging from behind the heart; *q*, the pulmonary artery.

whole body is supplied by a minute arterial plexus, or network; the smallest arteries divide into a finer network of still more minute vessels, the capillaries, which have extremely delicate walls, so that the blood can come into the closest relation with the cells of the body tissues. It is in these capillaries that the oxygen is given off, the nourishment furnished to the body elements, and the waste products taken up into the blood. The capillaries then unite to form a venous plexus, and later small veins which unite with each other to form larger ones, until all the blood is finally collected into the superior and inferior venæ cavæ, and thus brought to the heart again.

Thus there are in reality two circulations—one, a short circuit, from the right side of the heart through the lungs to the left side of the heart; and the second, a longer circuit, from the left side of the heart through the body back to the right side of the heart. In the heart the two circulations connect with each other and become continuous. In addition to the *pulmonary* and *systemic* circulations, described above, we have another subsidiary to the venous system, and known as the *portal circulation*. This is not indicated in the diagram. A certain amount of the blood of the intestines is collected into the portal vein and carried to the liver, where it traverses a capillary network in intimate relation with the liver cells. Bile is formed and other important changes are effected in the blood, which is highly charged with foodstuffs recently absorbed in its passage through the intestinal capillaries. The blood is collected a second time into veins, and carried to the inferior vena cava, where it again joins the general circulation. In its passage through other special organs the blood undergoes further modifications. See BLOOD PRESSURE; KIDNEY; SPLEEN; ETC.

The anatomy of the organs concerned is given elsewhere; they are here considered only in their mechanical relation to the circulation. The heart is situated in the anterior part of the chest, lying between the right and left lungs, and inclosed in a membranous sac (the pericardium), which consists of an outer fibrous layer and an inner serous lining. The fibrous layer is continuous with the outer coat of the large vessels, which enter and leave the heart; but the serous layer is reflected from these vessels on to the heart itself, which it entirely envelops. We thus have two sacs, the one within the other, but continuous with each other at their necks, and between the two sacs a closed cavity, secreting just enough fluid to lubricate its walls. Within this cavity the heart moves freely and with the minimum of friction. The shape of the heart is pyramidal; it is suspended nearly in the midline by the large vessels at its base, which firmly fix this portion; but otherwise the organ lies wholly free in the pericardium in a direction obliquely downward and to the left. The walls of the heart are almost entirely muscular, and the fibres are so arranged that by their contraction they diminish each cavity in all dimensions and drive the blood forward with great force. The work accomplished by each contraction of the two ventricles together is estimated at about 4.5 foot pounds. On this basis Houghton computes the total work of the heart in 24 hours at approximately 124 foot tons, or over 7.5 horse power.

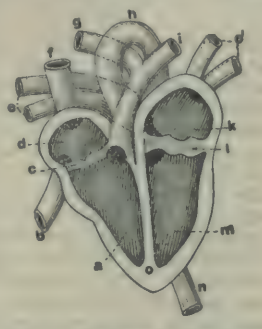

FIG. 3. Section of the human heart: *f*, *b*, the two vena cava opening into *d*, the right auricle; *a*, the right ventricle, from which proceeds the pulmonary artery, dividing into branches *g* and *i*, going to the right and left lungs respectively; *e*, *e'*, the pulmonary veins (two from each lung) entering into the left auricle, *k*; *l*, the mitral valve; *m*, the left ventricle, from which proceeds the aorta, whose arch is indicated by *h* and the descending portion by *n*, none of its branches being shown in this figure; *o*, the partition or septum between right and left hearts; *c*, the tricuspid valve.

In our outline of the circulation we have seen how the direction of the blood current in the heart is rendered constant by means of the cardiac valves. The heart's action consists in successive alternate contraction (systole) and re-

laxation (diastole) of the muscular walls of the auricles and ventricles. During the period of relaxation the blood flows into the two auricles from the veins, and they are gradually distended, while a certain amount of blood passes on into the ventricles through the auriculo-ventricular openings, which are patent during the entire diastole. At the end of this period the auricles are completely dilated, and their muscular walls contract and force nearly the entire contents into the ventricles. This action is very sudden, and occurs in both auricles at the same moment.

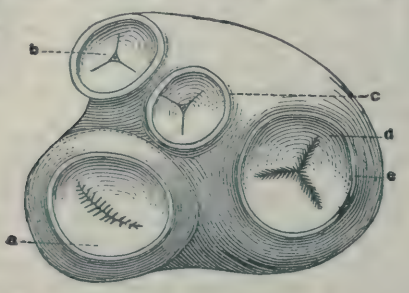

FIG. 4. Upper surface of the heart, the auricles having been removed.

The contraction begins near the entrance of the large veins and extends onward towards the auriculo-ventricular openings; in this way the reflux of blood into the veins is guarded against, and any tendency is still further counteracted by the mass of blood in the veins and by the valves which are present in the veins near their opening into the heart. The force of the blood flowing into the ventricles is insufficient to open the semilunar valves, but distends the ventricles themselves, which are still in a condition of relaxation. The tricuspid and mitral valves float upward on the blood current, and are in a position to close readily at the commencement of ventricular contraction. The ventricular systole follows immediately on the auricular systole. The contraction is slower, but far more forcible, and entirely empties the ventricular chambers at each systole. The apex of the heart is thrown forward and upward with a slight rotatory motion, and this impulse (the apex beat) is detected between the fifth and sixth ribs, slightly to the right of the left nipple. For a short time following the ventricular systole the whole heart is at rest. The entire cycle, therefore, can be divided into three periods, in the first of which the auricles contract, in the second the ventricles contract, and in the third both auricles and ventricles remain relaxed and at rest.

When we listen to the heart we hear two sounds with every beat, and these are followed by a short pause. We can roughly express their relative quality by speaking the words "lŭbb-dŭp." The first sound is dull and protracted, occurring at the same time as the apex beat, and coinciding, therefore, with the ventricular systole. This sound is supposed to be due to the vibration of the auriculo-ventricular valves and their fibrous attachments, and also, to a less extent, to the stretching of the ventricular walls and the coats of the large arteries by the tension at the moment of contraction. The contraction of the mass of ventricular muscular tissue is possibly a minor factor. The second sound is shorter and much sharper in character; it is probably dependent on the sudden closure of the semilunar valves. Diseases of the heart valves modify these sounds and enable one to detect the abnormal condition. In the healthy adult the heartbeats number about 72 per minute; but many circumstances, e.g., exercise, cause wide variations, even in health.

The arteries contain a considerable amount of elastic tissue which, by yielding, breaks the shock of ventricular systole, and thus protects the vessels from sudden pressure. This tissue also equalizes the blood current by its elastic recoil during cardiac diastole and forces the blood forward in a steady stream. It does not originate force, however, but simply restores the force expended on it by the contraction of the ventricles. Because of their elastic character, the arteries readily dilate and contract according to the total amount of blood in the body; the muscular tissue of the arteries is an additional factor here. The arteries also tend to regain their normal calibre under all circumstances, because of this same elasticity, and easily adapt themselves to the different movements of the body.

The most important function of the muscular tissue in the arteries is to adjust the size of the vessels to the amount of blood which each part of the body requires, and also to adapt the calibre to the quantity of blood that the arteries contain at any moment. The force of the muscular contraction in the arteries is probably a very slight factor in propelling the blood. The impulse of the blood, when it enters the arteries at the moment of ventricular contraction, can be felt in all the superficial arteries of any considerable size; and we designate this as the pulse. For clinical purposes it is usually felt in the radial artery at the outer side of the wrist.

In the mesentery of the frog we can trace the circulation in the capillaries by means of the microscope, and our observations here can probably, without error, be applied to the condition in man. The red blood corpuscles are seen moving along with considerable rapidity in the middle of the blood current, while the white corpuscles advance more sluggishly along the walls of the capillaries. The capillaries present a far larger surface with which the blood comes in contact than the other blood vessels, and therefore offer the greatest resistance to the progress of the blood. This resistance largely depends on the vital capillary force, so that the capillaries of themselves greatly influence the circulation. On the other hand, the condition of the arteries and veins exerts a decided control over the circulation in the capillaries which connect them. The propelling force in the veins is due to the impulse from the ventricles and, to some extent, to the pressure exerted upon the veins by the muscular movements of the body. The suction action of the heart is also a factor. The presence of valves along the veins enables them to take advantage of all the force applied. It is estimated that a portion of the blood can traverse the entire circuit of the circulation in half a minute. The circulation begins at a very early period in fœtal life and presents important modifications, which will be described under FŒTUS (q.v.). See also EMBRYOLOGY, HUMAN.

Our present knowledge of the circulation is of comparatively recent date. It was first described by Harvey, in his celebrated work, *Exercitatio de Motu Cordis et Sanguinis*, published in 1628.

CIRCULATION OF SAP. See SAP.

CIR'CULATO'RY SYSTEM, EVOLUTION OF. The organs by which fluids and sometimes gases and solids, suspended in the fluids, are transported from one part of the body to another. A circulatory system first becomes necessary when the organism gets to be of some size and a specialization of structure has taken place, so that the nutrient regions where fluid and gaseous food are supplied are far removed from the muscles, glands, and other organs which require that food, and where the excretory organs are distant from the great centres of metabolism. The circulatory system fulfills the function of transportation between the muscles and glands on the one hand, and the alimentary tract, respiratory organs, and kidneys on the other.

Lowest Forms.—In the Protozoa the body is so small that no special circulatory apparatus is necessary. The cell structure with its water spaces provides for carrying food in solution to the remotest plasm films. In the sponges the body often attains great size, but by the system of water canals penetrating all parts of the mass, food and oxygen are directly brought, as it were, to the door of every cell. Even in the Cnidaria the body wall is typically only two cells thick, so that between the external fluids and those of the cavity every cell is brought into direct contact with oxygenated water. In the Scolecida, where a true body cavity between the alimentary tract and the body wall makes its appearance, the fluids of this cavity serve to carry nutritive fluids and excreted products. The fluids of the body cavity are often set in motion by the cilia of the lining cells. In the Mollusca the body is so large and the muscular system so well developed that a more effective transporting system is necessary. This is gained by the separation of special tracts of the body cavity. In the dorsal part of the animal is a space that has gained thick muscular walls and constitutes a propelling organ or heart. The alimentary tract usually perforates the heart so that nutritive fluids by passing through the wall of the gut may reach the circulating fluid. From the heart a tubular space carries the circulating fluid to the spaces of the mantle and of the muscles and glands. These spaces are parts of the body cavity and, as in the case of the foot, some of them connect even with the outside world. The fluids in these spaces and in the gills make their way, in many cases at least, by the aid of cilia, to the heart. Oxygen is obtained both in the thin-walled mantle and in the gills. The Mollusca show thus a great advance in the specialization of a definite system of blood vessels. The echinoderms have acquired much the same or a less perfect system of blood spaces.

Annulosa.—Among segmented animals we find that many of the Polychæta have a well-defined system of blood vessels, which they have perhaps derived from the nemerteans. The system shows an advance over that of nemerteans, however; for in the latter group there is no regular circulation, whereas in the Polychæta such a circulation is established. They have a main dorsal vessel and a median ventral vessel, and a circular transverse vessel running in the body wall between the two. Vessels going to the alimentary tract get nutritive fluids, and those going to the body wall, parapodia, and gills bring back oxygen. The blood vessels contain corpuscles and often hæmoglobin. The dorsal-vessel "heart" contracts peristaltically. Not all Polychæta have a complete (closed) blood system, and in some cases the body fluid is the only circulating medium. The earthworms also have a well-developed system of vessels.

Arthropoda.—In the Crustacea there is a dorsal vessel, or "heart," but arteries and veins are often lacking, the heart pumping the general fluids of the body cavity. However, in the higher Crustacea, as, e.g., the lobster, definite vessels to the brain, muscles, gills, and alimentary tract appear, from which organs the blood is returned to the heart by blood spaces. In insects the respiratory functions of the circulatory system are largely replaced by respiratory tubes which ramify even to the muscles. There is always a heart, however, and in Arachnoidea a number of well-defined blood vessels.

In *Vertebrates* the organs of circulation are the heart, arteries, veins, and lymphatics. The heart is the central organ of the circulatory system. To it the blood is drawn by suction and is again forced out from it. The heart, as well as the rest of the vascular system, is of mesoblastic origin and appears close behind the gill clefts. Like the other large blood vessels, it is composed of layers: the outer (serous), the middle (muscular), and the inner (epithelium). Hence in origin the heart is a strongly developed blood vessel. Its complicated structure, such as occurs in the higher vertebrates, is the result of folding and swellings. The heart in the lowest of the vertebrates and in embryonic life is at first divided into two chambers with valves between them to prevent the blood from flowing backward again. One chamber, the auricle, receives the blood. The other, the ventricle, expels it to the body again. By further modification the sinus venosus develops at the venous end and the bulbus arteriosus at the arterial end. Such a condition of heart occurs at some time in the embryonic development of all vertebrates, and it is the permanent condition in many fishes. With the development of lungs, and consequently of the pulmonary artery and veins, the primitive heart is much changed. This change from gilled to lung-bearing condition may be studied in the embryonic development of all lung-bearing vertebrates. The heart of fishes is simple and, in structure, like the primitive heart described. It receives venous blood only, which it forces to the gills. In Dipnoi, where both gills and lungs exist side by side, the heart is halfway between that of fishes and amphibia. In amphibia the ventricle is single, and hence the blood in it is mixed. In many of the amphibia the ventricle is continued into a conus arteriosus, which is spirally twisted and contains a transverse row of valves. Among reptiles an incomplete ventricular septum exists in lizards, snakes, and turtles, but there is a complete one in crocodiles. The blood from the right ventricle passes into the pulmonary artery and into the left aortic arch. There are fewer valves in the heart and only one row at the beginning of the aorta and pulmonary artery. In birds and mammals there are two auricles and ventricles—that is to say, auricular and ventricular septa are complete. The ventricles are the larger and have more strongly developed walls. The blood from the head, heart, and body passes into the right auricle. In birds and mammals there is only one aortic arch. In birds it is the fourth right arch which persists, and in mammals the fourth

left. In the embryological development of birds and mammals the auricles are, for a time, in communication through the foramen ovale. Much variation exists among mammals in the mode of origin of the carotids and subclavians from the arch of the aorta. In branchial vertebrates the dorsal aorta is formed by the union above the gills of the branchial vessels. The allantois vein, which plays so important a part in reptiles and amphibia, is functional in birds and mammals only for a time in embryonic life, and from birds onward the hepatic-portal system supplants the renal portal.

The veins of vertebrates are provided with valves to prevent a back flowing of the blood.

The lymphatic system of elasmobranchs, amphibia, and, to some extent, of birds and reptiles, is provided with lymph hearts. In fishes and amphibia there are large lymph spaces, but from birds onward lymph vessels with well-defined trunks are present. The main lymph vessel is the thoracic duct, which empties in mammals into the left and in the Sauropsida into both the right and left branchio-cephalic veins. The lymph vessels, like the veins, are provided with valves which prevent a reflux of the lymph fluid. The lymph, like the blood, is composed of fluid and corpuscles. Lymphatic tissue occurs in fishes and amphibia, but lymph glands proper appear along the course of the lymph vessels, probably first in birds. In lymphatic tissue or glands the leucocytes, or white corpuscles of the blood, and lymph develop.

CIR'CUMCEL'LIO'NES (Lat. nom. pl., from *circum*, around + *cella*, cell; also called in Med. Lat. *circelliones*, by popular etymology with Lat. *circellus*, circlet, dim. of *circulus*, circle). Fanatical Donatists of the fourth century, who got their name from their habits of wandering. They rambled over the country, plundering, burning houses, and murdering those who made resistance, saying that by such means they sought the crown of martyrdom. They styled themselves *agonistæ*, wrestlers, or soldiers of Christ, and called their chiefs the leaders of the sons of the Holy One. Constantine treated them with forbearance; but his successors, Constans and Constantius, put them down with a strong hand. The name was also applied in the thirteenth century to a sect of fanatical heretics in Swabia, partisans of the Emperor Frederick II.

CIR'CUMCIS'ION (Lat. *circumcisio*, from *circumcidere*, to cut around, from *circum*, around + *cædere*, to cut). The cutting away of the foreskin, a religious ceremony practiced by many peoples in different parts of the world, and going back to a very early period of human history. It is probably a substitute for an original phallic sacrifice. Among many races the custom of cutting off the phallus of their enemies has prevailed. It is significant that the ancient Egyptians performed this mutilation only in the case of enemies who were circumcised. In order to be cut off, the phallus must be clean, i.e., fit to be offered. The purpose of such an offering, presumably to some god of fertility, would naturally be to increase the fruitfulness of those making the sacrifice. Just as the sacrifice of the first-born was intended to insure the life of those born later, so the offering of the phallus of some youth was no doubt intended to increase the fertility of the tribe. The first modification of this rite seems to have been the substitution of gelding for the removal of the phallus, the object of emasculation being attained without the loss of life. The next step, at least in some cases, appears to have been such a painful mutilation as that which Niebuhr (*Beschreibung von Arabien*, 1772, p. 1269) learned to know between Hejaz and Abu-Arish, on the Arabian coast, consisting of an incision in the skin on the upper side of the penis, extending the entire length of the organ. While very dangerous, this operation offered a chance of both life and virility. To the same stage belongs, probably, the *arilṭha*, or *mika*, practiced among the Australians, which consists of a subincision of the penis, so that the penile urethra is laid open from the meatus back to the junction with the scrotum. (Consult Spencer and Gillen, *The Native Tribes of Central Australia*, 1899, p. 263 and W. E. Roth, *Ethnological Studies among the Northwest Central Queensland Aborigines*, 1897, p. 178.) Finally, the removal of the prepuce was all that was required. In this form the mutilation was perpetuated either as a sign of the devotee, as a badge of priestly rank, or as a tribal mark. In the latter case it was generally administered as a sign of puberty and of capacity for participating in the cult, admitting the young man to the rights of cohabitation and of presenting sacrifices to the ancestors and the tribal gods. The rite retained somewhat of its sacrificial character even after it had been transferred to infancy, as was the case with some peoples. Generally the simple abolition of the prepuce was deemed sufficient. But after the Hellenized Jews had attempted to conceal their circumcision through the operation of epispasm, by which a plastic covering was effected (see 1 Macc. i. 15; 1 Cor. vii. 18; Josephus, *Ant.*, xii, 241, ed. Niese. Celsus, xxv, 1), the complete exposure of the glans was made an indispensable requisite to a valid circumcision. It is now universally recognized that this rite originated in religious considerations. Its value as a sanitary and prophylactic measure was probably not thought of as a reason for its observance until it was found necessary to defend it against the charge that it was a barbarous mutilation of the body. It chiefly consists in preventing masturbation and the carrying of disease through the retention of the smegma behind the glans.

From the representations of themselves on the walls of their caves it may be safely inferred that the men of the Magdalenian period of the Paleolithic age were not circumcised. But circumcision unquestionably

goes back to a period when the ancestors of the earliest civilized nations still walked about naked. (Stade, *Biblische Theologie des A. T.*, 1905, p. 147.) It seems to have been practiced already among the aborigines of the Nile valley, who probably belonged to the same race as the Libyans. A man belonging to this race, gored by a bull, on one of the oldest monuments is manifestly circumcised. (Consult *Bulletin des correspondances helléniques*, 1892, and Steindorff, in *Ægyptiaca*, 1897, p. 129.) The dynastic Egyptians were from the first familiar with the custom. Whether the rite was limited to the priestly classes or generally practiced among the Egyptians in earlier times is still an open question. As the poor could not afford to be mummified, we are dependent upon pictorial representations, and when naked fishermen, hunters, sailors, or shepherds are represented as circumcised, it may be maintained that they are temple slaves. On the other hand, the nobles and members of the middle classes did not, as a rule, allow themselves to be represented nude. There is, however, a statue of the priest Anisakha, shown nude and circumcised (see *Guide au Musée du Caire*, 1908, p. 30), from the sixth dynasty, and there is a statue of a king of the thirteenth dynasty, also showing him nude and apparently circumcised. (Consult Bissing, in *Sphinx*, 1908, vol. xii, p. 29.) In the case of the royal mummies there is only one clear exception to the rule that they are circumcised, so far as it is possible to examine them, and that is Thothmes II. The actual performance of the operation is set forth in a bas-relief from the twenty-first dynasty in a Theban temple (consult Chabas, in *Revue Archéologique*, 1861, p. 298) and on a sculptured doorpost in the necropolis of Saqqara from the sixth dynasty (consult W. Max Müller, *Egyptological Researches*, 1906, pp. 60 f., plate 106). Those operated on in the sixth-dynasty representation are evidently youths at the age of puberty. Naville and Wiedemann infer from the evidence that circumcision was neither widespread nor religiously important, while Wilcken holds that it was practiced by the whole people, and this view is supported by Bissing, Wendland, and Elliot Smith, at least so far as the mummified classes are concerned. Foucart also regards it as having had a marked religious significance and as having probably been obligatory on the priestly classes. It is intrinsically probable that the custom was in early times generally observed among all classes. If it were not so, it would be difficult to explain how, in Josh. v. 9, the Egyptians can be supposed to have reproached their Hebrew slaves with being uncircumcised, or why Herodotus (ii, 104) should not have mentioned that, in distinction from the custom in Syria, it was limited to the priesthood in Egypt, if he found it to be so. In recent years papyri have been discovered from the Græco-Roman period showing that in the second century A.D. the Roman government sought in every way to discourage the practice and was willing to issue a license only where it was absolutely necessary, as in the case of the priesthood. It seems to be through contact with Egypt, as Herodotus maintained, that Canaanites and Hebrews came to adopt the custom. Babylonians and Assyrians do not appear to have practiced the rite. It cannot be proved that the Moabites, Ammonites, and Edomites did so before their invasion of Syria. The Philistines were not circumcised. But they were Cretans (see CAPHTOR), and, according to Egyptian representations, the Mycenæan peoples were not circumcised. From the fact that this peculiarity of the Philistines is strongly emphasized by the Hebrews, it may be inferred that the Canaanites practiced circumcision. They may have derived the custom from some aborigines akin to the proto-Egyptians and the Libyans, or from Egypt in a later time. It is quite uncertain whether the clans that afterward formed the people of Israel knew the custom before they entered Palestine. The story in Ex. iv retains the memory that the Moses clan considered itself saved from threatening destruction by the adoption of this rite from their Midianite or Kenite neighbors. Yahwe seeks the life of Moses, but spares him when his Midianitish wife Zipporah circumcises their son and touches with the foreskin the genitals of Moses, exclaiming, "Thou art to me a bloody bridegroom." The sign of Cain (the Kenite) in Gen. iv has been thought by some scholars to be circumcision. (See CAIN.) This chapter seems to reflect an earlier attempt on the part of the Kenites to settle in Palestine. The people to which the Moses clan belonged do not seem originally to have had the custom. This apparently is also suggested in the story in Josh. v. Here all Israel is circumcised at Gilgal, upon "the hill of the foreskins," to remove "the reproach of Egypt" (verse 9), which seems to imply both a consciousness of the fact that Israel did not practice circumcision before settling in Palestine and knowledge of this as an Egyptian custom. That the youth of Benjamin were brought to the sanctuary called "the hill of the foreskins" to be circumcised there can be little doubt. But the shrine and the custom are likely to have been taken over from the Canaanites. No conclusion can be drawn from Gen. xvii, except that the fact that Ishmaelites practiced circumcision in the thirteenth year was traced back to the mythical ancestors of both Ishmaelites and Israelites. The story of Dinah in Gen. xxxiv suggests that the Hivites in Shechem were forced to accept circumcision by Israelitish tribes; but this may in reality show that the custom existed among the Hivites and had to be accounted for. It prevailed in some parts of Arabia before Mohammed, and, though not mentioned in the Koran, it has been retained by the nations accepting Islam. There is no serious objection to the assumption that everywhere in the Semitic world it goes back to Egyptian, and ultimately Libyan, influence. Whether the Colchians (Karki, Kashki) originally practiced circumcision—and this might be taken as an indication of its prevalence among kindred Asianic peoples—or it was brought to them in later times by colonists from Syria or Egypt cannot be determined. It still prevails among the Mandingos, Gallas, Falashas, and many Bantu tribes in Africa, where it cannot be traced back to Moslem influence. In Central America, and among the Aztecs of ancient Mexico, circumcision, or a somewhat similar mutilation, was practiced. It is still in use among the Teamas and Manaos on the Amazon. The Otaheitans and Tongas, some Melanesians in Polynesia, and nearly all tribes in Australia have this custom. In the present state of our knowledge a transmission of the rite through historic contact cannot be affirmed, and an independent development from the same social and religious considerations is most safely assumed.

Circumcision of females, consisting of mutilation of the clitoris, is practiced in Egypt, Abyssinia, West Africa, Arabia, and other countries. It was already known to Strabo, and it is referred to as a custom in Egypt in a Greek papyrus now in the British Museum. (Consult Müller, *l. c.*). As it is very generally found where male circumcision prevails, it is probably analogous in its history and development to the latter. The opposition to circumcision began with some of the Hebrew prophets (Jer. iv. 4; ix. 25–26). But it was the struggle reflected in the Pauline literature that eliminated this religious rite from the Christian usage, except in isolated instances, such as the Abyssinian church. Consult: R. Andree, "Die Beschneidung," in *Archiv für Anthropologie*, vol. xiii, pp. 53 ff. (1880); Ploss, Geschichtliches und Ethnologisches über die Knaben-Beschneidung," in *Archiv für die Geschichte der Medicin*, vol. viii (1885); Tomes, *Della circumcisione*, pp. 37–71 (1895); Salomon, *Die Beschneidung* (Brunswick, 1844); Glassberg, *Die Beschneidung* (Berlin, 1896); Zaborowski, in *Bulletin de la Société d'Anthropologie de Paris* (1893); Ploss-Bartels, *Das Weib* (9th ed., 1908, vol. i, pp. 261 ff.); Lewis Spence, *The Mythologies of Ancient Mexico and Peru* (1907); Wellhausen, *Reste arabischen Heidentums*, pp. 174 ff. CIRCUM'FERENCE. See CIRCLE.

CIR'CUMFLEX (Fr. *circonflexe*, Lat. *circumflexus*, p.p. of *circumflectere*, to bend round, from *circum*, around + *flectere*, to bend). A mark used to denote an original rising and falling in the pronunciation of a long vowel. In Greek the signs used are ~ ^; in Latin the sign is ˆ. The last sign is sometimes used instead of the macron to denote simple length. As a sign of Greek accentuation it is used in certain cases to indicate the long vowel of the last syllable or of the penult of a word. The presence of a circumflex accent in a French word generally indicates that the vowel has been lengthened due to a contraction, a consonant, often an *s*, having originally stood between the vowel and the succeeding consonant; e.g., fête (feste), abîme (abisme), âpre (aspre), âme (anme). Hence the circumflex, or contracted, verbs, so called because of the circumflex accent which, in these French verbs, surmounts most usually, after the contraction, the last syllable of the first person of the present indicative.

CIR'CUMNUTA'TION (from *circumnutate*, from Lat. *circum*, around + *nutare*, to nod). A special case of NUTATION (q.v.).

CIR'CUMPO'LAR STAR (Lat. *circum*, around + *polus*, pole, axis). Any star which, in the apparent daily revolution of the sky, does not pass below the horizon of the observer; or, in familiar language, does not set. It will be remembered that the apparent daily motion of the stars is in reality the result of the actual rotation of the earth upon an axis which passes through the centre of the earth and a point in the sky, near the north or polar star, and that the lines in which the stars seem to move—called lines of diurnal motion—are the circumferences of circles perpendicular to this axis. If an observer is at the equator, the axis lies in the observer's horizon, the circles of diurnal motion are all perpendicular to the horizon, and all stars seem to rise and set. If the observer is at a distance from the equator—for example, in latitude 10° N.—the northern end of the celestial axis is raised 10 degrees above the horizon, and any star which is within 10 degrees of the north pole of the sky will not pass below the horizon in its apparent motion about the pole. The largest circle of the sky that can be drawn about the pole without passing below the horizon of the observer is called the circle of perpetual apparition. A similar circle drawn about the opposite pole, without coming above the horizon, is called the circle of perpetual occultation, and the stars within that circle are never visible to the observer.

CIRCUMSCRIBED AND INSCRIBED FIGURES. In plane geometry a curve is said to be circumscribed about a polygon when it passes through all the vertices of the polygon, and in that case the polygon is said to be inscribed in the curve. A polygon is said to be circumscribed about a curve when all of its sides are tangents to the curve, and in that case the curve is said to be inscribed in the polygon. Thus, a circle can be circumscribed about or inscribed in any regular polygon. Surfaces, too, may be circumscribed and inscribed; e.g., a pyramid whose lateral faces are tangent to the surface of a cone is a circumscribed pyramid, the cone being then inscribed in the pyramid. The mensuration of the circle, sphere, cone, and cylinder may be effected by means of circumscribed and inscribed figures, with the aid of the theory of limits (q.v.). Thus, the perimeters of the circumscribed and inscribed regular polygons of a circle may be computed, and the circumference be taken, as the limit of either as the number of sides is indefinitely increased. When the diameter is 1 unit, this circumference becomes 3.14159 .... units, which number expresses an approximation of π. See CIRCLE.

CIR'CUMSTAN'TIAL EVIDENCE. Evidence of facts and circumstances which surround, and are connected with, the particular facts to be proved, and which, taken together, the court and jury may reasonably consider as tending to prove or negative the particular facts sought to be established in the case before them. Circumstantial evidence is most frequently called for in criminal cases; especially where the crime is secretly committed, as murder by poison sent by mail, in which case there is generally little positive and direct evidence that the accused committed the act with which he is charged. The circumstances precedent to and connected with a crime may so associate the accused with the crime that an inference of guilt would be the only one that could reasonably be drawn from such circumstances; in which case there

may be a conviction, even though there is no one who can testify, from actual knowledge, that the accused committed the act. See EVIDENCE.

CIR'CUS (Lat. *circus*, ring, circle). The name given by the Romans to the space in which they held horse races, chariot races, and, later, athletic contests and conflicts of wild beasts with one another or with men; they derived the name from the circuit made by the horses and the chariots as they raced. Many sports originally held in the Forum were afterward held in the Circus; in the Forum or in the Circus, for about two centuries, the contests took place which after the time of Julius Cæsar were held in the amphitheatre (q.v.). The Circensian games proper (i.e., horse and chariot races) were alleged by tradition to have originated in the time of Romulus, in honor of a Latin god Consus, identified, as a deity of horses, with Neptune. At these games, tradition further said, occurred the Rape of the Sabine Women. For these and similar games, later, a space was marked out in the long, narrow, level valley, between the Aventine and the Palatine hills, known as the Vallis Murcia; the horses and the chariots raced round an altar of Consus, which, save during the period of the games, was buried in the ground. This altar to Consus still existed in the time of Tacitus. Tarquinius Priscus, after capturing the Latin town of Apiolæ, gave Circensian games; at these for the first time, tradition said, wooden seats for spectators were constructed. Presently the games were held annually, and the tiers of wooden seats were made permanent and were periodically renewed. In 221 B.C. a second circus, the Circus Flaminius was built in the Campus Martius; henceforth the circus in the Vallis Murcia (see above) was known as the Circus Maximus. The wooden seats in the Circus Maximus were frequently burned and as often rebuilt; in the time of Julius Cæsar the lower seats were built of stone. Down to the time of Trajan, under whom this circus reached its greatest magnificence, the structure was several times rebuilt and the number of stone seats enlarged; the topmost portion, however, seems, even after this, to have been of wood. The masonry portions were covered inside and out by marble. In its final form, when the space for the spectators had been enlarged by additions on the slopes of the Aventine and the Palatine, the Circus Maximus, in its external dimensions, was about 2000 feet long by 625 feet wide; the arena was about 1850 feet long by 280 feet wide. In external appearance, as in the arrangements for ingress and egress of spectators, this circus finally resembled the Coliseum (see AMPHITHEATRE). There were three stories; the two lower stories had arches and engaged columns. The seats were in at least three groups, called *mæniana*, rising one above the other and receding from the arena; the *mæniana* were separated from one another by broad passages called *ambulacra* (walks) or *præcinctiones* (girdles). The front of each *mænianum* was a high perpendicular wall; this was pierced by doors called *vomitoria*, which gave entrance from staircases and crypts, or corridors beneath the seats, upon the *ambulacra*. As in the amphitheatre (q.v.), the spectators were seated according to their rank; nearest the arena was a *podium*, as in the amphitheatre. Between the *podium* and the arena was a water channel, about 10 feet wide and 10 feet deep, called the Euripus, which was meant to protect the spectators from the attacks of wild beasts. At the western end, towards the Tiber, the Circus Maximus towered high, in several stories; this part was known as the *oppidum* (town). The *oppidum* was curved, forming the arc of a circle whose centre was on the starting line of the chariot races; in its lowest story were the barriers (*carceres*) within which the chariots were kept till the trumpet gave the starting signal. The chariots were thus equidistant from the starting line; there were no handicaps. The other end of the *cavea*, or auditorium, formed a wide arc with a short radius; here was the Porta Triumphalis, by which processions entered the circus. Above the *carceres* were two boxes, one for the judges, the other for the presiding magistrate (*editor*). From the time of Augustus there was on the Palatine side a box (*pulvinar*) from which the Imperial household could view the games.

Each *mænianum* was cut into *cunei* (wedges) by numbered flights of steps, as in the amphitheatre and the theatre; each line of seats (*gradus*) was numbered. The amount of space granted to each spectator on the *gradus* was marked off by lines. According to one ancient authority the Circus Maximus contained, in Julius Cæsar's time, 150,000 seats; according to another it finally had 385,000 *loca*. Some modern authorities have interpreted the latter statement to mean 385,000 seats. An explanation accepted by many, however, is that there were 385,000 running feet of seats, which would give room comfortably for 250,000 spectators.

Through the major part of the arena ran the *spina* (backbone), a long, broad, wall which marked the arena off into two tracks for the races. On the *spina* stood two obelisks (one erected by Augustus, the other by Constantius; that erected by Augustus still stands in Rome, in the Piazza del Popolo, near the northern wall of the city). There was also on the *spina* an altar of Consus and other shrines. At each end was a shrine on which seven marble eggs were set at the beginning of the race; as a lap was run, one egg at each end was removed. Beyond each end of the *spina* stood three *metæ*, or conical pillars, of marble, which constituted the turning posts; each charioteer strove to reach the inside course and, to save distance and time, to turn as close as possible to the *metæ* (see Horace, *Odes*, 1, 1, 4).

In 221 B.C., as said above, the Circus Flaminius was built on the Campus Martius; this structure, which was much used, measured about 1000 by 400 feet. There was a circus of Caligula and Nero across the Tiber, near the Vatican; a circus of Hadrian, also across the Tiber, near his mausoleum; a circus in the gardens of Heliogabalus; and a circus of Maxentius on the Appia Via, about two miles south of the city. All these, at least in their final form, closely resembled the Circus Maximus. They all served as stone quarries down to the close of the Renaissance, so that few traces are left of any of them, except that of Maxentius. Drawings made of the Circus Maximus in the sixteenth century, when the structure was still well preserved, help to an understanding of its plan and general construction. Part of the exterior of the Circus Maximus is represented in a great oil painting, giving a bird's-eye view

of Rome in the fifteenth century; this painting, now in the museum at Mantua, is reproduced in facsimile in De Rossi's *Pianta di Roma Anteriore al XVImo Secolo* (Rome, 1879).

The circus was especially adapted for chariot races, an amusement of which the Romans became passionately fond, so much so that Juvenal (q.v.) declared that the Romans of his day cared only for *panis et circenses*, that is, free bread given by the government and the Circensian games (Juvenal, 10, 81). The race comprised seven circuits about the *spina;* from 10 to 20 races might be run in a day. The number of chariots (usually *quadrigæ*, four-horse chariots) was commonly four. Accidents were common; they are often represented on ancient monuments which portray the circus and its sports. The risk was increased by the fact that the charioteer (*auriga*) drove with the reins looped about his waist; that he might have some chance to cut himself loose he wore, within the loops of the reins, a curved knife. The charioteers were divided into four factions, or squadrons, named (*factio*) *albata, prasina, russata,* and *veneta,* from the white, green, red or blue colors worn by the charioteers, on cap or jacket. Bets and party spirit ran high, and the victor received a substantial pecuniary reward. Athletic exercises, when given in the circus, may well have been held in the large open space between the *carceres* and the *spina.* The *ludus Troiæ* was a mock conflict between young men on horseback. A regular battle was sometimes represented (*pugna equestris et pedestris*). By the formation of canals and the introduction of vessels, a *naumachia* or sea fight was occasionally exhibited; but under the Empire this form of exhibition as well as the *venatio* (contests of beast against beast, or of men against wild beasts) was gradually transferred to the amphitheatre (q.v.). (See also NAUMACHIA.) In providing for the *venatio,* vast sums of money were expended. Animals were procured from every available part of the Empire, including Africa and Asia. The exhibition afforded not only an opportunity for a display of private munificence and ostentation, but attained the importance of a political engine which none who aspired to popularity overlooked. When Pompey opened his new theatre, in 55 B.C., he is said to have given public exhibitions in the Circus for five days, during which time 500 lions and 20 elephants were destroyed.

Consult Friedländer, in Marquardt's *Römische Staatsverwaltung,* vol. iii (2d ed., Leipzig, 1885); the well-illustrated article "Circus," in Smith's *Dictionary of Antiquities,* vol. i (3d ed., London, 1890); the article "Circus" in Pauly-Wissowa's *Real-Encyclopädie der classischen Altertumswissenschaft* (Stuttgart, 1899); Lanciani, *Ancient Rome in the Light of Recent Discoveries,* 213 ff. (New York, 1889); Platner, *The Topography and Monuments of Ancient Rome* (2d ed., New York, 1911); Friedländer, *Roman Life and Manners under the Early Empire,* vol. ii (London, n. d.), a translation of Friedländer's *Darstellungen aus der Sittengeschichte des Rome* (7th ed., Leipzig).

CIR'CUS FLAMIN'IUS. A circus built about 221 B.C. in a part of the Campus Martius, called Prata Flaminia, by the Censor Gaius Flaminius Nepos, who was killed in 217 B.C. at Lake Trasimenus. Its central position made it the frequent scene of public meetings and fairs; and in it, according to Sallust, took place Sulla's massacre of 4000 prisoners in 82 B.C. The open space of the circus was used as a ropewalk in the Middle Ages, and the arcades as lime burner's kilns. All the remains have disappeared.

CIRENCESTER, sīz'e-tēr, sīs'e-tēr, *and* sīs'ĭ-tēr (AS. *Cirenceaster, Cyrenceastere*). A market town in Gloucestershire, England, on the Churn, a branch of the Thames, and on the Thames and Severn Canal, 17 miles southeast of Gloucester (Map: England, E 5). It has a large trade in agricultural produce, and is an important wool market. There are also two breweries. In the neighborhood are the well-known Royal Agricultural College, with a farm of 500 acres, 450 of which are arable, and Oakley Park, the seat of Earl Bathurst. Cirencester was the Roman *Corineum,* at the junction of the Fossway with branches of the Icnield and Ermin roads, and has traces of ancient walls two miles in circuit. Roman relics found here, such as coins, urns, etc., form an interesting collection in the local museum. Rupert stormed Cirencester in 1642, but in 1646 it was given up to the Parliament. Pop., 1901, 7500; 1911, 7631.

CIRILLO, chē-rēl'lō, DOMENICO (1739–99). An Italian naturalist and patriot, born in Grumo. He was early called to a chair of botany in Naples, afterward accompanied Lady Walpole to France and England, and on his return to Naples was appointed professor of medicine. He enjoyed the friendship of Buffon, Diderot, D'Alembert, and Franklin. When the French established the Parthenopean Republic in Naples, in 1799, he was chosen a representative and became president of the Legislative Commission. After the reëstablishment of the royal government he was sentenced to death, and, stubbornly refusing to ask for mercy, was hanged Oct. 29, 1799. His works on botany (1787) and entomology (1787) are no longer valuable. Consult Giglioli, *Naples in 1799* (London, 1903).

CIRL BUNTING, sĕrl bŭn'tĭng (Neo-Lat. *cirlus,* from It. *zirlo,* whistling, *zirlare,* to whistle, Sp. *chirlar,* to twitter). A small and very handsome European bunting (*Emberiza cirlus*), rare and local in England, often kept as a cage bird, though its song is slight.

CIRPAN, chĭr-pän'. A town of eastern Rumelia, Bulgaria, on the tributary of the Maritza, 30 miles east of Philippopolis (Map: Turkey in Europe, E 3). It is situated in a fertile fruit-producing region, and is noted for its mineral springs. Pop., 1900, 11,760; 1910, 11,863.

CIRQUE, sĕrk (Fr., circle). The name applied to basins occurring in mountainous regions at the head of narrow stream valleys and gorges. They are characterized by precipitous walls, which curve around in a semicircle, forming a natural amphitheatre. Their origin may be traced to the erosive action of converging glaciers and streamlets. See CORRY.

CIRRHO'SIS (Neo-Lat., from Gk. κιρρός, *kirrhos,* tawny). A pathological change of tissues, consisting of hardening due to increase of connective tissue. It may occur in lung, spleen, ovary, heart, stomach, and peritoneum, but is oftener found in kidney or liver. *Cirrhosis of the kidney* (chronic diffuse inflammation of the kidney, or chronic interstitial nephritis) is a chronic inflammation of the connective-tissue elements of the kidney. In any animal tissue

subject to long-continued irritation and congestion, there is an escape of connective-tissue cells into the surrounding tissues (termed round-cell infiltration). These cells grow into connective-tissue fibres, which, as they multiply, crowd out the parenchymatous or functional elements of the organ, a process furthered by the inherent tendency of connective tissue to contract. This is the essential pathological change where cirrhosis takes place, whether in the lungs, spleen, ovary, kidney, or liver. Cirrhosis of the kidney, or chronic interstitial nephritis, is such a pathological process, resulting in a gradual substitution of fibrous tissue for the functionating elements. (See BRIGHT'S DISEASE.) *Cirrhosis of the liver*, or chronic interstitial hepatitis, consists in an overgrowth of the connective-tissue elements of the liver, at the expense of the true hepatic cells. The new tissue usually follows the line of the old connective tissue, but may penetrate the lobules. It is often irregular in its distribution. During the early stages the liver tends to enlarge, sometimes weighing 8 to 10 pounds (hypertrophic cirrhosis). Later, the connective tissue tends to contract, and the liver becomes smaller than normal (atrophic cirrhosis). The surfaces of the large livers are usually smooth, while the irregular contraction of the connective tissue in the atrophic livers squeezes the lobules, and usually results in nodular surfaces. The new connective tissue, besides causing atrophy of the liver cells, often compresses branches of the portal or hepatic veins and of the gall ducts, thus interfering with the nutrition of the liver cells, and causing stoppage of the bile current. Dependent upon the condition in the liver and the consequent disturbance of the portal circulation, various secondary lesions occur, such as dilatation of the veins, dropsy, œdema of the feet and legs, etc. Cirrhosis of the kidney and arteriosclerosis (q.v.) are frequently associated with cirrhosis of the liver, probably dependent upon the same obscure cause. See LIVER; ALCOHOLISM; DROPSY.

CIR'RHUS. A tendril (q.v.).

CIR'RIPE'DIA (Neo-Lat. nom. pl., from Lat. *cirrus*, a lock, curl + *pes*, foot). An order of small marine crustaceans (barnacles), characterized by their fixed life. The body is indistinctly segmented, attached by the head end, and surrounded by a mantle. The limbs of the trunk, six pairs (rarely less or more), are biramous, long, and tendril-like, and the circulatory system is wanting. The species are mostly hermaphroditic. The Cirripedia are closely allied to the Entomostraca. See BARNACLE, and Plate of BARNACLES. For a description of fossil forms, see CRUSTACEA.

CIR'RUS. See CLOUD.

CIRTA, sĭr'tȧ (Lat., from Gk. *Κίρτα, Kirta*, Phœn. *kereth*, Heb. *qiryat*, city). A city of northern Africa, the capital of the Numidian Prince Syphax, and an important fortress of Masinissa and his successors. Later it became a flourishing Roman colony, and the centre of Roman military roads in Numidia. It was much injured by the troops of Maxentius in 310 A.D., but was restored by Constantine and named Constantina. The modern Constantine occupies its site.

CISAL'PINE REPUBLIC (Lat. *cisalpinus*, from *cis*, on this side + *Alpes*, Alps). The name given to the state constituted in 1797 by the union of the Cispadane and Transpadane republics (respectively south and north of the Po, Lat. *Padus*), which had been established by Bonaparte in May, 1796, after the battle of Lodi. The Cisalpine Republic embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona, and Rovigo, the Duchy of Modena, the Principality of Massa and Carrara, and the three legations of Bologna, Ferrara, and the Romagna. The Republic had a territory of more than 16,000 square miles and a population of 3,500,000. Milan was the seat of the government, or directory. The Legislative Assembly was composed of a Senate of 80 members, and a Great Council of 160. The army consisted of 20,000 French troops, paid by the Republic. A more intimate connection was formed in 1798 between the new Republic and France, by an offensive and defensive alliance. The Republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but was restored by Bonaparte, after the victory of Marengo (1800), with some constitutional modifications and an increase of territory. In 1802 it took the name of the "Italian Republic," and chose Bonaparte for its President. A deputation from the Republic, in 1805, conferred on the Emperor Napoleon the title of King of Italy—after which it formed the Kingdom of Italy till 1814. See ITALY; NAPOLEON I.

CIS'CO. The name of two separate species of whitefish: (1) the lake moon-eye (*Argyrosomus hoyi*) of the Great Lakes—the smallest and most brightly colored of the whitefish; (2) the lake or Michigan herring (*Argyrosomus artedi*), occupying lakes in shallow places from Wisconsin to Alaska. Both are excellent food fish. See WHITEFISH.

CIS'IUM. See CARRIAGE.

CISLEITHANIA, sĭs'lĭt-thā'nĭ-ȧ *or* -tȧ'nē-ȧ (Neo-Lat., from *cis*, on this side + Ger. *Leitha*, a little river which forms part of the boundary between Austria and Hungary), or CISLEITHAN AUSTRIA. A name applied to that portion of the Austro-Hungarian monarchy represented in the Reichsrat in Vienna. It contains nearly 116,000 square miles and had a population of 26,150,708 in 1900 and 28,571,934 in 1910, or considerably more than half of the total population of Austria-Hungary.

CISPADANE (sĭs-pā'dān) **REPUBLIC.** A republican state of Italy, which comprised Modena, Reggio, Ferrara, and Bologna. It was merged in the Cisalpine Republic (q.v.) in 1797. It took its name from the Padus, or Po, which divided it from the Transpadane Republic. It was established in 1796 by Napoleon I after the battle of Lodi.

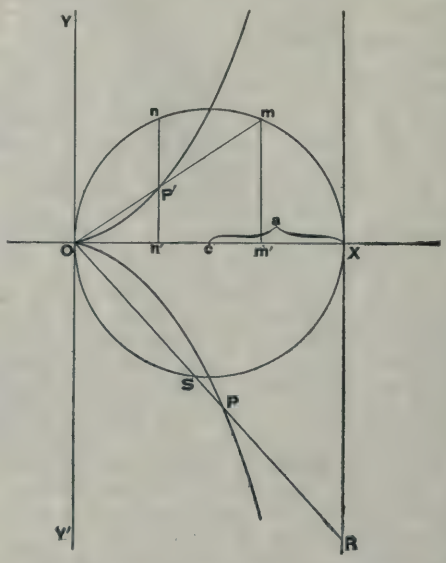
CISPLATINE (sĭs-plā'tĭn) **REPUBLIC** (Sp. *República Cisplatina*, from Lat. *cis*, on this side + Sp. *Plata*, the river dividing Uruguay from the Argentine Republic). The name of the Republic of Uruguay from 1828 to 1831. It had previously belonged to Brazil and had borne the name of the Cisplatine Province.

CISSAM'PELOS (Gk. *κισσάμπελος, kissampelos*, from *κισσός, kissos*, ivy + *ἄμπελος, ampelos*, vine). A genus of plants of the family Menispermaceæ, of which some of the species possess valuable medicinal properties, particularly *Cissampelos pareira*, a native of the West Indies and South America, the root of which was formerly thought to be that called Pareira brava. The plant is called "velvetleaf" in the West Indies, from the peculiar and beautiful appearance of the leaves. It is a climbing shrub, with round leaves, racemes of small yellow flowers, and

small, hairy, scarlet berries. The root of *Cissampelos* appears in commerce in pieces of 2 or 3 feet long, varying ½ to ¾ inch in diameter, tough, but so porous that air can be blown from end to end of it. It is dark brown externally and light yellow within. It has a sweetish, afterward nauseous, taste; is used as a tonic and diuretic, appears to exercise a specific influence over the mucous membrane of the urinary passages, and is administered with advantage in chronic inflammation of the bladder. Formerly this plant was supposed to yield all of the Pareira brava on the market; but now it is rare, its place being supplied by the roots of *Chonodendron tomentosum*, a plant of the same family found in Brazil, Peru, and elsewhere in South America. The root of this species, as found in the market, is of a grayish color, pale brown within, and with a waxy appearance when freshly cut. The roots vary from ½ inch to 3 inches in diameter, are longitudinally furrowed, and in sections show concentric markings. Another kind is also found in the American market, which greatly resembles *Cissampelos pareira*, but its exact botanical origin is not known. The properties of all are the same. They contain a bitter extractive and an alkaloid, pelosine or cissampeline, said to be identical with berberine and buxine. Pareira brava was introduced into European medicine in the latter part of the seventeenth century. In Brazil, in addition to its other uses, it is employed as a remedy for snake bites, a vinous infusion being taken internally, while the bruised leaves are bound over the wound.

CISSEY, sē'sâ', Ernest Louis Octave Courtot (1811–82). A French general. He was born in Paris and was educated at the school of Saint-Cyr. Having served with distinction in Algeria and the Crimea, he was promoted in 1863 to be general of a division. He fought in the Franco-German War and in the contest against the Commune of 1871. He was elected to the National Assembly in 1871, was Minister of War from 1871 to 1873, in 1874–75 and in 1875–76, and was elected life senator in 1875. In 1880 he was accused of intimacy with a German spy, but was acquitted in 1881.

CIS'SOID (Gk. *κισσοειδής, kissoeidēs*, like ivy, from *κισσός, kissos*, ivy + *εἶδος, eidos*, shape, form). An ivy-like curve, first studied by Diocles, about 180 B.C. The commentary of Diocles sets forth the definition of the cissoid, which in modern notation will be understood from the figure. The ordinates mm', nn' are equidistant from the centre c, and the line Om cuts nn' in P', a point on the cissoid. A more general construction is the following: Draw any line OR from O to XR, and take $RP=OS$. Then P will be a point on the curve. The Cartesian equation of this curve is $y^2=\frac{x^3}{2a-x}$, and the polar equation is $r = 2a \tan \theta \sin \theta$. (See Analytic Geometry.) The curve passes through the points (a, a) and $(a, -a)$, is symmetric with respect to the X-axis, and lies between the Y-axis ($x = 0$) and the asymptote XR, whose equation is $x = 2a$; the origin is a cusp of the first species. (See Curve.) Huygens expressed the lengths (rectified it) of an arc of this curve limited by any two points in 1661. The area of the space included between the two branches and their asymptote was first given by Fermat (1661); it is equal to three times the area of the generating circle. If, instead of the circle, any other curve is taken as the generatrix, the resulting curve is called cissoidal. The cissoid is the pedal (see Curve) of a parabola with respect to the vertex. This curve has been used in solving two



famous problems of antiquity—the construction of two geometric means between two segments, and the duplication of the cube (q.v.). Consult: Klein, *Vorträge über ausgewählte Fragen der Elementargeometrie* (Leipzig, 1895); translated by Beman and Smith, *Famous Problems of Elementary Geometry* (Boston, 1894); Gow, *History of Greek Mathematics* (Cambridge, 1884).

CIST, Henry Martyn (1839–1902). An American lawyer and soldier, born in Cincinnati, Ohio, of Russian descent, son of Charles Cist (1793–1868), a Cincinnati journalist. In 1858 he graduated at Farmer's (afterward Belmont) College. He joined the Sixth Ohio Volunteers upon the outbreak of the Civil War and advanced to the rank of assistant adjutant in the Department of the Cumberland, being on the staff of Generals Rosecrans and Thomas. He was corresponding secretary of the Society of the Army of the Cumberland from 1869 to 1892 and practiced law in Cincinnati. In addition to 20 annual reports of the society, and numerous articles in periodicals, he wrote *Life of General George H. Thomas* (in collaboration with Donn Piatt) and *The Army of the Cumberland* (1882), in the "Campaigns of the Civil War Series."

CIST BURIAL (Welsh *cist*, from Lat. *cista*, Gk. *κίστη, kistē*, chest). A mode of disposing of the dead among various peoples, chief among whom are certain American aborigines. A cell or box of stone slabs was placed in a shallow grave, and in this the remains were placed, usually folded into the smallest possible compass, sometimes denuded of flesh, together with the mortuary sacrifices; over these a broad slab was laid, and earth was spread above, sometimes in a mound. See Archæology, American; Mortuary Customs.

CISTER'CIANS. A branch of the Benedictine Order; also known as Bernardines, from their most famous member. It takes its name

from the mother house of Cîteaux (Lat. *Cistercium*), near Dijon, which was founded in 1098 by St. Robert, abbot of Molesme. He transferred 20 of his most zealous monks from the latter house, on account of the unhealthfulness of its site, and established a small and poor monastery at Cîteaux. Robert's successor, Alberic, obtained from Pope Paschal II a confirmation of the new foundation and drew up statutes which insisted on a strict observance of the Benedictine rule. A brown habit was at first worn; soon, however, perhaps to mark a contrast with the Cluniac Congregation, this was changed to white, with a brown, and later a black, scapular. Alberic died in 1109 and was succeeded by Stephen Harding, an Englishman. He pressed the rule of poverty to the utmost, applying it to the community as much as to the individual members. This extreme strictness diminished the number of postulants, so that the future looked unpromising, when in 1112 St. Bernard, with 30 companions, joined the struggling community. The numbers now began to increase, and Stephen was enabled within two years to found four other abbeys—La Ferté, Pontigny, Clairvaux, and Morimond. Fifty years later the order numbered 343 abbeys, and by the middle of the fourteenth century more than 700—in France, Germany, England, Ireland, Spain, Portugal, Norway, and Sweden. The austere and holy life of the early Cistercians won them universal respect and a vast influence throughout Christendom. They produced few great writers, but were indefatigable in collecting and copying manuscripts for their libraries. Practical matters, however, were not neglected in their zeal for literature and art; in England the order was a main cause of the growth of the wool industry.

After this golden age followed a period of decline. The rule was less strictly observed; many disorders crept in towards the end of the fourteenth century, and by the middle of the fifteenth the order had split into several congregations. The growth of luxury, the spread of the mendicant orders, and the practice of granting abbeys *in commendam* (see ABBOT) all contributed to its decay. Among the more noteworthy offshoots of the Cistercians were the Feuillants and the Trappists, and the Nuns of Port Royal in France. Before the Reformation England had 75 Cistercian monasteries and 25 nunneries. Among the English abbeys were Furness, Fountains, Woburn, Tintern, Kirkstall, and Rievaulx. Between internal decline and the hostility of various governments in modern times, the great majority of the Cistercian houses have ceased to exist. They are represented by a few in Italy, Switzerland, Belgium, and Austria, one in England (at Mount St. Bernard, near Leicester), and two in Ireland.

The influence of the Cistercians in art is sufficiently important to call for a separate treatment. When St. Bernard directed the policy of the order, he used it to carry out, among other things, his ideas as to the function of the fine arts. He wrote and preached against the current artistic extravagances in the construction, decoration, and furnishing of churches. As the order spread throughout the world during the twelfth century, it carried with it these ideas, some of which (for example, the invention of a single, low, wooden bell tower) were even expressed in the constitutions of the order. Cistercian artists, therefore, were architects, and of the constructive rather than of the decorative school. This is the only order that can boast of having consistently carried out an æsthetic ideal and had a style of its own, similar in whatever land it appears, and little affected by local art. Everywhere the order exercised a strong influence. The Dominicans and Franciscans borrowed from it many of the peculiar traits of their churches. The Cistercians adopted at once the vaulted type and were the pioneers of the Gothic revolution, carrying its germs, in Burgundian form, to nearly every civilized country. It was not until the middle of the thirteenth century that the order had largely yielded its simplicity to the advance of the rich and harmonious style of cathedral Gothic, though before that it had begun to change in minor ways, as in allowing the use of stone in place of wooden towers. When the special mission of the order was finished, its monasteries, being in remote country districts, were often allowed to go to ruin; but many of the most notable architectural monuments of its golden period remain worthy to stand by the side of the great cathedrals. Such are the abbeys of Maulbronn, Heiligen-kreuz, Lilienfeld, and Tischnowitz, in Germany and Austria; of Chiaravalle, Fossanova, and Casamari, in Italy; of Pontigny in France; Batalha in Portugal; Veruela in Spain, and those named above in England.

For the history of the order, consult: Janauschek, *Origines Cisterciences* (Vienna, 1877); Guignard, *Monuments primitifs de la règle cistercienne* (Dijon, 1877); D'Arbois de Jubainville and Pigeotte, *Etude sur l'état intérieur des abbayes cisterciennes aux XIIe et XIIIe siècles* (Paris, 1858); Tuite, *Cistercian Order* (New York, 1906). For the architectural side of the subject, Sharpe, *The Architecture of the Cistercians* (London, 1874); Eulart, *Origines de l'architecture gothique en Italie* (Paris, 1893); and the works named in the article on MONASTIC ART.

CIS'TERN (OF. *cisterne*, Lat. *cisterna*, reservoir, from *cista*, chest). An artificial reservoir, usually of masonry or woodwork, and located either above the ground, or, more commonly, in an excavation. In places where the supply of water is intermittent, or where rain water is used, every house requires a cistern, tank, or other receptacle for storing water. Where mosquitoes abound, especially the kinds which spread malaria and yellow fever, cisterns should be carefully screened or otherwise protected so that mosquitoes cannot deposit their eggs in the water. For comparatively large supplies of water, such as are required for manufacturing and railway service, receptacles for storing water are now almost universally termed reservoirs, tanks, or standpipes. See WATER WORKS; DAMS AND RESERVOIRS.

CIT'ADEL (Fr. *citadelle*, It. *cittadella*, dim. of *città*, a city, especially a fortified city). The fortified stronghold of a city or town; hence also the strongest part of any extensive fortification. Its function in ancient systems of fortification was akin to that of the donjon or keep of a castle; it provided a refuge of last resort for a garrison driven from the other works, in which they might hold out for a while longer against the enemy while awaiting succor from the outside. The mediæval citadel was accordingly situated, as a rule, at the most commanding and externally inaccessible angle of the city walls, with one gate opening towards the town and a

sally port towards the country. Modern warfare, with its long-range artillery and external lines of defense by earthworks and masked batteries, has rendered these old-time devices obsolete.

The term "citadel" is applied not only as above, to special portions of a system of fortifications, but also to any commanding and strongly defended castle or fort dominating a town, at once for defense and refuge. The acropolises of ancient Greece (as at Athens, Corinth, Tiryns, etc.) constituted the citadels of those towns. (See ACROPOLIS.) Edinburgh Castle, the ruined citadel castle of Smyrna, and the historic fortress of Antonia at Jerusalem (not extant) are examples of citadel castles in this sense. The fortified prison of the Bastile, in Paris, deemed impregnable until the Revolution of 1789, was the citadel of that royal capital. The fortified heights of Quebec are still called the Citadel. See CASTLE.

CITA'TION (ML. *citatio*, from Lat. *citare*, to call). A mandate of a court of competent jurisdiction, commanding the person or persons named therein to appear in that court for some purpose specified briefly in the citation.

It was originally the process by which a suit was begun in the English ecclesiastical courts, which formerly had jurisdiction over orphans, decedents' estates, and matrimonial causes.

In the United States the term is most frequently used to designate the process of surrogates', orphans', probate, and admiralty courts, commanding persons interested in a proceeding in such court to appear and show cause, if they have any, why the relief demanded by the party bringing the proceeding should not be granted, or for the purpose of receiving instructions, to make an explanation, or to show cause why they should not be punished for disobedience of some order, rule, or decree of the court.

The failure to obey a personal citation—that is, one for instructions or discipline—may render a party guilty of contempt of court; but if it is merely formal, notifying a party to appear and protect any interest he may have in a certain proceeding, appearance is not insisted upon, and the party failing to appear merely waives any right to object to the proceedings in which he is cited.

In Scotch practice, the act of an officer in summoning a party to an action under a proper warrant is called "citation." The term is also employed in the civil law.

The word "citation" is also used in law in the sense of the naming of an authority; as, the citation of a reported case or a passage in a legal treatise. See SUMMONS; SUBPŒNA; PROCEDURE.

CITHÆ'RON (Lat., from Gk. *Κιθαιρών, Kithairôn*). A mountain range in Greece, between Bœotia and Attica. The highest peak is a little over 4600 feet above sea level. It is now called Elatea, i.e., 'Pine Mountain.' It was famous in Greek mythology: on Cithæron Actæon and Pentheus met their fates, and Œdipus was exposed. Platæa lay at its foot.

CITH'ARA (Lat., from Gk. *κιθάρα, kithara*, a kind of lyre or lute). A musical instrument, somewhat resembling a guitar, much used by the Greeks and Romans, who attributed its invention to Apollo. In some respects it resembled a lyre; but it was played resting on the knees, whereas the lyre stood upright between them. The cithara had a hollow body, made sometimes of tortoise shell, from which two horns branched upward, supporting a crosspiece. The strings were stretched from this crosspiece to the body of the instrument, where they were supported by a bridge. Sounds on the lower strings were produced by the fingers of the left hand; on the upper, by the plectrum. From the cithara were derived the mediæval cither, and our modern

NUBIAN KISSAR, OR CITHARA.

zither and guitar. The modern instrument most nearly allied to the cithara is the Nubian kissar. See LYRE.

CITIES OF THE PLAIN. An appellation of the cities of Sodom and Gomorrah, which were situated in the plain about the Jordan and were destroyed because of their wickedness.

CITIUM. See LARNACA.

CIT'IZEN (OF. *citeain*, from Lat. *civitas*, state, from *civis*, citizen). In its most general sense, an individual member of a political society, or state; one who owes allegiance to, and may lawfully demand protection from, the government. The original meaning of the term, as denoting a person endowed with certain rights and privileges as a native or naturalized resident in a city, a free and lawful member of a civic community, has in America become its secondary signification; its Roman meaning, as a member of a free, self-governing commonwealth, having superseded it. It is in this latter sense, also, that it is employed in the French and Swiss republics. In England, however, it is properly employed only in the narrower sense, as equivalent to *municeps;* and this is its meaning, generally, in the law of modern monarchical states, in which the relation of the citizen to the state is expressed by the term "subject." In Imperial, as well as in Republican Rome, the state continued legally to be regarded as a commonwealth of free citizens, bound together by the tie of common membership of one body. The modern relation of sovereign and subject, which has been substituted for that of commonwealth and citizen, is of feudal origin, the oath of allegiance, on which it is based, being in its essence the creation of the

feudal obligation of fidelity and obedience due from a vassal to his lord.

It will be observed, then, that the more general sense of the term "citizen"—that in which it is employed in the United States and in other modern republics—is more closely in accordance with the original and historical meaning of the word. In the free republics of classical antiquity, the term "citizen" signified, not a resident of a town, but a free, governing member of the state, just as the term *civitas*, from which we derive our "city," signified, not merely a local municipality (*urbs*), but the state at large. The confusion is doubtless due to the importance of the rôle which several of these city states—as Athens and Rome—have played in history. In the ancient cities not all the inhabitants, perhaps not all the free inhabitants, were citizens, but these constituted a class entitled to special privileges and immunities; and as these cities formed the type of free government in the ancient world, the term "citizen" soon came to mean one who possessed full civil and political rights. The Greek idea of citizenship is expressed by Aristotle, who declared a citizen to be one to whom belonged the right of participating both in the deliberative or legislative and the judicial functions of the political community of which he was a member. The right was jealously guarded, and was rarely conferred on those of foreign birth. In Rome there were two classes of citizens—one that had a share in the sovereign power, i.e., were capable of attaining the highest offices of state; the other possessing only the private rights of citizenship. These, however, included the privilege of voting in the public assembly. There, as in the United States of America and some other modern states, citizenship, though usually acquired by birth, might be attained by naturalization or special grant of the state. In the later period of the Empire Roman citizenship, so highly valued under the Republic and early Empire, largely lost its distinctive character in consequence of the gradual disappearance of the political and legal privileges which formerly attended it. In the third century of our era the constitution, or decree, of Caracalla extended it to all persons, except slaves, freedmen, and their children, under the sway of the Empire, and Justinian completed the work by extending it to all free persons.

In the United States, as has been said before, the word "citizen" is used in its broadest sense, as defined at the beginning of this article. Perhaps as simple a statement as any is that made by an attorney-general of the United States, when he said: "The phrase, 'a citizen of the United States,' without addition or qualification, means neither more nor less than a member of the nation." The same person may be, and usually is, a citizen of the United States and of the State in which he resides. The two things are not, however, necessarily coexistent; for an inhabitant of one of the Territories or of the District of Columbia is a citizen of the United States without being a citizen of a State. The converse, however, is not true; no man who is not a citizen of the United States can be a citizen of one of the States. The idea of citizenship does not necessarily involve the right of voting or of other participation in political activity, as in the Greek conception of the term, for women and minors may be citizens, although excluded from all direct political activity. The question of race does not now enter into the definition of citizenship; previous to the adoption of the Fourteenth Amendment, this could not be stated, as the possession of negro blood was before that distinctly a disqualification from citizenship; yet even before the passage of the Fourteenth Amendment this position was doubted. The decisions denying the citizenship of Indians were founded not on race distinction, but on the existence of tribal relations, which were inconsistent with full allegiance to the United States.

A citizen of the United States may be either native-born or naturalized. Among native-born citizens are included all persons born in the United States and not subject to any foreign power, including even the children of alien parents, unless the latter be ambassadors of a foreign power, but excluding untaxed Indians still in tribal relations; children born in foreign countries of fathers who were citizens of the United States at the time of birth; freedmen not recognized as citizens before the Act of Emancipation, but so recognized by that act and by the ensuing Fourteenth Amendment; Indians born in the country who have abandoned tribal relations, have entered into civilized life, and have by paying taxes recognized their allegiance; and Indians who have accepted allotments of land in severalty under the Dawes Act of 1887.

We have already said that minors and women are citizens in the meaning of the term found in the United States Constitution; it is also true that wives of naturalized citizens become citizens by their marriage, if they were not legally incapable of naturalization. A naturalized citizen is one who was originally a subject of a foreign state, but who has been received by the United States as a citizen under the acts of Congress bearing on that subject. Theoretically, treatises on international law have always doubted the power of the subject to throw off his natural allegiance, and of a state to accept the allegiance of the subject of a foreign country. But these rights have been exercised very generally; and the right of naturalization is now recognized by treaties between the United States and many foreign powers. A person who is naturalized is admitted to all the privileges and duties of citizenship; and his naturalization includes that of any minor, but not of adult, children resident at the time in the United States.

In regard to the dual relation of citizenship in the general government and in the State in which a person resides, it may be said that a citizen of the United States owes his first and highest allegiance to the general government. The relations of the two forms of allegiance have been defined as follows by the United States Supreme Court: "There is in our political system a government of each of the several States, and a government of the United States. Each is distinct from the other, and has citizens of its own, who owe it allegiance, and whose rights, within its jurisdiction, it must protect. The same person may be at the same time a citizen of the United States and a citizen of a State; but his rights of citizenship under one of these governments will be different from those he has under the other. The government of the United States, although it is, within the scope of its powers, supreme and beyond the States, can neither grant nor secure to its citizens rights or privileges which are not expressly or by implication placed under its jurisdiction. All that cannot be so granted or secured are left to the exclusive pro-

tection of the States. A citizen of the United States owes his first and highest allegiance to the general government, and not to the State of which he may be a citizen." The word "citizen" is often loosely used as synonymous with resident or inhabitant. State laws conferring the franchise upon aliens who have filed declarations of intention to become citizens are often regarded as conferring citizenship. Where a law passed for a particular purpose makes such loose use of the word, and where no question of constitutional rights is involved, the courts will interpret the word. See ALIEN; ALLEGIANCE; NATURALIZATION; SUBJECT. Consult: F. Van Dyne, *Citizenship of the United States* (Rochester, 1904); J. S. Wise, *A Treatise on Citizenship* (Northport, 1906); W. L. Sheldon, *Citizenship* (Chicago, 1905).

CITIZEN, THE. A comedy by Arthur Murphy, performed July 2, 1761, at the Drury Lane Theatre, London, and printed (as a farce) in 1763. It is founded in part on Destouches's *Fausse Agnès*.

CITIZEN. See KASZTA AFFAIR.

CITIZEN KING, THE (Fr. *le roi citoyen*). An appellation bestowed upon Louis Philippe, King of France from 1830 to 1848. He had favored the revolutionary movement in his younger days and continued, even after he had mounted the throne, to sympathize with the people, though only in a half-hearted way.

CITIZENS INDUSTRIAL ASSOCIATION OF AMERICA. An organization founded on the belief that labor unionism has taken on certain features which operate injuriously to the general interest. The association vowed itself not opposed to labor unions, but opposed many of their practices, including the closed shop, limitation of output, boycott, sympathetic strikes, compulsory use of the union label, etc. There are over 500 local associations throughout the United States. The organ of the association is *The Square Deal*.

CIT'RIC ACID (Fr. *citrique*, Lat. *citricus*, from *citrus*, citron), $C_3H_4(OH)(COOH)_3 + H_2O$. A crystalline organic substance found in various plants, especially in the fruits of the lime (*Citrus bergamia*) and the lemon (*Citrus lemonum*). The citric acid of commerce is obtained from the lemon's juice, which is made in large quantities in southern Italy, in northern Africa, in the West Indies, etc. To obtain citric acid, lemon juice is boiled (to coagulate all proteid matter) and neutralized with chalk and lime; the precipitate of calcium citrate thus obtained is decomposed by boiling with dilute sulphuric acid; on filtering, and evaporating the filtrate, citric acid crystallizes out in the form of colorless rhombic prisms, freely soluble in water, and having an agreeable acid taste. Citric acid has the property of preventing the precipitation by potash or ammonia of the hydroxides of iron and certain other metals. This property is utilized in calico printing, citric acid being employed to prevent the formation of certain colors where they are not called for. Ammonium citrate, added to solutions of ferric salts, helps produce a smooth deposit of pure metallic iron by electrolysis. Citric acid is also used in making refreshing effervescent drinks; the pure acid, or preferably lemon juice (or orange juice), is very beneficial in scurvy; formerly it was popularly believed to be an excellent remedy for rheumatism; it is also used to increase the secretion of saliva and to allay thirst in fever. It is often used in medicine in combination with iron, magnesium, lithium, quinine, etc. Chemically, as its constitutional formula shows, it is a monoxy-tribasic acid, and is therefore capable of forming three series of salts, in which one, two, or all the three of the acid hydrogens are replaced by metals. It is somewhat similar to tartaric acid, from which it may, however, be readily distinguished by testing the solubility of its calcium salt, $(C_6H_5O_7)_2Ca_3+4H_2O$, which is insoluble in potash and is more soluble in cold than in hot water. Citric acid melts at 100° C. in its water of crystallization, which it loses at 130°. If heated further to 175° C., citric acid loses the elements of water, and is transformed into aconitic acid—an unsaturated tribasic acid, having the formula $C_3H_3(COOH)_3$. Citric acid was discovered by Scheele, in 1784; its properties were investigated by Berzelius and Liebig.

CIT'RIL, or CITRONENFINK (probably corrupted from *citrine*, Neo-Lat. *citrinella*, from ML. *citrinus*, citron colored, from Lat. *citrus*, citron; so called from the color of its breast). A small, canary-like finch (*Carduelis* or *Chrysomitris citrinella*), of southern Europe, related to the American goldfinch, and a favorite cage bird in Europe for the sake of its song.

CIT'RON (Lat. *citrus*, Gk. *κίτρον*, *kitron*, citron; possibly of Semitic origin; cf. Heb. *qātar*, Ar. *qatara*, to be fragrant), *Citrus medica*, var. *genuina*. (See CITRUS.) A tree, allied to the orange and lemon, cultivated in the south of Europe, and to some extent in Florida and California. It is a native of the forests of the north of India. The citron has oblong toothed leaves; the flowers are externally of a violet color; the fruit is large, warted, and furrowed; the rind is very thick and tender; the pulp is subacid. The part chiefly valued is the rind, which is candied, preserved, and used in confectionery and for culinary purposes. The juice is sometimes employed to make a syrup; or, with sugar and water, for a beverage and for flavoring liquors. The name "citron" is also applied, in the United States, to a variety of melon resembling in appearance the watermelon, but having a firm, white, inedible core. The rind of this melon is used for preserves, like that of the true citron. See CITRUS; ORANGE; LEMON. For illustration, see Colored Plate of CITRUS FRUITS.

CIT'RONEL'LA (Neo-Lat., dim. of ML. *citro*, citron, from Lat. *citrus*, citron). The name of a fragrant ethereal oil imported from Ceylon, and used by perfumers. Under the name of *Idris Jaghi* it is often employed as an adulterant of certain aromatic oils. The application of citronella oil to the skin is recommended for keeping away mosquitoes and other insects.

CITRONELLE, sĭt'rō-nĕl'. A village and health resort in Mobile Co., Ala., 32 miles north by west of Mobile, on the Mobile and Ohio Railroad (Map: Alabama, A 4). Here, on May 4, 1865, Gen. Richard Taylor surrendered to Gen. E. R. S. Canby the last Confederate army east of the Mississippi. The Citronelle Chautauqua meets here. Pop., in 1900, 696; in 1910, 935.

CIT'RON MEL'ON. See WATERMELON.

CITRON WOOD, or **CITRUS WOOD.** The most costly furniture of Roman antiquity was made from this wood, which is probably the *Callitris quadrivalvis*—a tree of the pine family, still employed in cabinetmaking on account of

its beautiful grain. It grows in Algeria and has large and gnarled roots from which the pieces used for ornamental purposes are taken.

CIT'RUS (Lat., citron tree). A genus of plants of the family Rutaceæ, consisting of 30 or more species of trees and shrubs, most of which bear spines or thorns and are natives of India and other warm parts of Asia, but many of which are now commonly cultivated in all warm climates on account of their fruit. This genus includes the orange, citron, lemon, lime, bergamot, shaddock, pomelo, and forbidden fruit. Citrus trees are distinguished by numerous stamens, irregularly united in bundles by their filaments, a pulpy fruit with a spongy or leathery rind, and smooth seeds. The leaves and the rind of the fruit abound in volatile oil. The flowers also contain volatile oil and emit a peculiar fragrance.

CITRUS DISEASES. See ORANGE, *Diseases*.

CITTADELLA, chĕt'tà-dĕl'lȧ (It., little city, dim. of *città*, city). A city in the Province of Padua, north Italy, situated 14 miles northeast of Vicenza (Map: Italy, F 2). It has a beautiful church and botanical gardens, and manufactures cotton and woolen goods. It was founded in 1220, as a protection against Treviso, and has still retained its walls, tower, and moat. Pop., 1901, 9886; 1911, 11,332.

CITTÀ DI CASTELLO, chĕt-tȧ' dē kȧs-tĕl'lō (It., City of the Castle). A city in the Province of Perugia, central Italy, situated near the left bank of the Tiber, 20 miles east of Arezzo (Map: Italy, G 4). It is surrounded by walls of the sixteenth century, and contains several fine palaces, a cathedral of the sixteenth century, and beautiful town hall of the fourteenth century, containing a fine art collection. Although some of the first church pictures of Raphael were painted for Città di Castello, the town does not possess any originals of the master in its public collections. The chief manufactured products are silk and nails. Its commerce is of some importance. Città di Castello is the seat of a bishop, and occupies the site of Tifernum Tiberinum, destroyed by Totila. Pop., 1901, 26,439; 1911, 27,713.

CITTANOVA, chĕt'tȧ-nō'vȧ. A town in the Province of Reggio, Calabria, Italy, 31 miles northeast of Reggio (Map: Italy, L 9). It arose from the ruins of Casalnuovo, which was destroyed by an earthquake in 1783. Its present name dates from 1852. The cultivation of olives and manufacture of olive oil constitute its chief industry. Pop., 1901 (commune), 11,713; 1911, 15,145.

CITTÀ VECCHIA, chĕt-tȧ' vĕk'yȧ. Former capital of Malta, seven miles west of Valetta. It is more often known as Città Notabile. The palace of San Antonio, residence of the English governor, is near the town. Pop., 4000.

CITY (Fr. *cité*, Lat. *civitas*). In the United States, a chartered municipal corporation whose chief executive officer is usually known as the mayor. The legislatures of the various States have prescribed different requisites for the granting of city charters, the principal condition being that in respect to population. City charters vary in the degree of power they confer on the municipal authorities, the measure of local autonomy being usually, though not always, regulated by the number of inhabitants. Besides the mayor, there are, as a rule, a board of aldermen and a common council. In Great Britain the term "city" is generally applied to an incorporated cathedral town—i.e., one which is, or has been, the seat of a bishop or the capital of his see. In the sense in which it was first used in the Romance languages of modern Europe, the word "city," like its Latin original and the Greek *πόλις*, was probably equivalent to State (*respublica*), rather than to town or borough (*urbs*, *municipium*); and while the latter signified a collection of hearths and households, governed by municipal laws internally, but subject externally to the laws of the country of which it formed a part, the former was applied only to such towns as, with their surrounding districts, were independent of any external authority. The only cities in this sense now are the free towns of Germany and such of the cantons of Switzerland as consist chiefly of a town and its surroundings, as Geneva. The ancient Gauls, though composing one nation, were divided into tribes, living in different cantons, each with its town, to which the term "*civitas*" was applied; and as they also acknowledged a species of central authority, several cities sending delegates to a central one of greater extent and importance to discuss their common affairs, there is reason to believe that the term "city" was applied, par excellence, to those central places of meeting, and thus, from a very early period, signified a capital or metropolis, though not independent. See CITIZEN.

Political and Commercial Aspects. The city has always been the centre of commercial and industrial development, but its origin is to be found among agricultural peoples who possessed the fertile lands and built themselves walled towns, or took possession of some naturally fortified places, such as the Acropolis of Athens, in order to protect themselves from the attacks of the predatory tribes. Within the city, handicraft, exchange, and various industries grew up. Babylon and Egypt were full of these small communities, now buried beneath the sand. They were situated on rivers and the seacoast, and soon became centres of commerce. Large cities were a prominent feature of the ancient world; Thebes, Memphis, Babylon, Nineveh, Susa, Tyre, Carthage, and Jerusalem were great centres. Greece, for its extent and population, had many large cities. Alexandria is said to have contained over 500,000, and Rome was still larger. As capital of the Empire of the East, Constantinople succeeded Rome as the principal city in Europe. Civilization was associated with city life, as was illustrated by the use of the word "pagan" (Lat. *paganus*, dweller in a country district, where heathenism often survived much longer than in the city). In the Mohammedan East, during part of the Middle Ages, Bagdad, Damascus, and Cairo led in population, while Cordova was the greatest city of the Mohammedan West and for a time of all Europe. Compact cities grew up in the Middle Ages in nearly every European country. At the beginning of the sixteenth century, Europe had six or seven cities numbering 100,000; at the end, 13 or 14. During the seventeenth century, while civil war prevailed, although the population of Europe remained stationary, the cities increased.

A remarkable fact of the nineteenth century has been the constant increase in urban life at the expense of the rural districts. Cities have grown absolutely and proportionally in respect to the total population. This is true not only

of the countries in which industry is highly developed, like England, Germany, and the Eastern and Northern States of the American Union, but also of agricultural countries like western Canada, Australia, and Argentina. The movement towards the city made its earliest appearance in England. In 1851, 50.08 per cent of England's population was urban; in 1911, 78 per cent of the population of England and Wales lived in cities and towns. In Germany 54.3 per cent of the population lived in towns of 2000 and upward. In France over 40 per cent of the population dwell in cities. Approximately 40 per cent of the population of Belgium and Holland is found in cities; and even in Australasia, where the importance of agricultural and pastoral pursuits might be expected to lead to a dispersion of population, one third of the population dwells in cities and towns. In the United States a diffusion of the population would have seemed natural; but urban tendencies are becoming stronger, as this table shows:

YEAR	Total Population	Urban population—Cities of 2500+	Per cent of urban total
1880	50,155,783	14,772,438	29.5
1890	62,947,714	22,720,223	36.1
1900	75,994,575	30,797,185	40.5
1910	91,972,266	42,623,883	46.3

The most striking urban development naturally appears in the Eastern States. In 1910, 96.7 per cent of the population of Rhode Island lived in cities of 2500 and over; 92.8 per cent of the population of Massachusetts; 78.8 per cent of that of New York; 89.7 per cent of that of Connecticut.

The percentage of population living in cities and towns is least in the South—25.4 per cent for the South Atlantic States, 18.7 per cent for the East South Central, and 22.3 per cent for the West South Central. Even here, however, the tendency is unmistakable. The corresponding percentages for 1890 were 19.5, 12.7, and 15.1 respectively.

Another notable fact is that the population of the large cities is increasing even more rapidly than that of cities in general. In 1890 15.4 per cent of the population lived in cities of 100,000 and over. In 1900 the percentage was 18.8; in 1910, 22.1. Nearly one-tenth of the population of the United States is found in the three cities New York, Chicago, and Philadelphia.

Throughout the world the remarkable growth of great cities is of special significance, and also the manner of growth. There is great difficulty in comparing statistics because of the failure to distinguish the economic from the political unit. It is the territory economically dependent upon the large centre which continues to grow rapidly. The important point to be noted is, that the increased size of these cities is due to suburban extensions. The older portions of the city have the population displaced by business and improvements; rapid-transit facilities remove the residential portions to outlying districts, where better conditions are possible, and the congested wards do not grow except where a low class of immigrants appear. However, the incomers to the slums are largely balanced by the outgoers. Certain forms of industry are also moving to the suburbs.

The principal cause of modern urban growth is the development of mechanical industry, which gives the large city a technical advantage over the small. Conditions making urban growth possible have been the epoch-making improvements in transportation and the increased productivity of agricultural labor resulting from the application of machinery to agriculture.

A few of the effects of this agglomeration of population may be enumerated. (1) *Economic.* Great extremes of wealth are found in the cities, but the possibilities of greater production raise the average of prosperity and the standard of living. Increased taxation and municipal indebtedness make heavy demands upon the social purse. The cost of living is high, especially in rents, resulting in the horrors of overcrowding. Staples, however, are lower, and consumption can be greatly varied. The existence of an unemployed class is probably due to the immigration of a low class. Association is an aid to labor, in that it favors organization. (2) *Political.* Urban growth has meant national greatness. National stability was considered to depend upon the conservatism accompanying land tenure. As urban life increases, tenancy becomes more general; but the new forms of wealth have simply expanded property interests. Municipal government (q.v.) presents difficult problems. The population contains floating, nontaxpaying, and foreign elements; the opportunities for corruption are many, and the needs of administration require an expansion in governmental functions. (3) *Social.* Among the evils of city life are those of disease, infection, dirt, high death rate, infant mortality, overcrowding, lack of light and air, poor water, the fostering of daring criminals, the nervous tension of the life and the lack of provision for education and recreation, as well as the dangers of class antagonism. Industrial competition has weakened the tendency of cities to be the centres of radicalism, but association unconsciously strengthens social solidarity. A humanitarian movement is apparent, as instanced in philanthropic associations, while common interests have developed municipal activities broadly social in their nature. The cities are necessarily the centres of thought, culture, and progress. Urban life must be accepted as a prominent factor of civilization, whose evils are temporary and remediable. The old cities are in process of remaking; the solution of the problem is not a return to rural life, but a better adjustment to the urban environment. See MUNICIPAL GOVERNMENT.

CITY HEIRESS, THE. A comedy by Mrs. Aphra Behn (1682), based upon Middleton's *A Mad World, My Masters.* The prologue was written by Otway.

CITY MADAM, THE. A comedy by Philip Massinger, licensed May 25, 1632, and printed in 1658. It was revived at Drury Lane, April 29, 1783. The doubt which has been raised as to its entire authenticity is unfounded.

CITY MATCH, THE. A comedy by Jasper Mayne, printed at Oxford in 1639 and produced the same year, first at Whitehall, London, before the King and Queen, and then at Blackfriars. It was republished in 1659 and was revised for the stage by Bromfield, in 1755, under the title of *The Schemers*, and by Planche, in 1828, under the title of *The Merchant's Wedding.* It is a clever though rather involved piece, criticized by Pepys as "silly."

CITY MOUSE AND COUNTRY MOUSE, THE. An old fable of a country mouse invited to the home of a mouse in the city, where, while feasting on unaccustomed dainties, she is terrified by the onslaught of a cat, and is led to esteem the security of her frugal life in the fields more highly than the town luxuries with their attendant perils. The fable is a satire by Matthew Prior (1687) on Dryden's *Hind and Panther.*

CITY NIGHTCAP, THE. A play by Robert Davenport, licensed for the stage in 1624, though not printed until 1661. Ten years later, an adaptation of the play, by Mrs. Aphra Behn, appeared under the title, *The Amorous Prince.* It is included in Dodsley's *Old Plays* (1740).

CITY OF A HUNDRED TOWERS. An appellation of Pavia, Italy, from its many towers and steeples.

CITY OF BROTHERLY LOVE. A nickname given to the city of Philadelphia, Pa. The name of Philadelphia in Asia Minor, whence William Penn derived the name for his city, was itself derived from that of Attalus Philadelphus; its Greek form was Φιλαδέλφεια. The nickname is due to an erroneous assumption that the original Greek name was Φιλαδελφία and was originally a common noun meaning "brotherly love" (compare Gk. *φίλος, philos*, dear + *ἀδελφός, adelphos*, brother).

CITY OF DAVID. Jerusalem, which David took from the Jebusites and made the capital of his kingdom. The term is applied also to Bethlehem, where David is supposed to have been born.

CITY OF DESTRUCTION, THE. The city from which Christian begins his journey to the Celestial City, in Bunyan's *Pilgrim's Progress.* It represents the state of worldliness.

CITY OF GOD (Lat. *De Civitate Dei*). See AUGUSTINE, SAINT.

CITY OF HOMES. An appellation of Philadelphia, from its large number of dwelling houses.

CITY OF MAGNIFICENT DISTANCES, THE. A term applied once somewhat derisively, but now proudly, to Washington, D. C. The city was laid out at the end of the eighteenth century on so grand a scale that the belief was strong that it would never realize the ideal of its founders.

CITY OF REFUGE (Heb. *'ir miglat*). A town reserved as a temporary asylum for homicides fleeing from the vengeance of the avenger of blood. The phrase refers particularly to the Jewish form of the right of asylum, which has existed, in most primitive societies, as a device for mitigating the excesses of private vengeance and for securing some form of legal inquiry into the offense charged. Such asylum, sanctioned and protected by law, is clearly a survival from the protection which the man slayer sought and found in his own family or tribe, early law permitting the *lex talionis*, or right of retaliation, on behalf of the injured family or tribe, so long as the malefactor was at large. Asylum once having been gained, the responsibility for the crime was transferred to the community protecting the wrongdoer, the compensation due being a money payment, the amount of which was regulated by law.

According to biblical law, there were six cities in which any one who committed murder unintentionally could find an asylum (Num. xxxv.). Three of these cities—Bezer, Ramoth in Gilead, and Golan in Bashan—were east of the Jordan; the other three—Kedesh in Galilee, Shechem, and Hebron—were to the west. If the murderer reached any of these cities, he was safe from the blood avenger (Num. xxxv. 12; Deut. iv. 41–43; Josh. xx. 2–9; Ex. xxi. 13; Deut. xix. 4–10). There are certain features of the law in Numbers which are unquestionably very old. The three refuge cities to the west of the Jordan are all ancient sanctuaries, and were probably, from a much earlier period even than the Hebrew conquest of Palestine, asylums under the protection of the deities worshiped in the places named. The city of refuge is thus an institution growing out of the ancient custom, widely prevalent, which made every sacred spot, every altar as the resting place of a deity, a place of refuge, within whose domain even animals were safe from the attacks of man. The oldest Hebrew legislation (Ex. xxi. 12–14) recognizes this law of asylum, while excluding from its protection the willful murderer, who is to be seized even at the altar of Yahwe (Ex. xxi. 14). Since it was the purpose of the religious reforms instituted by King Josiah (q.v.) to recognize the sanctity of only one sanctuary—that of Jerusalem—the asylums connected with the numerous sacred places naturally lost their force. Accordingly, to overcome the difficulty involved in obliging a murderer in any part of the country to flee to Jerusalem, the six cities above mentioned were recognized as places of refuge, with eventual provision of three more in Philistia, Phœnicia, and Cœle-Syria (Deut. xix. 8–10). In the legislation in Numbers (chap. xxxv), which is supposed by many scholars to be in its present form later than Deuteronomy, further provision is made: (1) The murderer is not to go unpunished, but is to be taken from his asylum to be tried in public, in order to check lawlessness, which prevailed through the survival of the blood-feud customs to a late day; (2) the manslayer who had been acquitted was safe, upon the death of the high priest in whose time

the murder was committed, to return to his home. All privileges of the blood avenger ceased with the death of the high priest, and any violence on the part of the blood avenger would be regarded as willful murder; whereas, previous to the death of the high priest, the manslayer, even after acquittal, had to be on his guard, and, if slain by the blood avenger, his death could not be punished. In the days of Greek and Roman supremacy many cities of Syria enjoyed special privileges as asylums. Among these were Gaza, Ashkelon, Dora, Ptolemais, and in the Decapolis, Hippus, Gadara, Abila, and Scythopolis. According to Josephus (*Ant.* xiii, 2, 3) Jerusalem was included in the number. The title ἄσυλος, *asylos*, implied above everything else freedom from the duty of extraditing fugitives who had sought refuge in these cities. Consult: Schürer, *Geschichte des jüdischen Volkes*, vol. ii, p. 105 (4th ed., 1907); Benzinger, *Hebräische Archäologie*, pp. 279 ff. (2d ed., 1907). See also Asylum, Right of; Blood Feud; Blood Money.

CITY OF THE PROPHET (Ar. *Madînat an-Nabî*). An appellation of Medina, Arabia, where Mohammed took refuge in the year 622, fleeing from Mecca.

CITY OF THE SUN, The. A name given to Baalbec, which was built on the ruins of Heliopolis ('The Sun City').

CITY OF THE VIOLET CROWN, The. A name applied to Athens.

CITY PLANNING is the designing and laying out of cities and towns to meet the manifold common public needs, including not only various physical necessities, comforts, and conveniences, but also the demands of the higher life. More specifically, the object of city planning is to arrange in one harmonious whole the streets, public buildings, parks, playgrounds, and amusement and recreation centres of a given city, and at the same time to provide adequate transportation facilities by land and water, proper water and light supplies, and sewerage and drainage systems. In its broader aspects city planning also includes a consideration of the proper housing of those classes of citizens who are unable to care for their own interests, as well as the division of the city into residential, industrial, and business districts. It should also take into account what the British town planners term the "amenities of city life."

The fundamental basis of city planning is utility. The greatest utility rests on fitness of form to purpose or function, and it is out of this adaptation that the æsthetic in city planning is developed. Adornment has a place in city planning, but it should be used chiefly to accentuate the beauty and dignity of natural form and to stimulate the civic spirit by well-designed and well-placed monuments, to commemorate epochal events and illustrious persons in the history of the city. The city plan should always express the individuality of the city, as regards both its topography and the life and spirit of its people.

It is apparent, from this survey of the scope of city planning, that its successful practice calls for the services of the landscape architect, the surveyor, the engineer, the architect, the sociologist, and the financier, as well as the real-estate developer. Unfortunately most of the city planning of to-day begins and ends with the speculator in real estate, who invokes the assistance of these other agencies only so far as to him seems necessary to realize the greatest immediate personal profit from his schemes for real-estate development. Such operations are directly opposed to the spirit of city planning. Real city planning looks to the interest of the public rather than the profit of the individual, to the development of the city as a whole, instead of the mere "improving" of isolated plots, to the needs of the future as well as the present good. It is not a matter of cutting up vacant tracts into the largest possible number of lots to sell as quickly as possible at the highest possible price. Indeed, one of the objects of the city plan is to regulate and restrain a practice so detrimental to homogeneous city growth.

It is only within the past few decades—indeed, outside of Germany, it might almost be said that it is only within the present century—that there has been any approach to a well-defined art, much less a science of city planning. This is explained by the relatively slow growth, small size, and simple needs of cities up to about the middle of the nineteenth century.

In olden times cities grew subject to little rule, save natural topography and the possible fancy or rather good judgment of some powerful ruler. When there was conscious planning, there was little to be provided for except streets of light traffic, largely pedestrian, a few open spaces and public buildings for civil and religious assembly, and, quite often, walls and other military defenses.

The marvelous growth of cities in the nineteenth century was so sudden and, through the advance of the arts and sciences, the needs of city dwellers became, simultaneously with this growth, so many and complex, that there was little time and less experience to direct its development. Street space became overtaxed at the surface and above and below it, by the advent of street railways, water, gas, and sewer pipes, and telegraph, telephone, and electric light and power wires. The tall office building with the consequent crowding of people during work hours introduced new problems of transportation. All these things, combined with a score of modern city conditions, made it necessary to plan or replan streets on a different scale, corresponding to the volume and character of the traffic they bear. Congestion of population made it imperative that parks, playgrounds, and breathing spaces, adequate and accessible, become an essential part and not a decorative afterthought of the city plan. With all this many legal and financial problems arose, not all of which are yet solved. In fact, while many of the elements of city planning, like the laying out and improvement of streets, water supply and sewerage, the utilitarian and æsthetic phases of park development, and the provision of rapid means of communication, have been put on a scientific basis, many others have not, and much remains to be done to correlate the elements of city planning with each other and bring all into a harmonious whole.

Since city planning as now conceived is so largely in the formative stage, and most of its elements are treated separately in other articles, the remainder of the present article will be devoted to an outline of city planning. For the better understanding of the subject the main types of city street plans will be described, since until quite recently city planning was confined chiefly to the laying out or remodeling of street systems and open spaces. The three main types of street plans are (1) the rectan-

gular, gridiron, or checkerboard; (2) the radial or diagonal, which sometimes may more properly be called the radial and circular or polygonal; and (3) a combination of the first two. To these there may be added the designedly irregular plan.

Obviously the simplest street plan is the rectangular, since it is easily laid out and mapped or otherwise recorded and lends itself readily to the transfer of property, besides making for directness of travel, as compared with winding streets. Radial street plans facilitate the movement of street traffic to and from central points, but give many awkward-shaped lots and make it necessary to turn many corners to get to points not on the radial streets. The radial or diagonal plan, superimposed on the rectangular plan, has some advantages over either, but is still liable to leave many awkward-shaped parcels of land. The designedly irregular type of street plan, largely a modern innovation and not widely used as yet, but admirably adapted to the local conditions of some cities, has the streets laid out quite irregularly, on curves following contour lines. The curved streets so formed avoid or reduce grades and often afford a pleasing variety of street views. Diagonal streets, or streets on curves whose general direction is diagonal, may prevent overirregularity. Streets on contour lines are particularly suited for residence districts. The streets of most cities of both ancient and modern times follow the rectangular plan, if any plan at all, except where some topographical feature, such as steep hills or curved water fronts, made this impossible.

Historical Outline. According to Unwin, the earliest-known town laid out on a definite plan was built about 3000 B.C. and was the semi-permanent construction camp (called Kahun) for the pyramid of Illahun. (Consult Flinders Petrie's *Illahun*.) This town had a rectangular street plan, with drains or gutters in the centre of the street, instead of at the side as in ancient Pompeii.

The earliest-known city planner of note appears to have been Hippodamus, an architect of Miletus, a follower of Pythagoras, and probably a contemporary of Pericles. Hippodamus is credited with the plans of the Piræus (the fortified seaport of Athens), Thurii, and Rhodes (the last in 408 B.C.), and has been called "the Greek Haussmann of the fifth century B.C." The Piræus was a fortified city which had a system of broad, straight streets, crossing each other at right angles, broken at frequent intervals by open squares, and adorned with temples and monuments, and provided with an agora similar to the later Roman Forum. In its best days the Piræus was connected with Athens by the "Long Walls," which made the two cities virtually one and impregnable so long as Athens was mistress of the seas. (Gardner, *Ancient Athens*, New York, 1903.) A modern reproduction of the Piræus and the strip inclosed by the Long Walls is the territory annexed in 1909 to Los Angeles to give that California city a seaport. Another notable ancient Greek city, laid out on the rectangular plan, was Selinus, in southern Sicily, founded by the Dorians about 628 B.C. and said to have been systematically laid out by the architect Hermocrates. Its acropolis appears to date from 575 to 560 B.C. and has been the subject of recent survey, study, and conjectural restoration by Gustave Fongères and Jean Hulot. (Consult a paper by Fongères, translated by J. W. Simpson for the 1908 exhibit of the Royal Institute of British Architects, *R. I. B. A. Journal*, 3d series, vol. xv. No. 4.)

The Romans, like the Greeks, laid out cities on the rectangular plan, also taking advantage of natural features; but whereas the Greeks were ever ready to modify or abandon the regularity of their plans, in order to use hillsides or rocky eminences to give grandeur and emphasis to their public buildings, the Romans often went to great labor and expense to level the sites of their cities. (Consult Anderson and Spiers, *The Architecture of Greece and Rome*.) The plan of the typical Roman city followed the lines of the Roman military camp, with two main thoroughfares at right angles to each other, and with a forum at or near the centre. An English example of this type is the old walled town of Chester. An interesting American copy of a Roman camp is the Dutch stockaded settlement of Bergen, N. J., laid out in 1660 and now the Bergen square section of Jersey City. (Consult *Engineering News*, Feb. 8, 1912, for history and for comparative plans of Roman camp and property around Bergen Square; Vitruvius, *De Architectura*, bk. ii, chap. iv, for Roman and Greek ideas of laying out a city.)

Although it is commonly believed that the mediæval towns of Europe were almost invariably irregular in plan, Triggs states that such cities as were really planned de novo in the Middle Ages were more regular than most modern towns. In the thirteenth century 50 towns were laid out in as many years by the English in Aquitaine and Guienne. Where practicable, these were laid out on a definite rectangular system, with wide, medium, and narrow streets and a large central market place with a church at one of its corners. "The most perfect example of these English towns of Edward I," says Triggs, "is Montpazier, founded in 1284 in Aquitaine; while the best example of the sort in England is Winchester, which was founded by Edward I on a new site."

The Renaissance led Italian towns in the sixteenth century to straighten and widen their streets and lay out public places. Rome was rebuilt at this time. The movement extended to France. Bernard Palissy wrote a treatise on town planning in which he urged that the streets be laid out squarely and regularly. In Germany, also under the influence of the Renaissance, the irregular city development of the Gothic period began to give way to more regular street plans. Notable examples are Mannheim and Karlsruhe. In the former the streets are mostly rectangular with a few diagonal and one which forms a part of a ring; in the latter, founded in 1715, the streets radiate from the castle of the founder. In Scotland the newer portion of Edinburgh, dating about 1768, affords a fine example of systematic and impressive city planning.

Among the lost opportunities of replanning a poorly planned or no-planned city, London takes the lead chronologically. After the fire of 1666 the great architect, Sir Christopher Wren, laid out a new city plan for London which has aroused the admiration of city planners ever since. A combined radial and rectangular street plan, with St. Paul's Cathedral as the main focal point, was proposed. The plan was sanctioned by Parliament, but the opposition of merchants and others anxious to rebuild immediately and opposed to the delays and troubles of reparceling the land, prevented the execution

of this plan. Somewhat like this was the experience of San Francisco after the earthquake and fire of 1906. The eminent architect and leader of American city planners, D. H. Burnham, had reported on a city plan just before the catastrophe occurred, but in rebuilding the city his plan was almost wholly ignored. In like manner Baltimore after its great fire of 1904 made but slight use of the opportunity this afforded to rebuild the city on a better plan. Considerably earlier the same lack of foresight was shown by Boston after the fire of 1872.

Philadelphia, founded in 1682 by William Penn, was laid out on the rectangular plan, with a large open space at the intersection of the two broad central streets and four smaller squares in each of the quarters of the city. From that day to this the rectangular plan has been followed so generally in the United States, where any considerable area has been laid out in advance of building operations, that it has become known abroad as the American or checkerboard plan. In a city of any size the result of this plan is an unspeakably dreary monotony. A notable American example of city planning, but one which unfortunately had no great influence upon subsequent city building for over a century, is the city of Washington. The national capital was planned in 1791 by Pierre Charles L'Enfant (q.v.), under the direction of George Washington and after a study of the plans of many European cities. The base plan of Washington is rectangular, but superimposed upon it is a network of diagonal streets, with numerous parks, open spaces, and commanding sites for Federal buildings. The main focal point is of course the Capitol. In grandeur of conception and in fitness of both general plan and detail, the layout of Washington was worthy of the capital of a future great nation. With such an example before it, it might have been expected that the commission which laid out the northward extension of New York City in 1807 would have avoided the rigid checkerboard plan, unrelieved by any break except that afforded by the already located Broadway. It is said that Thomas Jefferson, who also had a hand in the planning of Washington, favored a purely rectangular street system, and it is suggested that Washington was largely responsible for the radial streets, since he was familiar with the city of Annapolis, Md., laid out on a limited scale after Wren's plan for rebuilding London, and also that, when Washington was a young surveyor, he laid out a small town near Connellsville, Pa., with radiating streets. To L'Enfant is credited the plan of the radial avenues of Buffalo.

A bold reconstruction of the plan of Paris, under the direction of Georges Eugène Haussmann, Prefect of the Seine, and after the design of M. Dechamps, architect, was carried out in 1852–70. It made use of diagonal streets and a great central parked and monumented way to open up ample means of communication through a crowded and haphazard network of streets; at the same time supplying noble vistas, closed with notable public buildings and historic monuments. A large part of the success of this great scheme, and of its continuance from its inception to the present time, is due to the creation and perpetuation of a city-planning or art commission.

Berlin, since 1862, has also followed a systematic street-plan scheme. Some of the larger Italian cities have had similar commissions for a number of decades.

RECENT CITY PLANNING TO 1913

Germany. The examples of city planning which have been mentioned thus far were isolated and sporadic and followed no well-defined and generally accepted principles. It is to the scientific and artistic spirit of the Germans, stimulated by the national and municipal growth of the last few decades of the nineteenth century, that we are indebted for the beginnings of the modern art of city planning. As early as 1876 Prof. R. Baumeister of Karlsruhe wrote a book on the planning of suburbs (*Stadteerweiterungen*), and this was followed by many other books by the same author on various phases of city planning. A great impetus was given to the movement by *Der Städtebau*, a small book first published in 1889 from the pen of Camillo Sitte, of Vienna, emphasizing the æsthetic side of city planning. About the same time appeared the larger and more comprehensive *Der Städtebau* by J. Steuben, city architect of Cologne. In 1904 there was established, by Theodor Gaecke and Camillo Sitte, an important German monthly, *Der Städtebau*. According to Unwin, the Germans followed the geometrical system until 1889. Since then, influenced in part by Sitte, they have been in danger of going too far with the irregular and picturesque. Unwin mentions Cologne as an example of the transition planning and Nuremberg, a town plan for which was completed in 1907, as one of the most beautiful of German cities. It is important to note that Sitte's studies of mediæval towns led him to conclude that their irregularity was a matter of well-considered design rather than of chance.

England. In England city planning (or town planning, as it is called) was given the serious attention of the Seventh International Congress of Architects, London, 1906. In 1909 Parliament passed the Housing and Town Planning Act, which gives local authorities broad city-planning powers, subject to control by the Local Government Board. Many local authorities have proceeded under this act, chiefly in laying out vacant or scantily populated areas. The garden city movement, or small-town and suburban development for wage earners and other people of small means, has also made marked progress in England in the last few years. Notable examples are at Bourneville, Port Sunlight, and Hampstead Garden Suburb. The *Town Planning Review* (Department of Civic Design, School of Architecture, University of Liverpool) was started in 1910 and is a valuable quarterly exponent of British and foreign ideas and practice.

United States. The inspiration for the recent city-planning movement in the United States came largely from the World's Columbian Exposition of 1893. The well-ordered disposition of buildings, land and water spaces, monuments and other features of accentuation and adornment of the "White City," made an impression upon the minds of visitors which rapidly bore fruit. Its conception, as a whole, and some of its greater parts, were due to the late Daniel H. Burnham. The awakening caused by the World's Columbian Exposition, and subsequent European visits of American architects and students of municipal problems, led to the

presentation of many papers on various phases of city planning before such societies as the American Institute of Architects. In 1900 that body listened to a number of papers on *Future Grouping of Government Buildings and Park Treatment of Washington*. The interest thus awakened led to the appointment of a Federal commission on the plan of Washington, which pointed out how largely the L'Enfant plan had been ignored for many decades and recommended that the main outlines of the plan be followed in the future. Congress subsequently authorized a number of public buildings and other improvements in accordance with the revived and revised plan. The commission was headed by D. H. Burnham, and included F. L. Olmsted, Jr., and Charles F. McKim, with whom there was soon associated Augustus Saint-Gaudens.

All this discussion and its fruition at Washington added materially to the interest in city planning the country over. Various civic organizations and more rarely cities themselves have engaged landscape architects or engineers to prepare reports. Up to the close of 1913 such reports had been made for perhaps 100 cities and towns of the United States. These reports ranged from plans affecting the general layout of the whole city to suggestions for grouping public buildings at civic centers. At the close of 1913 but little had been done to carry out the recommendations made in the several reports. Perhaps the greatest progress was on the Cleveland civic-center group and mall, a plan for which was proposed by a commission some years before, of which D. H. Burnham was chairman. The most elaborate plans, both as to scope and method of presentation, were those worked out for Chicago in 1906 to 1908 by D. H. Burnham and Edward H. Bennett, under the direction of the Commercial Club of that city and published in 1909. Some progress in accordance with these plans had been made in 1913.

In 1907 the City Plan Commission of Hartford, Conn., was created. Somewhat similar official bodies were subsequently created in Milwaukee, Chicago, Detroit, Jersey City, Newark, St. Louis, Cleveland, Pittsburgh, Philadelphia, Cincinnati, and in smaller cities. In May, 1913, there were reported 18 city-plan commissions, with many more to follow under mandatory legislation in Massachusetts and permissive legislation in Pennsylvania and New York. A Massachusetts Act of 1913 directs all cities and all towns of 10,000 population and upward (of which there are many) to create city-planning boards. In the same year New York cities and villages and Pennsylvania cities of the third class were authorized to appoint planning commissions.

Canada. In 1913 city-planning commissions existed in Calgary, Winnipeg, Regina, Edmonton, Saskatoon, and Lethbridge, and the Province of Alberta passed a Town Planning Act in 1913. The same year Calgary and Victoria called a British expert to their aid, and St. John, N. B., was engaged in wholesale modernization work.

Prince Rupert, British Columbia, described by the *Review of Reviews* (April, 1910) as a city made to order by a railway, was laid out by the Grand Trunk Pacific Railway as its western terminus. The town covers 2000 acres of hilly land at the head of a bay some 14 miles long. The site was chosen because of its excellence for a deep-water harbor on the Pacific coast. In "The Real Prince Rupert" (*Architectural Record*, July, 1913) the population was given as 4000, and it was stated that large sums of money must be expended before the city can attain the standard set by other cities in the Canadian Northwest. Prince Rupert, however, has the advantage of a definite plan to follow, which can be said of but few cities.

Australia. The Australian Commonwealth received competitive plans for a new capital in 1912, to be built on an unoccupied site in Yass-Canberra, New South Wales, in a federal district 900 square miles in area. The first prize, £1750, or nearly $8500, was awarded to Walter Burley Griffin, architect and landscape architect of Chicago, Ill. Subsequently all the designs presented were referred to a departmental commission which decided to take the best features of each and combine them into a new plan. Both this procedure and the result were severely criticized. In 1913 Mr. Griffin was invited to go to Australia to assist in further deliberations over the plans for the new capital, and early in 1914 it was announced that the government had adopted his own modification of his original premiated design. Later, it appears that Mr. Griffin's connection with the work was terminated, due to what he regarded as departmental interference with his control over the project.

Other Countries. Besides the countries mentioned, other parts of the world are taking a part in the city-planning movement. To mention only two cities: Dalny, a seaport terminal for the trans-Siberian railway, has been built on a combined rectangular and radial plan. Delhi is being replanned as the new capital of India.

CITY PLANNING AND ZONING SINCE 1913

The outbreak of the war in the middle of 1914 brought a sudden check to city-planning activities in England and on the continent of Europe. In the United States this check did not come until several years later and its effect there was not so much upon city-planning activities as upon the execution of expensive street widening and extensions and other public improvements. Even before the war was over city and town planning for the devastated regions of France and Belgium was taken up with great activity and this has continued since. The British Parliament in 1919 made important amendments or supplements to its notable Housing and Town Planning Act of 1909. Many of these were designed to meet the great housing shortage, but others were intended to give municipalities broader planning authority than they had possessed under the 1909 Act, besides requiring them to enter upon certain projects which before had been left to their option. In 1919, also, France enacted its first city-planning law (see *The American City*, November, 1919). This law provided that within three years of the time it became effective, city-planning schemes must be in force, in accordance with a statutory schedule that includes various public services and amenities. The mandate applies to every city of 10,000 population and over, all communes in the Department of the Seine, and all cities with populations of 5000 to 10,000 which show growth of 10 per cent in population between two successive quinquennial censuses. Provision is made for a French national planning commission and for departmental (district) advisory commissions. Planning projects are re-

viewed in succession by several authorities, and when finally approved each plan is declared to be a public utility. In Canada model town planning legislation designed for adoption by the several provinces was framed by the town-planning division of the Dominion Conservation Commission. By 1921 all or nearly all the Canadian provinces had passed city-planning acts applying to their municipalities and some of them had created departments to supervise the work done under the act. Early in 1922 more than thirty American State Legislatures had enacted laws having to do with some phase of city planning. By 1922 the majority of the 100 largest cities of the country had done some city-planning work and well toward 100 cities and towns had placed the matter in charge of planning commissions or of the engineering or some other branch of the city government. Immediately after the entrance of the United States into the war in 1917, engineers, architects and other city planners were pressed into service in connection with the laying out of the several cantonments. Later on, to provide housing facilities for men and women engaged in various war supply activities, the United States Housing Corporation was formed under the United States Department of Labor, with a town-planning division headed by F. L. Olmsted, a landscape architect and city planner of Brookline, Mass. The Emergency Fleet Corporation had a division of housing and transportation. Under these two federal agencies a considerable number of industrial town planning and housing schemes were carried out in accordance with the most approved modern ideas. In 1921, under Secretary Hoover of the Department of Commerce, a division of building and housing was created for purposes of investigation and advice. Zoning work was also undertaken under Secretary Hoover. In India the first city-planning legislation is the Bombay Province Town-Planning Act of 1915, under which within four years ten town-planning schemes have already been presented to the authorities.

Work Executed. At present except for the occasional creation de novo of industrial towns and garden cities and the frequent laying out of additions to old cities and towns most of the city-planning work done throughout the world is in the nature of replanning. Most of the expenditure for replanning has been for widening streets and opening up main thoroughfares or arterial highways. St. Louis, Cleveland, and various other cities through their planning commissions have made extensive studies of their need for wider and more continuous streets, along both radial or diagonal and also circumferential lines, and as a result major street plans have been adopted or proposed. In Chicago, during the ten years 1909–20, twelve major city-planning improvements, some of which were for main thoroughfares, were promoted by the City-Planning Commission and got under way. The estimated cost of these improvements totals $230,000,000. Included in this sum is bonds to the amount of $61,500,000 voted by the people, $8,000,000 of special assessments on property directly benefited, $162,000,000 to be provided by various railways for electrification, terminal and related improvements. In England and Scotland main thoroughfares or arterial roads designed for the double purpose of improving the city plan and for giving unemployment relief were being carried out in Birmingham, Bradford, Bristol, Dundee, Glasgow, Leeds, Liverpool, Norwich, Portsmouth (see *Town Planning Review*, July and December, 1921).

Education and Publicity. A number of universities offer more or less extensive courses in city planning, including the School of Landscape Architecture of Harvard, the University of Illinois, the universities of California and of Southern California. In 1921 short courses in city planning were given at Sacramento, San Francisco, and Los Angeles by the Extension Division of the University of California, with the coöperation of the California Real Estate Association. In recent years the realtors have coöperated in many other ways than the one just indicated in the city-planning movement.

Regional Planning. An extension of city planning to include two or more municipalities in one project, has been extensively advocated, but as yet has not been adopted on any large scale — except for the joint construction by groups of municipalities—of a single class of improvement, like water-works, sewers, or parks. Metropolitan and county park districts come more within the ordinary conception of regional planning than do the other classes of improvement just mentioned. The Metropolitan Park District for Boston and vicinity was a leader in this respect in the nineties and was subsequently followed by the work of the Essex County Park Commission and other like commissions in New Jersey.

Zoning. Intelligent city planning, as well as the best economy in the construction and operation of the various public works that enter into a city plan, requires a knowledge of the kinds of buildings, the purposes to which they are devoted, their height and the percentage of the area of the lots upon which they are built. In fact, it is highly desirable that all these things should be known in advance of the making of a city plan, but in the older cities the best must be made of existing conditions which have arisen in most cases without any intelligent planning whatever. To provide for the future, restrictions as to the use and height of buildings and the area of the lots built upon began to be adopted in the United States in 1916, and have become more and more common as the years have passed. Indeed, they have been the first and chief city-planning activity in many cities, particularly during the war and post-war periods when funds for the execution of city-planning work involving heavy expenditures were not readily obtainable. Zoning requires comparatively little expense, being almost wholly a matter of close study of existing and probable future conditions of city populations and industries by districts and the adoption of zoning plans and ordinances. Legal authority for zoning is based on the police power. Early in 1922 some fifty cities and towns in the United States had adopted zoning plans and probably more than a hundred had plans in progress. States that have specifically authorized their municipalities to take up zoning numbered twenty-two. The pioneer work in zoning was done by New York City (as stated more in detail below), but Neenah, Wis., is credited as having adopted a zoning ordinance before New York City, in 1915. The general scheme of the zoning plan is to divide the city into two or more each of the following districts: *Use* to which the buildings in a district may be put; *height* to which they may be carried in relation

generally to street width, but often with specific limitation except for fires in towers; the percentage of *area* of the lot which may be built upon, with which is associated limitations as to width of side yards and depth of front and rear yards.

New York City adopted zoning regulations on July 25, 1916, which became effective immediately. They were the results of three years of study by two special bodies; (1) A Heights of Buildings Commission which made a 295-page report in 1914 covering the subject both locally and generally, and (2) a Commission on Building Districts and Restrictions, Edward M. Bassett, chairman, created in 1914. The second commission made a report in June, 1916, that included the zoning regulations officially adopted the next month. These regulations were based on block-to-block studies of the entire city and were made the subject of public hearings in various parts of the city before their submission to the Board of Estimate. The New York *use districts* include residence, business and unrestricted areas. In the residence districts, new buildings for business or manufacturing purposes are permitted. In the business districts, manufacturing (except certain unobjectionable types) is prohibited, but residences may be built. *Height* of buildings is governed chiefly by street widths, but there are variations in different parts of the city. The general relation between heights of buildings and street widths is 2½ times in the financial district, twice in Central Manhattan, 1½ in the rest of Manhattan, and in some small areas elsewhere down to building heights equal to street widths. These limits are materially modified by permitting towers covering not more than one-fourth of a lot to be carried to any height and by allowing setbacks for parts of the area. *Area* limitations vary from permitting 100 per cent of the lot to be built on in warehouse districts down through other grades for various uses until in villa residential sections a house may occupy only 30 per cent of the lot and must be well separated from other houses on at least one side. The administration of the New York zoning regulations is vested in specified officers, whose rulings may be taken to a Board of Appeals. The New York zoning regulations have been upheld by the New York State Court of Appeals.

Other Cities. Other and smaller cities have followed largely the general principles involved in the New York City zoning scheme, but naturally with many variations. Some of the cities go into rather minute sub-divisions of the use, height and area districts. For instance, in an almost wholly residential suburb of a large city, great stress may be laid upon the protection of residence sections from encroachments of business and particularly of manufacturing and the residence districts may sometimes be many in number. A zoning ordinance adopted in 1921 by *Montclair, N. J.*, establishes eight use zones, of which six are for residences, one for business, and one is an industrial zone. The six residence zones are classified as villa, suburban, two-family detached houses, two-family semi-detached, and apartment house districts Nos. 1 and 2. By combining with the use restrictions limitations as to height of buildings, percentage of lot area built upon, front, rear and side yards, sizes of courts if any, the Montclair ordinance aims to control the number of families per acre that may be housed in the various residence districts.

Civic Centers. The grouping of public buildings has been one of the chief concerns of American city planners, and perhaps affords, next after street widenings and extensions, the largest number of notable instances of the execution or partial execution of city plans in this country. Cities that have led in this respect have been *Washington* and *Cleveland* (already mentioned), *San Francisco* and *Denver*. At *Springfield, Mass.*, the "municipal group" includes a campanile flanked on either side by a city hall and auditorium.

Bibliography. Consult the *New International Year Book* 1912 to date, for further details of the modern city-planning movement and articles on leading American and foreign cities in this ENCYCLOPÆDIA, as well as the various travelers' guidebooks, atlases, etc., and the books cited below for plan of cities. For some 600 titles, consult *Select List of Works Relating to City Planning and Allied Subjects*, prepared by the New York Public Library for the City Planning Exhibit held in New York City in 1913. This list includes earlier bibliographies, periodicals, general works, American and foreign, city and town planning reports, garden cities, parks, water supply, sanitation, etc. AMERICAN books are: Robinson, *The Improvement of Towns and Cities* (New York, 1901); Robinson, *Modern Civic Art* (New York, 1903, illus. ed., 1904); Nolen, *Replanning Small Cities* (New York, 1912); Wacker's *Manual of the Plan of Chicago, especially designed for Study in the Schools of Chicago* (Chicago, 1912). Particularly valuable from an economic viewpoint and for its many typical city-street plans is Hurd's *Principles of City Land Values* (New York, 1905); from another viewpoint see chapters 2, 8, and 9 of Weber, *The Growth of Cities in the Nineteenth Century* (New York, 1899). BRITISH: Triggs, *Town Planning, Past, Present and Possible* (London, 1909); Unwin, *Town Planning in Theory and Practice* (London, 1911); Mawson, *Civic Art* (London, 1912); Bentley and Taylor, *Housing, Town Planning, etc., Act, 1909* (text and exposition of the British Town Planning Act, London, 1911). GERMAN: Baumeister, *Stadterweiterungen* (Berlin, 1876); Sitte, *Der Städtebau nach seinen kunsterlischen Wundsatzen* (Vienna, 1889); Steuben, *Der Städtebau* (Darmstadt, 1890). Some of the new reference works since 1913 are: Koester, *Modern City Planning and Maintenance* (New York, 1914); Shurtleff and Olmsted, *Carrying Out the City Plan* (New York, 1914); Julian, *An Introduction to Town Planning* (London, 1914); Geddes, *Cities in Evolution* (London, 1915); Nolen, *City Planning* (New York, 1914); Lewis, *The Planning of a Modern City* (New York, 1916) from the engineering viewpoint; Robinson, *City Planning* (New York, 1916); Burnap, *Parks* (Philadelphia, 1916); Lyle, *Parks and Park Engineering* (New York, 1916); Adams, *Rural Planning and Development* (Ottawa, Canada, 1917); Bird, *Town Planning for Small Communities* (New York, 1919); Evans, *Town Improvement* (New York, 1919); *Garden Cities and Back to the Land* (London, 1919); Moody's, *What of the City* (dealing largely with the Chicago Plan) (Chicago, 1919); Knowles, *Industrial Housing* (New York, 1920), is largely on town planning: The London Society's, *London of the Future* (London, 1921); and Miss Kimball's "Review of City Plan-

ning in the United States," annually for several years past in the *National Municipal Review* (N.Y.).

Periodicals. *Der Städtebau* (Berlin, 1904); *Garden Cities* and *Town Planning* (London, 1906); *Landscape Architecture* (official organ of the American Society of Landscape Architects, Harrisburg, Pa., 1910 to date); *Town Planning Review* (Liverpool, 1911, to date). Many valuable papers are included in *Proceedings National Conference on City Planning* (Washington, 1909, and Boston, 1910, to date); also in *Proceedings and Journal American Institute of Architects* (Washington, D. C.); *Transactions Royal Institute British Architects* (London, particularly for 1911). Consult also leading architectural journals.

CITY POINT. A village in Prince George Co., Va., 10 miles northeast of Petersburg, on the James River and on the Norfolk and Western Railroad (Map: Virginia, G 4). It has a gunpowder plant and is of considerable historical interest. Here, in 1864, General Grant made his headquarters, and in his subsequent operations the city was used by the Federal army as its principal landing place and depot for supplies. One mile from the village a national cemetery is situated. Pop., 1914 (est.), 400.

CITY POLITIQUES, pŏl'ĭ-tēks'. A satirical comedy, probably printed for the first time in 1683, and produced at the King's Theatre, London, the same year. It is a sharp attack on the contemporary Whig faction, especially on Oates, in the character of Dr. Pauchy. Only the King's protection kept it from being suppressed by the victims of the satire. Some authorities place the date of publication as early as 1675.

CITY RAMBLE, THE; or, THE PLAYHOUSE WEDDING. A play by Elkanah Settle, printed in London in 1711 and produced at the Drury Lane Theatre, Aug. 17, 1711. It is partly founded on Beaumont and Fletcher's *Knight of the Burning Pestle* and *The Coxcomb*.

CITY WIT, THE; or, THE WOMAN WEARS THE BREECHES. A comedy by Richard Brome (q.v.).

CIUDAD BOLÍVAR, sē'ōō-dăd' bō-lē'vär (Sp., city of Bolívar). The capital of the State of Bolívar, Venezuela, on the right bank of the Orinoco, about 240 miles from its mouth (Map: Venezuela, E 2). It is situated at a narrow point of the river, only 185 feet above sea level, and is well built, having spacious, handsome buildings. Of these the more notable are the palace of the governor, the college, the market, the cathedral, and the theatre. There are several fine monuments in the plazas Bolívar and Guzmán Blanco and in the cemetery. The city is the seat of a bishop. Owing to its position on the Orinoco, Ciudad Bolívar is an important commercial centre, and although certain restrictions have somewhat hurt its trade it long ranked as fourth among the large ports of Venezuela. Its chief export is coffee; but rubber, cattle, hides, sugar, and asphalt also are exported in considerable quantities. Population, 11,686. Ciudad Bolívar was founded in 1764 as San Tomás de la Nueva Guayana, but because of its location at a narrow part of the river it was known as Angostura until 1819, when the Congress met which, under the inspiration of Simón Bolívar, formed the new Republic of Colombia out of the states of Venezuela and New Granada. Since then the city has borne his name.

CIUDAD DE LAS CASAS, dā läs kä'säs. See SAN CRISTÓBAL DE LOS LLANOS.

CIUDAD DE LOS REYES, dā lōs rā'yās (Sp., city of the kings). The name given by Pizarro to the present city of Lima, Peru, when he founded it, in 1535, on the banks of the river called, by the Quichuan (Peruvian) Indians, "Rimac," which became first "Limac" and finally "Lima."

CIUDADELA, thē'ōō-dā-dā'lä (Sp., little city, dim. of *ciudad*, city). A seaport town of the Spanish island of Minorca, situated on the west coast. Pop., 1887, 8447; 1900, 8645; 1910, 9369.

CIUDAD GUZMÁN, gōōs-măn'. A city of Mexico, in the southern part of the State of Jalisco, 60 miles northeast of Colima. In 1891 it had a population of 23,025, but that number declined to 17,596 in 1900.

CIUDAD JUÁREZ, HWä'räs (Sp., city of Juarez). A city in the State of Chihuahua, Mexico, on the Rio Grande, opposite El Paso, Tex., and on the Mexican Central Railroad (Map: Mexico, F 2). It is situated at an altitude of 3800 feet above sea level, in a fertile district, devoted to agriculture, stock raising, and fruit and vine cultivation. The city has a Mexican army post, customhouse, and a statue of Juárez. It is the residence of a United States Consul. Ciudad Juárez was formerly known as El Paso del Norte. Pop., about 7000.

CIUDAD PORFÍRIO DIAZ, pôr-fē'rē-ō dē'äs. A town in the State of Coahuila, Mexico, on the Rio Grande, opposite Eagle Pass, Tex., and on the Mexican International Railroad (Map: Mexico, H 3). It is the Mexican terminus of the international bridge across the Rio Grande, and has a Mexican army post and a customhouse. It is the residence of a United States Consul. The town is the centre of an agricultural, stock-raising, and fruit-growing region, and carries on an extensive international trade. Coal is found in the vicinity. Ciudad Porfírio Diaz was founded in 1849, and derives its present name from the former President of the Republic. The town was formerly called Piedras Negras. Pop., about 5000 (est. of 1900).

CIUDAD REAL, thē'ōō-dăd' rā-äl' (Sp., royal city). A town of Spain, capital of the province of the same name, in New Castile, situated in a fertile plain between the rivers Guadiana and Jabalón, about 100 miles south of Madrid (Map: Spain, D 3). It is surrounded by walls, is the seat of a bishopric, and has some notable edifices, including the municipal building, the parish church of Santa María del Prado—a massive Gothic structure, with a fine interior—and several monasteries and hospitals. There are manufactures of coarse woolens, linen, olive oil, flour, leather, etc.; also a trade in the agricultural produce of the district, which is engaged in raising stock, particularly mules, and bulls for the ring. An annual fair is held. Pop., 1900, 15,327; 1910, 16,372.

Ciudad Real was founded by Alphonso X, after the middle of the thirteenth century, as a fortress against the Moors, and soon attained considerable importance from the privileges granted by its founder. In 1809 the town was the scene of a Spanish defeat by the French, under Sebastiani.

CIUDAD RODRIGO, rō-drē'gō (Sp., city of Rodrigo). A fortified town of Spain, in the Province of Salamanca, near the Portuguese frontier (Map: Spain, B 2). It is situated on

an elevation above the river Agueda, which is here crossed by a fine bridge, and has a cathedral of considerable architectural interest, the earliest portion of which dates from the close of the twelfth century, three Roman columns, and remains of an aqueduct. The city was founded in the twelfth century by Count Rodrigo González, whence its name. The manufactures include soap, leather, linen, woolens, etc. The town is the seat of a bishop. Pop., in 1900, 8007.

In the War of the Spanish Succession, Ciudad Rodrigo was taken by the English in 1706, and recaptured by the French in the following year. During the Peninsular War it was captured by the French under Marshal Ney in July, 1810; but in January, 1812, it was retaken by the British, under Wellington, who thereby won his titles of Earl of Wellington in the peerage of Great Britain, Duque de Ciudad Rodrigo and Grande de España (First Class) in the peerage of Spain, and Marquéz de Torres Vedras in the peerage of Portugal.

CIUDAD VICTORIA, thē′o͞o-däd′ vĭk-tō′rē-ä (Sp., city of victory). The capital of the State of Tamaulipas, Mexico, 160 miles southeast of Monterey (Map: Mexico, J 6). It is finely situated on the east slope of the great plateau and is the centre of a sugar-growing district. It is the see of a bishop and the residence of a United States consular agent. Ciudad Victoria dates from 1750, under the name of Santa María del Refugio de Aguayo, and not until 1825 was its present name adopted. Pop., 1900, 10,086.

CIV′ET (Fr. *civette*, from MGk. *ζαπέτιον*, *zapetion*, from Ar. *zabad*, *zubad*, civet, from Pers. *zadab*, froth of water). A genus (*Viverra*) of carnivores of the Old World family Viverridæ, connecting the cats with the hyenas, and having the body elongated in some of the species as much as in the weasel tribe; the head is also long and the muzzle sharp. The ears are short, broad, and rounded. The feet have five toes, and the claws are only semiretractile. There is a more or less conspicuous erectile mane along the back, as in hyenas. Near the sexual organs, in both sexes, there is a large double pouch, in which is secreted an odoriferous, fatty substance, called "civet," much used in compounding perfumes. There are several species of civet, of which the best known is the common or African civet (*Viverra civetta*) of northern Africa, from 2 to 3 feet long, brownish gray, with numerous black bands and spots. The civet preys on birds, small quadrupeds, and reptiles, and is regarded as a benefactor along the Nile on account of its appetite for crocodile's eggs. It is very commonly kept in confinement for the sake of its perfume, which is removed from the bag about twice a week by means of a small spatula and is obtained most abundantly from the male, especially after he has been irritated. A dram is a large quantity to obtain at a time. After being cleaned of hairs, washed, and dried, civet is ready for the market, and is worth from $10 to $12 an ounce, if pure. About 20,000 ounces are imported into London annually, and this represents a large part of the total product. The civets kept for the purpose of providing perfume are fed on raw flesh; the young partly on farinaceous food. The principal source of supply of commercial civet is northern Africa, especially Abyssinia. Several other species of civet occur in southeastern Asia and in the East Indies, all handsomely striped or spotted. The linsang and the binturong are most prominent among these. The American civet cat is the cacomistle (q.v.). Compare ICHNEUMON; MUNGOOS.

Fossil remains of the genus *Viverra* have been found in those deposits of the Tertiary era that lie above the Middle Eocene. They show no considerable variation from their modern descendants. The remains of other extinct allied genera from the Tertiary show interesting relations between the early members of the family Viverridæ and the hyenas. See VIVERRIDÆ.

CIVETTA. See CHEVECHE.

CIVIALE, sē′vē-äl′ JEAN (1792–1867). A French surgeon, born at Thiézac, Cantal. He is remembered for his discovery (1826) of the operation of "lithotrity" for the removal of stone from the bladder without the loss of blood. For this he was awarded a prize of 6000 francs by the Academy. Sir Henry Thompson (q.v.) was one of his pupils and followers. Civiale's important writings are all on operation for stone and on diseases of the genito-urinary organs.

CIVIC ASSOCIATION, AMERICAN. An organization founded in 1904, for the "cultivation of higher ideals of civic life and beauty in America, the promotion of city, town, and neighborhood improvement, the preservation and development of landscape, and the advancement of outdoor art." The association carries on its work on national lines by its varied activities for the physical improvement and development of the communities. It has directed special attention to the importance and comprehension of city planning, and such other activities as the creation, development, and maintenance of parks and boulevards, the wise planting of trees, the elimination of the smoke, billboard, and housefly nuisances, and the organization of adults and children into working groups for civic improvement. During 1913 a group of members of the association visited European countries for the purpose of studying civic advance and the methods adopted in these countries for efficient administration. One of the most important movements undertaken by the society was the protection of the scenic beauty of Niagara Falls. The association has also led in the movement for the protection of national parks. The president in 1914 was J. Horace McFarland. Its headquarters are in Washington, D. C.

CIV′IC CROWN (Lat. *corona civica*). One of the most highly valued honors that a Roman could obtain. It was given for saving the life of a citizen in battle, provided that in so doing the rescuer slew the opponent and maintained the ground on which the fight had taken place. It was voted by the Senate to the Emperor Augustus as *servator civium*. It was merely a wreath of oak leaves, with pendant acorns. The one to whom it was given had the right to wear it always. When he appeared at the games, all rose to do him honor, and he was entitled to a seat next to the senators; he was also excused from all troublesome duties and services, with the same immunities for his father and his father's father.

CIVIDALE DEL FRIULI, chē′vē-dä′lā dĕl frē-o͞o′lē (probably from ML. **civitalis*, from *civitas*, town). A city in the northeastern part of Italy, in the Province of Udine, near the Austrian border, about 10 miles east by north of the city of that name, with which it is connected by rail (Map: Italy, H 1). The Natisone, which flows through the city, is crossed

by a fifteenth-century bridge. There are many relics of the eighth and tenth centuries, and the cathedral, which is of the fifteenth century, contains many valuable MSS. and art treasures. Cividale was for many years the residence of Lombard dukes. The modernized city has a military training college, and silk, cotton, and linen factories. Pop., 1901, 9061; 1911, 10,031.

CIVIL ACTION (Lat. *civilis*, from *civis*, citizen). Any judicial proceeding involving a controversy between individuals in regard to their private matters, distinguished from proceedings where public interests are concerned, as in a criminal prosecution. Civil actions include the procedure in a court of chancery or equity, and also those cases in which the state submits to an action instituted by an individual. See ACTION; PROSECUTION.

CIVIL ADMINISTRATION. In the most general sense, public administration—the conduct of the affairs of the state, or government, or of any subordinate division thereof. In a more restricted sense, the term is frequently employed to describe the management of the municipal or nonmilitary concerns of the state; and sometimes, more narrowly, as referring to the executive and judicial departments of the government, as distinguished from the legislative. See ADMINISTRATION; ADMINISTRATIVE LAW.

The principles and the methods of civil administration vary greatly, from the simplicity and flexibility of patriarchal government or other personal autocracy, to the rigidity of a modern bureaucratic system, like that of France and Russia, and the complexity of a highly developed political system, like that of Great Britain and the United States. There is a general similarity among modern civilized states in the organization and working of the central administration. The great departments of state—those having to do with foreign affairs, with the army and navy, with the collection and disbursement of national revenue, with commerce and industry, and with the post office—present no great diversity, either in functions or in organization. The chiefs of these departments are ministers of state, the principal and authorized advisers of the executive, or, as in Great Britain, constitute the real executive. (See CABINET.) Usually these chiefs are political and therefore temporary officers, who may come and go without greatly modifying the organization and methods of their departments. Their influence is great while it lasts, but is short-lived; the permanent policy of the administration, as well as its methods and *personnel*, being for the most part determined by permanent officials of great experience, known as undersecretaries, assistant secretaries, bureau chiefs, etc. As these permanent officials are the persons who really conduct the work of administration, so they are, in everything but the political sense of the term, responsible for the proper conduct of the affairs of their respective departments, and, being so, they are usually unfettered in the choice of their subordinates.

In other matters, however, especially in those of purely domestic concern—as the administration of justice; the maintenance of the public peace; the supervision and control of religion, of morals, and of public education; the levying and collection of taxes, direct and indirect; the conduct of elections, and the "internal affairs" generally of the community—there is as great diversity in the organization and methods of administration as there is in the political character and ideals of the several states. In those countries in which the feudal and monarchical tradition is strongest, whatever the form of the government may be, not only is the civil administration most highly centralized, but it is much further-reaching, more searching and obtrusive, than in those countries which have more completely emancipated themselves from that tradition. This is as true of republican France as of monarchical Germany and autocratic Russia. In the free governments, on the other hand —as in the United States, Great Britain and her self-governing colonies—not only is the administration decentralized, and left, as largely as possible, in the hands of local self-governing groups, but the general administration is rigidly confined to matters of general or national concern, and is not permitted to trench upon the local concerns of the subordinate political groups of the state. In these countries, accordingly, such matters as the building and repair of roads and bridges, and the maintenance of an adequate constabulary or police force, are dealt with by the borough, parish, town, or city, and not by the state; while, in the United States, even the matter of public education, which is conceded to be an affair of state, and is usually governed by State statutes, is, for the most part, turned over to the locality concerned—the city or school district— for administration.

While in no modern civilized state is the administration wholly centralized, or, on the other hand, wholly decentralized, the two systems are, in their principles and methods, if not in their actual embodiment in practice, so sharply discriminated as to call for a few words of comparison. Doubtless a centralized administration is capable of a much higher degree of efficiency than is attainable under the other system. For matters of great moment, requiring time for their maturing, and, when ripe, calling for prompt and decisive action, it is indispensable. No government would think of employing any other system in its military and international affairs. Then, too, it achieves a certain uniformity and regularity of action, and thus tends to strengthen the established government by giving its administration an impersonal effect of permanence and solidity. On the other hand, these very qualities of regularity and uniformity of action tend to harden into the inflexibility and routine of bureaucratic system, which, being lifted above public opinion and free from any effective criticism, crystallizes its abuses in the form of hallowed customs, and lends itself too easily to oppression.

The virtues of the system of decentralization are political rather than administrative. It is only under this system that a free government has free play for its varied activities and experiments. And, though its potential efficiency is not to be compared with that of the system of centralization, it has much to recommend it even from the purely administrative point of view. While not adapted to the regulation of international relations, or the carrying out of far-reaching measures of policy, its responsiveness to public opinion makes it an efficient agency for supervising and controlling the far more numerous and important private and local interests of the community. Being local and familiar, it is vigilant and sympathetic; and

though some of the affairs committed to it may be badly administered, it is probable that the sum total of its achievement is greater than that of a centralized administration, with its limited knowledge and its indifference to criticism.

The character of the public administration—whether efficient or inefficient, economical or wasteful, pure or corrupt—depends fundamentally on the conception of the proper aim and purpose of government which prevails. Extravagance and corruption, and, with them, the inefficiency they engender, flourish under any government, whether popular or autocratic in form, which is maintained for the benefit of the ruler, whether that be a king, an aristocracy, or a political party. And, on the other hand, the honest acceptance of the principle that government is instituted for the benefit of the governed tends to produce clean and efficient administration, whatever the external form of the state. It is doubtless to the persistence of the feudal conception of the state that we owe the long era of corrupt and, upon the whole, inefficient administration of public affairs which has marked the history of modern states. So long as the executive head of the state is at once the supreme landowner and the lord paramount, from whom all honor and protection are derived, so long will the offices of administration be regarded as his perquisites, and the treasure derived from taxation of the people be expended for the gratification of his ambitions and those of his favorites. He may, of his favor, or for his own purposes, grant a certain measure of efficient administration; but the extravagance and corruption which are inseparable from that system will destroy the efficiency of the government as well.

The profound modification of the theory of government effected by the democratic movement of the eighteenth and nineteenth centuries, in substituting the welfare of the people at large for that of the governing classes as the end and aim of government, has brought about a corresponding revolution in its administration. This change became apparent in England upon the accession of William of Orange to the throne in 1689, and in France a hundred years later, in the Revolution; but owing to the development of party government in the former country, and the excesses to which that system led, it did not become effective there until the middle of the last century. It is true that more than one administrative reform had been accomplished in Great Britain—as in the provision of Magna Charta, requiring all justices, constables, sheriffs, and bailiffs to have knowledge of the laws of the realm; the statute of Edward VI (1552) forbidding the sale of offices (except the higher judicial offices); and the extraordinary law enacted in the twelfth year of Richard II (1388), declaring that "none shall obtain office by suit, or for reward, but upon desert"; yet as late as the period of the American Revolution the "spoils system" of the distribution of public office as the reward of party service flourished unchecked. In the United States that vicious system did not come into existence until the administration of President Jackson, and it is only now giving place to the system prefigured in the statute of Richard II, above referred to. (See CIVIL-SERVICE REFORM; MERIT SYSTEM.) The more recent development of party government in France has lately fastened the spoils system on the administration of that country; but, upon the whole, in Europe as well as in America, civil administration has been enormously improved, in purity and economy as well as in efficiency, during the last hundred years; while in England and many of the English colonies, and in considerable portions of the administrative system of the United States, it has completely emancipated itself from the taint of corruption and extravagance. (See GOVERNMENT.) For a comparison of administrative systems and methods of controlling officers of administration, see Goodnow, *Comparative Administrative Law* (2 vols., New York, 1893). Consult also Goodnow, *Administrative Law of the United States* (New York, 1905), and Bryce, *The American Commonwealth* (London and New York, 1888, 1913).

CIVIL CHURCH LAW, AMERICAN. The body of law which defines the ecclesiastical function of the State, and maintains the civil status of the religious bodies within the United States. The status of the American churches is without a parallel in Christendom, in that in no other state do all organizations for the purposes of religion bear exactly the same legal relation to the civil authority. This body of law has been developing during the life of the American people as a nation, and has become one of the fundamental principles of their political philosophy. It is to be found (1) in provisions of the Federal and State constitutions; (2) in statute legislation; (3) in the decisions of the State and Federal courts, which now include about 1000 leading cases in these matters.

The Ecclesiastical Function of the American State. Although there is within the United States no church or churches by law established, yet the American State has an ecclesiastical function to perform. Formulated in its briefest terms, this ecclesiastical function is to cause it to be legally possible and also convenient for all residents, whether citizens, subjects, or aliens within the jurisdiction of the American governments, to sustain voluntary ecclesiastical relations. In other states it is regarded as a proper function of the civil power to provide for definite ecclesiastical relations; and the aggregate of those relations so specifically provided for is regarded as constituting an ecclesiastical establishment. In either case the civil power has an ecclesiastical function; but the difference in the two concepts is this, that the development of the individual's sphere of speech and action has in the American State completely included the sphere of speech and action for all purposes of religion, and has correspondingly altered the nature of the ecclesiastical function of the State, which, however, is none the less real because of such alteration. Such a function of the government is no mere philosophical abstraction, but is a working institution, which has been in successful operation for more than a century. It has been carried wherever there has been an expansion of American sovereignty, and has been made to meet new conditions among new peoples, and has been so applied as to maintain its principles intact, and has everywhere produced substantially the same civil status for the churches.

History of Civil Church Law. Like other successful systems, the separation of church and state, and the equal status of churches, were not planned in detail and put into operation, but developed gradually under the force of pub-

lic opinion. At the outbreak of the American Revolution the Colonies were divided ecclesiastically into three groups. In one group, consisting of New York, New Jersey, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia, the direct establishment of the communion of the Church of England was more or less complete in law. In the second group of Colonies, consisting of Massachusetts, New Hampshire, and Connecticut, the Congregational form of ecclesiastical organization, on the basis of the town and "poll" parish, was established in law and in fact. In the third group of Colonies, consisting of Rhode Island and Pennsylvania, no ecclesiastical establishments had been developed, either in law or in fact. As a result of political revolution, the direct establishments by royal authority were nullified in law. The indirect establishments in the New England commonwealths, built upon provincial legislation and local administration, remained undisturbed for some years. There remained, as survivals of the direct establishments, a number of incorporated parishes in New York and Virginia, and a few in other States; and, as remains of a still earlier establishment in New York, there were three or four incorporated Reformed Dutch churches that had received special protection by the Treaty of Breda, transferring the Province of New Netherlands to the British in 1667. During the Colonial period religious dissent had, with more or less vigor, resisted the legal church establishments, and especially the system of compulsory taxation for the support of the clergy; and the overthrow of British sovereignty brought its opportunity. A demand developed very generally, even in the New England commonwealths, but with stronger political backing in other sections, for a complete divorcement of political and church affairs. There is evidence that the conditions were such that the politicians could not disregard this demand. At the formation of the Federal government religious liberty was secured to the people of the United States, so far as the action of the Congress was concerned, by the provisions of Chapter III, Article 4, of the Constitution, and the First Amendment. Both of these provisions were limitations upon the powers of Congress only; and neither the original Constitution nor any of the early amendments undertook to protect the religious liberties of the people against the action of their respective State governments. Religious affairs were included within the sphere of domestic relations, and were so left to the States to deal with. There were then inserted in the early constitutions of the several States the guarantees of religious liberty generally in the forms that we are familiar with. The development of the local peculiarities in the ecclesiastical institutions of the several States and sections of the country continued without interruption. The Colonial legislatures had granted a few charters of incorporation to local churches, and this practice was continued for some years by the State legislatures. It was, however, abandoned in time, because of the objection made by the political minorities, that the granting of such particular charters was special legislation, secured by political influence. At this period the American churches were beginning to revive from the exhaustion caused by the war, and were becoming the legal and equitable owners of property. Legal means for securing property to pious and charitable uses were sorely needed. Hence, a demand arose in several of the Middle States for a uniform procedure by which the local organizations of all religious bodies could secure a corporate form, with full control of their property. To meet this demand there were enacted a series of general statutes, beginning with that of New York of April 6, 1784. An act of similar intent and of like provisions was passed, in 1793, by the State of New Jersey; and these two statutes became the models for similar laws in many of the Northern States. The provisions of these statutes were very meagre. No reference was made to particular ecclesiastical polities, except in the case of the Protestant Episcopal churches. The powers conferred upon the religious corporations so created were very limited, and nowhere were such corporations allowed to be self-perpetuating. Partiality to certain religious bodies was dreaded, and there was a very real fear that something might be done towards recreating an ecclesiastical establishment. The prevailing policy in legislation during the period extending through the third decade of the nineteenth century was based upon the idea that the civil power should treat all organizations alike, by doing as little as possible for any of them. The method of providing for the incorporation of religious societies by general statute has developed unequally in different sections of the country. As late as the year 1866, the States of Rhode Island, Virginia, and South Carolina had no such statute; and 30 years later, in 1896, a general statute of incorporation was still forbidden in the States of Virginia and West Virginia.

The third stage in the development of American civil church law has been the result of specializing legislation in two directions. One form has been the discrimination between religious organizations proper and other social, educational, and philanthropic organizations. The second form of specialization has consisted in supplementing the general provisions of the statutes with optional provisions for corporations of particular denominations and polities. Through these supplemental provisions there has been wrought into the statute law the recognition of purely ecclesiastical functionaries; and this is done most effectively by the creation of ecclesiastical corporations sole. This form of corporation is used by the Roman Catholic church, in which body in certain of the States archbishops and bishops are vested with the legal attributes of the corporation, with power to hold real and personal property and to sue and be sued. The Methodist Episcopal church also uses the ecclesiastical corporation sole. There has developed a marked legislative cordiality towards the churches. At the present time the policy is to treat all interests alike, by giving to each all that is asked. The early concept of religious organization in American law was naturally that of a simple and completely autonomous local society. To denominations whose type of polity corresponds to this concept the legislation of the general statute era was satisfactory. The special optional provisions have, therefore, been enacted as a rule for the benefit of churches having polities by which the local bodies sustain definite relations to some more general authority, such as synodical and episcopal churches. At the present time 25 distinct denominations have been thus specially legislated for. American religious corporations are not ecclesiastical corporations in

the sense of the English law, but are merely private corporations not for profit. The constituent elements of these corporations vary all the way from the total number of church members to the corporation sole; as, e.g., a presiding elder, bishop, or archbishop.

The Principles of Civil Church Law. In the course of the adjudication of the many causes that have arisen from ecclesiastical matters, the civil courts have developed the following as the basic principles of American civil church law: 1. All ecclesiastical relations are voluntary, both in their inception and continuation. 2. The freedom of action for the purposes of religion is guaranteed to every one by the organic law, and is limited by the same law by the civil rights of others, and by all that is necessary for the purpose and good order of the State and for the protection of public morals. 3. No civil right can, in the eyes of the law, be impaired by an ecclesiastical relation. 4. The law of the land is a part of the law of the churches. 5. No law of the churches, when it is found to be in conflict with the law of the land, has any validity. 6. The civil courts are open for the adjudication of ecclesiastical causes when civil rights are involved. 7. The civil courts, when they assume jurisdiction of a cause, will accept the decisions of ecclesiastical tribunals, if such tribunals act according to the church law, and do not exceed their jurisdiction. 8. The authority of the civil courts over all religious organizations is secured by the same means as in the case of private persons and secular organizations; judgments, decrees, and the issue of the writs of mandamus, information in the nature of quo warranto, prohibition, and injunction. 9. The principles of the law of charitable uses and of trusts, as modified by statute, are applied to property devoted to the purposes of religion. 10. The American clergyman, from the standpoint of the law, is a voluntary member of the association to which he belongs. The station is not forced upon him; he seeks it. He accepts it with all its consequences, and with all the rules and laws and canons then enacted or to be made by competent authority. Such laws cannot, in any event, endanger his life or liberty, impair any of his personal rights, deprive him of property acquired under the laws, or interfere with the free exercise and enjoyment of religious profession and worship; for these are protected by the constitutions and laws.

The results of American civil church law may be summed up in the language of the Supreme Court of the United States, in the case of Watson *vs.* Jones, 13 Wall. U. S., 639, as follows: "In this country, the full and free right to entertain any religious belief, to practice any religious principle, and to teach any religious doctrine, which does not violate the laws of morality and property, and which does not infringe personal rights, is conceded to all. The law knows no heresy, is committed to the support of no dogma, the establishment of no sect."

It is these principles of civil church law that are to govern in all the relations of the civil power and the churches beyond the confines of the United States—in the insular possessions of the Hawaiian Islands, Porto Rico, and the Philippines. Consult Tyler, *American Church Law;* Bayles, *Civil Church Law.*

CIVIL-DAMAGE ACTS. Statutes which have been passed in many of the United States, giving to those who sustain an actual injury by or through any intoxicated person, as a result of the intoxication, a right of action against the person who sold or gave away the liquor which caused the intoxication. In some States this liability has been extended to the owner of the premises where the liquor was dispensed; and it is immaterial whether the liquor business is lawful in the particular jurisdiction or not. While these statutes vary more or less in the different States, they generally provide for compensation for injuries to person or property of any one, and for loss of support by the wife or child of a drunkard. Exemplary or punitive damages are allowed in some cases, but actual injury must also be proved. Where one in any way helps to bring about the intoxication, he cannot recover.

These statutes have been held constitutional, being within the "police power" of the States under which the liquor traffic is regulated. See TEMPERANCE; POLICE POWER; PROHIBITION.

CIVIL DEATH (Lat. *mors civilis*). The status of a living person who is deprived by law of his legal and civil rights.

The term is of feudal origin, and was introduced into the English law after the Norman Conquest. At that time civil death was one of the consequences of conviction of treason, banishment from the realm, abjuration of the realm (by which a criminal escaped other punishment by leaving the country forever), conviction of felony, and the act of entering upon a monastic life as a monk or nun; and in all of these cases there was a total extinction of all civil rights, including loss of real and personal property, as if the person were physically dead. Treason, felony, and abjuration of the realm involved forfeiture of property to the crown as a penalty; but one taking monastic vows could make a will and appoint an executor to administer his estate.

In the United States, generally, civil death can occur only as the result of a sentence of imprisonment for life; but the doctrine is modified, so that there is only a partial extinction of the convict's rights, as in the New York statute providing that a sentence of life imprisonment shall operate as an absolute divorce of the felon from wife or husband; and in no case is his property forfeited to the State, as under the early law of England.

The English law has also been greatly modified by statutes and decisions. For an annotation on civil death in the United States, consult Davis *vs.* Laning, 18 Law. Rep. Annot., 82.

In some of the countries of Europe the ancient doctrine is still applied in cases of persons entering a monastic life. See ATTAINDER; FORFEITURE; OUTLAWRY.

CIVIL ENGINEER. See ENGINEER; ENGINEERING.

CIVILIAN. In a popular sense, a person whose pursuits are civil, i.e., neither military nor clerical. In a legal sense, the term may signify a person who is versed in the principles and rules in accordance with which civil rights may be vindicated in society generally, or in the particular state in which he belongs, or one who has made a special study of these rules and principles as exhibited in the laws and government of Rome (the Roman civil law). The civil law of Rome exercised such an influence upon the formation of the municipal systems of almost all the states of modern Europe that

those who devoted themselves to its study were regarded as "civil" or municipal lawyers par excellence. From the more learned training which this study demanded, civilian came often to be used as synonymous with professor or doctor of law, as opposed to practitioner of law, the former being generally more deeply versed in the Roman law than the latter; and this in its turn led to its being loosely applied to the great international lawyers of the seventeenth century (Grotius, Pufendorf, etc.). At present, in the United States, from having no class of persons who prosecute law as a *science* as opposed to an *art*, the term "civilian" has reverted to its narrower mediæval sense of student or teacher of the Roman civil law; and thus we speak of Savigny as a civilian, but not of Story.

CIVI'LIS, JULIUS (or CLAUDIUS). A chief of the Batavi, for 25 years connected with the army of Rome. Alienated by unjust treatment and by the execution of his brother, Julius Paulus, he headed an insurrection in Gaul in 69 A.D., but in 70 A.D. was subdued by an army under Cerealis. Having arranged with Cerealis a treaty advantageous to the Batavi, Civilis resumed friendly relations with Rome. Tacitus extols his patriotism and heroic acts.

CIV'ILIZA'TION. In general, the condition of more advanced peoples in contradistinction to those classed as barbaric and savage. See CULTURE.

CIVIL LAW. 1. The law applicable to the citizens (*cives*) of a particular state (*civitas*). The Romans used the term *jus civile* in this sense, distinguishing it from the law observed by all nations (*jus gentium*) and from the ideal law of nature (*jus naturale*). 2. The Romans also described their ordinary law, established by custom and by legislation, as their civil law, distinguishing it from the law introduced by the edicts of their magistrates very much as we distinguish common law from equity. 3. In the Middle Ages, civil law meant Roman law as set forth in the law books of Justinian, in distinction from the ecclesiastical or canon law. In England, at the same period, civil law meant Roman law as distinguished from English law. 4. Because the part of the Roman law which has most influenced European legal development is that part which deals with the ordinary relations of private persons, civil law has come, in modern European usage, to mean private law in general, without regard to its origin, as distinguished from public law. 5. In modern English usage, civil law includes and designates all the existing systems of private law that are in the main based on the Roman law. Civil law in this sense is a blend of Roman, Teutonic, ecclesiastical, and purely modern institutions and rules, fitted into a framework which is still substantially Roman. It prevails not only upon the continent of Europe and in the dependencies of the continental European states, but also in Scotland and in many parts of the world that were first colonized and civilized by the Portuguese, Spanish, Dutch, or French, and which to-day are independent (Central American and South American republics), or are under the rule of Great Britain (e.g., South Africa, some of the West Indian Islands, the Province of Quebec), or are now included in, or belong to, the United States (e.g., Louisiana, Porto Rico, and the Philippines). It is also finding its way, in some measure, into non-Christian portions of the world (e.g., Turkey and Japan).

HISTORY OF THE CIVIL LAW

I. *The Roman City Law* (*jus civile*), during the Royal period (down to about 500 B.C.), was largely religious in its character. The patricians had "*sacral*," or religious, customs which controlled the public law of the city and regulated their own family relations. The so-called Royal Laws (*Leges Regiæ*), of which some fragments have been preserved, were obviously priestly formulations of these customs. The plebeians apparently had no share in this religious law, and they certainly had special forms of marriage and of testament. The customs regulating property and debt were the same for both orders and were secular in their character. The interpretation of all law, however, whether religious or secular, rested with patrician priests; and after the expulsion of the kings the enforcement of the law was in the hands of patrician magistrates. In consequence of plebeian complaints and agitation, the nonpolitical custom of the city was reduced to writing; and the Law of the Twelve Tables, thus drafted, was submitted to and accepted by the popular assembly (c.451–450 B.C.). This code, of which numerous fragments have come down to us, set forth simple rules suitable to an agricultural community, in a remarkably clear and terse fashion. It established equal law for both orders, except in the matter of marriage; and a few years later (c.445 B.C.) even this inequality was removed. This law was prized by the Romans as a charter of liberties, and they were reluctant to amend its provisions by legislation. The necessary development of the law was therefore obtained during the following three centuries by interpretation. For two centuries the priestly order remained the authoritative interpreters; but after 252 B.C., when a plebeian became *pontifex maximus*, the legal system lost its predominantly religious character. With the expansion of Rome, its law was extended over Latium; but the Roman city law was not applicable to the Italian allies (*socii*), unless expressly made so by treaty. The best reconstruction of the Royal Laws is that of Voigt; of the Twelve Tables, that of Dirksen and Schöll. Both may conveniently be consulted in Bruns, *Fontes Iuris Romani Antiqui, Leges et Negotia* (6th ed., Mommsen and Gradenwitz, editors, Leipzig, 1893).

II. *Roman Mediterranean Law* (*jus gentium*).—The extension of Roman rule over the Mediterranean basin compelled the Romans to work out a new system of law. The Roman city law was not, in theory, applicable to the provincials, since these were not citizens, but subjects; and it would have been ill suited to the needs of Mediterranean commerce. Between the years 250 and 150 B.C. the new law required was developed: (1) in the edict of the prætor of the foreigners (*prætor peregrinorum*), who administered justice in Rome in all controversies except those in which both parties were citizens; and (2) in the edicts of the provincial governors (proconsuls and proprætors). In matters of purely local interest (e.g., family relations and inheritance) the provincial edicts apparently preserved local usages; but in matters of commercial interest the provincial edicts were patterned after the edict of the foreign

prætor in Rome. A common law of property, of contracts, and of judicial procedure was thus established for the entire Mediterranean basin. The sources of this law, according to the Romans, were the usages of all the ancient peoples (*jus gentium*) and natural reason. During the last century of the Republic the rules of the new system were gradually made applicable to controversies between Roman citizens. This was accomplished in the edict of the city prætor. In this edict, moreover, the Roman law of inheritance was modified and made more equitable. Of the city edict in its final form, much has been preserved. The best reconstruction is that of Lenel, *Das Edictum Perpetuum* (Leipzig, 1883).

III. *Roman Imperial Law.*—At the close of the Republican period Roman citizenship had been extended throughout Italy. Under the Empire it was gradually extended through the provinces, until, early in the third century, Caracalla made all the free inhabitants of the Empire Roman citizens. With this change the city law of Rome became, in theory, the law of the Empire. The prætor of the foreigners and his edict disappeared, but the city edict and the provincial edicts remained in force. These, however, had ceased to develop; the city edict received its final revision in the reign of Hadrian (117–138 A.D.). During the first three centuries of the Empire the law was developed partly by legislation, proceeding from the Emperor and the Senate, partly by juristic interpretation. Legislation gradually effaced provincial diversities; interpretation fused the city law and the prætorian law into a harmonious system. In this period the leading jurists were drawn more directly than before into the administration of justice. Three of the most famous, Papinian, Paul, and Ulpian, were successively chief justices of the Roman Empire. The juristic literature of the late Republic and early Empire (100 B.C. to 250 A.D.) was very extensive and of the highest order of excellence. It consisted largely of the collection and criticism of recorded decisions (*responsa*) and the scientific formulation of the principles on which they were based; that is, it was substantially a progressive digesting of case law. Little of this literature has been preserved, except in the *Digest* of Justinian. Of the works which have survived—which may conveniently be consulted in Huschke, *Jurisprudentiæ Antejustinianeæ quæ supersunt* (5th ed., Leipzig, 1886)—the most important are the *Institutes* of Gaius and fragments of Paul's *Sentences* and Ulpian's *Rules*. (Gaius has been translated by Poste, Oxford, 1871, 3d ed., 1890; Gaius and Ulpian by Abdy and Walker, Cambridge, Eng., 1876, 3d ed., 1885; and by Muirhead, Edinburgh, 1880, 2d ed., 1895.)

IV. *Codification.*—After the middle of the third century the law was developed solely by Imperial constitutions, viz., decisions (*rescripta*) and enactments (*leges*). The first attempts at codification were systematic arrangements of these constitutions. Such were the *Codex Gregorianus* (about 295 A.D.) and a supplementary *Codex Hermogenianus*, published in the following century. These were private compilations. The first official revision of the Imperial laws was made under the direction of the Byzantine Emperor Theodosius II. The *Codex Theodosianus* was published 438 A.D., not only in Constantinople, but also, by arrangement with Valentinian III, in Rome. The greater part of this code has come down to us. The fullest edition is by Hänel (1842). Some additional fragments have been edited by Krüger (1880). Theodosius had entertained, but did not carry out, a broader plan, involving an official digest of the older law, as set forth in the juristic literature. This plan was taken up by the Byzantine Emperor Justinian, and carried out under the direction of his minister, Tribonian. The law books published by Justinian were: 1. *Institutes* (Nov. 21, 533 A.D.). This book, which sets forth the elements of the law, is based on the *Institutes* of Gaius. It was intended primarily for law students, but it was published with statutory force. 2. *Digest* or *Pandects* (Dec. 16, 533), a full exposition of the older law, civil and prætorian. It is composed of excerpts from the juristic literature of four centuries (c.100 B.C. to c.300 A.D.)—chiefly, however, from the literature produced between 150 A.D. and 250 A.D. The greater part of the excerpts seem to have been reproduced without change; but antiquated terms were replaced by those current in the sixth century, and in some cases the passages quoted were condensed or amplified. Like the literature from which it was compiled, the *Digest* is substantially a collection of case law. 3. *Codex* (April 7, 529; "second reading," Dec. 17, 534), a revised collection of Imperial constitutions, based on the earlier codes and replacing them. The language of these law books is Latin, although some passages in the *Digest* and many of the constitutions in the *Code* are in Greek. During the remaining years of his reign Justinian issued many new constitutions (*novellæ*), mostly in Greek; but of these no official compilation was made. The combination of these "Novels" with the other law books of Justinian, under the general title *Corpus Juris Civilis*, dates from the twelfth century. The best edition is that by Mommsen and Krüger. There are complete French and German translations of the *Corpus Juris*, but only the *Institutes* have been translated into English (Moyle's *Institutes*, 2d ed., 1890). For the history of Roman law to Justinian, the best English work is by Muirhead, *Historical Introduction to the Private Law of Rome* (2d ed., Edinburgh, 1899).

V. *Roman and Teutonic Law in the Middle Ages.*—The law books of Justinian remained in force in the Byzantine Empire until the end of the ninth century, when they were condensed into a single Greek code, the *Basilica*. This, in its turn, remained nominally in force until the capture of Constantinople, by the Turks, in 1453; but, in fact, briefer private compilations were more generally used. One of these, the *Hexabiblos*, made in Thessalonica (Saloniki) in 1345, had legal authority in Greece as late as the nineteenth century. In the Teutonic kingdoms established on the ruins of the Western Roman Empire, the conquered Romans continued to live (at least in their relations with one another) by the Roman law; and in some cases official compilations of Roman law (antedating those of Justinian) were made for their use. The most important of these was the *Lex Romana Visigothorum*, compiled at Aire, in Gascony, under the authority of Alaric II and published 506 A.D., and commonly known as the "Breviary of Alaric" (q.v.). It included Imperial constitutions, a condensation of the *Institutes* of Gaius, and passages from Paul's *Sentences*. Until the eleventh century it was the principal source

from which Roman law was drawn in western Europe. Even earlier, in the reign of Euric (466–84), the Visigoths had begun to reduce their own law to written form, and their example was followed by other Teutonic tribes. So came into existence the *Leges Barbarorum* (as they were termed afterward), written in Latin, and exhibiting more or less Roman influence. The most important of these are: The *Lex Antiqua* of the Visigoths, the law of the Burgundians (*Lex Gundobada*), and the law of the Salian Franks (*Lex Salica*), all dating from the close of the fifth century; the law of the Ripuarian Franks, dating from the close of the sixth century; and the law of the Longobards, compiled in the seventh century. In Spain Visigothic legislation developed, in the course of the seventh century, into an elaborate code, the *Lex Visigothorum* (later known as the *Forum Judicum* or *Fuero Juzgo*). It is a blend of Teutonic, Roman, and ecclesiastical law, and it bound Goths and Romans alike. In the eighth century this national development was arrested by the Moorish conquest of the Iberian Peninsula. In the Frankish Empire (which, in the course of the eighth century, came to include all Christian Europe, except Great Britain and Ireland and the Byzantine Empire) the system of the "personal statute" prevailed; each German tribe lived by its own law, and the people representing the Roman element in Gaul, Burgundy, and Italy lived by Roman law. Here also, as in Spain, new law (in this case European law) was in process of creation by Imperial legislation (*capitularies*) and the decisions of the Imperial courts; but in the ninth century this development also was arrested by the disruption of the Empire. In the new nations in process of formation the royal authority was too slight either to enforce the old Frankish laws or to develop new national law. With the gradual disappearance of racial distinctions the *Leges Barbarorum* became obsolete, and the "personal statute" was supplanted by local law, largely customary in character. In southern France and in central and southern Italy, where the Roman element was strongest, the local laws were mainly Roman; in Germany and in northern France they were mainly Teutonic; in northern Italy and in Spain, Roman and Teutonic rules were more equally blended; but each local system, in the absence of any appellate jurisdiction, developed independently. Across these local differences ran class distinctions; there were separate courts and different laws for the nobles, the peasants, and the townsmen. In most of these courts judgments were rendered by men familiar with the customs of their locality or their class (*scabini, échevins, Schöffen*), but without other legal training. The most important body of written law produced in this period (except the canon law) was a twelfth-century Lombard code of feudal law (*Libri Feudorum*), which obtained great authority throughout Europe. Many city laws, and not a few territorial and local customs, were also put into written form, usually by private persons. Among the more important are the so-called *Etablissements de St. Louis* (1272 or 1273), the *Grand Coutumier de Normandie* (1270–75), and the *Mirror of the Saxons* (*Sachsenspiegel*, about 1230).

VI. *Canon Law.*—Throughout the Middle Ages there existed still another set of courts—viz., the ecclesiastical courts—applying a law which was not local, but European, and which bound all Christians. From the ordinary judge (*judex ordinarius*), the bishop, or his surrogate, appeals ran to Rome, and the interpretation of the canon law was kept uniform by the decisions of the papal Curia. In the Pope and the General Council the Church possessed also effective legislative organs. Canon law profoundly affected the development of European law in many matters; in particular, it gave Europe a common law of marriage and of family relations and rational forms of judicial procedure. For the development of the ecclesiastical law as a whole, and for its codification, see CANON LAW.

VII. *Reception of the Law Books of Justinian.*—Till the eleventh century, the only texts of Roman law that were much used in western Europe were the "Breviary of Alaric" and similar scanty compilations. In the eleventh century, however, the law books of Justinian were studied and used in Lombardy, in southern France, and in Barcelona; and there was a regular law school in which the laws of Justinian were taught at Pavia. Early in the twelfth century a more thorough and minute study of these texts, particularly of the *Digest*, was inaugurated at Bologna by Irnerius; the canon law was taught with equal thoroughness; and by the close of the century the University of Bologna had 10,000 students, drawn from all parts of Europe. Before the end of the thirteenth century law schools were established in 12 other Italian cities. From Italy the systematic study of the civil and canon laws spread through Europe. In Italy the text of Justinian was "glossed"—i.e., furnished with a running marginal commentary; and in the thirteenth century one Accursius digested the glosses of his predecessors and produced what came to be recognized as the standard commentary. The revival of the study of the law books of Justinian was followed, in many parts of Europe, by the "reception" of these books as authoritative law. Where, as in Italy and southern France, Roman law of a sort was already in use, the substitution of fuller and better texts was a simple matter, and here the reception came early. In Germany and the Netherlands it came late; it was not completed until the beginning of the sixteenth century. The reception was facilitated, especially in Germany and Italy, by the theory of "continuous empire," which viewed the Roman emperors as legal predecessors of the mediæval kings and princes. The reception, further, was in part the result, and in part the cause, of a gradual change in the organization of the courts, judges learned in the civil and canon laws taking the place of the *scabini*, or lay judges. The fundamental cause, however, of the reception of ancient Roman law was the inadequacy of mediæval law. The revival of commerce, in the twelfth and following centuries, and the social changes which ensued, necessitated a more highly developed law. The first result of the revival of commerce was the reception, throughout Europe, of the ancient law merchant, which had survived in the eastern Mediterranean region; but this law was applicable only to traders, and its reception did not solve the problems that were raised by the increasing importance of personal property. Hence the subsequent reception of the entire Roman private law. In those parts of Europe where economic conditions changed more slowly and local customs longer remained adequate—e.g., in

Switzerland, in the Scandinavian kingdoms, and in Russia—the law books of Justinian were not received. These countries became civil-law countries later, partly through the influence of the universities, partly by borrowing or imitating French and German legislation. A second and negative cause of the reception was the inability of the mediæval state to work out the new law that was required. In those countries in which central legislative power existed, or in which appeals were running to a supreme court, the law books of Justinian were not received. They were not received in England, nor in northern France, nor in Aragon; and in Castile the Roman law, as taught in the universities, was received only indirectly, in the form of an independent Spanish code—viz., the law of the "Seven Parts" (*Las Siete Partidas*), prepared under the auspices of Alfonso X (1252–82). Even in those countries in which the Imperial Roman law was not received in gross there was, nevertheless, more or less reception in detail; that is, special institutions and rules were borrowed. Where the law books of Justinian were received, they were applied: (1) as modified by the canon law; (2) as interpreted by the Italian commentators; (3) as subsidiary law, not overriding, but only supplementing, local laws. The judges trained in the Roman law were, however, not friendly to local laws. They insisted that such laws must be proved to be in force; and where the local law was unwritten, it was not easy to convince them of its validity.

VIII. *Modern Codification.*—In Spain and in France the earlier modern codes were collections of provincial and local laws—viz., the laws (*fueros*) of the different Spanish provinces and cities and the revisions of the same, dating from the thirteenth century to the nineteenth; and the customs (*coutumes*) of the French provinces, published under royal authority in the fifteenth and following centuries. In Germany and in Italy the earlier modern codes were state codes—e.g., those of Bavaria (1756), Prussia (1794), Baden (a translation of the Code Napoléon, 1809), and Saxony (1863); and those of the Two Sicilies (1819), Parma (1820), Piedmont-Sardinia (1837), and Modena (1851).

The principal civil codes now in force in Europe are national codes. The oldest of these is the French Civil Code, commonly known as the Code Napoléon, promulgated in 1804. It is still in force in Belgium, and it has served as a model for much subsequent codification, especially in Latin countries. The Austrian Civil Code dates from 1811. The Italian Civil Code was published in 1865; the Spanish Civil Code, in 1888–89; both of these are based upon the French Code. The German Civil Code was published in 1896, and has been in force since 1900. All of these codes, except the Spanish, have supplanted the older provincial and state codes; indeed, the chief object with which they were framed was to create common national law. Nearly all of the smaller European states have civil codes. In Switzerland, where cantonal codes are still in force, there is already a federal code of obligations, and a general civil code is in preparation.

In America, French law has been codified in Lower Canada (now the Province of Quebec; Code of 1865) and in Louisiana (Code of 1808, amended 1824, and since from time to time revised). In nearly all the Spanish-American states the civil law has been codified, with the Code Napoléon as the chief model. The more important of these codes are those of Bolivia (1831), Peru (1851), Chile (1855), Uruguay (1868), Argentina (1869), Mexico (1870, revised 1884), Colombia (1873, revised 1887) Identical with the Chilean Code, or based upon it, are the codes of Nicaragua (1867), Guatemala (1882), Salvador, Honduras, Venezuela (1880), Costa Rica (1884), Ecuador (1890). The Argentine Code was adopted by Paraguay in 1889. The Spanish Civil Code of 1889 is in force in Cuba, Porto Rico, and the Philippines. To this list of civil-law codes should be added the new Civil Code of Japan (1898), since its provisions, except as regards the family, are largely drawn from modern European codes. A general history of European law is yet to be written, although there are good histories of the law of Germany, Italy, France, Spain, etc. Consult Savigny, *Geschichte des römischen Rechts im Mittelalter* (2d ed., Heidelberg, 1834–51), which is still the most important general work. There are special works on the reception of Roman law by Schmidt (Göttingen, 1868) and Modderman (Groningen, 1874). See Howe, *Studies in Civil Law* (Boston, 1905).

CIVIL LIST. An annual allowance granted to the sovereign and the members of the royal family in constitutional monarchies, where the Parliament has obtained control of the purse. In England, down to 1660, the entire expenses of government, civil and military, were defrayed out of what was called the "Royal Revenue." This revenue, which arose partly from crownlands and partly from other sources, remained for a long period after the Conquest at the disposal of the crown; and even after supplies were voted by Parliament, the specific mode of their expenditure continued to be free from parliamentary control. After the accession of William III a distinction was drawn between the military and naval expenditure, which was henceforth voted by Parliament annually, and the Civil List proper, which included the maintenance of the royal household, the salaries of the judges, ambassadors, and such great officers of state, and such miscellaneous disbursements as the secret-service money and pensions. The Civil List was fixed at £600,000. Under William IV all salaries were transferred from the Civil List to the National Budget, and the royal grant placed at £510,000. Upon the accession of Victoria, the hereditary revenues of the crown were consolidated with the national domains, in lieu of which the sovereign was allowed an annual stipend of £385,000, to be devoted solely to the support of the royal household and the honor and dignity of the crown. Under the Act of 1901 the Civil List of the King was fixed at £470,000. The Act also provided for an annuity of £20,000 for the Prince of Wales and £10,000 for the Princess of Wales; also £6000 to each of the three daughters of the King. Under Act of 1910 the Civil List of the reigning King was fixed at the same figure as that of his predecessor. The British monarch also enjoys the income from the Duchy of Lancaster, varying from £50,000 to £60,000 annually. Of the sum represented by the King's Civil List, £110,000 is appropriated to the privy purse of the King and Queen; £125,800 for salaries of the royal household, etc.; £193,000 for household expenses. In all the countries of continental Europe, with the exception of Russia and Turkey, the sovereign

and the members of the royal family are provided for by a civil list, generally in proportion to the value of the royal possessions which they may have ceded to the nation. The income of European monarchs ranges from £250,000 in the case of the King of Denmark to £800,000, which represents the allowance made the King of Prussia.

CIVIL PROCEDURE. Legal procedure—the process whereby legal rights are protected and enforced, and violations of private or public rights punished. As commonly employed in English and American law, however, the term "civil" refers to private as distinguished from public rights, and civil procedure would not include the processes of the tribunals in protecting the peace and vindicating the dignity of the state, i.e., criminal procedure. Neither does it cover any administrative process of the state, nor diplomatic or other action for the purpose of protecting the interests of citizens or subjects in foreign lands. See PROCEDURE; INTERNATIONAL LAW.

CIVIL RIGHTS. See RIGHTS, CIVIL.

CIVIL RIGHTS BILL. In American history, a bill passed by Congress in 1866, as one of the Reconstruction measures of that body, for the purpose of securing an equality of civil rights to all citizens of the United States, and particularly for the purpose of placing the freedmen in the South on an equal political footing with the whites. Its main provision was as follows: "All persons born in the United States and not subject to any foreign power, excluding Indians not taxed, are hereby declared to be citizens of the United States; and such citizens of every race and color, without regard to any previous condition of slavery or involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall have the same right, in every State and Territory of the United States, to make and enforce contracts, to sue, be parties, and give evidence, to inherit, purchase, lease, sell, hold, and convey real and personal property, and to the full and equal benefit of all laws and proceedings for the security of person and property, as is enjoyed by white citizens, and shall be subject to like punishment, pains, and penalties, and to none other, any law, statute, ordinance, regulation, or custom to the contrary notwithstanding." The other sections of the bill merely provided for the carrying out of this provision and fixed penalties for its infraction. The bill passed the Senate on February 2 by a vote of 33 to 12, and the House on March 13 by a vote of 111 to 38; was vetoed by President Johnson on March 27, and was passed over the veto by the Senate on April 6, and by the House on April 9. It was the subject of an animated debate both in and out of Congress, and the challenging of its constitutionality led to the passage and adoption of the Fourteenth Amendment. Another bill, of March 1, 1875, provided further for the rights of the blacks, prescribing that blacks should not be distinguished from whites by innkeepers, teachers or officers of schools, theatre managers, and common carriers; that Federal courts should have exclusive jurisdiction over infractions of the bill; and that negroes should not be excluded from juries. This law was declared unconstitutional in 1883 on the ground that it dealt with social and not civil rights. See RECONSTRUCTION.

CIVIL SERVICE. The civil service of a state is, properly speaking, the entire body of public officials charged with the duty of conducting its civil administration. As commonly employed, however, the term does not include members of the military and naval establishments, nor members of the legislative branch of the government; nor, generally, other elective officers. Indeed, in the popular connotation of the phrase, the direct representatives of the sovereignty, whether elective or appointive, are not usually included. Thus, neither the appointed members of the British cabinet nor the elected President of the United States would usually be described as civil servants; while there is no doubt that the Viceroy of India and the Civil Governor of the Philippine Islands, as well as the members of the President's cabinet, come under that designation. On the other hand, it is not usual to include within the description of the civil service mere laborers, though the method of their employment, their terms of office, and sometimes the nature of their duties, render it difficult to distinguish them from their coemployees of the state, who are undeniably within the common acceptation of the term.

The civil service of a modern civilized state is a very complex affair, consisting of a multitude of officers and civil servants of various grades, performing a great variety of highly differentiated functions, and grouped in various administrative departments. Some of the more important of these are modern additions to the functions of the state, while others are of great antiquity. Thus, the officers of the royal household in England, many of the officers of the courts of justice in Great Britain and the United States, can trace their offices back to the very beginnings of English history, while such great administrative departments as the post office, the British Board of Trade, the United States departments of agriculture, of commerce, and of labor, and the Interstate Commerce Commission are of recent origin. It is to the modern additions, especially to the institution of a postal service, that we owe the enormous increase in the number of public servants in the latter half of the nineteenth century. To this should be added, however, as contributing causes, the large increase in the number and size of cities in recent times, with the growing necessity for police protection, together with the assumption, by municipalities and by the state, of a variety of services and functions that were previously left to private enterprise; such as the cleaning of streets, the removal of waste, and the furnishing of a water supply in cities, and, in some countries, the building and management of telegraph lines, railways, and canals, and of irrigation works on a large scale, by the general government.

At the head of the British civil service stand the officers of the royal household, under several departments; then come the officers of the House of Lords and the House of Commons; then a vast number of offices or departments, of which the following are the more important: treasury, home office, foreign office, colonial office, India office, war office, admiralty, board of trade, post office, customs, inland revenue (including stamps, taxes, and excise), exchequer and audit office, office of woods and forests, office of works and buildings, Duchy of Lancaster, public-record office, local government board, education department, civil-service commission, registrar-general's office, stationery

office, ecclesiastical commission, charity commission, patent office, emigration office, Trinity House, herald's college, law and equity courts, ecclesiastical and admiralty courts, prisons department, British Museum, science and art department, diplomatic and consular corps. Several departments peculiar to Scotland and Ireland form distinct lists, not included in the above. The heads of most of the departments are political officers, changing with the ministry. Others, such as the head of the exchequer and audit department, or the commissioners of customs and of inland revenue, are permanent officials. Excluding the judicial offices, and a few departments where special knowledge is required, the civil service is open to the public generally, the principle of open competition being in force as regards most of the departments. See GREAT BRITAIN, *Government*.

The civil administration of the Federal government of the United States is confided to a body of upward of 300,000 officials. These are all included within the 10 general departments of the national government—the departments of state, justice, interior, war, navy, treasury, post office, agriculture, commerce, and labor—and Congress, though some of these contain a large number and variety of bureaus dealing with a great diversity of interests not logically related to the main business of the department. As examples of this incongruity, it is only necessary to mention the National Observatory, under the jurisdiction of the Navy Department, and the National Library, under that of Congress. The President is the great source of power in the American Federal system, all the officers of the government, excepting the Vice President, the members of the two Houses of Congress, and the employees of the latter, owing their offices to his appointment.

The curious identity of the governmental and administrative forms which have been adopted in the several States of the American Union is treated in the article UNITED STATES, section on *State Government*. The result of this identity is, of course, a great similarity in the civil service of the States. In most of the States the principal judicial officers and the heads of the great departments of administration, as well as the Governor and Lieutenant Governor, are chosen by popular vote. Generally, each elective officer has the power to name his own subordinates, the Governor's appointing power being limited to his own clerks and secretaries and to the officials of certain bureaus or commissions, which do not come under the jurisdiction of the constitutional departments of administration. The restricted character of the functions of the States in our Federal system has thus far furnished no occasion for an extensive civil service, and, accordingly, the number of persons employed in that service in the State governments is very small compared with the number employed in the Federal service. The establishment of a State constabulary, or police system, or the assumption by the Commonwealth of the ownership and operation of telegraphs, railroads, or other great industrial enterprises, would of course enormously increase the civil service of the State.

In the modern city, on the other hand, by reason of the great diversity and extent of the functions of municipal government in our day, the number of civil servants is very great and tends constantly to increase. Not only the purely governmental operations of a city government, as the maintenance of a police force and efficient local tribunals; not only its quasi-governmental functions, as the regulation and administration of a system of public instruction, the cleaning of streets, and the removal of waste; not only its gigantic business enterprises, as in supplying its citizens with water and gas, and the building and operation of bridges, systems of transportation, etc.; but also its administration of the property interests committed to its charge, as the docks, parks, streets, etc., call for a vast and complicated machinery of administration and an army of civil servants. American cities have generally reproduced, with great fidelity and uniformity, the type of municipal government brought over by our earliest city builders from England. The head of the administration is a mayor, elected by popular vote, and with him are usually chosen a treasurer, comptroller, or other financial officer, and sometimes other heads of departments. But generally the power of appointment vested in the mayor is a large one, and often it extends to the appointment of most if not all of the chiefs of the several administrative departments of the local government. See CITY; MUNICIPAL GOVERNMENT.

Local political divisions, such as counties, towns, parishes, and school districts, present a greater diversity of governmental form and administration; but in the United States the number of appointive officers in those divisions is small, and in a general view of the subject of civil service they do not call for special consideration.

The method of appointment to the public service and the tenure of the civil servant vary greatly in England, according to the historical character of the service; in the United States, according to the jurisdiction and the rank of the official. High officers of state are appointed in Great Britain by royal warrant; in the United States, by commission. In the former country the complexity of the service is great, many public officers deriving their status from long usage, and being attended with privileges and immunities of immemorial force. Many of them are for life, many have the personal quality associated with the feudal tenure of land, and some are hereditary. Indeed, by the common law of England, public office was a species of real property, held by a tenure, like land, and vesting in the incumbent an estate, either for life or in fee. Even as late as the middle of the eighteenth century, offices are enumerated by Blackstone in his classification of real property as one of the class of incorporeal hereditaments. (See OFFICE.) To-day, however, most of the positions in the public service in England and all offices in the United States are, in law, regarded as held in trust for the public benefit; and though an appointment to office usually vests in the incumbent a certain definite right to perform its duties and enjoy its emoluments, it no longer entitles him to make merchandise of it, to alienate it, or to transmit it to his heirs. All public offices in the United States being of comparatively recent origin and created by statute, there is much greater simplicity and uniformity in the mode of their creation and in the incidents of their tenure than in Great Britain. Comparatively few positions in the public service are held by a life tenure—the principal exceptions being high judicial positions in the Federal service and

in a few of the States. In many cases an office is held at the will of the appointing power, and by statute a large proportion of the positions in the Federal service are held by a four years' tenure. See TENURE-OF-OFFICE ACT.

The power of appointment to the public service, even when, as is usually the case, unrestricted in theory, may be practically limited by custom, by the despotism of political party control, or, as in the case of the President of the United States, by the operation of self-imposed rules. The British Parliament, and many of the United States, have enacted laws restricting the exercise of the power of appointments, and prescribing the qualifications for the civil service, and providing for an impartial method of selection among the candidates for office; and in several States these provisions have been embodied in the constitution. The object of these laws being to raise the moral tone and improve the efficiency of the civil service by eliminating, so far as possible, political motives for appointments, and by securing to the incumbents of public office independence of external control, whether personal or political, some form of the so-called "merit system" (q.v.) has generally been adopted. Similar boards exist in New York and in many other cities to govern appointments to municipal office. This system will be fully described under that title; but it may be noticed, here, that it is based on the principle of competitive examinations, conducted by a board of administrative officers known usually as "Civil-Service Commissioners." The results of the examinations and the rating of the candidates are reported by the Civil-Service Board to the appointing officer, who makes his selection from among the names so certified to him, as the law may direct.

The power of appointment being vested in the President of the United States by the Federal Constitution, it is not within the power of Congress to fetter his action by the enactment of similar laws. The merit system has, however, been extensively applied by the voluntary action of the President, most of the great departments of the government being now wholly or in large part under its operation.

In many of the States by law, and in some departments of the Federal administration by executive order, the independence of civil servants has been further secured by provisions restricting the power of removal from office, in many cases by providing for a definite tenure, and in others by requiring the removing officer to file his reasons for making the proposed removal, and to give the accused official an opportunity to be heard in his own defense. In still other cases, where the tenure is for life, or "during good behavior," the action of the removing officer may be reviewed by the courts, and the removed official reinstated if the grounds for the removal are deemed by the court to be insufficient. Generally, however, where the tenure is not permanent, the provisions above described operate solely as a check on hasty and inconsiderate action, and as securing to the civil servant reasonable notice and the consideration of his claims upon the office, and vest no power of review in the courts. It has been judicially determined that the civil-service rules promulgated by the President of the United States do not have the force of general law, and confer upon members of the service no right to invoke the aid of the courts to protect them against violation thereof. They are the President's law, and he alone can enforce them. The general effect of the adoption of the merit system and of the legislation last referred to has been most salutary. The evils at which these laws were aimed, and the history of the popular movement which resulted in their general adoption, will be found set forth in the article on CIVIL-SERVICE REFORM. See Ashley, *The American Federal State* (New York, 1902); Anson, *Law and Custom of the Constitution* (Oxford, 1892); Eaton, *Civil Service in Great Britain* (New York, 1880); Goodnow, *Comparative Administrative Law* (New York, 1893); Fairlie, *The National Administration of the United States* (New York, 1905); and the authorities referred to under CIVIL-SERVICE REFORM.

CIVIL-SERVICE REFORM. In the most general sense, the adoption, by legislation or executive action, of rules for improving the civil service of the state by prescribing the qualifications of candidates for public office, and for the good behavior of public servants and their independence of external control. Specifically, and as commonly employed in the United States, the expression refers to the movement of the last hundred years in Great Britain and the United States for the elimination from the public administration of the corrupting influences of party politics.

Owing to the power which has usually attended the possession of public office and the lack of any effective supervision or criticism, public administration has in all stages of political development been affected with corruption and inefficiency and extravagance. The various forms of autocratic government, which preceded the more popular governments of our day, furnished a peculiarly favorable soil for the growth of these evils. (See CIVIL ADMINISTRATION.) It was a disappointing result of the first effective appearance of government "by the people" in modern times, that it should not only have failed to correct these tendencies of the earlier régime, but should have intensified them and given them new and more enduring vitality. It is to the excessive and vicious development of the party system in its earlier stages that we owe this condition of affairs. Human nature is much the same under all forms of government; and it is, therefore, not to be wondered at that great party leaders, like Bolingbroke and Walpole, having great patronage at their command, should employ it to consolidate their power or that of their party. The "spoils system," as it is called in the United States, had its inception with the real beginning of popular government, in the reign of William III. William III was himself a great administrator, and his first efforts were directed to a reform in the public service. But the only permanent "reform" effected was the substitution of Parliament for the crown as the source of office and official corruption. At the accession of Anne in 1702 the party system had enveloped the whole civil service of Great Britain. All of the offices of state and all employments under them, from the highest to the meanest, were the assets of the party in power and were available for party purposes. The results of the system were in the highest degree demoralizing to the public administration and to the public spirit of the nation. As has been well said of this period in England, "the partisan system of appointments and promotions aggravated the evils of parlia-

mentary patronage, made administration costly and feeble, spread corruption from the departments to cities, boroughs, and elections, while it disgusted the better class of citizens, alarmed statesmen, and exasperated and debased all political contests." Matters grew steadily worse through the early part of George III's long reign, the efforts of Rockingham, Burke, Pitt, and other patriots to stay the tide of corrupt practices being neutralized by the stubborn resistance of the King. The tide turned, however, with the coming in of the second Rockingham ministry in 1782, and when George IV ascended the throne, in 1820, though the partisan system still existed, its worst abuses had been driven out by the growth of a better public sentiment. The great Reform movement which culminated in 1832 had no direct concern with administration and produced no immediate effect on the movement for administrative reform; but the "merit system" of selecting candidates for office was tried on a small scale as early as 1834 and slowly but steadily made its way. It was probably the demoralization of the Indian service which opened the eyes of British statesmen to the necessity for more sweeping methods of reform; and after securing the passage of the India Act of 1853, the government of Lord Aberdeen appointed a commission, consisting of Sir Stafford Northcote and Sir Charles Trevelyan, to make an inquiry into the condition of the public service and to suggest improvements therein. This commission having in the same year reported, recommending a uniform system of competitive examinations to test personal fitness for the public service, in 1855 such a system was established by the ministry of Lord Palmerston, through an order of the Queen in Council. This sweeping reform, which has proved to be as permanent as it has been salutary, was brought about by the wisdom and experience of the administration, in the face of a hostile majority in Parliament and an apathetic public opinion. The beneficial effects of the new system quickly became apparent, and in the extremely short space of four years had roused a strong public sentiment in its favor and won the unanimous support of Parliament, and in 1859 was fully legalized by statute. The last step in the reform of the British civil service was taken in 1870, when the competition, previously somewhat restricted, was thrown open by an order in Council to all persons of requisite age, health, and character.

The "spoils system" and its reform have had a shorter and a more recent history in the United States. It was instituted by President Jackson in 1829, as an incident of his bitter and proscriptive campaign for the presidency, at a time when it was already on the wane in Great Britain. The doctrine enunciated in the notorious declaration of Senator Marcy, that "to the victor belong the spoils of the enemy," rapidly became the accepted principle of political action in the United States, and represents a more thoroughgoing and vicious form of the system than ever existed in England. In England, as in the United States, office was the reward of party service; but the principle of the "clean sweep," whereby an incoming administration makes room for its supporters by the wholesale removal of the incumbents of the public service, was the exclusive possession of the American Republic. So well adapted did this principle prove itself to the American party system, that it spread rapidly from the national government to the several States until it permeated the entire public life of the country. So firmly did it become intrenched in the civic life of the American people, that it has been affectionately described and defended by its supporters as the "American system." Its essentially artificial character is evidenced by the fact that in the 40 years from the beginning of Washington's administration to that of Jackson, not a single subordinate officer of the government was removed without cause, while in Jackson's first term the number of such removals rose to thousands.

This was not accomplished without protest, however. The new principle was vigorously combated in the Senate of the United States by Clay, Webster, Calhoun, and other leaders—the first of whom denounced it as "a detestable system, drawn from the worst periods of the Roman Republic." But nothing availed to stay the tide, and for 40 years more no President raised his voice against the system or failed to act upon it. But the sentiment in favor of reform was slowly gathering force, and in 1867 it found its first effective expression in a report to the House of Representatives, made by Mr. Thomas A. Jenckes of Rhode Island, recommending the establishment of a merit system, based upon competitive examinations. A second report, recommending similar action, was made by Mr. Jenckes the next year, but it was not until 1871 that the growing force of public opinion compelled Congress to take action upon the subject. In that year a clause in the general appropriation bill authorized the President to prescribe rules for admission to the civil service and to appoint a commission for that purpose. President Grant thereupon appointed the first Civil-Service Commission, with George William Curtis as chairman, and in December of the same year the commission reported, recommending a set of rules and regulations. This report was adopted and the rules and regulations of the commission put into effect, and thus the first victory for Civil-Service Reform was won. These rules, with certain additions to them recommended by the commission in the spring of 1872, remained in force until the winter of 1875, when the growing opposition of the politicians induced Congress to withhold the annual appropriation for the working of the system, and the President yielded to party pressure and suspended the operation of the Civil-Service Rules.

The most memorable event in the long struggle for the reform of the civil service in the United States was the organization of the Civil-Service Reform Association in New York in May, 1877. This organization, and the National Civil-Service Reform League into which it developed, under the presidency of Mr. Curtis, instituted an active propaganda for the creation of a public sentiment in favor of the reform, and by its meetings and public addresses, and by the high and disinterested character of the men who were prominent in its work, powerfully stimulated the movement. After this the triumph of the reform was not long delayed. In January, 1883, the bill introduced by Senator Pendleton, of Ohio, which, in the language of the National Civil-Service Reform League, provided "a constitutional, practical, and effective measure for the remedy of the abuse known as the spoils system," was adopted by overwhelming majori-

ties of both Houses of Congress, and the "merit system" was an established fact. The Civil-Service Law, which went into effect in July, 1883, prohibited the vicious practice of levying assessments for partisan purposes upon members of the civil service of the government, authorized the appointment of a commission to frame rules and regulations for the civil service, and empowered the President, from time to time, to determine by executive order what classes of the public services should come under the operation of such rules. In the same year a similar bill, applying the same principles to the civil service of the State of New York, was passed by the Legislature and became a law, and in the following year the system was extended by statute to the 23 incorporated cities of that State. In 1884, also, the new system was adopted in Massachusetts. The reform of the civil service was now secure, but still far from complete. The President (Arthur), who had himself, as a New York politician, been a devoted adherent of the old system, nevertheless administered the new one faithfully; but it was deemed expedient to proceed slowly in its application, and only 14,000 employees of the government were at first brought within the "classified service." It must be said that the high tide of public feeling which resulted in these sweeping victories for the movement has never been reached again, and that the active hostility of party leaders has greatly retarded its progress. The new system has made gains; it has been adopted in whole or in part in a few more States, and it has been extended by executive order of the President to classes of public servants not previously affected by it, but in many of the United States the political "machine" has been strong enough to maintain the old system unimpaired, and in many others there is a complete absence of popular feeling on the subject. In other words, the political development of the American people has not yet reached the point, attained by the English electorate a generation ago, of recognizing the supreme importance of clean and efficient administration to the welfare of the State. Much of the progress of the past 30 years has been due to the cautious initiative of enlightened presidents, especially of Cleveland, Harrison, and Roosevelt, the last of whom has long been known as a devoted friend of the reform movement, and, as Civil-Service Commissioner under President Harrison, did much to commend the new system to the American people. President Taft, at the close of his administration, transferred the fourth-class postmasterships to the classified service; an act accepted by the administration of President Wilson with the qualification that all persons in that service, not appointed originally under a merit system, should be required to establish their right to their positions through competitive examinations. The nature of the "merit system" and its operation will be described under that title. The character of the partisan system will be found discussed in the article on the SPOILS SYSTEM. CIVIL WAR IN AMERICA. The conflict between the Northern and Southern States of the Union, in 1861–65, ostensibly and immediately occasioned by disagreement between the two sections on the subject of the control of slavery, but perhaps not less the result of long-standing differences in political and economic theories. The public agitation of the Abolitionists; the nomination of antislavery candidates for the presidency, at each election, from 1840; the introduction in Congress of the "Wilmot Proviso" (q.v.) in 1846; the passage of the Fugitive Slave Law in 1850, and the incidents connected with its enforcement; the repeal of the Missouri Compromise in 1854; the "Dred Scott" case (q.v.) in the United States Supreme Court in 1857; the adoption of the Lecompton Constitution for Kansas in 1858; the John Brown raid at Harper's Ferry in 1859—served to force slavery into conspicuous notice as the leading political issue, to accentuate the irreconcilable divergence of beliefs relative thereto, and to intensify the bitterness which rendered a peaceful settlement of the problem still more difficult. The projection into politics of a sectional issue served to divide the only party that still retained a following both North and South—the Democratic—and to bring about the nomination of four presidential candidates in 1860; Stephen A. Douglas, of Illinois, and John C. Breckenridge, of Kentucky, who were nominated by the two wings of the Democratic party; John Bell, of Tennessee, who was nominated by the so-called Constitutional Union party; and Abraham Lincoln, of Illinois, who was nominated by the Republican party. Abraham Lincoln was elected President, exclusively by the votes of the North; and the immediate effect of his election was to precipitate the secessionist movement. A State convention met at Charleston, December 17, and on the 20th passed an ordinance declaring that "the union now existing between South Carolina and other States, under the name of the United States of America, is hereby dissolved." This example was followed by acts, similarly phrased, passed by conventions of 10 other Southern States, in the following order: Mississippi, Jan. 9, 1861; Florida, January 10; Alabama, January 11; Georgia, January 19; Louisiana, January 26; Texas, February 1; Virginia, April 17; Arkansas, May 6; North Carolina, May 20; Tennessee, June 8. The States of Missouri, Maryland, and Kentucky were divided in sentiment on the question of secession, and in the ensuing war had representatives in the governments and armies of both sections. The western counties of Virginia remained loyal to the Union and separated themselves from the rest of the State. On Feb. 4, 1861, a Congress met at Montgomery, Ala., in which were represented all the States that had passed ordinances of secession previous to that date. This Congress adopted for the new organization a Provisional Federal Constitution, which was later ratified, and the title "Confederate States of America." Jefferson Davis, of Mississippi, was elected President, and Alexander H. Stephens, of Georgia, Vice President, of the new Confederacy. In the meantime the State forces of South Carolina had seized the

United States Customhouse, Post Office, and Arsenal in Charleston, and had taken possession of Forts Pinckney and Moultrie in the harbor of that city; Major Robert Anderson, in command of Fort Moultrie, with a force of only 128 men, many of whom were noncombatants, having withdrawn to Fort Sumter, which he considered more defensible. On April 12, 1861, hostilities began with the bombardment of Fort Sumter, which, after a brave defense, although several times set on fire by shells, was surrendered on the 14th by Major Anderson—the small garrison withdrawing with the honors of war. There were no casualties on either side. On the day following this event, President Lincoln issued a proclamation calling for 75,000 volunteers for three months; this was followed by a proclamation declaring the blockade of the Southern ports; and on May 3 a second call was issued for 64,000 men for the army and 18,000 for the navy, to serve "during the war." The United States regular army consisted, Jan. 1, 1861, of 16,402 officers and men; but these had been dispersed by John B. Floyd, Secretary of War under Buchanan, to distant parts of the country. Under his directions, also, quantities of arms and ammunition had been transferred from Northern to Southern arsenals during 1860; and the ships of the United States navy were mostly absent at foreign stations by direction of the Secretary of the Navy, Toucey. A very large proportion of the Southern army officers resigned and entered the Confederate service, though this course was by no means so general on the part of Southern officers in the navy. In the Southern States preparations for war were carried on with great energy. Gen. Robert E. Lee was appointed commander in chief of the Confederate forces in Virginia, their main body being concentrated at Manassas Junction. On June 10 a Union force was repulsed by the Confederates at Big Bethel, Va. (q.v.), and on July 21 was fought the first battle of Bull Run (q.v.), when the Confederates, under Generals Johnston and Beauregard, completely defeated the Federals, under General McDowell, and threatened the capital. This was the first important battle of the war, and its effect was to rouse both sides to what now promised to be a long and bloody struggle. Meanwhile General McClellan (q.v.) had succeeded in wresting the western portion of Virginia from the Confederates; and immediately after the disastrous defeat at Bull Run he was appointed commander in chief of the Army of the Potomac. His skill in organizing and disciplining large bodies of men, and making valuable soldiers out of raw and inexperienced recruits, doubtless qualified that army for the magnificent part it afterward took in the war.

The Congress of the United States met in extra session July 4, 1861, and, in response to the President's call, voted 500,000 men and $500,000,000. The Northern States, in their individual capacity, had before this time drawn upon their own resources in behalf of the Union cause—New York and Pennsylvania each voting $3,000,000 for the prosecution of the war; Massachusetts and other New England States sending regiments into the field fully armed and equipped; while in every city, town, and village volunteers were gathering and forming themselves into companies and regiments, to be afterward offered to the governors of the respective States, and through these officials to the country. The latter half of the year 1861 was devoted mainly to organization, and the engagements that occurred were generally without great importance. At the South the enlistment of 400,000 men was going on under a call from the Confederate Congress. The Confederates also had possession of the United States Arsenal at Harper's Ferry and of the Navy Yard at Norfolk, Va., where they had seized 2000 cannon and the steam frigate *Merrimac*, one of the finest in the United States navy. General Lyon succeeded in securing Missouri for the Union by a series of engagements, which terminated, however, in the defeat at Wilson's Creek (near Springfield), August 10, in which he fell. On October 21 the Confederates gained a success by almost annihilating the Federal force of 1500 to 1700 men which had been sent to Ball's Bluff (q.v.) on the Potomac and left there unsupported. Gen. U. S. Grant, after having seized Paducah, at the mouth of the Tennessee River, and another important strategic point at the mouth of the Cumberland, captured, on November 7, the Confederate camp at Belmont, Mo., though he was soon driven back by the Confederate General Pillow, acting under orders from General Polk. On the same date a United States naval force under Admiral Dupont captured Forts Walker and Beauregard at Port Royal, S. C. On the following day the Confederate commissioners, Mason and Slidell, were taken, by Captain Wilkes of the United States frigate *San Jacinto*, from the British mail steamer *Trent*, while on their way to their respective missions to England and France. Complications with England were averted by the prompt disavowal of Captain Wilkes's act by the United States government. The Federal force in the field in the beginning of 1862 was about 450,000 men; the Confederate force about 350,000. During January some successes were gained in Kentucky, at Prestonburg and Mill Springs, by the Federals, under Colonel Garfield and General Thomas. General Grant, aided by a naval force under Commodore Foote, captured Fort Henry, on the Tennessee River, February 6; and 10 days later General Grant attacked Fort Donelson, on the Cumberland, which surrendered with nearly 15,000 prisoners and 40 cannon. A naval expedition under General Burnside and Commodore Goldsborough captured Roanoke Island, Newbern, N. C., on February 8. On March 7–8 occurred the battle of Pea Ridge, in western Arkansas, in which the Federals under Gen. S. R. Curtis defeated the Confederates under Gen. Earl Van Dorn. On March 9 the Confederate ironclad *Virginia* (formerly the *Merrimac*), after having on the preceding day inflicted great loss on the wooden vessels of the Union squadron in Hampton Roads, was herself defeated in a remarkable naval engagement by the newly constructed *Monitor*, under Worden. In the West the Northern campaign was directed towards opening the Mississippi, and towards cutting the Memphis-Charleston railroad line. In the course of the southward movement for the latter purpose, General Grant fought the great two days' battle of Shiloh (or of Pittsburg Landing), on the Tennessee River, April 6–7. On the first day the attack of the Confederates, under Generals A. S. Johnston (who fell) and Beauregard, threatened the destruction of the Union force, but on the second day Grant, reënforced by Buell, drove the enemy from the field. In this theatre of the

war, at the close of the following month, the Federals, under Halleck, compelled the evacuation by Beauregard of the important strategic point of Corinth, Miss. On April 8 General Pope and Commodore Foote captured Island No. 10 (q.v.), in the Mississippi River. Fort Pulaski, near Savannah, Ga., was bombarded and captured by Major Gillmore, April 11; and at the close of this month New Orleans was captured by Farragut and occupied by Northern forces. The Army of the Potomac, which had devoted its time during the winter of 1861–62 to organization, moved early in the spring to the peninsula formed by the James and York rivers, and gained an equivocal success at Williamsburg, Va., May 5. The army then advanced up the peninsula to the Chickahominy, and won the battle of Fair Oaks (Seven Pines), on May 31–June 1, against Gen. Joseph E. Johnston, but the approach of "Stonewall" Jackson, with a force fresh from a victorious advance through the Shenandoah valley, to coöperate with Lee, made it necessary, in the judgment of McClellan, to effect a change of base to the James River; and this hazardous movement was accomplished at the expense of some of the hardest-fought engagements of the war, known collectively as the Seven Days' Battles —those of Oak Grove, June 25; Mechanicsville, June 26; Gaines's Mill, June 27; Savage's Station, June 29; Frazier's Farm, June 30; and Malvern Hill, July 1. In July, Halleck was appointed commander in chief of the Union armies, but he did not assume personal command. As a result of the peninsula movement and the "change of base," the advantage remained with the Confederates, who had successfully defeated the original plan for the capture of Richmond by this route. The scene of the Eastern campaign was thus again shifted to northern Virginia, and on August 29–30 occurred the second battle of Bull Run (q.v.), between the Federal forces commanded by Gen. John Pope and the Confederates under Lee, Jackson, and Longstreet. Pope was utterly defeated, and his broken and dispirited columns were driven back upon Washington. Lee now undertook the invasion of the Union territory, and crossed the Potomac into Maryland. McClellan encountered him successfully at South Mountain, September 14, and definitively checked his progress in the severe battle of Antietam, September 16–17, forcing him to retreat across the Potomac. Harper's Ferry, which had been evacuated by the Confederates in June, 1861, was recaptured by Stonewall Jackson (q.v.), Sept. 15, 1862, when 11,583 men and a great quantity of munitions of war fell into the hands of the Confederates. On September 22 President Lincoln issued a proclamation decreeing the emancipation on Jan. 1, 1863, of all slaves in the States which should till then continue in a state of rebellion. This was followed on January 1 by a proclamation definitively emancipating the slaves in the rebellious States. On Nov. 7, 1862, General McClellan was superseded in the command of the Army of the Potomac by General Burnside, against the wish of the latter, who was defeated disastrously at Fredericksburg, Va., December 13. (See FREDERICKSBURG.) On Jan. 26, 1863, General Burnside was relieved by General Hooker, who was defeated by Lee in a great battle at Chancellorsville (q.v.) on May 2–4. The death of Stonewall Jackson made the victory a dearly bought one for the Confederates. Lee followed up this success by invading Maryland again, and early in June entered Pennsylvania. On June 28 Hooker was relieved from the command of the Army of the Potomac by Gen. George G. Meade (q.v.), and the latter at once pursued the Confederates with such celerity and determination that Lee was forced to stop and give battle. The two armies met in the great battle of Gettysburg, which lasted July 1–3. General Reynolds was killed during the first day's fight, and on the last day General Hancock was dangerously wounded. The result of the three days' battle was a most complete Federal victory. Lee, having recrossed the Potomac, now retreated to a position on the Rapidan, and strategic movements on the part of the two armies, accompanied by occasional heavy skirmishing, occupied the time until winter. In the southwest, since the close of 1862, the main operations had centred about Vicksburg, converted by the Confederates into a great stronghold. After various attempts at its capture had failed, General Grant, by a series of brilliant strategic movements, succeeded in May, 1863, in closely investing the city, and on July 4, almost at the moment of the victory of Gettysburg, General Pemberton was forced by famine to surrender the place with his army of 30,000 men. The fall of Port Hudson, July 8, secured the complete control of the Mississippi by the Union forces and thus separated the two sections of the Confederacy. The struggle for the middle ground of Kentucky and Tennessee was marked by the battles of Perryville, Oct. 8, 1862, and of Murfreesboro, Dec. 31, 1862, and Jan. 2, 1863, with a result favorable to the Federals. On Sept. 9, 1863, General Rosecrans occupied Chattanooga. On September 19–20 he fought a bloody battle at Chickamauga and was defeated, the heroic stand made by General Thomas alone saving the Union army from destruction. This reverse was more than redeemed by the great victory of Grant over Bragg at Chattanooga (November 23–25—storming of Lookout Mountain, November 24, and of Missionary Ridge, November 25). This made it possible for Sherman to raise the siege of Knoxville, where General Burnside had been hard pressed by the Confederates under Longstreet. At the close of the year the Federal forces held Missouri, Arkansas, Kentucky, Tennessee, a large part of Louisiana, Mississippi, and Florida, and the Rio Grande frontier of Texas, and had control of the Mississippi River. A draft in the Northern States for 300,000 men, with an exemption clause, had added 50,000 men to the Federal armies.

In the early part of 1864 General Banks, assisted by Gen. A. J. Smith and a fleet under Admiral Porter, undertook an expedition up the Red River. A defeat at the hands of Generals Kirby Smith and Richard Taylor at Sabine Cross Roads, April 8, ruined the prospects of the expedition, which ended in complete failure.

General Grant was made lieutenant general and commander in chief in March, 1864. He turned over his command in the West and South to Sherman and took personal command of the armies of the East. A combined movement against the two remaining armies of the Confederates, those of Lee and Johnston, was now to be made under the personal direction of these two great generals. Sherman's army was in

motion from Chattanooga by May 7, and forced General Johnston through Georgia as far as Atlanta, defeating the Confederates at almost every point in a series of vigorous engagements, including those at Dalton, Rome, and Resaca, though he met with a severe defeat at Kenesaw Mountain. General Hood, who now replaced General Johnston, made repeated but disastrous attacks upon Sherman's forces (July 20, 22, 28) and, after being beleaguered in Atlanta, evacuated the city, which was occupied by Sherman on September 2. In the meantime the Army of the Potomac, with General Meade in immediate command, had broken camp on the Rapidan and undertaken the tremendous campaign of the Wilderness, with the design of forcing the fighting straight to Richmond. During this campaign of 43 days, fully 130,000 men on the Federal side and about 70,000 men on the Confederate side, with constant reenforcements, were engaged almost continuously. On May 5–6 was fought the battle of the Wilderness, which was followed by the battles of Spottsylvania Courthouse, the sharp engagement on the North Anna, and the terrible repulse of the Federal army at Cold Harbor on June 3. Finally, on the night of June 12, the Army of the Potomac crossed the Chickahominy and took position on the south side of the James River. The design of this movement was to threaten Richmond by way of Petersburg; and, to thwart it, Lee at once threw a large portion of his army within the defenses of the latter city, which proved to be impregnable to assault, and only to be reduced by regular approaches and a skillful siege. The regular investment of Petersburg was begun on June 19. While this protracted siege was in progress, the Confederate General Early made a rapid movement across the Potomac, achieving a success on the Monocacy, July 9, and threatening Washington itself. He then withdrew into the Shenandoah valley, and engaged in a vigorous campaign against General Sheridan, which ended, after a defeat near Winchester on September 19, in General Early's utter rout at Cedar Creek October 19. On June 19 the *Kearsarge* ended the destructive career of the Confederate cruiser *Alabama*, by sinking her off Cherbourg, France. In the month of August Admiral Farragut forced his way into Mobile Bay and defeated the Confederate squadron. General Sherman set out from Atlanta on his famous "March to the Sea" on November 15, carrying his compact army of 60,000 men through the heart of Georgia, and occupied Savannah on December 21, after carrying Fort McAllister by assault on the 13th. While Sherman was thus successful, General Hood had invaded Tennessee, driving the Federal forces before him. His movement ended in the battle of Nashville, December 15–16, where his army was destroyed by General Thomas. Thus at the close of the year the Federal forces were in possession of a large portion of the South, and Sherman was in a position to have the coöperation of the navy, and thus to move northward securely, so that he and Grant might hold between their two armies the weakened forces of both Lee and Johnston. In 1864 Abraham Lincoln was renominated by the Republicans, and General McClellan was nominated by the Democrats, who put forth a platform declaring the war a failure. Twenty-five States took part in this election; the electoral vote was 233, of which Lincoln received 212; the popular vote of Lincoln and Andrew Johnson, of Tennessee, was 2,223,035, and that of McClellan and Pendleton 1,811,714. During the latter part of December and January, General Sherman had remained in Savannah, resting his troops; but on Feb. 1, 1865, he again took the field. Marching through South Carolina, he took possession of Columbia on February 17, and on the following day Charleston, which had been besieged since 1863, was occupied by the Federals. Sherman now pushed on into North Carolina, where, on January 15, Fort Fisher, near Wilmington, had been captured, and where now two other Federal armies—under Schofield from Newbern, and Terry from Wilmington—coöperated with him, the three armies meeting at Goldsboro, N. C. Gen. J. E. Johnston, with the main army of the Confederates in that region, made an ineffectual attempt to check Sherman's advance at Bentonville, N. C. On March 24 General Grant issued an order for a combined movement of the armies operating against Richmond, to take place on the 29th. But on the 25th General Lee made a desperate attempt to break through the Federal line on the Appomattox River, and Fort Stedman was captured by the Confederates, only to be immediately retaken. On March 31–April 1 General Sheridan defeated the Confederates at Five Forks, which protected the South-Side Railroad, and thereby Lee's connections with Richmond, and captured 6000 prisoners. This was the final and irretrievable blow to the Confederate army. On the following day, April 2, General Grant attacked along the whole line in front of Petersburg, and on the evening of that day both Petersburg and Richmond were abandoned. General Lee retreated towards Lynchburg, but was intercepted by Sheridan, and on April 9 surrendered his army to General Grant at Appomattox Courthouse. General Johnston finally surrendered his army on April 26, although he had practically surrendered eight days earlier. On May 4 General Taylor surrendered the Confederate forces in Alabama to General Canby. The last fight of the war took place, May 13, 1865, on the Rio Grande. The last Confederate army in the field—the trans-Mississippi—was surrendered by Kirby Smith, on May 26. At the moment of final victory occurred the assassination of President Lincoln, on April 14.

The number of Federal soldiers in the field during the war was 2,666,999, the number drafted and held to service being 43,347; furnished substitutes, 73,607; paid commutation, 86,724; total drafted, 206,678, to which should be added 87,588 credited to the States under the draft of 1862; making in all, drafted, 294,266. The amount of commutation moneys received by the government was $26,366,316.78; the amount of bounties paid by the United States government was $300,223,500; by State and local authorities, $285,941,036. The casualties in the Federal army numbered 359,528; 110,070 men were killed in action or died of wounds; and 249,458 men died from disease, accident, or other causes. The entire available force capable of active service in the field, enrolled in the Confederate armies, was about 500,000 men, the number of enlistments being estimated from 1,239,000 to 1,400,000. Their entire loss in killed and wounded during the war was about 95,000 men; that from disease, accident, and other causes probably amounted

to 164,000. During the war Confederate cruisers, fitted out mostly in British ports, scoured the ocean, doing irreparable damage to the commerce of the United States. (See ALABAMA CLAIMS.) After the evacuation of Richmond, Jefferson Davis, President of the Confederacy, fled south, and was captured May 10, 1865, at Irwinville, Ga., by General Wilson's forces, as he was attempting to make his escape farther south. In company with certain others of the prominent leaders of the Confederacy, he was imprisoned for a time, but was not eventually punished. See NULLIFICATION; RECONSTRUCTION; UNITED STATES; LINCOLN; GRANT.

Bibliography. Three brief general works are: *A Short History of the War of Secession*, by Johnston (Boston, 1889); T. A. Dodge, *Bird's-Eye View of our Civil War* (Boston, 1883; rev. ed., 1897), and Formby, *The American Civil War* (New York, 1910). A more detailed work is the *History of the American Civil War*, by Draper (3 vols., New York, 1867–70). An important though unfinished military history is that by J. C. Ropes, *Story of the Civil War* (2 vols., New York, 1899, continued by Livermore, *The Campaigns of 1863 to July 10th* (2 vols., New York, 1913). A series of valuable monographs on various campaigns of the war is Scribner's *Campaigns of the Civil War* (13 vols., New York, 1881); and a noteworthy collection of essays, largely by participants in the events described, is *The Battles and Leaders of the Civil War*, ed. by Johnson and Buel (4 vols., New York, 1887–89). The original material bearing on the war has been published by the United States War Department, in an extensive series, begun in 1880 and completed in 1901, entitled *War of the Rebellion: Compilation of Official Records of the Union and Confederate Armies* (Washington). Numerous volumes of military memoirs have been written by officers of the two armies; and some of them, notably Grant's *Memoirs*, are of great value. There is also a *History of the Civil War in America*, by the Comte de Paris (trans., 4 vols., Philadelphia, 1875–88). More recent is Eggleston, *History of the Confederate War* (2 vols., New York, 1910). For particular phases of the conflict, consult: J. Bigelow, *France and the Confederate Navy* (New York, 1888); J. D. Bulloch, *Secret Service of the Confederate States* (London, 1883); and J. Fiske, *The Mississippi Valley in the Civil War* (Boston, 1900). With reference more particularly to the political aspects of the war, consult: Jefferson Davis, *Rise and Fall of the Confederate Government* (2 vols., New York, 1881); Giddings, *History of the Rebellion* (New York, 1864), incomplete; Greeley, *The American Conflict* (2 vols., Hartford, 1864–66); Logan, *The Great Conspiracy* (New York, 1886); Pollard, *The Lost Cause* (New York, 1868), not entirely reliable; and vol. i of Blaine, *Twenty Years in Congress* (2 vols., Norwich, 1884–93). See also Moore, *Rebellion Record* (11 vols., New York, 1861–71); and McPherson, *Political History of the Great Rebellion* (Washington, 1864). Recent works of value are: *The Civil War and the Constitution*, by Burgess (2 vols., New York, 1901); vol. vi of Schouler, *History of the United States under the Constitution* (New York, 1899); and Rhodes, *History of the United States from the Compromise of 1850* (5 vols., New York, 1893–1904); Hosmer, *The Appeal to Arms, 1861–63; Outcome of the Civil War, 1863–65* (New York, 1907). This work contains a select bibliography. MILITARY MAPS. Comte de Paris, *Atlas to the History of the Civil War; War of the Rebellion; Official Records, Atlas* (official and very elaborate).

CIVIL WARS IN FRANCE. A play by Dekker and Drayton, produced in 1598.

CIVIL-WAR VETERANS, SOCIETIES OF. Associations of veterans of the United States Civil War or their descendants. The predominant purpose of these associations is social; occasionally, however, political aims have been added, as in the case of the Grand Army of the Republic, which has striven successfully for the increase of the pension list and rate, and has become recognized as a considerable factor in national politics. The oldest of the Civil War associations is the Military Order of the Loyal Legion. (See LOYAL LEGION.) Membership in this society is restricted to officers of the army, navy, and marine corps, and to their oldest male lineal descendants; thus following closely, in organization, the Society of the Cincinnati. The most influential as well as the largest of the societies of the Civil War is the Grand Army of the Republic (q.v.). This organization admits to membership any soldier or sailor of the army, navy, or marine corps who was honorably discharged. It has two auxiliary organizations, known as the Woman's Relief Corps, which admits to membership mothers, wives, daughters, and sisters of Union soldiers, and the Sons of Veterans, which is composed of lineal descendants of those who served in the Civil War. Similar to the Grand Army is the Union Veteran Union (see VETERAN UNION, UNION), the membership clause of which, however, is more exacting, requiring service for a term of three years. This society also has an auxiliary society, known as the Ladies of the Union Veteran Union, and the Loyal Guard, for its junior male members. The Union Veteran Legion (see VETERAN LEGION, UNION) admits to membership only participants in some battle who possess an honorable discharge from the army. In addition to the foregoing, there are three special organizations, whose character is indicated by their names. They are: The Society of the Army of the Tennessee, organized on April 14, 1865; the Society of the Army of the Cumberland, organized Feb. 6, 1868; and the Society of the Army of the Potomac, organized Sept. 2, 1868. There was formerly a Society of the Army of the James, but that was merged, in 1876, into the Society of the Army of the Potomac. There are also numerous corps societies, such as that of the Eleventh Army Corps and the Sixth Army Corps, which hold annual meetings, and whose work has consisted largely in the erection of monuments on various battlefields and in other places to the memory of their leaders. The National Association of Naval Veterans (q.v.) admits to membership any appointed or enlisted man who served in the navy during the period of the Civil War. The Union Society of the Civil War was founded in 1907 to perpetuate the memory of those who, outside the regular service of the army and navy, rendered aid to the Union during the war. The memory of the Civil War is preserved in the Southern States through the instrumentality of three flourishing organizations, known as the United Confederate Veterans (see CONFEDERATE VETERANS, UNITED), which admits

to membership actual participants in the Civil War; the United Sons of Confederate Veterans (see CONFEDERATE VETERANS, UNITED SONS OF), which was organized by the male descendants of the Confederates; and the United Daughters of the Confederacy (see CONFEDERACY, UNITED DAUGHTERS OF THE), which admits to membership the widows, wives, mothers, sisters, and lineal female descendants of those who served in the Confederate armies. There are various other societies which, while they do not restrict their membership to participants in the Civil War, admit to membership participators in that conflict or their descendants. Of this character are the Military Order of Foreign Wars (see FOREIGN WARS, MILITARY ORDER OF), the Naval Order of the United States (q.v.), and the Medal of Honor Legion (q.v.).

CIVITÀ CASTELLANA, chē'vē-tä' käs'tĕl-lä'nä (It., castle city). A city in central Italy, about 27 miles north by west of Rome, in the province of that name (Map: Italy, G 5). It is situated on an elevation above the Rio Maggiore. The town is near the site of the ancient Etruscan city of Falerii, and the surrounding ravines contain many interesting relics and remains of that place. There are also ruins of a Roman theatre, and the twelfth-century Abbey of Santa Maria. The Neapolitans, led by Mack, were here defeated by the French under Macdonald, Dec. 4, 1798. Pop., 1901, 5265; 1911, 5383.

CIVITALI, chē'vē-tä'lē, MATTEO (1436–1501). One of the foremost Tuscan sculptors of the early Renaissance; also an architect and engineer. He was born at Lucca, June 5, 1436, of a family identified with the arts. From the style of his sculpture it is evident that he studied in Florence, probably in the workshop of the Rossellini; he was also influenced by Desiderio da Settignano. (See these titles.) Most of his life was passed in or near his native town, where he married, and reared a numerous family. In 1495 he removed to Carrara, the site of the famous marble quarries, to facilitate the execution of commissions for Genoa and Sarzana. He died on a visit to Lucca, Oct. 12, 1501, and lies buried in the church of San Cristoforo. Civitali's art is best represented in the cathedral of Lucca. His principal works there are: the bust of the humanist Pietro di Avenza; the tomb of Pietro da Noceto (1472), a papal secretary, resembling the Florentine monuments, but more severely architectural; two beautiful angels belonging to the former Altar of the Sacrament (1473–76; the shrine itself is in South Kensington Museum, London); the tomb of his friend and patron Domenico Bertini (1479), who also commissioned the chapel of the Volto Santo (c.1481)—a miniature octagon temple, vaulted with a dome and wonderfully decorated; the statue of St. Sebastian; the two-storied altar of St. Regulus (1484–85), with the recumbent image of the martyr, besides six statues and several reliefs; and, lastly, the simple but highly decorative pulpit of the cathedral (1498). Among his other works at Lucca are statues of the Madonna, in the choir of San Michele and Santa Trinità; an "Annunciation" and the "Redeemer" in the Museum, and the tomb of St. Romanus (1490) in the church of that name. The Museo Nationale, Florence, possesses a marble relief of "Faith," the most beautiful representation of the subject in the Renaissance, and another of the Saviour; South Kensington Museum, a relief with a powerful masculine portrait; the Metropolitan Museum of New York, a charming painted terra-cotta "Angel of the Annunciation." The productivity of Civitali's workshop may be judged from the fact that in 1480 he is said to have furnished no less than 22 altars for the cathedral of Pisa, of which interesting fragments remain. His last surviving work is the six statues in the chapel of St. John Baptist in the cathedral of Genoa, in the style of the high Renaissance, and less charming and sincere than his earlier work. As an architect and engineer he constructed a bridge near Lucca and, in 1491–92, the fortifications of his native town.

Civitali is one of the most able and attractive sculptors of the later fifteenth century. He is best classed with the Florentine school, from which he learned his subtle treatment of marble surfaces and acquired decorative skill. But he soon developed an individual style, simple and more rugged than the Florentine. In the expression of sincere religious feeling he is without a peer among the sculptors of his day. His son and pupil NICCOLAO (1482–c.1560) was a sculptor and architect of local importance at Lucca, as was also his grandson VINCENZO (1523–97). Several of his nephews followed their uncle's profession. The best monograph on Civitali is by Yriati, an authoritative work; others are by Roselli (Lucca, 1891), Cappelletti (ib., 1892), and Volpi (ib., 1893).

CIVITAVECCHIA, chē'vē-tä-vĕk'kē-ä (It., old city). A fortified seaport in the Province of Rome, central Italy, situated on the Tyrrhenian Sea, 37 miles northwest of Rome (Map: Italy, F 5). It is the chief port of Rome, and its harbor is protected by two curving moles and a breakwater with a lighthouse. There are extensive dry docks, a magazine, an arsenal built by Bernini, and a citadel constructed from plans by Michelangelo. The fortifications date from the sixteenth and seventeenth centuries. The city has an aqueduct 18 miles long. Civitavecchia is of considerable commercial importance, and has regular steam communication with England and France. It is the seat of a bishop and of a number of foreign consuls, including one from the United States. In the vicinity of the town are situated sulphur springs, with remains of ancient baths. There are manufactories of cement and calcium carbide and the principal imports are coal, cattle, and fire bricks. Civitavecchia is the ancient Centum Cellæ, sometimes called Portus Trajani in honor of Trajan. It was destroyed by the Saracens in 828, but its exiled inhabitants returned in 854, when it received the name of Civitavecchia (old city). It was fortified by Urban VIII, and declared a free port by Innocent XII in 1696. The French held it from 1849 to 1870. Pop., 1901, 17,589; 1911, 17,930.

CIVOLI, chē'vō-lē, LUDOVICO. See CIGOLI, LUDOVICO CARDI DA.

CLAAR, klär, EMIL (1842–). A German stage manager and author. He was born at Lemberg and made his first appearance as an actor at the Burgtheater, Vienna. After holding engagements at Gratz, Brünn, Innsbruck, and at the Court Theatre, Berlin, he successively became stage manager of the Stadttheater, Leipzig (1864–70), and of the Court Theatre, Weimar (1870–71), and was subse-

quently appointed director of the Landestheater, Prague, and the Residenztheater, Berlin (1876–79). From 1879 to 1900 he was associated as director with the two principal theatres of Frankfort-on-the-Main, but afterward he confined himself solely to the management of the Schauspielhaus in that city. Among lyrical poems and dramas written by him are the following: *Gedichte* (1868 and 1885); *Neue Gedichte* (1894); *Weltliche Legenden* (1898); *Samson und Delila*, a comedy (1872); *Shelley*, a tragedy (1876); *Die Schwestern*, a melodrama (1892); *Königsleid*, a tragedy (1895).

CLACKMAN'NAN (Gael. Clachan Mannan). The county town of Clackmannanshire, Scotland, on the north bank of the Forth, 9 miles east of Stirling (Map: Scotland, E 3). The neighborhood is rich in coal, iron, and limestone. On a hill above the town is the ruined tower of a castle once belonging to a descendant of the Bruces. Pop., 1901, 2501; 1911, 2203.

CLACKMANNANSHIRE. The smallest county of Scotland, in the East Midland Division, at the head of the Firth of Forth, and bounded by the counties of Perth, Fife, and Stirling (Map: Scotland, E 3). Area, 55 square miles. It is an agricultural and coal-mining county; oats, barley, wheat, and potatoes are the chief crops. The leading towns are Clackmannan, the county town, Alloa, and Dollar. Pop., 1901, 32,000; 1911, 31,121.

CLAD'ODUS. See CLADOSELACHE.

CLADOPH'ORA (Gk. *κλάδος, clados*, sprout + *φόρος, phoros*, one that bears). A genus of green algæ (Chlorophyceæ), belonging to the Confervales. This is one of the most common of the green algæ, being a profusely branching and anchored filamentous form, and occurring in masses in most fresh waters, attached to various kinds of supports. It is particularly interesting because it is a partial cœnocyte (q.v.); that is, it has cross walls and all of its cells are cœnocytic. For this reason it is a transition type between the ordinary Confervales, which are completely septate, and the Siphonales, which are completely cœnocytic.

CLADOPHYLL. See PHYLLOCLAD.

CLADOSELACHE, klăd'ô-sĕl'*a*-kē (Neo-Lat., from Gk. *κλάδος, klados*, branch + *σέλαχος, selachos*, shark). The most primitive genus of sharklike elasmobranch fishes, found fossil in the concretions of the Lower Carboniferous shales of Ohio and elsewhere. The fish had an elongated, round, tapering body, with a short, blunt head, and eyes situated far in front. The fins, of which there are a pair each of pectoral and pelvic, and two low dorsal, are triangular, with broad bases and without spines, the middle rays of the fins being the longest. The heterocercal tail fin is peculiar in its strongly upturned notochordal axis, with the neural arches continued to the top of the upper lobe; its vertical straight posterior margin and long lower lobe is supported by cartilaginous rays, so that it nearly equals in size the upper lobe. The best-known species are *Cladoselache fyleri*, with a length of 22 inches, and *Cladoselache kepleri*, which attained a length of 6 feet. Both of these are from the Cleveland shale of Ohio. Many of the tricuspid teeth from the Upper Devonian and Carboniferous rocks of Europe and America, described under the generic name of *Cladodus*, seem to be teeth of *Cladoselache*. Consult Dean, "Contributions to the Morphology of Cladoselache (Cladodus)," in *Journal of Morphology*, vol. ix, No. 1 (Boston, 1894). See also ELASMOBRANCHII; SELACHII; SHARK.

CLADRAS'TIS (Neo-Lat., from *κλάδος, klados*, branch + *θραυστός, thraustos*, brittle) (*Cladrastis lutea*). A small leguminous tree, resembling the common locust, having a yellow bark, with cathartic properties. It is variously called yellow wood, yellow ash, yellow locust, and fustic. The tree is native of Kentucky, Tennessee, North Carolina, and adjoining regions, growing in rich soils. It is also common in cultivation.

CLAF'LIN, HORACE BRIGHAM (1811–85). An American merchant, born in Milford, Mass. He established himself in business in Worcester, Mass., where, within a few years, he built up one of the largest mercantile establishments in New England. In 1843 he removed to New York, where he established the firm of Bulkley and Claflin, a business which was conducted after the retirement of William Bulkley, in 1851, under the name of Claflin, Mellin and Company. Although the business interests of Mr. Claflin were seriously endangered by his strong anti-slavery attitude, he steadfastly adhered to his opinions, which he did not hesitate to express in public meetings. Upon the outbreak of the Civil War the house was seriously affected, because of its large business in the South. In consequence of Mr. Claflin's integrity and business ability, however, the volume of trade greatly increased during the war, and reached the enormous sum of more than $72,000,000 in 1865. From this time until his death the transactions of the firm probably exceeded those of any other mercantile house in America. Mr. Claflin was noted for his liberality and his numerous charities.

CLAFLIN, JOHN (1850–). An American merchant, born in Brooklyn, N. Y. He graduated from the College of the City of New York in 1869, and in the year following traveled in Europe and in the East. In 1870 he entered his father's firm, H. B. Claflin and Company, one of the largest wholesale dry-goods houses in New York, and in 1873 he became a member of the firm. He organized The H. B. Claflin Company in 1890, and in the years following formed into a combination several of the large retail dry-goods houses in New York as an outlet for his wholesale business, which became the most important of its kind in the United States. He was chosen a trustee of many financial and charitable corporations.

CLAFLIN, WILLIAM (1818–1905). An American merchant and politician, born in Milford, Mass., son of Lee Claflin (1791–1871), a benefactor of Wesleyan College and Boston University. He succeeded his father in a successful wholesale boot and shoe business. He was in the State House of Representatives from 1849 to 1852, State Senator in 1859–60, and President of the Senate in 1861. He became a member of the Republican Executive Committee in 1864, and was its chairman from 1868 until 1872. He was Lieutenant Governor of Massachusetts (1866–68), Governor (1869–71), and a Republican Representative in the Congress in 1877–81.

CLAIBORNE, klā'bôrn, or **CLAYBORNE,** WILLIAM (c.1589–c.1676). An American colonist, prominent in the early history of Virginia and Maryland. He was born in Westmoreland,

England, went to Virginia as surveyor in 1621, and in 1625 was appointed Secretary of State for that Colony. In 1627 and 1628 he explored Chesapeake Bay. He founded a trading post on Kent Island in 1631, which became a flourishing community, and was represented in the General Assembly of Virginia. Afterward the island was included in the grant to George Calvert, first Lord Baltimore, whom Claiborne had bitterly opposed in London. He resorted to arms to maintain his claim, and in 1645 made a descent upon the island, from which, however, he was soon driven. Its possession remained a subject of animated controversy between Maryland and Virginia until 1776. After the execution of Charles I, when Virginia and Maryland had decided in favor of Charles II, Claiborne obtained an appointment on the commission chosen by Cromwell to reduce them to submission (1651). This was soon accomplished; Governor William Berkeley, of Virginia, was removed from office, and Claiborne became Secretary of State of Virginia, under the new Governor, Richard Bennett. In Maryland all Catholics were promptly removed from office—an act which caused considerable friction until 1658, when the province was restored to Lord Baltimore. After the Restoration, in 1660, Claiborne naturally ceased to have influence at court, and about 1676 he died in obscurity. W. H. Carpenter's novel *Claiborne the Rebel* (1845) is based on his career. See Mereness, *Maryland as a Proprietary Province* (New York, 1901).

CLAIBORNE, William Charles Cole (1775–1817). An American politician, first Governor of the State of Louisiana. He was born in Sussex Co., Va.; was educated at William and Mary College; went to New York when he was 15; was employed there in the office of the clerk of Congress; studied law in Richmond, Va.; removed to Tennessee, where he was a protégé of John Sevier; and in 1796 was a member of the State constitutional convention. Though technically ineligible on account of his age, he was elected to succeed Andrew Jackson as a member of Congress in 1797, and served until 1801, when he was appointed to succeed Winthrop Sargent as Governor of Mississippi Territory. In 1803, with Gen. James Wilkinson, he was delegated to accept the transfer of Louisiana to the United States, and in 1804 became first Governor-General of the Territory of Orleans—that part of the Louisiana Purchase lying south of Mississippi Territory and of the thirty-third parallel. His administration of office made him none too popular with the French and Spanish element; but upon the admission of Louisiana, in 1812, he was elected the first Governor of the State, which position he held until 1816. At New Orleans, during the War of 1812, he coöperated with Jackson in repelling the attack of the British. In 1816 he was elected to the United States Senate, but did not live long enough to take his seat.

CLAIBORNE STAGE (from *Claiborne*, in Alabama). A subdivision of the Eocene Tertiary in American geology. The rocks of this stage are found along the Alabama and Tombigbee rivers, in Alabama and in Arkansas. See Tertiary System.

CLAIM (OF. *claim*, demand, from Lat. *clamare*, to call out). A demand of a right; sometimes used of the legal right asserted, as a creditor's claim to be paid the amount due him, sometimes of the amount alleged to be due. In both these senses the term is commonly employed in bankruptcy and other creditors' proceedings against an insolvent debtor, and in the administration of the estates of deceased persons. In all such cases the claim must be proved—i.e., verified by oath—in order to share in the distribution of the assets; the duty of the trustee in the former case, and of the executor or administrator in the latter, being limited to the payment of duly authenticated claims against the estate.

At the common law, a claim was a formal assertion of title to, or of interest in, property, real or personal, which was in the possession of another. It was not a mere protest against an unlawful seisin or detainer of property, but was a recognized process for preserving the rights of the claimant against extinction by reason of lapse of time or other cause. It had, therefore, much of the effect of an actual entry upon land, and was available to one who, by reason of his interest being a future and not a present one (as a remainder or reversion), was not entitled to make an immediate entry; or, as Coke explains, "when a person dares not make an entry on land for fear of being beaten or other injury, he may approach as near as he can to the land and claim the same, and that shall be sufficient to vest the seisin in him." In other cases, however, in which the claimant's right depended on possession, it seems to have been considered that, to make a claim to an estate effective, there must be an actual entry into some part of the lands claimed.

Continual claim was the process whereby one who had been disseised of lands prevented his claim from lapsing by reason of the death of his disseisor and the transmission of the lands to the latter's heir by descent. In order to avoid this consequence, it was necessary to make claim within a year and a day of the disseisor's death, and to insure this to repeat the formality *continually* within that interval until the descent took place. See Adverse Possession; Disseisin.

In the United States the term "claim" has acquired a distinctive sense as applied to the initial or prima-facie title acquired by settlers to government lands, and by prospectors to mineral lands, under United States statutes. The term is also applied to the land so secured. These claims may, upon the performance of the terms of sale, ripen into complete and valid titles; but, in the meantime, they confer on the claimant or holder a recognized though defeasible property right, which may be bought and sold and administered upon, like any other property. Because of its precarious nature, it is generally considered personal rather than real property. See Government Lands; Preemption.

In admiralty proceedings the statement of rights of the defendant or other party to property attached under process of the court is called the "claim."

Statement of claim is the pleading in which the plaintiff sets forth the facts constituting his cause of action. It supersedes the declaration in England, and corresponds to the complaint in the code practice of most of the United States. The facts are alleged in it in a plain, concise, and natural way, avoiding the arbitrary forms that characterized the declaration in common-law pleading. The phrase is used

in some jurisdictions to designate any narrative of facts that is made the basis of a judicial of official proceeding. See DECLARATION; PLEADING.

Claim of liberty, in English law, is a petition to the sovereign, filed in the Court of Exchequer, claiming a privilege or immunity, as freedom from jury duty, by virtue of custom or the petitioner's rank. The claim was made under an actual or supposed grant, as these "liberties or franchises" (q.v.) were said to have originally been a part of the crown's prerogative, which could only be enjoyed by a subject by virtue of a grant from the sovereign.

CLAIMS, COURT OF. In the United States, a tribunal created by act of Congress, or by the Legislature of a State, to entertain and adjudicate claims against the general government or against the State so authorizing them. A State, being sovereign, can of course not be sued, or subjected to legal process. It is perfectly obvious that, under ordinary circumstances, the tribunals that are instituted by the sovereign power for the adjudication of controversies and the punishment of offenses against itself cannot be employed, either by a citizen or by another sovereignty, to enforce claims against such power. Indeed, in the legal sense of the term, there can be no such thing as a "claim" against a sovereign State. In recent times, however, it has become customary for governments voluntarily to submit alleged claims of a civil nature —such, i.e., as involve a demand for a money compensation—to tribunals of limited powers for consideration and determination. Where the controversies are international, the tribunal may be a board or commission of arbitration. Where the claim is that of an individual citizen, the State may either authorize the ordinary tribunals to hear and determine the question at issue, or may create separate tribunals for that purpose. The latter method is the one that has been generally adopted in the United States, both by the Federal government and the several States. The tribunal so created is variously termed a "court of claims" or a "board of claims." It must be borne in mind, however, that the State does not abdicate its sovereign authority to these courts, and that no process lies for enforcing their decrees. The judgments of a court of claims are in the nature of recommendations only, certifying that the adjudicated claim is, or is not, under the rules established by the statute, a valid and proper claim. If the judgment is in favor of the claimant and against the State, the payment thereof is, like the payment of an award made in an international arbitration, a voluntary act. Under the American system, such payment calls for an appropriation by Congress or the Legislature of the State affected by the decision.

The Court of Claims of the United States (which has served as a model for those of the several States) was created by Act of Congress, Feb. 24, 1855, and consisted originally of three judges appointed by the President and Senate, to hold office during good behavior, and to have jurisdiction to hear and determine all claims founded on any act of Congress, or on any regulation of any executive department, or on any contract, express or implied, with the government of the United States; and all claims which might be referred to it by either House of Congress. The government was to be represented before it by a solicitor and assistant solicitor appointed by the President; and the compensation of all members of the court was fixed by law. By the Act of March 3, 1863, two additional judges were to be appointed by the President, and a chief justice from the whole number of judges (five). By this act the court was also authorized to take jurisdiction of all set-offs, counterclaims, claims for damages, liquidated or unliquidated, or other demands whatsoever on the part of the government against any person making claim against the government in said court. If the judgment of the court be in favor of the government, it shall be filed in the office of the clerk of the proper district or circuit court of the United States, and shall ipso facto become and be a judgment of such district or circuit court, and shall be enforced the same as other judgments. If the judgment be in favor of the claimant, it is provided that the sum thereby found due to the claimant shall be paid out of any general appropriation made by law for the payment of private claims, on presentation to the Secretary of the Treasury of a duly certified copy of such judgment. In cases where the amount in controversy exceeds $3000, an appeal may be taken to the Supreme Court of the United States at any time within 90 days after judgment. Where the judgment or decree may affect a constitutional question, or furnish a precedent affecting a class of cases, the United States may take an appeal without regard to the amount in controversy. Claims must be filed within six years after the claim accrues, except in cases of disability. The court is required to hold one session annually, commencing on the first Monday in October.

The jurisdiction of the court is not to extend to any claim growing out of any treaty with foreign nations or Indian tribes, unless such claim was pending in said court Dec. 1, 1862; nor shall the jurisdiction of the court extend to any claim against the United States for the destruction, appropriation, or damage of any property by the army or navy engaged in the suppression of the Civil War, from the commencement to the close thereof. The general principle characterizing all the legislation relating to this court is that its jurisdiction is confined to claims arising out of contract or for damages in cases not sounding in tort. Accordingly, the Supreme Court of the United States has held that a person injured by the tort—that is, by the wrongful act—of a government officer or agent, cannot obtain redress in the Court of Claims, but must apply to Congress for relief. It has also been held, by the same court, that in order to obtain a recovery upon an implied contract, the claimant must show that the United States received a consideration for the claim presented, or that they received money or property with a duty to turn it over to the claimant, or that the claimant had a lawful right to it when the United States received and appropriated it. The statutes provided that claims of the character above described may be recovered whether or not they are such as would be prosecuted in a court of law, of equity, or of admiralty if the United States were suable; but the actions in this court are not actions at common law, and therefore the claimant has no right to a jury trial; nor does this court possess the jurisdiction and powers of an equity tribunal. The court has declared that it has never felt itself bound

by the strict rules of common law or of equity pleading and practice, but that its aim is to administer justice between the claimant and the government in a simple and expeditious manner. Proceedings originate in the court by petition filed; and testimony used in the hearing and determination of claims is taken by commissioners who are appointed for the purpose by the court. Consult, for full information, the United States statutes and the digests. For the organization and jurisdiction of similar tribunals constituted by them, the statutes of the several States must be consulted.

CLAIRAC, klâ'rāk'. A town in the Department of Lot-et-Garonne, France, situated in a fertile country on the Lot, 16 miles northwest of Agen. It has a large trade in white wines. Clairac was built about an abbey in the eighth century. It was the first place in the south of France which, in 1527, embraced the doctrines of the Reformation. It was the scene of frequent contests between Roman Catholics and Huguenots. Théophile Viaud, the French poet, was born here in 1626. Pop. (commune), 1891, 3562; 1901, 2880; 1911, 2824.

CLAIRAUT, klâ'rô', Alexis Claude (1713–65). A prominent French mathematician, physicist, and astronomer, born in Paris. He showed a precocity analogous to that of Pascal. At the age of 10 he read l'Hôpital's works on infinitesimal analysis and conic sections; before he was 13 he presented a memoir on curves to the French Academy of Sciences; at 16 he published his first work, on curves of double curvature, and at 18 he was elected a member of the Academy. In 1736 he was appointed to accompany Maupertuis on an expedition to Lapland, for the purpose of measuring a degree of the meridian—a work which proved, contrary to the opinion of Cassini, the flattening of the earth towards the poles. Shortly after his return, in 1743, appeared his *Théorie de la figure de la terre*, based on Newton's law of gravitation, and on Maclaurin's results concerning homogeneous ellipsoids. In the field of mathematics Clairaut studied curves of the third order, tortuous curves, and projections, and was the first to find the *singular* solution of a differential equation of the first degree in x and y. The equation used by Clairaut, often called Clairaut's form, is $y = px + f(p)$, in which $p = \frac{dy}{dx}$. In physics he first showed the necessity of considering the attraction between the parts of the fluid itself, in order to explain the phenomenon of capillary action; computed the change in gravity at high latitudes, and so fully demonstrated the figure of the earth that little essentially new has since been added. At least, according to Todhunter, "The splendid analysis which Laplace supplied, adorned but did not really alter the theory which started from the creative hands of Clairaut." In the field of astronomy he solved the famous problem of three bodies in the case of the sun, earth, and moon; explained the motion of the lunar apsides, and constructed lunar tables, later supplanted by those of Mayer. Clairaut also predicted the return of Halley's comet for about April 15, 1759; although the degree of accuracy was remarkable for the time, and the approximation closer than Halley's, it failed by a month, and subjected its author to the ridicule of his rival, D'Alembert. During his last years fondness for society and desire for luxury hindered his scientific work. His leading works (published in Paris) are: *Recherches sur les courbes à double courbure* (1731); *Traité de la figure de la terre* (1743 and 1808); *Théorie de la lune* (1752 and 1765); *Eléments de géométrie* (1741 and 1765); *Eléments d'algèbre* (1746 and 1760); and *Théorie du mouvement des comètes* (1760).

CLAIRFAIT, Charles D. See Clerfayt.

CLAIRIN, klâ'răn', Jules Georges Victor (1843–1919). A French painter and illustrator. He was born in Paris, studied with Picot and Pils, and afterward traveled in Spain and Morocco with Henri Regnault, a journey which strongly influenced his choice of subjects. Like Regnault, he may be classed as one of the last Romanticists. (See Painting, *History.*) His paintings are fine in color, effective in composition, and have always aroused wide interest. Among them are: "The Benediction of the Swords," "Allah! Allah!," "The two Hostile Tribes," "After the Victory," "The Massacre of the Abencerrages" (Rouen), "A Moorish Sentinel" (Metropolitan Museum, New York), "Entering the Harem" (Walters Gallery, Baltimore). His portraits include those of Mounet-Sully as Hamlet (1889), Sarah Bernhardt, and Madame Krauss. He also executed a number of effective decorative paintings in the Paris Opera, the Bourse, and in the Salle-des-jeux at Monte Carlo.

CLAIRON, klâ'rôn', Mlle. (1723–1803). A French actress, commonly known as "La Clairon," whose real name was Claire Josèphe Hippolyte Léris. She was born near Condé, in Flanders, and had played for several years at Rouen, Lille, and elsewhere before she appeared at the Paris Opéra, and a little later, in September, 1743, made her first appearance at the Théâtre Français. This was in *Phèdre.* Her success was immediate and brilliant, and she became the rival of Mlle. Dumesnil, then at the height of her popularity. Mlle. Clairon was of small stature, but with a beauty which was both vivacious and dignified, and she was gifted with a remarkable voice. She and her colleague Lekain were known as innovators, for endeavoring to bring about a more rational mode of costuming than was at that time conventional upon the stage. Some of her greatest achievements were in the *Zelmire* and *Le siège de Calais* of Belloy, and in the tragedies of Voltaire, *Zulime, Sémiramis, Olympie, Tancrède, Oreste,* and *L'Orphelin de la Chine.*

In 1765, as the result of a scandal of which she was a victim, she abandoned the stage. For a number of years she resided at the court of Ansbach. The *Mémoires d'Hippolyte Clairon et réflexions sur la déclamation théâtrale,* which she wrote in old age, were published in Paris in 1799. The book gives many interesting details concerning her art and is full of lively anecdotes.

CLAIRVAUX, klâr'vô' (from Lat. *clara vallis,* fair vale; from *clarus,* clear, and *vallis,* valley). A village in the Department of Aube, France, about 10 miles southeast of Bar-sur-Aube, on the left bank of the river Aube (Map: France, N., K 4). It is the site of the famous Cistercian abbey (*Clara Vallis*) founded in 1115 by St. Bernard, who presided over it until his death, in 1153. His body still lies in the church. The abbey was raised to a central prison during the French Revolution and at one time

held nearly 1500 prisoners. The extensive buildings are still used as a penitentiary. See Arbois de Judainville, *Etudes sur l'état intérieur des abbayes cisterciennes et principalement de Clairvaux.* The chief industries are lumbering in the neighboring forests and agriculture.

CLAIRVILLE, klâr'vēl', Louis François (1811–79). A French dramatic author, whose real name was Nicolaie. He was born Jan. 28, 1811, in Lyons, but went early to Paris, and in youth had a varied practical experience with theatrical life. About 1837 he began his long series of dramatic productions, which he wrote generally in collaboration with other playwrights. Some of the more noted are the comedies *La propriété, c'est le vol* (1848), *Les tentations d'Antoinette* (1850), *Quinze heures de fiacre* (1867), and the librettos to the operas *Daphnis et Chloë,* by Offenbach (1849), and *La fille de Madame Angot,* by Lecocq (1873).

CLAIRVOY'ANCE (Fr. *clairvoyant,* clear-seeing, from *clair,* Lat. *clarus,* clear + *voir,* Lat. *videre,* to see). An alleged ability to see, in a trance state, objects and occurrences which are not discernible in the normal state. Belief in the clairvoyance of the hypnotic trance is as old as history. Socrates, Apollonius, Cicero, Pliny, Tertullian, all furnish records of the prophetic dreams and utterances of clairvoyants. In later times the visions of Swedenborg and Davis have become widely known.

Of the existence of the somnambulistic state of hypnosis, in which clairvoyance is said to occur most often, there can be no doubt. Suggestion (q.v.), whether it be from without (the words, passes, or other artifices of an operator), or from within (autosuggestion, q.v.), suffices in most people to induce this state. Certain other conditions (fasting, drugs, disease, general emotional excitability) may induce an apparently spontaneous and indeterminate appearance of somnambulism. Every one is familiar with the epidemic catalepsy of the religious revival, best exhibited, perhaps, by the negroes of the South.

As to the existence of clairvoyance in somnambulism, opinions are divided. Some, with Tuttle, consider clairvoyance "an inherent faculty, a foregleam in this life of the next spiritual life." They esteem the clairvoyant as a peculiarly sensitive person, whose mind is, for the time being, directed by some departed spirit, and whose lips speak with an intelligence not his own. Others consider that the clairvoyant is able, without such direction, to see objects and occurrences beyond the ken of normal vision. Still others take a middle ground, and consider that the results are to be explained by telepathic communication, not between departed spirits and the medium, but between the minds of one or more living persons and that of the 'percipient' (*télépathie-à-trois*). Finally, many deny the presence of supernormal agencies; indeed, scientific psychology has neither found satisfactory evidence of such agencies, nor has it been able to accept the evidence adduced by the votaries of "psychical research." Consult: Flournoy, *From India to the Planet Mars* (New York, 1900); Podmore, *Apparitions and Thought Transference* (London, 1895); Hyslop, *Enigmas of Psychical Research* (Boston, 1906).

CLAKAMA, klä-kä'mä, **CLOCKAMA,** klŏ-kä'mä, or **KLOKAMA.** An Indian tribe of the Chinookan stock. See Chinook.

CLAL'LAM, Sklalam, or Nuskilala. A Salishan tribe, formerly of considerable importance, occupying the greater part of the coast extending west from Puget Sound, in Clallam Co., Wash. They still number 398, attached to the Puyallup Agency.

CLAM (older form also *clamp,* from the firm clamp of the shell, AS. *clam,* bond, OHG. *clamma,* narrow pass; cf. also Dutch *klamp,* cleat). The popular name of many widely various bivalve mollusks, especially those good to eat. In the United States it commonly designates either the quahog (*Venus mercenaria*), distinguished as the hard or round clam, or else the manninose (*Mya arenaria*), called long or soft clam. The former is a heavy, globose shell, allied to the cockles, which plows its way along sandy bottoms, standing erect upon its thin edge, and is obtained wholly by raking, in water from 10 to 40 feet in depth. It abounds from Cope Cod to Florida, and also near Shediac, New Brunswick, and is the common "clam" of New York markets, where small ones (young) are much esteemed under the name of "little necks," according to some authorities after Little Neck, Long Island. In Boston and New England the Indian name "quahog" attaches to this, and "clam" usually means the *Mya,* called "soft clams" elsewhere. These are of a very different character, having comparatively thin, smooth, elongated shells, a protrusile, bladelike foot, adapted to digging, and siphons that may be longer than the shell. They remain sunken in the sand of the shore, between tide marks, their siphon mouths just at the surface, and when disturbed they eject a spurt of water as they withdraw to safer depths. These clams are obtained by digging at low tide; and they are cultivated by the protection of certain favorable areas of seabeach, where they soon lie almost as thick as paving stones. Formerly enormous quantities of both these clams, with razor clams, etc., were gathered and salted in New England as bait for the cod fisheries, but this demand has diminished. Great Britain has the "gaper," a closely allied species, but it is not so popular. On the New England coast two other large mollusks of deep water are eaten when obtainable, under the name of beach, sea, or surf clams—especially *Spisula solidissima.* The Southern States have a large edible species, also, in the painted clam (*Callista gigantea*). On the Pacific coast—to which Eastern clams have been transplanted with some success, and are constantly sent, refrigerated, for immediate consumption—several edible bivalves are used, for some of which the term has been borrowed. Thus, the California "flat clam" is a species of Semele, and others are of the genera *Tapes, Saxidomus,* and *Glycymeris.* The "geoduck," gathered for food by the Indians of the Northwest coast, is *Glycymeris generosa.* The shells of most of these were formerly used by the natives in manufacturing the various beads and shell ornaments which passed as money among them. (See Shell Money.) Inland, the word "clam" refers to some of the many fresh-water mussels. (See Mussel.) The "giant" clam of the East Indies (*Tridacna gigas*) is the greatest of living mollusca, its soft part amounting to 20 pounds of edible flesh, while the deeply hollowed shells may weigh 500 pounds. "In some churches of France they are employed to hold the holy water—a use which well accords with the beautiful white of the inner surface of the shell. . . . In many of the islands, stones

CLAMS AND EDIBLE MUSSELS

COPYRIGHT, 1902, BY DODD, MEAD & COMPANY

1 AMERICAN HARD CLAM OR QUOHOG - (VENUS MERCENARIA)
2 AMERICAN SOFT OR LONG CLAM - (MYA ARENARIA) SEE FIG. 4.
3 EDIBLE MUSSEL - (MYTILUS EDULIS)
4 BRITISH SOFT OR GAPER, CLAM - (MYA TRUNCATA) SHOWING EXTENDED SIPHONS

9 PULLET - (TAPES PULLASTRA)

are unknown; but, as a substitute, the natives make their knives and axes from the fragments of this shell." See Colored Plate of CLAMS AND EDIBLE MUSSELS.

Fossil Forms. The genus *Mya* ("soft" or "long" clam) appeared in Tertiary time, with species that show little difference from those now living. So with the genus *Mactra*. The family Veneridæ, to which the little-neck clam (*Venus mercenaria*) belongs, is an old one; it began in the Middle Jurassic, with small species of rounded form, which can often with difficulty be distinguished from the accompanying species of Cyprinidæ. The genera *Tapes*, *Cytherea*, and *Cyprimeria* are abundant in Cretaceous rocks, *Cytherea* in the Eocene, and *Venus* in the Miocene. Shells of several species of Venus are extremely common, and finely preserved in the Miocene sands and marls of some localities in Virginia and southern Europe. For American clams of all sorts, consult: Goode, *Fishery Industries*, sec. i. (Washington, 1884); Lovell, *Edible Mollusks of Great Britain*, etc. (London, 1884). For fossil forms, see TERTIARY; MIOCENE.

CLAM. In heraldry, a term for an escalop or cockleshell. It is supposed to indicate that the bearer has been a crusader or has made long voyages by sea. See HERALDRY.

CLAMART, klä'mär'. A town in the Department of Seine, France, 4½ miles southwest of Paris at the foot of the Chatillon plateau (Map: Paris). It is a favorite residential suburb of Parisians, and is the seat of the Hospice Ferrari, an asylum for aged men. The Bois de Clamart, which is part of the Bois de Meudon, is a popular picnic resort of the Parisian bourgeoisie. It has an old Gothic church. Pop. (commune), 1901, 7391; 1911, 11,376.

CLAM CRACKER. A sting ray. See RAY.

CLAMECY, klà'me-sê'. The capital of an arrondissement in the Department of Nièvre, France, at the confluence of the Yonne and the Beuvron, 46 miles northeast of Nevers (Map: France, N., J 5). It is also situated on the Canal du Nivernais. Its parish church of St. Martin, surmounted by a fine square tower, has interesting architectural features of the thirteenth, fifteenth, and sixteenth centuries. The twelfth-century church of Bethlehem is now the annex of a hotel. The modern Château of Vauvert is a handsome building in fine grounds. There are manufactures of cloth, paper, leather, pottery, boots, shoes, and chemicals, and a considerable timber trade by river with Paris; a thriving trade also flourishes in cattle and wine. A bronze bust, by Angers, of Jean Rouvet, the native who in 1549 invented the wood raft for supplying Paris with timber, stands on a bridge spanning the river. Pop. (commune), 1901, 5426; 1911, 4869.

CLAM-GALLAS, kläm'gäl'läs, EDUARD, COUNT (1805–91). An Austrian general, born at Prague. He entered the army in 1823, and became a major general at the age of 44. In 1848 he served with distinction in the Italian and Hungarian campaigns and in the latter commanded the Transylvanian corps which effected the union with the Russians, and thus led to the defeat of General Bem at Sepsi-Saint György and Kaszon-Ujfalu. In 1850 he was placed at the head of the First Division of Bohemian Regulars, and in 1859 fought with distinction at Magenta and Solferino, but during the disastrous campaign of 1866 he was defeated by the Prussians at Hühnerwasser, Podol, Münchengrätz, and Gitschin; was relieved of his command and brought before a military tribunal, by which, however, he was acquitted. While he was known to have committed strategical errors, the chief responsibility for the disasters was probably traceable to his superior officers.

CLAMPING SCREW. A tool used by carpenters and joiners for holding work on a table, or for securing two or more pieces together. Two sorts are generally found: One consists of two straight bars of wood or metal, to which are fitted two screws parallel to each other and at right angles to the bars. The one screw passes through both bars and is threaded in the second one, with an abutting shoulder which bears on the outside of the first. This adjusts the distance between the bars to the thickness of the work to be clamped. The second screw is threaded in the second bar, but its end abuts against the outer end of the first. When it is tightened to refusal, a powerful combination of lever and screw forces the opposite ends of the bars to grip with great power. The second type is a device shaped like the letter G, through the upper end of which the screw passes, and holds between its point and the lower end the portions to be clamped, generally for gluing together.

CLAN (Gael. *clann*, Ir. *clann*, *cland*, offspring, tribe, Welsh *plant*, offspring, children, Lat. *planta*, connected with Skt. *kula*, Lith. *kiltis*, family). A collection of families united under a chieftain, all claiming descent from a common stock, and possessed of a common surname. The word "clan" has been adopted as the ethnological generic term. Synonyms and parallels have been sought in the Arabic *hayy*, the Greek *γένος*, *genos*, the Roman *gens*, the Russian *mir*, the German *Gemeinde*, the Swiss *almend*, the Irish *sept*, and the North American *otem* (totem). It is now well established, however, that in the primitive Indo-European organization of society several families, presumably kindred, united in a brotherhood (Greek *φρατρία*, *phratria;* South Slavonic *bratstvo;* Latin *curia*, house); several brotherhoods in a tribe (Greek *φυλή*, *phylē*, South Slavonic *pleme*, Latin *tribus*); and finally several tribes in a folk, or nation (Greek *ἔθνος*, *ethnos*, Latin *populus*). Higher than the folk were loose federations merely of nations—*Völker*, or *populi*. From this scheme it is clear that the primitive "clan" is to be identified with the brotherhood rather than with the *γένος*, *genos*, or gens. In fact, the Greek *γένος* is post-Homeric, and therefore comparatively late; doubtless it became politically important with the rise of the aristocracy. The typical Greek *γένος* was but a powerful family under a single leader; most probably in early Attica the chief of every noble *γένος* had a seat in the great aristocratic council (of the Areopagus). But some Attic *γένη*, *genē*, were mere guilds of coppersmiths, of heralds, etc. The typical Latin *gens* likewise developed from the family, as is indicated by the derivation of the gentile name from the personal name, and was also a comparatively late institution. Probably every patrician *gens* was once represented by its chief in the Senate. Whereas the *γένος* and *gens* are thus seen to have been monarchial, the *φρατρία*, *phratria*, and the *curiæ* were aristocratic; the nobles held the offices and priesthoods, and doubtless controlled the votes of the commons,

many of whom were clients. In all essentials the *bratstvo* resembles the *gens* (*γένος, genos*) of the Greeks and Romans. The general principles of clanship were common rights and duties, with obligations to avenge one another's wrongs. The members were bound together, not only by the sentiment of common origin and blood, but also by the common worship of a protecting deity, from whom all claimed descent. After the introduction of Christianity among the Southern Slavs, a patron saint took the place of the ancestral deity, who is still celebrated in song, though shorn of his divine qualities. Much confusion has arisen from identifying the clan with the village. The basis of the clan, tribe, and folk is kinship, real, or assumed; the basis of the village, *pagus*, and *civitas* is in some degree territorial—the idea of neighbor partly supplanting that of kin. In simpler words, all the villagers were not even presumably kinsmen. Thus the village was the first step in the development of political society from tribal life. No theory of exogamy, metronymy, or of patriarchal government will apply to all clans; there are indications of a great variety of primitive usage. Apart from the Southern Slavs and from sections of India, the Indo-European clan has continued most vital among the Celts, especially in the Highlands of Scotland. The feuds of the clans and the struggle between these autonomous societies, on the one hand, and the central government on the other, made up a large part of the history of Scotland to the suppression of the Rebellion of 1745, after which the British Parliament enacted laws for the abolition of the hereditary jurisdiction of the Scottish chieftains, and for the disarming of the clans. The influence of the system still lingers, however, in remote and sparsely populated districts.

For the relation of the clan to existing political institutions, see also TRIBE; SOCIOLOGY.

CLANDESTINE MARRIAGE, THE. A comedy by Colman and Garrick (1766), worked over from the Rev. James Townley's farce *The False Concord*.

CLANG TINT, EXPLANATION OF. No one who is at all familiar with music has any difficulty in naming the instrument or class of instruments from which a given tone proceeds. "The same note" may be sounded, e.g., on piano, organ, violin, and harp. We recognize it as "the same" in every case; and yet it "sounds different," so that we can say, "This is the note of a pipe, this of a struck, or bowed, or plucked string." The criterion of difference, in such cases, is termed clang tint, or clang color, or timbre. The note of a musical instrument is not a pure tone (see AUDITION), but a mixture of tones. Strongest of the "partial" tones is the fundamental, the lowest constituent tone; this dominates and gives name to the whole tonal mass, so that the a^1 of the above-named instruments is named a^1 and sounds as a^1 in virtue of its fundamental—a pure tone of (say) 440 vibrations in the one second. Besides the fundamental, the note contains a number of higher partials or overtones. If we represent the pitch number of the fundamental by 1, then the pitch numbers of the overtones stand to it in the ratios 2, 3, 4, etc.; hence a perfect musical note would contain the vibration ratios 1: 2: 3: 4: 5: 6: 7 . . . , the overtones decreasing in intensity with their height, until they finally became inaudible. The primary reason that differences of clang tint obtain is that the various musical instruments favor certain overtones, and suppress others (Helmholtz); in some cases, e.g., the resonance chamber of the instrument reënforces only the odd-numbered partials, 3, 5, etc. (clarinet); in others, a particular overtone is killed by the striking of a string at a certain fraction of its length (in most modern pianos, the sixth overtone or seventh partial is thus suppressed); in others, again, the low overtones are weak and the high are strong (bassoon, harmonium). A practiced ear is sensible of these differences as such, and can analyze the note into its tonal components. For most hearers, however, the differences exist merely as differences in the "coloring" of the fundamental.

There are two further constituents of clang tint: 1. Different musical tones are accompanied by characteristic noises in wind instruments, by the rush or hiss of the air; in string instruments, by a scrape or thud or pluck. 2. Different musical tones begin and end in characteristic ways; the clangs of the zither are dry and short, those of the organ full and sustained; the oboe is flexible, the bombardon or bass tuba lumbers into the orchestral complex, etc. Finally, there are many secondary criteria for the recognition of musical tones: the range within which the fundamental falls, the intensity of the clang, the peculiar melodic task set to a sequence of tones, etc.

Clang Tint of Vowels. It was formerly believed that the vowel sounds of the human voice owe their clang tint to a regular series of overtones, and that vowel qualities differ from the tones of musical instruments in that the loudness of their overtones depends not solely upon numerical order, but principally upon absolute pitch. At the present time the evidence of experiments is against this view, and the following new theories have been proposed. 1. The vowel sounds owe their timbre to certain concomitant tones whose pitch remains relatively constant whatever the fundamental may be upon which the vowel is spoken or sung. These tones are called "formants"; they apparently represent the proper tones of the buccal resonance chambers; they are usually inharmonic both to the fundamental and to one another; and they may attain to a high degree of intensity. 2. Pure tones, without partials or formants, have in themselves vowel qualities. For example, low tones immediately suggest the sound of *oo* as in *moon;* if we ascend the scale, the *oo* gradually becomes more like *o* as in *hole*, until a tone is

reached that seems to be a pure *o;* if we continue up the scale, we find other tones which are like *a* as in *father*, then *e* as in *prey*, and finally *i* as in *machine*. 3. Finally, it is held that vowels are not tones at all; that, on the contrary, they are modes of noise; and that, if we attempt to classify them, we must regard them as qualities of noise.

Consult: Helmholtz, *Sensation of Tone* (Eng. trans., London, 1895); Stumpf, *Tonpsychologie* (Leipzig, 1890); Titchener, *Experimental Psychology* (New York, 1901); See INSTRUMENTATION.

CLAN-NA-GAEL. An Irish secret society, founded by fanatical Irishmen in the United States, for the purpose of intimidating the British government by violence and forcing compliance with Irish demands for home rule. It was responsible for the dynamite outrages of 1883 in London.

CLA'OSAU'RUS. See THESPESIUS.

CLAP, ROGER (1609–91). An English colonist in America; one of the founders of Dorchester, Mass. He was born in Salcomb, Devonshire, England; emigrated to New England, where he became one of the first settlers in Dorchester, in 1630, and was captain of the fort or "castle" on Castle Island from 1665 to 1686, after which, until his death, he lived in Boston. He is best remembered for his *Memoirs*, which he prepared about 1676, but which were not published until 1731, when they were edited by Thomas Prince. Six subsequent editions were published, the last appearing in 1844, as vol. i of the *Collections of the Dorchester Antiquarian and Historical Society*. The book is of slight historical value.

CLAP, THOMAS (1703–67). An American Congregational clergyman. He was born at Scituate, Mass., June 26, 1703; graduated at Harvard, 1722; was minister at Windham, Conn., from 1726 to 1740; president of Yale College from 1740 to 1766, rendering valuable service to the institution. Through his efforts, a college building and chapel were erected. His resignation was the result of his opposition to the revival movement headed by Jonathan Edwards and George Whitefield. His ingenuity and scientific attainments are attested by his construction of the first orrery or planetarium used in America. He published sermons, letters, and tracts; *Religious Constitution of Colleges, Especially of Yale College* (1754); *History and Vindication of the Doctrines Received and Established in the Chronicles of New England* (1755); and *Annals or History of Yale College* (1766). He died in New Haven, Conn., Jan. 7, 1767.

CLAPHAM, klăp'am. A Parliamentary district of London (q.v.), England, 4½ miles southwest of St. Paul's Cathedral (Map: London, F 6). It is noted as one of the busiest railway centres in the world.

CLAPP, CORNELIA MARIA (1849–). An American zoölogist, born at Montague, Mass. She was educated at Mount Holyoke College, Syracuse University, and the University of Chicago, and in 1896 became professor of zoölogy at Mount Holyoke. During the summers of 1888–1902 she carried on investigations at the marine biological laboratory at Woods Hole, Mass. Her writings comprise articles on biology and morphology in technical journals.

CLAPP, MOSES EDWIN (1851–). An American legislator, born in Delphi, Ind. He graduated from the Wisconsin Law School in 1873, was county attorney of St. Croix Co., Wis., in 1878–80, and attorney-general of Minnesota in 1887, 1889, and 1891. He then removed to St. Paul. In 1901 he was elected to the United States Senate to fill a vacancy, and was reëlected in 1905, and again in 1911 for the term ending 1917. Senator Clapp identified himself with the progressive wing of the Republican party, and strongly supported the candidacy of Theodore Roosevelt for President in 1912. In the Sixty-third Congress he was chairman of the Committee on Standards, Weights, and Measures, and was a member besides of various important committees.

CLAPPER RAIL, or MUD HEN. See RAIL.

CLAP'PERTON, HUGH (1788–1827). A British explorer of Africa, born at Annan, Dumfriesshire, Scotland. He went to sea at 13, was impressed in the navy, served in the East Indies and on the Great Lakes (in the War of 1812 and immediately afterward), and returned to England as lieutenant in 1817. In 1822, with Oudney and Denham, he set out from the Mediterranean to explore the interior of Africa. The expedition was the first from Europe to reach Lake Chad (1823). Thence Clapperton and Oudney struck westward to find the source of the Niger; but on the way Oudney died (1824), and Clapperton was detained at Sokoto by the Sultan. He returned to England in 1825, was promoted to be commander, and was placed in charge of a second expedition for the exploration of the Niger. He set out from the coast of the Gulf of Guinea, his party this time consisting of Richard Lander (q.v.), who published an account of his chief's experiences, and three others, who died soon after leaving the Bight of Benin. Crossing the Niger to Bussang, the two survivors reached Sokoto, where Clapperton was detained for the second time, on account of civil war, and, worn out by hardships and failure, succumbed to disease. For his explorations, consult *Narrative of Travels and Discoveries in Northern and Central Africa, in the Years 1822, 1823, and 1824, by Major Denham, Captain Clapperton and the Late Dr. Oudney* (London, 1826), and Lander, *Records of Captain Clapperton's Last Expedition to Africa* (London, 1830).

CLAQUE, klăk (Fr., handclapping). A body of persons, individually known as "claquers," engaged to promote the success of a public performance by bestowing upon it preconcerted applause, and thus giving the public a false notion of the impression it has made. In principle, the claque has existed from time immemorial, since the friends of authors and actors would naturally be expected to assist with their appreciation; and tears and laughter in an audience are well known to be infectious. As a paid institution, it is traditionally counted an invention of Nero's time. According to Suetonius, the actor emperor had a body of 5000 stalwart applauders, whose example the public were expected to follow.

It was in Paris, however, that the claque was first regularly organized into a trade. It is said to have owed its suggestion to a trick of the poet Dorat, who distributed free tickets to his dependents upon condition that they applaud. About 1820 two men named Porcher and Santon regularly established the business of insuring dramatic success (*l'assurance des succès dramatiques*) by supplying the theatres with

as many "claqueurs" as the authors or managers thought each piece would require. Since their day various *chefs de claque* have gained importance in a position which required discrimination and tact. They have relations directly with the management of the theatres, and commonly attend the last rehearsals of a piece, in order to study it in advance and receive instructions as to the points where demonstrations are expected. Their assistants are, as a rule, picked up merely for each occasion. The main body of the claque sits generally near the rear of the middle of the parterre, beneath the chandelier, from which they have been called *chevaliers du lustre*. Others are distributed in different parts of the house, according to their particular functions, which illustrates how minutely the art is organized. Thus, the connoisseur is bound to learn the play by heart, and call the attention of the audience about him to the fine points; the *rieur* or *rigolard* must laugh at every jest; the *pleureur* ("weeper") has to manifest sensibility at the moving passages. This last part is generally assigned to women, in whom the frequent use of the handkerchief seems most natural. The *chatouilleur* ("tickler"), on the other hand, endeavors, by distributing bonbons, theatre bills, etc., and by lively conversation, to keep his neighbors in good humor; and, lastly, the *bisseur* calls *"bis!"* with the utmost enthusiasm, at the conclusion of the specified pieces of music.

The following incident, which found its way into the newspapers on the occasion of the death of the famous French actress Rachel, shows the ludicrous seriousness with which the members of the claque view their singular profession: Mademoiselle Rachel had just created a new character in a modern piece, and during the first evening was loudly applauded. The next, however, she thought her reception by no means so warm, and she complained that the claque did not do its duty. Its leader, on hearing of Rachel's dissatisfaction, wrote to her as follows: "Mademoiselle—I cannot remain under the obloquy of a reproach from such lips as yours! The following is an authentic statement of what really took place: At the first representation, I led the attack in person not less than 33 times. We had three acclamations, four hilarities, two thrilling movements, four renewals of applause, and two indefinite explosions. In fact, to such an extent did we carry our applause, that the occupants of the stalls were scandalized, and cried out *A la porte!* My men were positively exhausted with fatigue, and even intimated to me that they could not again go through such an evening. Seeing such to be the case, I applied for the manuscript, and, after having profoundly studied the piece, I was obliged to make up my mind for the second representation to certain curtailments in the service of my men. I applied them, however, only to MM. ——, and if the *ad interim* office I hold affords me the opportunity, I will make them ample amends. In such a situation as that which I have just depicted, I have only to request you to believe firmly in my profound admiration and respectful zeal; and I venture to entreat you to have some consideration for the difficulties which environ me." In spite of the comic side of the business, the public is generally hostile, and there have been actual riots owing to ill-timed efforts of the claque to overcome popular disapproval of a play. Occasional efforts have been made, with partial success, for the abolition of the claque; but it still commonly prevails, and plausible arguments are urged in its justification.

The allegation that, in London, theatrical artists and managers are obliged to endeavor to insure success by means of a similar institution is strenuously denied, although there, and in Germany and the United States, similar artifices, not so publicly organized, are practiced to some extent.

CLARA, Saint. See Clare, Saint.

CLARAC, klȧ′rȧk′, Charles Othon Frédéric Jean Baptiste, Comte de (1777–1847). A French painter and antiquarian. He superintended for a time the excavation at Pompeii, of which he gave an account in *Fouilles faites à Pompéi* (1813); was a member of the French Embassy in Brazil; and on returning to Paris was made keeper of the Museum of Antiquities in the Louvre, of which he published a catalogue. Others of his works are *Manuel de l'histoire de l'art chez les anciens* (1847), and *Musée de sculpture antique et moderne* (1826–52). The latter, an inventory of all the principal monuments in marble and bronze preserved in the various museums of Europe, is still consulted by archæologists and has been valuable for its promotion of the study of antique art in France.

CLARA VALLIS. See Clairvaux.

CLÄRCHEN, klĕrK′en. A country maiden in love with Egmont, in Goethe's *Egmont*. After his death she poisons herself.

CLARE (Ir., plain; Welsh *clawr;* connected with Gk. κλῆρος, *klēros,* lot). A maritime county in the Province of Munster, Ireland, bounded north by Galway and Galway Bay; east and south by the Shannon and its expansion, Lough Derg, separating it from Tipperary, Limerick, and Kerry; west by the Atlantic (Map: Ireland, C 4). Area, 1332 square miles—more than half being arable, and only a small part in wood. The surface is mostly hilly, with some mountains, bogs, marshes, and rugged pastures. The southwest third of the county forms part of the Munster coal field. Less than one-fifth of the county is under cultivation, but fine sheep and cattle are raised on the pastures. There are fishing interests and manufactures of frieze and hosiery. The chief town is Ennis, the county town. Pop. (which has decreased steadily since 1841), 1901, 112,334; 1911, 104,232. Consult Frost, *History and Topography of the County of Clare* (Dublin, 1893).

CLARE, John (1793–1864). An English peasant poet, born July 13, 1793, near Peterborough. He was taken from school at seven and employed on a farm, paying for such education as his meagre wages would allow. He became a servant in a public house, was apprenticed to a gardener, ran away, enlisted in the militia, lived among the gypsies, worked at a lime burner, and at one time was compelled to seek parish relief. In 1820 he published *Poems Descriptive of Rural Life and Scenery,* and later in the same year, his *Village Minstrel and Other Poems.* He became famous, was patronized and flattered, fell into dangerous habits, and, becoming insane, died in a private asylum, May 20, 1864. Though helped much by his friends, Clare was always poor. When very young he learned old songs, which first led him to verse making. Afterward he came across Thomson's *Seasons,* which he read constantly. His poems deal with rustic scenes and the incidents of village life. They are spontaneous and musical, but lack

vigor. For his life, consult: Martin (London, 1865); Cherry, *Life and Remains* (London, 1873); and A. Symons's introduction to *Poems* (London, 1908) of Clare, for a critical study.

CLARE, or **CLARA,** SAINT (1191–1253). The founder of the Order of Poor Clares, the Franciscan Order for women. She was a member of a rich and noble family of Assisi, in the Duchy of Spoleto. Attracted by the eloquence and piety of St. Francis of Assisi, she abandoned the pleasures of social life, in which she had previously indulged, and betook herself to solitude, prayer, and mystic meditation. With the advice of St. Francis she founded her Order in 1212, and, after obtaining a great reputation for sanctity, died at Assisi, Aug. 11, 1253. Two years afterward she was canonized by Pope Alexander IV. (See CLARES, POOR.) Consult Demore, *Vie de Sainte Claire d'Assisi* (Paris, 1856).

CLARE COLLEGE. One of the colleges of the University of Cambridge. It was founded as "University Hall" by the university in 1326. Ten years later its advowson or patronage was made over to Elizabeth de Burgh, Countess of Clare, by the chancellor of the university, Richard de Baden. Part of the great estates she had inherited by the death of her brother at Bannockburn she devoted to refounding this hall, first as Clare Hall, with the particular object of educating clergy to take the place of those swept off by the plague. In later generations the college departed from this pious purpose somewhat, though it was especially noted in the sixteenth and seventeenth centuries for its divines, who were learned, if somewhat too liberal-minded for their times. Bishop Latimer was a fellow of the college, as was Archbishop Tillotson; Cudworth was master, and among the other members of the seventeenth century may be noted William Whiston and Thomas Burnet. Wheelock, the Anglo-Saxon scholar, and Maseres, the mathematician, were also members of Clare. The buildings of the college have suffered very frequently from fire. The present quadrangle, one of the most beautiful in Cambridge, was begun in the seventeenth century; but the work was interrupted by the Civil War, and it was not completed till 1715. The present foundation consists of a master, 15 fellows, 31 scholars, besides undergraduates who in 1913 numbered 238. Consult J. R. Wardale, *Clare College* (London, 1899).

CLARE ISLAND. An island off the west coast of Mayo, Ireland, at the entrance of Clew Bay (Map: Ireland, A 3). It has a length of 4½ miles, with a breadth of 2 miles. On its northeast extremity there is a lighthouse at an elevation of 487 feet above the sea. Pop., 1000.

CLARE'MONT (Fr., fair mount). A mansion at Esher, in Surrey, England, 15 miles southwest of London. It was the home of Prince Leopold of Saxe-Coburg (later King of the Belgians) in the early part of the nineteenth century, and from 1848 to 1850 the residence of the exiled Louis Philippe, King of the French, who died there. In consequence, Claremont became the headquarters of the Orléans party.

CLAREMONT. A city in Los Angeles Co., Cal., 37 miles east of Los Angeles; on the Atchison, Topeka, and Santa Fe Railroad. It is the seat of Pomona College, established in 1888. Fruit growing, especially the raising of oranges and lemons, is the principal industry. Pop., 1910, 1114.

CLAREMONT. A town in Sullivan Co., N. H., 55 miles northwest of Concord; on the Boston and Maine Railroad (Map: New Hampshire, D 6). It is also on the Sugar River, which furnishes abundant water power. The town has manufactures of cotton and woolen goods, paper, diamond drills, machinery, machinery supplies, shoes, and lumber; and there are granite and marble yards. Claremont contains a Carnegie library, and owns its water works. Pop., 1900, 6498; 1910, 7529.

CLAREMORE. A city and the county seat of Rogers Co., Okla., 25 miles northeast of Tulsa, on the St. Louis and San Francisco and the St. Louis, Iron Mountain, and Southern railroads (Map: Oklahoma, F 2). Springs with medicinal properties, discovered in 1903, have made Claremore a popular health resort. The city contains also a fine State preparatory school. There are oil and stock-raising interests and manufactories of brick. The water works and electric light and power plant are owned by the municipality. Pop., 1900, 2064; 1910, 2866.

CLAR'ENCE, DUKE OF. A title occasionally given to a younger member of the British royal family. It was first bestowed on Lionel, the second son of Edward III. In recent years it was held by Albert Victor Christian Edward (1864–92), the eldest son of King Edward VII, then Prince of Wales.

CLARENCIEUX, klăr'en-shōō *or* -sū. An English heraldic officer, the first of the two provincial kings-of-arms, the second being Norroy. The jurisdiction of Clarencieux extends over all England south of the Trent, that of Norroy comprehending the portion north of that river. Clarencieux is named after the Duke of Clarence, third son of King Edward III. It is his duty to visit his province, to survey the arms of all persons bearing coat armor within it, to register descents and marriages, and to marshal the funerals of all persons who are not under the direction of Garter. He also grants arms within his province, with the approval of the Earl Marshal. See GARTER KING-AT-ARMS; HERALDS' COLLEGE; KING-AT-ARMS.

CLAR'ENDON. A lodge in Wiltshire, near Salisbury, England, where the "Constitutions of Clarendon," fixing the limits of the jurisdiction of the civil and ecclesiastical courts, were drawn up in 1164.

CLARENDON. A city and the county seat of Monroe Co., Ark., 60 miles (direct) east of Little Rock; on the White River and on the St. Louis Southwestern and the St. Louis, Iron Mountain and Southern railroads (Map: Arkansas, D 3). It is in a rich cotton-growing region and has lumber mills, boat-oar, barrel, button, plow-beam, wagon-material, telegraph and telephone supply, and shoe-last factories; a foundry, cotton gins, saw and planing mills, and bottling works. Pop., 1900, 1840; 1910, 2037.

CLARENDON. A town in Rutland Co., Vt., 6 miles south of Rutland; on the Rutland Railroad (Map: Vermont, B 5). The principal industries are dairying, fruit raising, and maple-sugar making. The locality is visited for its mineral springs, the waters of which are of considerable medicinal value. It is governed by an annual town meeting. Pop., 1910, 857.

CLARENDON, ASSIZE OF. A series of decrees issued by Henry II of England in 1166. By these he ordered (1) that in each county juries consisting of 12 men from each hundred, and four men from each vill should present

for trial before his justices all who were accused, or publicly suspected, of robbery or murder, or of harboring robbers or murderers; (2) that the system of frankpledge (q.v.) should be carried out more fully. Section 21 treated of the heretics who had recently appeared in England and was the first secular legislation against heresy in the west of Europe since the days of the Roman Empire. Consult Stubbs, *Select Charters Illustrative of English Constitutional History* (7th ed., Oxford, 1890). A translation can be found in Adams and Stephens, *Select Documents of English Constitutional History* (New York, 1901).

CLARENDON, CONSTITUTIONS OF. A body of laws defining the spheres of ecclesiastical and secular jurisdiction in the courts of England, adopted in 1164. In that year Henry II summoned the whole body of bishops and barons to a council at Clarendon, and some of the oldest members of the council were ordered to set down in writing the customs in use under Henry I. The report was to be made the basis for the definite determination of the disputes between the King and the clergy. The document known as the "Constitutions of Clarendon" was presented as the result of the inquiry. The constitutions were 16 in number. The substance of the most important articles was as follows: Members of the clergy accused of crime should be sent to the ecclesiastical courts for trial, and, if there convicted, were to be turned over to the law courts for further punishment. There was to be no appeal to Rome without the consent of the King. No beneficed clergyman might leave the realm without the King's consent. No villein could be ordained without the consent of his lord, and no tenant in chief of the King could be excommunicated without the King's knowledge. In addition to these subjects, the "constitutions" decided that questions of advowson and presentation should be tried in the King's court; that election to bishoprics and abbacies should be in the King's presence; and that the King had a right to the goods of felons deposited under the protection of the Church. Finally, the questions of titles to ecclesiastical estates, the trial of laymen for spiritual offenses, and the bestowal of churches in the King's gift were determined.

A great authority upon the "Constitutions of Clarendon" says: "They are no mere engine of tyranny, or secular spite, against a churchman; they are really a part of a great scheme of administrative reform, by which the debatable ground between the spiritual and temporal powers can be brought within the reach of common justice, and the lawlessness arising from professional jealousies abolished." The enactment of the "Constitutions of Clarendon" brought to a crisis the dispute between Henry II and Thomas à Becket, who made himself the champion of the ecclesiastical power, siding with Pope Alexander III when the latter rejected the "constitutions." Though the King had to undergo penance after the murder of Becket, some of the provisions of the "Constitutions of Clarendon" remained permanent gains to the civil power. Consult: Stubbs, *The Constitutional History of England*, vol. i (Oxford, 1896); Pauli, *Geschichte von England* (Gotha, 1853–58); and for the text of the "Constitutions," Stubbs, *Select Charters Illustrative of English Constitutional History* (7th ed., Oxford, 1890).

CLARENDON, EDWARD HYDE, EARL OF (1609–74). An English historian, and Chancellor of Charles II. The son of Henry Hyde, a private gentleman, he was born at Dinton, Wiltshire, Feb. 18, 1609. Destined for the church, he proceeded to Magdalen College, Oxford, where he was graduated Bachelor of Arts, Feb. 14, 1626. But instead of the clerical profession, he entered the Middle Temple, under his uncle, Chief Justice Sir Nicholas Hyde, treasurer of the society, and was called to the bar Nov. 22, 1633. His intimate friends were the brilliant *literati* of the period—Ben Jonson, Waller, Selden, Carew, Chillingworth, Hales, Falkland, and others. To them in after years he attributed much of his knowledge and worldly experience. He was twice married—his first wife dying after six months—and by both alliances gained wealth and political influence. In 1634 he became Keeper of the Writs and Rolls of the Common Pleas, and by some brilliant defense work acquired an extensive law practice. He came into high favor with Laud and was frequently consulted by him. He entered the "Short Parliament" of 1640 for Wootton Bassett and distinguished himself as a supporter of the Popular party. He represented Saltash in the "Long Parliament," but as an Episcopalian he eventually seceded from the Popular party on ecclesiastical questions, and thereby gained the King's favor. He headed the Royalist party in the Commons and counseled conciliation by a persistent appeal to the "known laws of the land." He was the author of most of the King's answers to the parliamentary manifestoes. At the outbreak of the Civil War he attached himself to the royal cause and in 1643 was knighted and made Chancellor of the Exchequer and Privy Councilor. After viewing the battle of Edgehill he joined Prince Charles (Charles II) in the West, and accompanied him in his flight to Jersey. He remained in that island for two years and began his *History of the Rebellion*. In June, 1648, after capture and spoliation by an Ostend pirate, he rejoined Prince Charles at The Hague. He exerted himself to save the life of Charles I, and after that monarch's execution was retained as counselor by Charles II, in 1649, going to Spain on an unsuccessful mission for assistance. At Charles's request he rejoined him in Paris, and as the King's most trusted adviser there, as also in Cologne and Bruges, spent the next nine years, frequently in abject poverty. Charles formally declared him Lord Chancellor in 1658. At the Restoration in 1660 Charles confirmed this appointment and in November of this year created him Baron Hyde. He also became chancellor of Oxford University and in April, 1661, he was created Viscount Cornbury and Earl of Clarendon. In September, 1660, his daughter Anne formed a secret marriage with the Duke of York, afterward James II, and subsequently became the mother of Mary and Anne, the future English queens. The King and Clarendon were wroth; but Clarendon's indignation was somewhat overacted, and excited an aftersuspicion that he deliberately proposed the barren Catharine of Braganza as Charles II's consort, to provide for his posterity's succession to the throne. During his premiership the settlement of Scotland and Ireland owed much to him, and he took a leading part in colonial extension. He was one of the eight proprietors to whom the first Carolina Charter was granted in 1663, the Cape Fear establishment being named "Clarendon

County" after him. He also helped the Presbyterian Baxter, to whom he offered a bishopric, in the incorporation of a company for the propagation of the gospel in New England. The ill success of the Dutch War and the sale of Dunkirk to the French aroused public indignation, and he became exceedingly unpopular. In 1663 the Earl of Bristol unsuccessfully accused him of bribery in the House of Lords, but in 1667 he fell a victim to court intrigue; and having offended the King by opposing his divorce, that he might marry Fanny Stewart, whom Clarendon induced the Duke of Richmond to wed, Charles deprived him of his offices and indirectly advised him to withdraw to Calais. Clarendon sent a vindication to the Lords, which both houses of Parliament ordered to be burned by the common hangman. After being almost murdered by some English sailors at Evreux, he lived in exile for six years, sending humble appeals to be allowed to pass his remaining years on English soil. He died in Rouen, Dec. 9, 1674, and was buried in Westminster Abbey.

In a generally profligate court he was almost the only moral man, and was distinguished for his unswerving fidelity to the Episcopal church and his determined maintenance of what he considered the true and ideal English constitution. He was a ready debater and pleasing speaker, but it is for his literary productions that he is best remembered. The first edition of his great *History of the Rebellion* (Oxford, 1702–04) was not printed from the original manuscript, and some passages were slightly altered by the editors. A complete edition, by Dr. Bandinel, first appeared in 1826; while the best edition, in 6 vols., was published at Oxford in 1888. He wrote also a *Life of Edward Hyde, Earl of Clarendon*, with a *Continuation of the History of the Grand Rebellion from the Restoration to his Banishment in 1667* (1759); and a *History of the Rebellion and Civil War in Ireland* (1720). Consult: Agar-Ellis, *Historical Inquiry Respecting the Character of Edward Hyde, Earl of Clarendon* (London, 1827); Lister, *Life and Administration of Edward Hyde, First Earl of Clarendon* (London, 1837–38); Lewis, *Lives of the Friends and Contemporaries of Clarendon* (3 vols., London, 1852); Campbell, *Lives of the Lords Chancellors*, vol. iii (London, 1869); Oldmixon, *Clarendon and Whitelocke Compared* (2d ed., London, 1787); Craik, *Life of Edward, Earl of Clarendon* (New York, 1911); Firth, *Edward Hyde, Earl of Clarendon* (Oxford, 1909); and the histories of Green, Ranke, and Gardiner.

CLARENDON, George William Frederick Villiers, fourth Earl of (1800–70). An English diplomat and statesman, the eldest son of George Villiers and grandson of Thomas Villiers, who in 1752 married the heiress of the last Lord Clarendon of the Hyde branch, and was created Baron Hyde, 1756, and Earl of Clarendon, 1776. He was born in London, Jan. 12, 1800. He entered St. John's College, Cambridge, in his sixteenth year, and by titular privilege attained the M.A. degree in 1820. The same year he entered the diplomatic service as an attaché to the British Embassy at St. Petersburg, and at 23 years of age had acquired practical experience that was of particular value in his subsequent career. He was an accomplished linguist and writer. Appointed Commissioner of Customs in 1823, in 1827–29 he gained administrative knowledge in arranging the union of the English and Irish excise boards, and an insight into Irish character and affairs which made him an authority with Lord Lieutenant Paget, Marquis of Anglesey. In 1831, as coadjutor to Sir John Bowring, he successfully negotiated a commercial treaty with France, and in 1833 was sent as envoy extraordinary and minister plenipotentiary to Madrid, where he acquired great influence and a lifelong popularity. He was rewarded with the Grand Cross of the Bath in 1837, and at his uncle's death, Dec. 22, 1838, succeeding to the Clarendon peerage as fourth Earl, he returned to England to take his seat in the House of Lords. He entered Lord Melbourne's administration as Lord Privy Seal in 1840, and also became chancellor of the Duchy of Lancaster. When the ministry fell, in 1841, he became an active member of the Opposition, but, as a stanch free trader, warmly supported Sir Robert Peel's measures for the repeal of the Corn Laws. Under Lord Russell he became President of the Board of Trade in 1846, and in the following year was appointed Lord Lieutenant of Ireland. The insurrectionary follies of Smith O'Brien and his followers were agitating the country; but Clarendon's prompt and decisive measures soon restored tranquillity, while his tact and impartiality allayed party feeling. In 1852, under Lord Aberdeen, and in 1855–58, under Lord Palmerston, Clarendon was Foreign Secretary. Upon him fell the burden of the Crimean War; he personally attended the Congress of Paris, and the peace of 1856, with its beneficial results to European politics, testifies to his foresight and ability. He retired with the ministry in 1858; resumed the Foreign Secretaryship in 1865–66, and held it again under Gladstone from 1868 until his sudden death, June 27, 1870. Consult Thornton, "Life of George William Frederick Villiers, Fourth Earl of Clarendon," in *Foreign Secretaries of the Nineteenth Century*, vol. iii (London, 1881–82).

CLARENDON PRESS. A printing and publishing establishment connected with Oxford University (England). It was founded in 1672, and named Clarendon, because the printing house was paid for by the profits on the sale of Lord Clarendon's *History of the Rebellion*, of which work the university has a perpetual copyright. It now has an American branch.

CLARENS, klà'răn'. One of a number of villages in the Canton of Vaud, Switzerland, scattered along the shores of Lake Geneva. It is 3½ miles southeast of Vevey, and 1200 feet above sea level (Map: Switzerland, A 2). The town is charmingly situated, has a mild climate, and is a favorite resort for invalids. It is known as the scene of Rousseau's *La Nouvelle Hélöise.*

CLARES, klârz, Poor, or Clarisses. A religious order founded by St. Clare, with the counsel and help of St. Francis of Assisi, in 1212. At first the nuns observed the rule of St. Benedict, but in 1224 the austerity of this rule was mitigated by St. Francis, and again modified by Urban IV in 1263. The order rapidly increased, and by the end of the sixteenth century numbered nearly 50,000. The nuns devote themselves chiefly to the education of the young. They are under the jurisdiction of the General and Provincials of the Friars Minor. In 1875 two sisters came to the United States from Rome; in 1877 others came from Germany. They had in 1911, in the United States, 7 convents and 204 professed sisters; in England, 11

convents; in Scotland, 1; and in Ireland, 9. The English follow the reform of St. Colette, who in 1436 brought back many. French, Belgian, and German converts to the strict Franciscan rule.

CLARET. See WINE.

CLARETIE, klär'tē', JULES (properly ARSÈNE ARNAUD) (1840–1913). A French author and theatrical manager, born at Limoges (Haute-Vienne). He studied at the Lycée Bonaparte of Paris, and became known as a feuilletonist and dramatic critic. During the Franco-Prussian War he acted as correspondent for Paris papers for a brief period. His first play won but moderate success (*La famille des Gueux*, 1869), but subsequently dramatizations of several of his own works of fiction, such as *Les Muscadins* (2 vols., 1874, and presented as a play in that year) and *Le Prince Zilah* (1884; presented in 1885), established him upon the French stage. In 1907 he wrote and had produced the drama *Thérèse*. In 1885 he became director of the *Comédie française*, whose traditional excellence he sought to maintain. He is best known, however, for his novels and historical and critical works. Among the former are, in addition to the two already named, *L'Assassin* (1866), *Monsieur le Ministre* (1882), *Puyjoli* (1890), and *L'Accusateur* (1897). From the latter may be cited *Histoire de la révolution de 1870–71* (new ed., 5 vols., 1875–76); *Cinq ans après* (1876), a study of postbellum conditions in Alsace-Lorraine; *Les Prussiens chez eux* (1872). Among his critical works may be mentioned *La vie moderne au théâtre* (1868–69); *Molière* (1871); and *Histoire de la littérature française* (2d ed., 1905). In 1888 Claretie was elected to the Académie Française.

CLARI, klä'rē, **THE MAID OF MILAN.** An opera by Sir Henry Bishop (1823), introducing John Howard Payne's "Home, Sweet Home," which was written expressly for it.

CLARIFICATION. See FINING.

CLARIN'DA. A city and the county seat of Page Co., Iowa, 79 miles by rail southeast of Council Bluffs; on the Nodaway River, and on the Chicago, Burlington, and Quincy Railroad (Map: Iowa, B 4). It is in an agricultural and stock-raising region, which has also some coal deposits. The city exports live stock, poultry, butter, eggs, seeds, grain, and coal; and there are flour mills, carriage works, brickyards, lawn-mower and well-boring machine factories, a foundry, a creamery, a cold-storage plant, an ice plant, etc. Clarinda contains a public library, and owns its water works. The State Asylum for the Insane is a short distance from the city. Pop., 1890, 3262; 1900, 3276; 1910, 3832.

CLAR'INET' (Fr. *clarinette*, from It. *clarinetto*, dim. of *clarino*, clarion, from *claro*, Lat. *clarus*, clear), or CLARIONET. A wood-wind instrument of the reed kind, developed by Joseph Christopher Denner, in Nuremberg, in 1690, from the chalumeau, a primitive wind instrument, by the addition at the nodal point of a small hole and key, which gave an additional register, one-twelfth higher. Its tone is produced by a thin piece of Spanish reed nicely flattened and tied, or otherwise fixed to the mouthpiece. On the body of the instrument there are 18 holes, 13 of them with keys for the fingers of the performer, by which the notes are produced. In extent (3½ octaves, from *e* to c^4), fullness, and variety of tone, the clarinet is the most perfect of wind instruments. Its construction, however, does not admit of every key in music being played on the same instrument; for which reason clarinets of different pitch, generally A, B♭, and C, also a bass clarinet (usually in B♭) are used in orchestra music. Mozart's familiar E♭ major symphony is the first work of its kind in which clarinets were employed. Consult W. Altenburg, *Die Klarinette* (Heilbronn, 1904). See ORCHESTRA.

CLAR'ION. A borough and the county seat of Clarion Co., Pa., about 100 miles (direct) north-northeast of Pittsburgh, on the Pennsylvania Southern Railroad, and on the Clarion River, here spanned by a State bridge (Map: Pennsylvania, B 3). It is the seat of a State Normal School and has an attractive courthouse. The surrounding region produces natural gas, oil, and lumber, and there are coal works and cigar and glass-bottle factories. Clarion was settled in 1839 and was incorporated in 1841. The government is administered by a burgess, elected every three years, and a unicameral council. Pop., 1900, 2004; 1910, 2864.

CLARIS'SA HAR'LOWE. A novel, by Samuel Richardson, published in 1748. See HARLOWE, CLARISSA.

CLARISSES, klà'res'. See CLARES, POOR.

CLARK, ABRAHAM (1726–94). An American patriot, a signer of the Declaration of Independence. He was born near Elizabeth, N. J.; practiced law for a time, and was called the "poor man's councillor"; and, on the approach of the Revolutionary War, identified himself with the patriot cause. He was elected to the Provincial Congress in 1775; was a member of the Continental Congress in 1776–78, 1780–83, and 1785–88; was a delegate to the Annapolis Convention (q.v.) in 1786, and from 1791 to 1794 was a member of Congress.

CLARK, ALBERT CURTIS. An English classical scholar. He was educated at Oxford, graduated at Queen's (1882) and became (1884) fellow and tutor of Queen's College and (1909) university reader in Latin. His great work was as an editor of the Oxford *Cicero*, and as an investigator, after Zielinski, of rhythmic *clausulæ* in Cicero's prose and in other authors. He edited *Asconius* (1907) and *Fontes Prosæ Numerosæ* (1909); wrote *The Cursus in Mediæval and Vulgar Latin* (1910), and *Prose Rhythm in English* (1913).

CLARK, ALONZO (1807–87). An American physician. He was born in Chester, Mass., and graduated in 1828 at Williams, and in 1835 at the New York College of Physicians and Surgeons, where he was professor of physiology and pathology from 1848 to 1855, and of pathology and practical medicine from 1855 to 1885, and dean and president of the faculty in 1875–85. Possibly his most important publication was *Lectures on Diseases of the Heart* (1889).

CLARK, ALONZO HOWARD (1850–). An American ichthyologist, born in Boston. He studied at Wesleyan University; in 1883 was a member of the United States Commission at the International Fisheries Exhibition, London, and in 1889 was sent as expert commissioner to the Paris Exposition of that year. From 1889 to 1908 he was assistant secretary of the American Historical Association. His publications include: *Statistics of Fisheries of Massachusetts* (1882); *History of the Mackerel Fishery* (1883); and *A National Register of the Society of the Sons of the American Revolution* (1902).

CLARK, Alvan (1808–87). An American optician, born at Ashfield, Mass. The son of a farmer, he became a self-taught engraver, portrait painter, and optician, and was employed as an engraver in a calico-print manufactory at Lowell, Mass. After being a portrait painter in Boston, he began the manufacture of telescopes at Cambridgeport, Mass., about 1844, and completed the first achromatic lenses made in the United States. He also devised an ingenious eyepiece for measuring celestial arcs of lesser magnitudes. The chief telescopes of recent times have been the work of his establishment. *The Proceedings of the Royal Astronomical Society,* vol. xvii (London, 1857), contains the list of his own discoveries with his telescopes. See Telescope.

CLARK, Alvan Graham (1832–97). An American optician and astronomer, born at Fall River, Mass., son of Alvan Clark, with whom he was associated in the manufacture of telescopes. Among the great telescope lenses made by him are those in the Lick Observatory in California (36 inches in diameter), and in the Naval Observatory at Washington (26 inches); the 30-inch refractor for the Nicholas Central Observatory of Pulkowa; and the great 40-inch lens, the largest in actual use, for the Yerkes Observatory (at Williams Bay, Wis.) of the University of Chicago. He was also active as an astronomical observer, and made many discoveries of double stars, including that of the companion of Sirius (January, 1862; after Safford's determination of its position), for which he received the Lalande gold medal of the French Academy. See Telescope.

CLARK, Sir Andrew (1826–93). A British physician, born in Aberdeen, Scotland, and educated at the University of Aberdeen and in Edinburgh. He joined the medical department of the navy in 1848 and was appointed pathologist to the Haslar Hospital (1849), curator of the museum of the London Hospital (1853), and assistant physician of this hospital (1854). After 1854 he was connected with the College of Physicians, as member, fellow, and officer—from 1888 to his death he was president. Meanwhile he built up a large practice in London, and counted among his patients many of the notable persons of his day. He wrote on various subjects, especially tuberculosis, a tendency to which he himself had had all his life.

CLARK, Champ (1850–1921). An American politician, born in Anderson Co., Ky., and educated at Kentucky University, at Bethany College, and at the Cincinnati Law School. In 1873–74 he was president of Marshall College, W. Va. He was city attorney of Louisiana, Mo., and afterward of Bowling Green, Mo., and was prosecuting attorney of Pike County, in that State. In 1904 he was chairman of the National Democratic Convention, at St. Louis, and chairman of the committee which notified Judge Parker of his nomination to be the Democratic candidate for the presidency. He was elected Democratic Representative from the Ninth District of Missouri in 1893, and from 1897 was reëlected to the three succeeding congresses. He was chosen Speaker of the House in the Sixty-second Congress partly as a reward for the ability he had displayed as minority leader in the preceding Congress. Mr. Clark brought impartiality and dignity to the speakership, and was notably successful in perfecting the organization of the House and in establishing absolute discipline; and among those of his own party at Washington his council came to have much weight. Speaker Clark was one of the leading candidates for the presidential nomination at the National Democratic Convention, Baltimore, 1912; and it was only on the forty-sixth ballot that his chief competitor, Woodrow Wilson, obtained the nomination. This result was hastened by W. J. Bryan, who threw his support over to Wilson, alleging that Mr. Clark was allied with Tammany Hall. The charge, vehemently denied by Mr. Clark, aroused the most bitter feeling among the latter's supporters against Bryan. But the defeated nominee himself loyally supported the Democratic ticket in the ensuing campaign.

CLARK, Charles Edgar (1840–1922). An American naval officer, born at Bradford, Vt. He entered the United States Naval Academy in 1860 and in 1863 was made an ensign. Subsequently he served on the steam sloop *Ossipee,* of the Western Gulf Blockading Squadron in 1863–65; took part in the battle of Mobile Bay and in the bombardment of Fort Morgan (1864); was commissioned a lieutenant commander in 1868, and in that year was serving on the *Suwanee* when she was wrecked off Vancouver Island. He was stationed at the Naval Academy in 1870–73, became a commander in 1881, was lighthouse inspector in 1887–91, and was stationed at the Mare Island Navy Yard in 1891–93. Promoted to captain in 1896, he was transferred from the *Monterey* at the Mare Island Navy Yard, San Francisco, to the command of the battleship *Oregon.* In this vessel he sailed from San Francisco on March 19, 1898, and covered the 13,000 miles around Cape Horn to Key West in 65 days, thereby establishing a new record for a sea voyage under such conditions. Under command of Captain Clark, the *Oregon* at once joined Admiral Sampson's squadron, and bore an important part in the destruction of Admiral Cervera's fleet. He was advanced to rear admiral in 1902, was afterward governor of the United States Naval Home at Philadelphia, and retired in August, 1905.

CLARK, Charles Hopkins (1848–). An American newspaper editor, born in Hartford, Conn. He graduated from Yale in 1871 and in the same year became connected with the Hartford *Courant,* the oldest newspaper continuously published in America. After 1890 he was editor in chief of this paper. He was president and director of many important financial institutions and companies, and from 1909 to 1913 was treasurer and member of the commission on the State Reformatory. In 1910 he received the degree of L.H.D. from Trinity College.

CLARK, Charles Kirk (1857–). A Canadian physician and alienist. He was born at Elora, Ontario, and graduated at Toronto University in 1878. In 1880 he was appointed assistant medical superintendent of the Hamilton Insane Asylum, and for 20 years after 1885 he was medical superintendent of the Rockwood Asylum for the Insane at Kingston, while at this post serving also as professor of mental diseases at Queen's University. In connection with the asylum he founded a home for nurses and convalescents. Of the *American Journal of Insanity* he became coeditor in 1904. He was appointed medical superintendent of the Toronto Asylum for the Insane in 1905, professor of psychiatry in Toronto University in

1907, and dean of that institution's medical faculty in the following year. In 1907 he was also a member of the royal commission for the study of methods of treatment of the insane in Europe. His contributions on alienistic subjects to various journals gained him a high reputation.

CLARK, Clarence Don (1851–). An American legislator, born at Sandy Creek, N. Y. He was educated at Iowa State University, practiced law in Delaware Co., Iowa, and at Evanston, Wyo., and was a member of the constitutional convention of Wyoming, and a delegate to a number of Republican national conventions. Upon the admission of Wyoming as a State he was elected to the Fifty-first and Fifty-second Congresses; in 1895 was elected to the United States Senate to fill a vacancy, and in 1899 and 1905 was reëlected, and again in 1911 for the term ending 1917. In the Sixty-third Congress he was chairman of the Committee on Geological Survey, and was also a member of other important committees.

CLARK, Daniel (1836–1912). A Canadian physician. He was born at Granton, Inverness-shire, Scotland; went to Canada in 1841, and graduated at Victoria University in 1858. He subsequently received from the University of Toronto the degree of M.D., studied at Edinburgh, and practiced at Princeton, Ontario. During the Civil War he was for a short time attached as volunteer surgeon to the Army of the Potomac, and in 1872 was elected a member of the Ontario Medical Council. He was afterward connected with various educational and charitable institutions, and in 1875 was appointed superintendent of the Provincial Lunatic Asylum, Toronto. He wrote *Pen Photographs* (1873); *Josiah Garth*, a novel; and other works.

CLARK, Edward (1822–1902). An American architect, born in Philadelphia, Pa. He studied architecture with Thomas U. Walter, and succeeded him as architect of the United States Capitol extension in 1865. He was appointed by Congress on the commission for the completion of the Washington Monument, and on the commission for the construction of the Congressional Library, and did other governmental work. He was a member of the American Institute of Architects, fellow of the Clarendon Historical Society of Edinburgh, and trustee of the Corcoran Art Gallery in Washington.

CLARK, Edwin Charles (1835–). An English legal writer and teacher. He graduated at Trinity College, Cambridge, became a scholar and fellow of Trinity, and subsequently was appointed professorial fellow of St. John's, and was then regius professor of civil law in the university until 1914. He published: *Early Roman Law: Regal Period* (1872); *An Analysis of Criminal Liability* (1880); *Practical Jurisprudence* (1883); and *Cambridge Legal Studies* (1888); *Practical Jurisprudence: A Comment on Austin* (1888); *History of Roman Private Law* (1906).

CLARK, Francis Edward (1851–). An American Congregational clergyman. He was born at Aylmer, Canada, Sept. 12, 1851; graduated at Dartmouth College in 1873, and at Andover Theological Seminary in 1876. He held a Congregational pastorate at Portland, Me., from 1876 to 1883, and was a pastor of Phillips Church, South Boston, in 1883–87. In 1881 he organized the Williston Young People's Society of Christian Endeavor in his church at Portland, and in 1887 became president of the United Society of Christian Endeavor, which sprang from it, and editor of its official organ, the *Golden Rule*. (See Christian Endeavor, Society of.) He published: *The Children of the Church, and the Y. P. S. C. E. as a Means of Bringing them Together* (1888); *World-wide Endeavor, the Story of the Y. P. S. C. E. from the Beginning and in all Lands* (1896); *Fellow Travelers: A Personally Conducted Journey in Three Continents; A New Way Around the World* (1901), an account of experiences on the Trans-Siberian Railway; *The Continent of Opportunity* (South America) (1909); and other works in the interest of the society.

CLARK, Galen (1814–1910). An American naturalist, born at Dublin, N. H. In 1853 he went to California and worked in placer mines, but within four years was serving as guide to parties of tourists to Yosemite Valley. In 1857 he discovered the great redwood growth at Mariposa, in 1864 he opened a small hotel at Wawona, and in 1865 was appointed commissioner and guardian of the newly created Yosemite Valley Park. He was succeeded by another, but for the last 20 years of his life was again guardian of the park. He was an intimate friend of John Burroughs, John Muir, and Joseph Le Conte, who considered him a high authority on the geology and natural wonders of the Sierra Nevada Mountains. He published *The Indians of Yosemite Valley* (1904); *The Big Trees of California* (1907); *The Yosemite Valley, its History, Characteristic Features, and Theories Regarding its Origin* (1910).

CLARK, George Rogers (1752–1818). An American soldier and frontiersman, who rendered valuable services to the United States during the Revolutionary War. He was born near Monticello, in Albemarle Co., Va.; received a common-school education; made a tour west of the Alleghanies in 1772; became a land surveyor, and in 1774 served against the Indians in Lord Dunmore's War (q.v.). He spent some months in Kentucky in 1775; removed thither early in 1776, and soon became the recognized leader of the backwoodsmen. In June, 1776, he was chosen one of two delegates to represent Kentucky, then a district of Virginia, in the Virginia Legislature, and in this capacity not only brought about the organization of Kentucky as a separate county, but secured a large supply of much-needed powder for the use of the backwoodsmen. After his return he conceived a plan for the conquest of the "Illinois Country," and having won the support of Patrick Henry, then Governor of Virginia (to lay his plans before whom he had traveled on foot from Harrodsburg, Ky., to Williamsburg, Va.), he was appointed lieutenant colonel, raised the necessary troops, and proceeded to the site of Louisville, Ky. Starting from this point on June 28, 1778, he captured Kaskaskia (q.v.) on July 4, and by deputy secured the surrender of the other French villages, Cahokia and Vincennes. General Hamilton, the English commander at Detroit, recaptured Vincennes, then held by Captain Helm, in December; and Clark, upon hearing the news at Kaskaskia, put himself at the head of 170 men, and after an arduous march in the depth of winter, through swamps and dense forests, forced Hamilton to surrender on Feb. 24, 1779. (A monument to Clark, commemorating these feats, was erected at Vincennes in 1905.)

Early in 1780 he built Fort Jefferson, on the left bank of the Mississippi, a short distance below the mouth of the Ohio. From this time until the close of the war he was engaged almost constantly in warfare against the British and Indians, totally defeating the Shawnees, destroying the Indian villages along the Big Miami, and rising to the rank of brigadier general of Virginia militia. After the close of the war he led an unsuccessful expedition against the Wabash Indians in 1786, came into conflict with the Spanish authorities in the West, and seems to have advocated an expedition, which he was to lead, for the capture of Natchez and St. Louis and the opening of the Mississippi to unrestricted navigation. In 1793, during the pro-French agitation in the United States, he was commissioned a general by the French government, and issued a call for volunteers for the purpose of reconquering the Spanish possessions along the Mississippi on behalf of the French. He passed the latter part of his life in poverty at Clarksville, in Indiana, near Louisville, Ky., on part of the land granted him by the Virginia Legislature.

Clark's services during the Revolutionary War were of the utmost value to the United States government, inasmuch as the virtual conquest of the Northwest served as, perhaps, the chief basis of the American claim, in the peace negotiations of 1782–83, to the territory between the Mississippi and the Alleghanies. But for this conquest, according to many historians, the western territory would probably have passed either to England or to Spain. In recognition of his services, the Virginia Legislature, in 1783, granted him a tract of 8049 acres—140,000 more being granted to his officers and men—in the present State of Indiana, and on two occasions presented him with a sword. Clark wrote two accounts of his expedition—one of which, his *Letter to George Mason, of Virginia*, was first published in Cincinnati in 1869; and the other, entitled his *Memoir*, and written probably in his old age, at the request, it is said, of Presidents Jefferson and Madison, was first published in part in Dillon's *Indiana* (1843). Consult: English, *The Conquest of the Country Northwest of the Ohio River, 1778–83, and Life of George Rogers Clark* (Indianapolis, 1896); and Roosevelt, *Winning of the West*, vols. i and ii (New York, 1889); Butterfield, *History of G. R. Clark's Conquest of the Illinois and the Wabash Towns* (Columbus, 1904). Many documents relating to Clark and the conquest of the Illinois country are to be found among the Draper Manuscripts, in the Library of the Wisconsin Historical Society, Madison, Wis.

CLARK, Henry James (1826–73). An American naturalist, born at Easton, Mass. He graduated at New York University in 1848; then studied botany under Asa Gray at the Cambridge Garden, and later under Agassiz at Harvard. On graduating from the Lawrence Scientific School (1854), he remained with Agassiz in the capacity of private assistant until 1863. With Agassiz he did important work on the embryology of the turtle (1857). In 1860 he was made adjunct professor of zoölogy at the Lawrence School. In 1864 he delivered a course of lectures, *Mind in Nature* (published 1865), at the Lowell Institute, and from 1866 to 1869 was professor of the natural sciences at the Pennsylvania Agricultural College. From 1869 to 1872 he held a similar post at the University of Kentucky, and during the last year of his life was professor of veterinary science at the Massachusetts Agricultural College, in Amherst. Consult Packard's "Memoir" in *Biographical Memoirs of the National Academy of Sciences* (Washington, 1877).

CLARK, Hubert Lyman (1870–). An American zoölogist, born at Amherst, Mass., and educated at Amherst College and Johns Hopkins University. He was professor of biology at Olivet (Mich.) College from 1899 until 1905, when he became an assistant in invertebrate zoölogy in the Museum of Comparative Zoölogy, Harvard. Scientific investigations, leading to the publication of numerous papers, were carried on by him in Jamaica and Bermuda. He was a contributor to the New International Encyclopædia in 1900–03. His publications include: *The Birds of Amherst and Vicinity* (1887); *The Echinoderms of Porto Rico* (1901); *A New Ophiuran from the West Indies* (1910); *North Pacific Ophiurans in the Collection of the United States National Museum* (1911).

CLARK, Isaac (1833–1918). An American theologian, born at Canterbury, Conn. He was educated at Yale University, Union Theological Seminary, and Andover Theological Seminary, and was ordained at Elmira, N. Y. (1861–68); Aurora, Ill. (1868–72); Brooklyn (Elm Place Church, 1872–74); Rondout, N. Y. (1874–82); and the Edwards Church (Congregational), Northampton, Mass. (1882–91). In 1891 he became professor of theology, homiletics, and English exegesis at Howard University (Washington, D. C.), and after 1901 was in addition dean of that institution's theological school.

CLARK, Sir James (1788–1870). An English physician. He studied law and then medicine, practiced in Rome in 1819–26 and then in London, and on the accession of Victoria, was appointed physician in ordinary to her Majesty, and attended the Queen on most of her journeys to Scotland and the Continent. He was made a baronet in 1838. He wrote *The Influence of Climate in the Prevention and Cure of Disease* (1829), and *A Treatise on Pulmonary Consumption* (1835).

CLARK, John Bates (1847–). An American economist, born at Providence, R. I., Jan. 26, 1847, and educated at Brown University, Amherst College, and at the universities of Heidelberg and Zurich. He was appointed professor of political economy and history in Carleton College, Minn., 1877; professor of history and political science in Smith College, 1881; professor of political economy in Amherst College, 1892; and in Columbia University, 1895. For three years (1892–94) he was lecturer on economics in the Johns Hopkins University, and (1893–95) was president of the American Economic Association. In 1911 he was appointed director of the division of economics and history of the Carnegie Endowment for International Peace. Besides numerous articles in scientific periodicals, he has published the following works: *The Philosophy of Wealth* (1885); *Capital and its Earnings* (1888); *Wages* (1889); *The Distribution of Wealth* (1901); *The Control of Trusts* (1901); *The Problem of Monopoly* (1904; revised, in collaboration with John Morris Clark, 1912); *Essentials of Economic Theory* (1907). Since the death of Francis A. Walker, Professor Clark has occupied the first place among American economists. The distinguishing features of Professor

Clark's economic theory are his distinction between the static and dynamic forces in economic life; his derivation of value from effective utility; and his explanation of interest in terms of the productivity of capital. In his social political teachings Professor Clark defends the essential justice and beneficence of an economic system based upon free enterprise. The chief defects in the existing economic system are, in his view, an outgrowth of monopoly, and can be removed by appropriate legislative measures. Professor Clark does not limit the economic sphere of the state to the protection of property and the restraint of monopoly, but offers a qualified defense, on dynamic grounds, of protection and other measures usually regarded by economists as paternalistic.

CLARK, JOHN WILLIS (1833–1910). An English zoölogist. He was educated at Eton and at Trinity College, Cambridge, where in various capacities he spent more than three quarters of a century. As superintendent of the museum of zoölogy for 25 years he did much to promote the study of natural sciences at Cambridge. He became registrar of the university in 1891. Besides his papers on the anatomy and habits of the narwhal, and on the dolphins and on the extinct rhytina his publications include: *Old Friends at Cambridge and Elsewhere* (1900); *The Care of Books* (1901; 3d ed., 1909); *Cambridge, a Concise Guide of the Town and University* (1902; 3d ed., 1906); *Endowments of the University of Cambridge* (1904).

CLARK, JONAS GILMAN (1815–1900). An American philanthropist, born at Hubbardston, Mass. After a term of service as a carriage maker's apprentice, he began the manufacture of tinware, with shops at Milford and Lowell. In 1853 he went to California, where he developed a successful business. He invested largely in real estate, and subsequently added to his fortune by banking operations in the East. About 1880 he removed from New York City to Worcester, Mass. There, in 1887, he obtained a charter for an institution of higher education, and in 1889 founded Clark University for postgraduate study such as could not well be carried on up to that time in the United States. He provided an endowment fund of $1,000,000, and by the terms of his will secured to the university a further endowment of $2,500,000. (See CLARK UNIVERSITY.) He also established an endowed public library at Hubbardston.

CLARK, KATE UPSON (1851–). An American author, born at Camden, Ala. She graduated from Wheaton Seminary in 1869 and from the Westfield (Mass.) Normal School three years later. In 1874 she was married to Edward Perkins Clark, who died in 1903. For several years she taught school in Cleveland, Ohio, in 1882–87 was editor of *Good Cheer*, at the same time conducting a department in the Philadelphia *Press*, and from 1892 to 1895 edited *Romance*. In 1907 she became an editorial writer on the *Brooklyn Eagle*, also acting as literary editor of the *Christian Herald*, and contributing to many magazines and religious weeklies. She also became known as a lecturer on literary, educational, and domestic topics. Her writings in book form include: *Bringing Up Boys* (1900); *White Butterflies* (1900); *Move Upward* (1902); *The Dole Twins* (1906); *The Adventures of Spotty* (1907); *Art and Citizenship* (1907).

CLARK (JOSIAH), LATIMER (1822–98). An English electrician and engineer, born at Great Marlow, brother of Edwin Clark (1814–94), an engineer, with whom he was associated. He invented the gutta-percha coating for inclosing underground wires, the "double-cap invert" insulator and the "Clark cell," and made valuable investigations concerning the action of electric currents in submarine cables. He also invented a submarine cable covering of asphalt, hemp, and silica, and had a part in laying many submarine cables, including the first in the South Atlantic Ocean between Pernambuco and St. Louis, Senegal. He was interested in other forms of engineering as well, including the construction of pneumatic tubes, canals, and floating docks. In 1861–68 he was a partner of Sir Charles Tilston Bright (q.v.). He published *An Elementary Treatise on Electrical Measurement* (1868); *Electrical Tables and Formulæ* (1871); *Dictionary of Metric and Other Useful Measures* (1891), and a *Memoir of Sir W. F. Cooke* (1895).

CLARK, LEWIS GAYLORD (1810–73). An American editor, born in Otisco, N. Y. For 25 years (1834–59) he edited, in New York City, the *Knickerbocker Magazine*, which, by contributions from such writers as Irving, Bryant, Willis, and Longfellow, and by his own departments, the "Editor's Table" and "Gossip with Readers and Correspondents," he made the leading American literary publication of the time. Pecuniary distress caused its discontinuance in 1859, and Clark removed to Piermont, N. Y., where he lived in a residence presented by former contributors to his magazine, who raised the necessary funds in part by publishing a volume of their contributions, under the title *The Knickerbocker Gallery*. He held a place for some time in the New York Customhouse, but still contributed regularly to most of the leading periodicals. His work was marked by a pleasant humor. He published the *Knickerbocker Sketch-Book* (1850), including some of his own essays, *Knick-Knacks from an Editor's Table* (1852).

CLARK, THOMAS MARCH (1812–1903). An American Episcopal prelate. He was born at Newburyport, Mass.; graduated at Yale in 1831; studied theology at Princeton, and was licensed to preach as a Presbyterian in 1835. He became an Episcopalian in the following year, and was rector of Grace Church, Boston, for seven years, afterward holding charges in Philadelphia, Hartford, and Providence. In 1854 he was consecrated Bishop of Rhode Island, and in 1899, on the death of Bishop Williams, of Connecticut, became presiding Bishop of the Episcopal church in America. His *Reminiscences* appeared in 1895; among his other works are *Early Discipline and Culture* (1852), and *Primary Truths of Religion* (1869).

CLARK, VICTOR SELDEN (1868–). An American economist, born at Portageville, N. Y. He was educated at the universities of Minnesota and Chicago, and at Göttingen, Bern, and Columbia. After serving as principal and superintendent of schools in Minnesota (1893–97), he became superintendent of public instruction and President of the Insular Board of Education of Porto Rico under the military government. From 1902 to 1909 he investigated labor conditions in foreign countries and insular possessions for the United States. In 1910 he had charge of the census of Hawaii and in the same year he was appointed commissioner of immigration, labor, and statistics for that territory. His publications include: *Movement in Australasia* (1906);

Women and Children Wage Earners in Great Britain (1908); *The Canadian Industrial Disputes Act of 1907* (1909), and also bulletins of the Bureau of Labor on the labor conditions in Cuba, Hawaii, New Zealand, the Philippines, Java, and Mexico.

CLARK, Walter Eli (1869–). An American public official, born at Ashford, Conn., and educated at the Connecticut Normal School, Williston Seminary, and Wesleyan University. He was for many years engaged in journalistic work, chiefly as Washington correspondent for several important newspapers. In 1907 he was appointed Governor of Alaska by President Taft, and this office he held until 1913. Previous to his appointment as Governor, he had been engaged in gold mining in Alaska. He contributed articles to magazines and weekly periodicals.

CLARK, William (1770–1838). An American soldier and explorer, brother of George Rogers Clark (q.v.), and the associate of Meriwether Lewis on the famous Lewis and Clark expedition (q.v.). He was born near Charlottesville, Va.; removed with his family to the site of Louisville, Ky., in 1784; entered the army in 1791; and served as a lieutenant of infantry, under General Wayne, against the Indians, in 1794. He resigned, owing to ill health, in 1796; but in 1803 was recommissioned as a second lieutenant, and from 1804 to 1806 shared with his friend Meriwether Lewis the command of an exploring party which, leaving St. Louis in May, 1804, crossed the continent, reaching the mouth of the Columbia River in November, 1805, and arrived at St. Louis on its return in September, 1806. He was commissioned brigadier general of militia in 1807, served as Indian agent for the Territory of Upper Louisiana, was Governor of Missouri Territory from 1813 to 1821, and acted as Superintendent of Indian Affairs at St. Louis from 1822 until his death. In 1828 he laid out Paducah, Ky., and in 1830 negotiated the Treaty of Prairie du Chien. Consult the biographical sketch by Coues in vol. i of his *History of the Expedition Under the Command of Lewis and Clark* (New York, 1893), and the other authorities referred to under Lewis and Clark Expedition, The.

CLARK, William Andrews (1839–). An American capitalist and politician, born near Connellsville, Pa. He settled in Iowa in 1856, studied law at Mount Pleasant (Iowa) University, but never practiced; drove an ox team from Colorado to Montana in 1863, and by manufacturing, mercantile pursuits, mining, and banking, acquired a large fortune. It is said that he became the largest owner of copper mines in the world. In 1884 and 1889 he was president of the Montana Constitutional Convention. He was Democratic nominee for United States Senator in 1890, but although he claimed the election, did not secure a seat. In 1889 he was elected by the State Legislature to succeed Lee Mantle as United States Senator. Thereupon, at the instance of Marcus Daly, the Anaconda mine owner, and his political rival, there was begun, before the Senate Committee on Elections and Privileges, an investigation which resulted in the recommendation by the committee that the Senate adopt a resolution to the effect that Clark "was not duly and legally elected to a seat in the Senate." Clark, in an address to the Senate, reviewed the report of the committee, and resigned. Almost immediately thereafter he was appointed by the acting Governor of Montana to fill the vacancy caused by his resignation. This appointment was subsequently declared by the Governor to be invalid. Clark was elected to the United States Senate by the Montana Legislature for the term 1901–07. In 1900–05 he built in New York City, at Fifth Avenue and 77th Street, an elaborate house—one of the show places of the city—and there housed a magnificent collection of art masterpieces.

CLARK, William Bullock (1860–1917). An American geologist, born at Brattleboro, Vt. He was educated at Amherst College, and studied geology at Munich. In 1887 he was made instructor in geology at Johns Hopkins University, and in 1888 became connected with the United States Geological Survey. In 1891 he was appointed director of the Maryland Weather Service; from 1892 to 1894 was associate professor of geology at Johns Hopkins University, and in the latter year was placed at the head of the geological laboratory. In 1896 he was made State geologist of Maryland, in 1900 was appointed commissioner for the State of Maryland on the resurvey of Mason and Dixon's line, and in 1908 was made a member of the Maryland State Conservation Commission. His publications include a number of interesting papers and reports dealing with subjects of American geology, contributed more especially to the volumes of the Maryland Geological Survey.

CLARK, William George (1821–78). An English scholar, born in 1821. He passed his boyhood in Yorkshire and in 1844 was graduated from Trinity College, Cambridge, with great distinction, being elected fellow of his college. He was subsequently elected a tutor, and then public orator of the university (1857). In 1849 he visited Spain, and in 1856 he made a tour of Greece. Sketches of these travels were published under the titles *Gazpacho* (1850) and *Peloponnesus* (1858). In 1853 he took orders, but in 1869 he asked his Bishop to be relieved, stating his reasons for the step in a pamphlet entitled *The Present Dangers of the Church of England* (1870). He edited the first series of *Cambridge Essays* (1855); contributed to *Fraser's Magazine;* and was one of the founders of the *Journal of Philology* (1868), of which he was an editor; but he is chiefly known for the *Cambridge Shakespeare* (9 vols., 1863–66), in which, though it was planned by himself, he was aided by W. A. Wright (q.v.). It furnishes one of the best texts yet published. The two editors also prepared the *Globe Shakespeare* (1864) and single plays for students. Owing to ill health, Clark retired from Cambridge in 1873 and passed his last years at York, where he died, Nov. 6, 1878. In 1883 the Clark Lectureship in English Literature was founded, at Trinity, from property left by him to the college.

CLARK, William Thomas (1831–1905). An American soldier, born in Norwalk, Conn. At the beginning of the Civil War he became a lieutenant and adjutant of an Iowa regiment. He rose to the rank of brigadier general of volunteers (1865), and was made a major general at the close of the same year for gallant and meritorious services during the war. He was chief of staff of General Grant's Army of the Tennessee. After the war he made his home in Galveston, Tex., where he organized the first

negro school and befriended negroes at the risk of his life; founded the First National Bank and was its first cashier, and also served as postmaster. He was a Republican. As a representative from Texas in Congress in 1869–72, he obtained the first appropriation for the harbor of Galveston ($100,000), making possible the completion of the jetties there.

CLARK, Willis Gaylord (1810–41). An American poet, born at Otisco, N. Y. He became proprietor and editor of the *Philadelphia Gazette*, and was long a contributor to the *Knickerbocker Magazine*, edited by his twin brother, Lewis Gaylord Clark (q.v.), by whom were prepared his *Literary Remains* (1844), with a memoir, and a complete edition of his poems (1847). The former of these was made up chiefly of the *Ollapodiana Papers*, a series of prose sketches that had first appeared in the *Knickerbocker*. His poetry is contemplative and serious, his prose marked by humorous fancy, and both have the facility of the group to which he belonged.

CLARK COLLEGE. An institution for higher education, founded in 1902 at Worcester, Mass. The college was endowed by Jonas G. Clark with $1,300,000, and was granted equal rights in the already existing campaign and buildings of its sister institution, Clark University (q.v.). Clark College is legally "the collegiate department of Clark University," but owing to peculiarities in the will of the founder, it is a completely independent organization of a separate endowment, and is autonomous in all its activities. The students in 1913 numbered 161, and the instructors, not counting assistants, 24. All students, though pursuing a variety of groups of study, are candidates for the degree of A.B. The library of the college contains upward of 65,000 volumes, of which about 10,000 are specifically set apart for college use in a special college library. The productive funds amount to about $1,500,000, and the net income from all sources to about $73,000. The president is Edmund C. Sandford.

CLARKE, Adam (c.1762–1832). A British Methodist clergyman and biblical scholar, born in County Londonderry, Ireland. He studied at John Wesley's School, at Kingswood, near Bristol; adopted the career of a Methodist preacher; was sent out by Wesley, in 1782, and was president of the conferences of 1806, 1814, and 1822. He was a thorough student of the classics, natural science, Church history and Oriental languages and literature, and published works in all of these branches. He assisted in the preparation of the Bible Society's Arabic Bible and wrote: *A Bibliographical Dictionary* (6 vols., 1803–04); *Memoirs of the Wesley Family* (1823); and, most important of all, *Commentary on the Bible* (8 vols., 1810–26). He was engaged in editing Rymer's *Fœdera*, from 1808 to 1818, when exhaustion compelled him to give up the task. For his *Life*, consult Etheridge (London, 1858).

CLARKE, Alexander Ross (1828–1914). An English geodesist and astronomer. He was commissioned second lieutenant in the Corps of Royal Engineers in 1847 and was transferred to the Ordnance Survey in 1850, retiring in 1881 with the rank of lieutenant colonel. The results of his first investigation on the figure of the earth were published in 1858 and those of his second investigation in 1866. Colonel Clarke was a delegate to the International Geodetic Congress in Rome in 1883. In 1887 he was awarded the Royal medal of the Royal Society, of which he was a fellow. He published, besides the abovementioned reports: *Comparisons of the Standards of Length of England, France, Belgium, Prussia, Russia, India, Australia* (1866); *Determination of the Position of Feaghmain and Haverfordwest* (1867); *Comparisons of Standards and Lengths of Cubits* (1873); *Geodesy* (1880), which was translated into several foreign languages.

CLARKE, Benjamin Franklin (1831–1908). An American engineer and educator, born at Newport, Maine. He graduated in 1863 at Brown University, and afterward became connected with the university as instructor (1863–68), professor of mathematics (1868–93), professor of mechanical engineering (from 1893), and acting president (1896–97 and 1898–99). In 1884 he published a biography and eulogy of Prof. Samuel S. Greene.

CLARKE, Sir Caspar Purdon (1846–1911). A British American art connoisseur. He was born at Richmond, County Dublin, Ireland. In 1862 he entered the National Art Training School at South Kensington, London. He assisted in the construction of the Houses of Parliament and the South Kensington Museum in 1865 and 1867. In 1879 he was appointed architect to the English Legation in Persia. In 1880 Clarke was appointed to direct the reorganization of the Eastern collections in the South Kensington Museum. He was made director of the Museum in 1896, and was knighted in 1902. In 1905 he was appointed director of the Metropolitan Museum in New York, in which capacity he served until failing health caused his retirement in 1910. Under his administration the Museum was reorganized and many acquisitions were made, especially in the decorative arts. He published many papers on architectural subjects. He was a fellow of the Royal Institute of British Architects, and a member of many important societies.

CLARKE, Charles Cowden (1787–1877). An English author and lecturer, born in Enfield, Middlesex. He was an intimate friend of Shelley, Keats (whose schoolmaster was Clarke's father), Leigh Hunt, and Lamb. He was a music publisher. With his wife, Mary Cowden Clarke (q.v.), he annotated an edition of Shakespeare (1869), and compiled *The Shakespeare Key* (1879). His brilliant lectures on Shakespeare and other poets, delivered in London (1834–54), did much to arouse a wider interest in the higher drama. He published: *Tales from Chaucer* (1833); *Shakespeare Characters* (1863); *Molière Characters* (1865); *Recollections of Writers* (1878); and periodical articles on the drama and fine arts. Consult the *Biography*, by his wife (London, 1887).

CLARKE, Edward Daniel (1769–1822). An English traveler and mineralogist. He was born at Willingdon, in Sussex; graduated at Cambridge in 1790; and then traveled, as tutor to different young men, through the greater part of Europe, Egypt, and Asia Minor, remaining away from England most of the time until 1802. In 1807 he began a course of lectures on mineralogy at Cambridge, and the university established a professorship of that science for him, and made him University librarian in 1817. He presented to the library a number of valuable marbles; among others, the colossal statue called the Eleusinian Ceres, but really a Cistophorus, discovered by Wheler in 1676, and now in the

Fitzwilliam Museum. His *Travels* (6 vols., 1810–23) were received with extraordinary favor. Besides numerous publications bearing on mineralogy, he also wrote *Greek Marbles Brought from the Shores of the Euxine, Archipelago, and Mediterranean* (1809), and *The Tomb of Alexander* (1805). His collection of minerals was purchased by Cambridge, and his MSS. by Oxford University. For his *Life*, consult Otter (London, 1825).

CLARKE, Sir Edward George (1841–). A British lawyer and public official, born in London. He was educated at the College House of Edmonton, at the City of London College, and in King's College evening classes. He was called to the bar in 1864, and won a great name through his brilliant handling as counsel of the Penge and Detective cases (1877), the Bartlett Case (1886), the Baccarat Case (1891), and the Jameson Case (1896). In 1886–92 he was solicitor-general under the Conservative administration. He was a member of Parliament for Southwark (1880), for Plymouth (1880–1900), and for the City of London (1906). His publications include: *Treatise on the Law of Extradition* (1866; 4th ed., 1903); *Easy Shorthand* (1907); *Selected Speeches* (1908); *Swifthand* (1909); *The Epistles of St. Paul* (1912).

CLARKE, Frances Elizabeth. See Grand, Sarah.

CLARKE, Frank Wigglesworth (1847–). An American chemist, born in Boston and educated at the Lawrence Scientific School, Harvard University. He was an instructor at Cornell University in 1869, professor of chemistry at Howard University in 1873–74, and professor of chemistry and physics at the University of Cincinnati from then until 1883, when he was appointed chief chemist of the United States Geological Survey and honorary curator of minerals in the National Museum. In 1900 he was a member of the Paris Exposition international jury of awards; in 1901 he was president of the American Chemical Society; and his distinction was recognized in various other ways. He is joint author with Louis M. Dennis of *Elementary Chemistry* (1902) and *Laboratory Manual of Elementary Chemistry* (1902), and author of *The Constants of Nature* (5 vols., 1873–82; vol. v, "A Recalculation of the Atomic Weights," 3d ed., 1910), and of various bulletins of the Geological Survey and many papers.

CLARKE, Sir George Sydenham (1848–). An English soldier and military writer, born in Lincolnshire. He was educated at the Royal Military College at Woolwich, and from 1871 to 1880 was on the staff of the Royal Engineering College, Cooper's Hill. He saw active service in the Egyptian expedition of 1882 and in the Sudan in 1885, was in the War Office until 1892, then on special duty abroad, and in 1894–1901 superintendent of the royal carriage factory. From 1901 to 1904 he served as Governor of Victoria, Australia, and in 1907 as Governor of Bombay. He was made Knight Commander of St. Michael and St. George in 1893. His principal writings are: *Fortification, Past, Present, and Future* (1890); *The Navy and the Nation* (1897); *Imperial Defense* (1897); *Russia's Sea-Power, Past and Present* (1898).

CLARKE, Helen Archibald. An American editor and critic, born in Philadelphia. She graduated, in 1884, at the music department of the University of Pennsylvania; in 1889, with Charlotte Porter founded *Poet-Lore*, a quarterly magazine of letters. With Miss Porter also she edited, notably, *Robert Browning's Complete Poetical Works*, 12 vols. (1898); *Mrs. Browning's Complete Works*, 6 vols. (1900); and *The First Folio Edition of Shakespeare*, 40 vols. (1903). Among books of her own writing are *Browning's Italy* (1907); *Browning's England* (1908); *Longfellow's Country* (1909); *Hawthorne's Country* (1910); *Poet's New England* (1911); *Browning and his Century* (1913).

CLARKE, Henri Jacques Guillaume, Comte d'Hunebourg and Duc de Feltre (1765–1818). A French general, born at Landrecies (Nord). He studied at the Ecole Militaire, Paris, entered the cavalry, and having become lieutenant colonel, so distinguished himself at Landau as to be promoted to be brigadier general. In 1793 he was deprived of his command, as a suspect, but in 1795 was reinstated in the service as a general of division, and made by Carnot chief of the topographical bureau of the War Ministry. Sent by the Directory to Italy to observe the movements of Napoleon, then commanding the French army there, he entered into the spirit of that general's plans, and was later rewarded by being appointed his private secretary. In 1805 he was Governor of Vienna, in 1806 of Berlin, and in 1807–13 Minister of War. Upon the entry of the allies into Paris, he declared himself a Royalist; during the Hundred Days accompanied Louis XVIII into exile to Ghent, and from 1815 to 1817 was again Minister of War.

CLARKE, Jacob Augustus Lockhart (1817–80). An English physician, born in London. He was brought up in France, but studied medicine in England, at Guy's and St. Thomas's hospitals. He divided his attention between private medical practice and original research in microscopic anatomy and pathology, giving most of his time to research. A group of ganglion cells in the spinal column was named after him, "the posterior vesicular column of Clarke." The results of his investigations were published in the form of special papers, a list of which is in the *Catalogue of the Library of the Medico-Chirurgical Society* (1879).

CLARKE, James Freeman (1810–88). An American Unitarian clergyman. He was born in Hanover, N. H., and graduated at Harvard in 1829, and at the Cambridge Divinity School in 1833. He was pastor of a Unitarian church in Louisville, Ky., until 1839. In 1841 he assisted in founding the Church of the Disciples, Boston, of which he was pastor from 1841 to 1850, and from 1854 until his death. He was a friend of Emerson and Channing—with whom he edited the *Memoirs of Margaret Fuller Ossoli* (1869), and wrote for the *Dial*—a supporter of the antislavery movement, and secretary of the American Unitarian Association in 1859–62. He was one of the overseers of Harvard, where he was professor of natural religion and Christian doctrine (1867–71), and lectured on ethnic religions (1876–77). Besides a vast number of articles contributed to current journals and magazines—many collected in *Nineteenth Century Questions* (1898)—Dr. Clarke published many works, including: *Theodore* (1841), a translation from the German of De Wette; *Campaign of 1812* (1848); *Eleven Weeks in Europe* (1852); *Christian Doctrine of Prayer* (1854, new ed., 1874); *The Hour Which Cometh and Now Is*, a volume of sermons (1864, 3d ed.

1877); *Orthodoxy: Its Truths and Errors* (1866; reprinted often); *Steps of Belief* (1870); *The Ten Great Religions* (2 vols., 1871–83; vol. i, 22d ed. 1886; vol. ii, 5th ed. 1886); *Common Sense in Religion* (1874); *Essentials and Non-Essentials in Religion* (1878); *The Legend of Thomas Didymus, the Jewish Skeptic* (1881); *Manual of Unitarian Belief* (1884); *Anti-Slavery Days* (1884); *Vexed Questions* (1886); and *Sermons on the Lord's Prayer* (1888). Consult E. E. Hale's edition of Clarke's *Autobiography, Diary, and Correspondence* (Boston, 1891).

CLARKE, James P. (1854–1916). An American public official and legislator, born at Yazoo City, Miss. After graduating from the University of Virginia he was admitted to the bar in 1878, and in the following year he moved to Helena, Ark. He was a member of the Arkansas House of Representatives in 1886–87, and of the Arkansas Senate in 1888–92, and was President of the latter in 1891. In 1893–94 he was Attorney-General of Arkansas, during the following two years was Governor of the State, and after serving as United States Senator in 1903–09 was reëlected to that office for the term 1909–15. In 1913 he was elected President pro tem of the Senate.

CLARKE, John (1609–76). An English physician, one of the founders of Rhode Island, in America. He emigrated to Boston in 1637; as one of the friends of Anne Hutchinson there, he was driven out of the Colony. Roger Williams received him, and Clarke became one of the settlers of Aquidneck, R. I. He founded at Newport, probably in 1640, a Baptist church, which, next to the one founded by Roger Williams at Providence in 1636, was the earliest in America. In 1651 he was arrested, fined, and imprisoned for holding a Baptist meeting in Lynn, Mass. In the same year he went with Williams to England, as an agent for the Colony, and there published *Ill News from New England; or, a Narrative of New England Persecution* (1652). After remaining for 12 years in England, he obtained from Charles II a second charter for Rhode Island, which secured the right of personal liberty in matters of religion. On his return he resumed the care of the Newport church, and kept the pulpit until his death. He was a member of the General Assembly from 1664 to 1669; was Deputy Governor in 1669 and 1671, and afterward codified the Rhode Island laws. He has been called "the Father of American Baptists." Consult Richman, *Rhode Island* (New York, 2 vols., 1902).

CLARKE, John Mason (1857–). An American geologist and paleontologist, born at Canandaigua, N. Y. He studied at Amherst and the University of Göttingen, and in 1881–84 was professor of geology and mineralogy at Smith College. In 1885 and 1886 he was lecturer on geology at the Massachusetts State Agricultural College, in Amherst. In 1894 he was appointed professor of geology in the Rensselaer Polytechnic Institute at Troy, and in 1898 State paleontologist of New York, becoming State geologist and director of the Museum in 1904. His publications include: *New Devonian Crustacea* (1882); *Cirriped Crustacea from the Devonian* (1883); *Ueber deutsche oberdevonische Crustaceen* (1884); *On Devonian Spores* (1885); *On the Higher Devonian Faunas of Ontario County, New York* (1886); *Early Devonic History of New York and Eastern North America* (1908); *The Eurypterida of New York,* by Clarke and Ruedemann (1912); and *The Heart of Gaspé: Sketches in the Gulf of St. Lawrence* (1913).

CLARKE, John Sleeper (1833–99). An American comedian, after 1867 a resident of England. He was born at Baltimore, and in his boyhood was a schoolmate of Edwin Booth, with whom he engaged in amateur dramatic readings. Giving up the study of law in order to go upon the stage, he made his first professional appearance in Boston, as Frank Hardy in *Paul Pry,* at the Howard Athenæum, in 1851. The next year he went to Philadelphia. In 1859 he married Asia Booth, the sister of his old schoolmate. He made his appearance in New York, in 1861, as Diggory in *The Spectre Bridegroom.* From 1864 to 1867 he was associated with Booth in the management of the Winter Garden, New York; they also had theatres in Philadelphia and Boston. Clarke's popularity was very great, among his favorite parts being Dromio of Syracuse, Paul Pry, Bob Brierly in the *Ticket-of-Leave Man,* and especially Major Wellington de Boots in *Everybody's Friend,* and Toodles. Having gone to London in 1867, he made his English début in the rôle of Major de Boots. His success was such that he decided to remain in England, though he afterward made several visits to the United States (1870, 1871, 1879, and 1884), where he was warmly welcomed. Some of his later parts were Salem Scudder in *The Octoroon,* Dr. Pangloss in *The Heir at Law,* Ollapod in *The Poor Gentleman,* Babbington Jones in *Among the Breakers,* and Bob Acres in *The Rivals;* but Toodles remained the favorite. Its first run at the Strand Theatre, where Clarke was long engaged, was for 200 nights. He managed several London theatres, including the Haymarket, which the Bancrofts took after he gave it up. In 1889 he retired and spent the last 10 years of his life in leisure, near London. Consult Bell, in Matthews and Hutton, *Actors and Actresses of Great Britain and the United States,* vol. ii (New York, 1886), and Clapp and Edgett, *Players of the Present* (New York, 1899).

CLARKE, MacDonald (1798–1842). An American writer, known as "The Mad Poet." He was a native of Bath, Me., but was for many years a conspicuous figure in New York City, where he married an actress and wrote with much freedom and little taste of the belles of the city. In spite of his conceit and eccentricities he endeared himself to his contemporaries, notably Fitz-Greene Halleck, who made him the hero of a poem, "Discarded." He considered himself the greatest poet of America, and, besides a mass of trash, wrote some things that are tender and lovable. Among his conceits the best known is "Now Twilight lets her curtain down, And pins it with a star." Among his publications, most of which are now rare, are: *A Review of the Eve of Eternity* (1820); *The Elixir of Moonshine, by the Mad Poet* (1822); *Afara, or, The Belles of Broadway* (1833); *Death in Disguise*—a temperance poem (1833); *A Cross and a Coronet* (1841).

CLARKE, Marcus. See Australian Literature.

CLARKE, Mary Victoria Cowden (Novello) (1809–98). An English Shakespearean scholar and author. She was the pupil and associate of Mary Lamb. At the age of 19

she was married to Charles Cowden Clark (q.v.), her brother's partner in the music publishing business, and soon afterward began the great work of her life, the *Concordance to Shakespeare*, which was published in London in 1845. She wrote: *The Girlhood of Shakespeare's Heroines* (1850); *The Iron Cousin* (1854); *World-Noted Women* (1850); *My Long Life: An Autobiography* (1896); and *Letters to an Enthusiast: Being a Series of Letters addressed to Robert Balmanno, Esq., of New York, 1850–61*, edited by A. U. Nettleton (Chicago, 1902).

CLARKE, Rebecca Sophia (1833–1906). An American author, born at Norridgewock, Me. Under the pseudonym of "Sophie May," she published such juvenile books as the *Little Prudy Stories* (6 vols., 1864–65); *Dotty Dimple Stories* (6 vols., 1867–69); and one or two novels.

CLARKE, Samuel (1675–1729). An English clergyman, born at Norwich and educated at Caius College, Cambridge. He was a disciple of Newton, and attempted to modify the theories of Descartes. In 1698 he became chaplain to Bishop Moore, of Norwich, and undertook the study of divinity, publishing in 1699 *Three Practical Essays on Baptism, Confirmation, and Repentance*. In 1704–05 Clarke delivered the Boyle lectures, out of which was developed his *Demonstration of the Being and Attributes of God*, and after the death of Locke, in 1704, he was considered as the leading English metaphysician. Queen Anne made him one of her chaplains and presented him to the rectory of St. James, Westminster. In 1708 he published *A Discourse Concerning the Unalterable Obligations of Natural Religion and the Truth and Certainty of Christian Revelation*, and in 1712 *The Scripture Doctrine of the Trinity*, in which his denial of the belief of the primitive Church in the Trinity brought upon him the attacks of theologians. In 1714 the Lower House of Convocation complained of his teachings and sent the matter to the Upper House. Clarke evaded the difficulty, and promised to be silent on the subject of the Trinity. His views were considered to be semi-Arian (see Arius), and involved him not only with the authorities of the Established church, but with the freethinkers of his time. In 1715 appeared his *Philosophical Inquiry Concerning Human Liberty*. The Princess of Wales, afterward Queen Caroline, requested him to discuss with Leibnitz the questions of time and space and their relations to God. The correspondence to which this gave rise is to be found in the collection of papers which passed between Clarke and Leibnitz (1717). His works include an edition of Cæsar (1712); Homer's *Iliad*, in Greek and Latin (1729); and *An Exposition of the Church Catechism* (1729). His most important work was done in the sphere of ethics, where he maintained that morality is "incumbent on men, from the very nature and reason of things themselves." "The fitness of things" requires that every object be treated according to its own nature, and therefore that man be treated by man with due respect to his freedom of choice. The laws of morality are as reasonable as those of mathematics, and are independent of the consequences of moral acts; but God has so constituted the world that morality is finally rewarded. He was thus an ethical rationalist. See his *Life*, by his friend Hoadly, prefixed to his collected works, published in 1738; and consult L. Stephen, *History of English Thought in the Eighteenth Century* (London, 1876).

CLARKE, Samuel Fessenden (1851–). An American naturalist, born at Geneva, Ill. He graduated from the Sheffield Scientific School (Yale) in 1878 and received his doctor's degree from Johns Hopkins University in 1879. He served as assistant to the United States Fish Commission (1874–75), was a fellow at Johns Hopkins (1879–81), lectured at Smith College, and in 1881 became professor of natural history at Williams College. He was elected a fellow of the American Association for the Advancement of Science and of the American Academy of Arts and Sciences, and was president of the American Society of Naturalists in 1914.

CLARKE, Thomas Shields (1860–1920). An American sculptor and painter. He was born in Pittsburgh and studied at the Art Students' League, New York, and under Lefebvre and Dagnan-Bouveret in Paris. Among his paintings "A Fool's Fool" (1887, Pennsylvania Academy), and "A Night at Morocco" (Philadelphia Art Club), which received a medal at Berlin in 1891, deserve special mention. He later studied modeling under Chapu, and thereafter devoted himself almost entirely to sculpture. His fountain the "Cider Press" (1893), in Golden Gate Park, San Francisco, is vigorously handled but lacking in decorative conception. Better examples of his work are the caryatids of the "Four Seasons" on the Appellate Court building, New York, and "Alma Mater" on the campus at Princeton University, which are decorative as well as graceful and dignified. He was elected an associate of the National Academy of Design and received several medals.

CLARKE, William Eagle (1853–). An English naturalist, born at Leeds. He was educated at Yorkshire College. In 1884 he became curator of the Leeds Museum, four years later an assistant in the Edinburgh Museum, and in 1906 keeper of the natural history department of the Royal Scottish Museum, Edinburgh. He was for a time acting editor of the *Annals of Scottish Natural History* and the *Naturalist*, and became joint editor of the *Scottish Naturalist*. His publications include *Handbook of Yorkshire Vertebrata* (1881) and *Studies in Bird Migration*, 2 vols. (1912).

CLARKE, William Horatio (1840–1913). An American organist and musical author. He was born at Newton, Mass.; held positions as organist at Norwood, Dedham, Boston, and Woburn, and subsequently removed to Dayton, Ohio, where he was appointed superintendent of public schools. From 1878 to 1887 he was organist at the Tremont Temple, Boston. After his retirement, he became established at Reading, Mass. Clarigold Hall, a well-known chapel of music in that town, with its excellent four-manual organ, was built by him. His *New Method for Reed Organs* is justly celebrated, and he also published, besides collections of anthems and voluntaries, *Short Service Preludes* (1903); *Valuable Organ Information* (1904); *Artistic Information for Reed Organs* (1905); *How to Use Organ Stops and Pedals* (1908); *Standard Organ Building* (1909).

CLARKE, William Newton (1841–1912). An American Baptist theologian. He was born at Cazenovia, N. Y., and graduated at what is now Colgate University in 1861, and from Hamilton Theological Seminary in 1863. After serving as a pastor, he was professor in Toronto Baptist

College from 1883 to 1887, and from 1890 to 1908, of Christian theology, from 1908 to his death, of ethics, in Colgate University, Hamilton, N. Y. He published: *Commentary on the Gospel of Mark* (1881); *The Circle of Theology: An Introduction to Theological Study* (1897); *Outline of Christian Theology* (1898); *What Shall We Think of Christianity?* (1899); *Can I Believe in God the Father?* (1899); *A Study of Christian Missions* (1900); *The Use of the Scriptures in Theology* (1905); *The Christian Doctrine of God* (New York, 1909); *Sixty Years with the Bible* (New York, 1909).

CLARKE, William Robinson (1829–1912). A Canadian Anglican clergyman and educator. He was born at Inverurie, Scotland, and was educated at Aberdeen and at Hertford College, Oxford. He was ordained a priest in 1858, and after filling several minor appointments became prebendary of Wells in 1870. Coming to Canada in 1882, he was in the same year appointed professor of mental and moral philosophy in Trinity University. During the term of his professorship, from which he retired in 1908, he was widely known in Canada and the United States as a preacher, writer, and lecturer. In 1887 he was Baldwin lecturer, and in 1899 Slocum lecturer, at the University of Michigan. He was frequently a delegate to the provincial and general Anglican synods, and in 1895 a delegate to the Pan-American Congress of Religion and Education at Toronto. In 1891 he was elected a fellow of the Royal Society of Canada and in 1900 president of that institution. For some years he was editor of the *Canadian Churchman*. His principal publications were: *The Redeemer* (1863); *The Comforter* (1864); *The Four Temperaments* (1874); *Witnesses to Christ* (Baldwin lectures, 1888); *Savonarola: His Life and Times* (1892); *The Anglican Reformation* (1896); *The Paraclete* (Slocum lectures, 1900); *Pascal and the Port Royalists* (1902). In 1886 he translated and edited Hefele's *History of the Councils*, and later, Hagenbach's *History of Christian Doctrine*.

CLARK FORK. One of the most important forks of the Columbia River, formed by the junction of the Flathead and Missoula rivers, Montana (Map: Montana, A 2). It flows northwest, through Lake Pend Oreille, in Idaho, continuing in a northwest course thence across the northeast corner of Washington, and empties into the Columbia River (q.v.) on the Canadian frontier. It has a total length of about 650 miles, from the source of either tributary, and possesses abundant water power.

CLARKSBURG. A city and the county seat of Harrison Co., W. Va., 82 miles by rail east of Parkersburg, on the Monongahela River, and on the Baltimore and Ohio and the Monongahela Traction Company railroads (Map: West Virginia, D 2). The city contains three hospitals and an Elks Home. It is in a country rich in coal, oil, and natural gas, has important shipping interests, and manufactures chemicals, fire brick, window glass, glass bottles, fruit jars, decorated tableware, iron and tin plate, enamelware, shaft pulleys, etc. It was the birthplace of Stonewall Jackson. Settled in 1772, Clarksburg was incorporated in 1849, and is governed at present under a charter of 1897, which provides for a mayor, elected annually, and a city council chosen by wards. The water works, including a large plant on the west fork of the Monongahela, are owned and operated by the municipality. Pop., 1890, 3008; 1900, 4050; 1910, 9201; 1920, 27,869.

CLARKSDALE. A city and the county seat of Coahoma Co., Miss., 77 miles south of Memphis, Tenn., on the Yazoo and Mississippi Valley Railroad (Map: Mississippi, D 2). It contains a Carnegie library and an Elks Home. Clarksdale is situated in an alluvial delta, known for the richness of its soil, and carries on a trade in agricultural products and lumber. The water works and electric-light plant are owned by the city. Commission government has been adopted. Pop., 1890, 781; 1900, 1773; 1910, 4079.

CLARK'SON, Matthew (1758–1825). An American soldier and philanthropist, born in New York City. At the outbreak of the Revolutionary War he enlisted as a private, and in 1777 took part in the Saratoga campaign. He afterward served as aid-de-camp, with the rank of major, to Gen. Benedict Arnold (August, 1778–March, 1779) and to Gen. Benjamin Lincoln (1779 and 1781–July, 1782); was taken prisoner at Charleston on May 12, 1780, and in 1783 was brevetted lieutenant colonel. After the war he returned to New York, served several terms in the State Legislature, was president for many years of the bank of New York, was governor of the New York Hospital for 30 years, and did much for prison reform and the establishment of public schools. Consult *The Clarksons of New York* (New York, 1875–76).

CLARKSON, Ralph Elmer (1861–). An American portrait and figure painter. He was born at Amesbury, Mass., studied in the schools of the Boston Museum of Fine Arts, and from 1884 to 1887 under Lefebvre and Boulanger in the Académie Julian, Paris. After practicing portrait painting in New York, he again went abroad in 1892, remaining until 1896, when he took up his permanent residence in Chicago. He took a prominent part in the movement for municipal improvement, and was elected president of the Municipal Art Commission of Chicago; a member of the Chicago Society of Artists and of the Society of American Artists; was a member of the American Art Jury at the Paris Exposition in 1900, and of the International Jury of Awards at the St. Louis Exposition in 1904. He devotes himself chiefly to portraiture, but also exhibited figure subjects, characterized by refinement and tonal effects. Good examples are "Twilight Harmony" (Art Institute, Chicago) and "Studio Corner."

CLARKSON, Thomas (1760–1846). An English philanthropist and antislavery agitator, born in Cambridge. He studied at Cambridge University, and early gave evidence of his antagonism to slavery in a Latin prize essay, which he wrote in 1785, on the question, "Is it right to make slaves of others against their will?" An English translation (1786) had an extensive circulation, and Clarkson resolved to devote his life to a crusade against African slavery. Associations were formed, and Clarkson, besides visiting the principal cities of England and going to Paris in the cause, published numerous essays, pamphlets, and reports on the subject. Wilberforce, whose coöperation he had secured, took the lead in the antislavery agitation, and in 1787 brought the subject before Parliament; but he afterward quarreled with Clarkson and claimed for himself priority in the antislavery movement. On March 25, 1807, the bill for the suppression of the slave trade became a law, and Clarkson, whose health had

failed in 1794, wrote *A History of the Rise, Progress, and Accomplishment of the Abolition of the African Slave Trade* (1808). At the Congress of Aix-la-Chapelle (1818) he presented an address to the Czar of Russia for concerted action by the Powers for the abolition of the slave trade; but nothing was accomplished at that time. On the formation of the Anti-slavery Society, in 1823, for the abolition of slavery in the West Indies, Clarkson became one of its leading members. His other works include: a valuable *Portraiture of Quakerism* (1806); *Memoirs of the Private and Public Life of William Penn* (1813); *Thoughts on the Necessity of Improving the Condition of the Slaves in the British Colonies* (1823). Consult: Taylor, *Biographical Sketch of Thomas Clarkson* (1839), and Elmes, *Thomas Clarkson* (1876).

CLARKS'VILLE. A city and the county seat of Montgomery Co., Tenn., 45 miles (direct) northwest of Nashville, near the junction of the Cumberland and Red rivers, and on the Louisville and Nashville and the Tennessee Central railroads (Map: Tennessee, C 1). It is the seat of the Southwestern Presbyterian University, founded in 1875, and of a Methodist seminary for young ladies, and has a public library. It is one of the great tobacco markets of the United States, and has manufactures of iron, agricultural implements, lumber, flour, snuff, etc., and valuable iron-ore deposits in the vicinity. Settled in 1780, Clarksville was incorporated some five years later, and is at present governed under a charter of 1850, revised in 1891. The mayor is elected every two years, and the city council controls all appointments to municipal offices. The city owns and operates its water works. Pop., 1890, 7924; 1900, 9431; 1910, 8548.

CLARKSVILLE. A city and the county seat of Red River Co., Tex., 61 miles west by north of Texarkana, on the Texas and Pacific Railroad (Map: Texas, E 3). The centre of a fertile agricultural region, it carries on a large trade in cotton, live stock, grain, and hides. The industrial establishments include a cotton compress, cottonseed-oil mill, etc. Pop., 1890, 1588; 1900, 2069; 1910, 2065.

CLARK UNIVERSITY. An institution of higher education, founded in 1887 at Worcester, Mass., by Jonas Gilman Clark. The university was originally planned to afford opportunity for full and free research along advanced lines; to add as materially as might be to the ascertained truths of science; to equip educators and specialists of the highest qualifications. It was especially stipulated that the best academic standards should forever be maintained, and as the original endowment was insufficient to equip courses in all subjects, but few courses were at first equipped, and those completely. These comprised postgraduate courses and the fundamental sciences of physics, chemistry, biology, psychology, and education. Only accredited college graduates are admitted as candidates for the Ph.D. degree, and students are thrown largely upon their own resources, the instructors acting as far as possible as "guides" and counselors. Ten scholarships and 20 fellowships have been established. Instruction is intrusted in some degree to the fellows and also to the docents (see DOCENTS), the latter representing the highest academic university appointments. Upon the death of Mr. Clark in 1900 the university received a bequest of additional funds for research—$600,000 for a library fund and $150,000 for a library building, $100,000 for an art department, and $1,300,000 for the establishment of an undergraduate department. (See CLARK COLLEGE.) In 1913 the number of students enrolled in the university was 90, while the faculty numbered 25. The productive funds amounted to about $2,400,000, and the income to about $96,000. The library contained 65,000 volumes. The university publishes several journals, including the *American Journal of Psychology*. Its president from its beginning has been Granville Stanley Hall (q.v.). Consult *Clark University 1889 to 1899* and the annual catalogues.

CLASSICAL PHILOLOGY. See GREEK LANGUAGE; ITALIC LANGUAGE.

CLAS'SICS (Lat. *classicus*, from *classis*, class, from *calare*, Gk. *καλεῖν*, *kalein*, to call). The term *classici* was originally applied to those citizens of Rome that belonged to the first and most influential of the six classes into which Servius Tullius divided the population. As early as the second century A.D. it is applied figuratively by Aulus Gellius, xix, 8, 15, to writers of the highest rank; this mode of designation has since been very generally adopted in both literature and art. Most nations style the best period of their literature the classical period, and its most distinguished writers their classics. But since the great productions of the writers and artists of antiquity have continued to be looked upon by moderns as models of perfection, the word "classic" has come to designate, in a narrower sense, the best writers of Greece and Rome, and "classical" to mean much the same as "ancient."

CLASSIFICATION. A term used in ore dressing to denote the separation of crushed ore into several products or sizes, the grains of which fall with the same maximum velocity. The coarser sizes in a product consist of light minerals or gangue rock and the finer sizes of heavy minerals. The values or minerals of a classified product are later separated from the gangue or barren rock by some method of sizing. Consult Richards, *Ore Dressing* (New York, 1903–09).

CLASSIFICATION OF ANIMALS. Classification is the act of sorting out and putting into groups kindred ideas, observations, or objects. As many classifications, then, are possible as are the categories which different persons may erect; for no two persons see things in the same light, nor have the same thoughts. Besides, there are many aspects that the one observer may take in viewing the same thing. Thus, we may classify plants and animals according to their anatomical structure, the method of their embryological development, their food or habitats. All classifications, then, are arbitrary; are the attempts of man to arrange, in an orderly fashion, his conceptions and observations. Classification in biology is, consequently, to be regarded as a subjective process. Nevertheless, the constant attempt of all modern naturalists is to conform, in the formation of their groups, as closely as possible to the facts of nature, and thereby express the natural kinship or blood relationship of animals, as learned through the investigation of their structure and phylogeny. A natural and true classification, then, is a statement of near or remote relationships, according to the degree of differentiation the forms sought to be classified have undergone in their descent from a more or less remote common ancestor. If a complete classification of animals is ever made, it will be a

complete genealogy of the animal kingdom. In this sense, classification is neither arbitrary nor artificial, but only tentative; and it will be permanent in so far as it conforms to the facts of kinship in descent. Hence, a nearer and nearer approach to a natural and real classification has been made with each forward step of knowledge in embryology, morphology, and paleontology.

"There is no question in natural history," said Louis Agassiz, in his classic *Essay on Classification*, "on which more diversified opinions are entertained than on that of classification—not that naturalists disagree as to the necessity of some sort of arrangement in describing animals or plants, for since nature has become the object of special studies, it has been the universal aim of all naturalists to arrange the objects of their investigations in the most natural order possible. Even Buffon, who began the publication of his great Natural History by denying the existence in nature of anything like a system, closed his work by grouping the birds according to certain general features exhibited in common by many of them. It is true, authors have differed in their estimation of the characters on which their different arrangements are founded; and it is equally true that they have not viewed their arrangements in the same light, some having plainly acknowledged the artificial character of their systems, while others have urged theirs as the true expression of the natural relations which exist between the objects themselves."

By collaboration and by common consent certain categories have been agreed upon, and these we generally have in mind when we speak of the classification of the animal or vegetable kingdom. These categories are founded mainly on anatomical and embryological relationships and differences; and in zoölogical classification, e.g., animals that resemble one another in structure, development, or both, are grouped closely together, or are more distantly associated, according to the nearness or remoteness of the kinship as evidenced by the facts of structure or development, whether in existing or in extinct forms. These grades or degrees of kinship we speak of as species, genera, families, orders, classes, etc. Species are more nearly related than genera, genera than families, etc.

The total number of the kinds of animals, or species, that are recognized is well over 500,000. We may roughly estimate 7000 mammals, 20,000 birds, 5500 reptiles, 2000 amphibians, 13,000 fishes, 60,000 mollusks, 360,000 insects, besides a host of the lower invertebrates. In order to think of all of these, it is necessary that they should be grouped into categories of larger size than species, and these, in turn, into still larger ones. This is rendered possible by the fact that animals show nearer and remoter affinities. The ordinary lowest category is *species;* but this may be subdivided into *races* or *subspecies;* several similar species are grouped into a *genus;* related genera constitute a *family;* several families may make up an *order.* Orders constitute a *class;* classes, a *phylum.* For example, see table below.

A particular species receives a composite name, embracing, first, that of the genus and, second, that of the species; thus, the common cat is *Felis domesticus.*

Scientific Nomenclature.—The custom, above stated, of giving to each animal a double name, that of its genus and its species, arose with Linnæus, and is called "binomial nomenclature." It answers to a man's family and individual or "Christian" name, as Smith, John. It always consists of Greek or Latin words, or of words put into Latinized form, partly because of a traditional custom descended from the early authors, who wrote only in Latin, but mainly because it is thus made comprehensible to readers in all languages. Furthermore, great confusion would follow the attempted use of vernacular names alone, since many different animals are given the same name in popular speech, while the same animal is known by various names in different localities. "Robin" means several very diverse birds to persons living in America, Great Britain, India, or Australia, but *Turdus migratorius* is unmistakably the American thrush, locally called the robin. Theoretically, these names are supposed to be suitably applied. Thus, *turdus* is the old Latin term for a thrushlike bird, and *migratorius* the Latin adjective "migratory." It often happens, however, through the misapprehension or ignorance of the person who first applies the name, that unsuitable or positively erroneous appellations have been given, or wrong collocations have been made. A subsequent student, discovering this error, or taking a different view of the animal's relationship, endeavors to correct it by giving it a new and, in his opinion, better name; or he may transfer it to another genus, but retain the specific name. A third writer, not knowing that the same animal has been previously described and named, may name it something entirely different. These changes and duplications went on almost unchecked until the middle of the nineteenth century, when the British Association for the Advancement of Science and other influential bodies of naturalists devised means of

INDIVIDUAL	Race, breed, or subspecies	Species	Genus	Family	Order	Class
House Cat	Manx Angora Tabby Tortoise-shell	*domesticus*	*Felis*	*Felidæ*	*Carnivora*	*Mammalia*
		lion tiger leopard	lynxes hunting cats	dogs hyenas bears	whales bats apes, etc.	

regulating the matter, which resulted in certain now generally accepted rules, the substance of which is as follows: A name for a new species is not recognized in science unless it is in the customary binomial form (the two parts agreeing in number and gender) and has been accompanied by a description by which the animal may be satisfactorily identified, and which is published in some book or periodical accessible to students in general; and when this has been done, no other person may give the animal a different *specific* name. This is called the rule of priority—that is, the first name legally applied must remain (as a mere label), whether it is subsequently found to have been well chosen or not. A limit, however, was found necessary to this rule, and it is therefore agreed that no name previous to the one made or sanctioned by Linnæus in the tenth edition of his *Systema Naturæ* (1758) shall be recognized. Certain minor limitations are also made for local needs —as, for example, with reference to Rafinesque in the United States. In zoölogical or botanical nomenclature, a generic name can be applied only to one group of organisms. If it is subsequently given to something else, the new application will not hold. According to one code, at least, a generic name that has disappeared by fusion of genera or the splitting of a genus cannot be used again. In scientific works, the technical name of an animal is often followed by the name (usually abbreviated) of the man who named it as a whole, as *Turdus migratorius*, Linn.; but if the generic name was made by one man and the specific by another, this is indicated by inclosing the name of the author of the specific name in parentheses, thus: Bluebird, *Sialia sialis* (Linn.). Latterly, the recognition of subdivisions within species, called subspecies, races, or varieties, has led to the addition of a third name in many cases, forming a trinomial; e.g., *Falco peregrinus anatum* means the (American) subspecies *anatum* of the European peregrine falcon, or our duck hawk. Another custom is that all specific and subspecific names shall begin with a small letter, even when "proper" adjectives or nouns. Similar rules and explanations apply to the names of the higher groups, which are capitalized, always in the plural, and, in the case of the family, take the termination *idæ*, which in zoölogy invariably indicates a group of family rank.

Categories of Classification. The number of known species of living animals is well over 500,000, to which must be added over 50,000 fossil-described species, making over 550,000 in all. To contain all these forms it is necessary to provide a complicated system of categories of varying ranks. We recognize the fact that, in beast as well as in man, no two individuals are exactly alike. But just as the various members of the B. Smith family more nearly resemble each other than they do the Jones or Brown families, so certain other animals, while showing slight individual differences, possess so many common, constant qualities that we put them in the same species. Likewise, several species have certain qualities in common, while they differ in other respects so markedly from all other species that we class them together in one genus. In the same way, a number of related genera fall naturally into the same family.

Species.—A term applied in biology to the unit of classification—that is, the lowest group that receives a name. (For the exceptional usage in respect to "subspecies," see below.) Although the term "species" is almost universally employed by biologists to-day, a precise definition cannot be applied to it; for there is absolutely no criterion by which a species may be distinguished from a variety, on the one hand, or a genus on the other. Whether a lot of organisms under consideration showing certain differences shall be considered two subspecies, two species, or two genera, depends upon the personal characteristics of the classifier. If he be conservative, and has studied extensively the systems of the past, he will draw his ideals from them, and call those groups "species" which show about that difference accorded to other related species by equally conservative classifiers in the past. If he be radical, he will disregard the ideals of his predecessors and, according to his personal bent, "lump" the diverse forms into one species, or possibly into one subspecies, or "split" them into distinct species. Indeed, a radical may take occasion to "revise" the grouping of a conservative in accordance with his peculiar ideals—in consequence of which, numbers of species may disappear by inclusion into old ones, or new ones may be added by division of old ones; or, finally, the grouping may be thoroughly reorganized or disarranged. At the present time naturalists have hit upon no method of avoiding this intolerable condition of affairs, which is rapidly bringing chaos into what was supposed to be a "system." A century ago, before so extensive collections had been made and studies were so critical, it was generally believed that "species" were perfectly distinct as well as immutable things. Even many of the scientific workers regarded the mythology of the first chapters of Genesis as a scientific record, and admitted that there were only so many "species" as were created in the beginning; that each species received its name from Adam, and that one pair of each (except parthenogenetic species) was preserved in the ark, to become the progenitors (or progenitor) of all the members of the species which have existed since. The worthlessness, for scientific purposes, of this literary account of the creation appears when we try to enumerate the "species" that were thus created. We then realize that "species" are not natural phenomena, but human devices of convenience, like the ward boundaries of a city. The boundary lines between species may, in some cases, be in part determined by natural phenomena, as ward boundaries may be limited by a stream or a bluff.

The history of the ideas entertained concerning species is an epitome of the most profound biological thought. In the development of any large idea, three stages may be recognized—first, the speculative suggestion of it; second, the clear statement of it as a working hypothesis; and, third, the demonstration. Such has been the history of the development of the modern idea of species as part of a continuous stream of life. The early Greeks were not troubled with the idea of species; they sought only a satisfactory speculative account of the origin of organisms. The early Christians interpreted the "Mosaic" account of the creation liberally, regarding the creation not so much as the forming of completed organisms as the forming of the *seed* out of which they were to arise. During the Middle Ages, however, and especially from the middle of the sixteenth to the middle of the nineteenth century, the doctrine of "special

creation" was universally taught by the Church. Milton's epics popularized the idea of creation ready made, with adult animals of the different species; and the rigid conceptions of species which the early botanists and zoölogists had invented seemed to support the teachings of the churchmen. With the founding of universities in the twelfth and thirteenth centuries, science began to awaken, and one of the first products of the Renaissance was the natural philosophers. Such men as Francis Bacon, Descartes, Leibnitz, and Spinoza did not limit their ideas to the teachings of the Church; they taught the necessary principle of continuity, to which the natural development of "species" was a necessary corollary. The more speculative naturalists, or philosopher naturalists, next applied the doctrine of continuity, as an hypothesis, to the facts of organisms. Such were Bonnet, who recognized that all life was continuous, and Oken, who conceived that all organisms have developed out of a primitive slime. Finally came the great naturalists, putting forth the idea of the mutation of species tentatively at first, then with greater vigor, until Darwin came, at the fullness of time, to precipitate the revolution. See EVOLUTION; DARWIN; LAMARCK.

The view that species are wholly arbitrary groups is not accepted by all naturalists. De Vries especially lays stress on the point that species are objective. Every species, he believes, is made up of a number of specific characters, each of which depends upon a certain chemical particle or aggregation of molecules, which perpetuates itself and multiplies by self-division. So long as the descendant chemical particles remain like the parental ones, so long the species persists. These particles may, however, suddenly change through some cause, not precisely known, but probably environmental; and with a change in one of these particles goes a change in the adult specific quality that it controls, and also of the "correlated" qualities. The consequence is that a form with many new qualities suddenly arises, and this form we may call a new species. De Vries has studied (*Die Mutationstheorie*, 1901) variable species in the field —e.g., the evening primrose—and finds that new forms, clearly marked off from the original, typical ones, are constantly arising. They are, from the beginning, distinct and fully formed species. There are, however, other theories to account for that "distinctness" or isolation which is not infrequently found. One is that species originated in isolated situations.

A group of land animals, getting by accident upon an island and varying normally, will in time come to be quite dissimilar from the forms on the mainland, because, being isolated, any peculiarities that may crop out among them will not be swamped by intercrossing with the main mass of the species. Thus, we find in the Galapagos Islands that each island has a peculiar species of lizard of a particular genus, and only one species occurs on each island. The same is true of certain sparrows on these islands. Even on islands nearer the mainland, like Nantucket or Fire Island, on the south side of Long Island, there are peculiar forms—incipient species. It is the isolation which has permitted them to arise; even a less degree of isolation may permit a difference to grow up. Thus, Darwin tells this story: "The two flocks of Leicester sheep kept by Mr. Buckley and Mr. Burgess have been purely bred from the original stock of Mr. Bakewell for upward of 50 years. There is not a suspicion existing in the mind of any one at all acquainted with the subject that the owner of either of them has deviated in any one instance from the pure blood of Mr. Bakewell's flock; and yet the difference between the sheep possessed by these two gentlemen is so great that they have the appearance of being quite different varieties." Darwin's explanation of the lack of intergrades between many species differs from the foregoing, and depends on the assumption that, of the descendants of any species, those that are most unlike are most apt to survive; so that where the number of forms (varieties or subspecies) is very great, the intermediate ones (the intergrades) are pushed to the wall and are extinguished. In Darwin's words: "As in each fully stocked country natural selection necessarily acts by the selected form having some advantage in the struggle for life over other forms, there will be a constant tendency in the improved descendants of any one species to supplant and exterminate, in each stage of descent, their predecessors and their original progenitor. For it should be remembered that the competition will generally be most severe between those forms which are most nearly related to each other in habits, constitution, and structure. Hence all the intermediate forms between the earlier and later states—that is, between the less and more improved states of the same species—as well as the original parent species itself, will generally tend to become extinct. So it probably will be with many whole collateral lines of descent, which will be conquered by later and improved lines." This striking passage of Darwin deserves an experimental or statistical test. Until that is had, it can only stand as an excellent illustration of Darwin's logical treatment of special difficulties in his theory.

Another important attribute of a species is that its members are frequently sterile, with even closely related species. It would, however, be a mistake to assume that, on the one hand, all species, or even the hybrid offspring of crossed species, are always sterile. It is likewise an error to suppose that, on the other hand, sterility is confined to crosses between species. Breeders of animals are accustomed to find a considerable percentage of sterility between members of the same species; and when the members are close blood relations, the percentage becomes very high. Nevertheless, the sterility of hybrids (crosses between species) is so common that Cuvier gave it as the sure criterion of species. For further facts and explanations of this question, see HYBRIDITY.

Finally, species are adapted to the conditions in which they live. By many this characteristic is considered a fundamental one; so that, when we have explained how their adaptations arise, we have explained how the species arose. It may be worth while, here, to state that there is a lack of unanimity in respect to the adaptive nature of all specific characters. Those who assert such adaptation insist that it cannot be denied that any given apparently useless organ may not be useful, or may not have been useful in some period of the animal's life, or that of its ancestors. See EVOLUTION; NATURAL SELECTION; and similar titles, and the books mentioned thereunder.

Subspecies (or *variety*), in natural history, is the designation of a group subordinate to

species, distinguished from a race or breed chiefly by the circumstance that the latter two are artificial. Subspecies are regarded as the first step in the formation of species. They are not to be confused with variations, since, like species, they are groups of similar individuals. The question of when to call two differing lots of animals species and when subspecies is not capable of satisfactory solution, except by erecting an artificial and arbitrary bar separating them. In the absence of any such arbitrary rule, we find some naturalists "splitting" one species into many by elevating the subspecies to specific rank; while another naturalist will "lump" several species, reducing them to the rank of subspecies of one species. Many authors would consider subspecies to be founded on differences due to environment—differences that will disappear with changing environment. Those who are radical in recognizing by name minute and transitory differences of this kind confess that they cannot recognize with certainty their own subspecies, unless they know the habitat of the specimen. Other authors regard the difference between subspecies and species to be solely one of degree of divergence in characters. As subspecies became recognized, the custom was formed of adding a subspecific name to the specific name, as has already been explained.

Genus.—A category having a rank between species and family, and consisting of a group of species deemed to be more closely related to each other than to anything else. There is absolutely no criterion by which we can distinguish between a genus and a species, on the one hand, and a family on the other; but it is often a fact that, when a collection of related species is arranged in an orderly fashion, more or less sharp breaks occur, which enable naturalists to draw lines. Consequently, the boundaries of genera are being constantly widened or restricted; and generic names change and disappear as a result of fusion of genera or of splitting up of a genus. Since the genus is that under which species are usually indexed, this instability of generic names is highly regrettable. What is needed is a recognition of the subjectiveness of generic names and of the prime necessity of the stability of nomenclature; no changes in generic names should be made without the best of reasons. The name of the genus (always written with a capital initial) is combined with that of the species. The name of the cat genus, for example, is *Felis;* and *Felis leo, Felis tigris, Felis catus* are the names of the lion, tiger, and wildcat species. These cats are more alike to one another than any one of them is to the dogs. The latter belong to the genus *Canis.* The size of a genus varies with the number of species it contains; some genera containing a hundred species or more, while others contain only one. Darwin believed that the species of a large genus are more variable than those of a small one. In any case, the species within a genus are not regarded as having diverged very widely from their common stock, and the criteria for generic distinctions are largely superficial characteristics.

Family.—A group of genera having a certain resemblance to one another, which indicates common descent, or "family connection." Features of structure more or less external, and belonging to parts, as limbs, wings, teeth, horns, etc., characteristic of methods of life, are of the kind of characters used in judging of family limits. Thus, the prime family distinction of the cats (Felidæ) is the arrangement for retracting the claws, which sharply defines them as a group from the dogs, on the one hand, and the civets on the other; but the cheeta is able to retract its claws only partly, and this fact, in connection with other distinctive features, causes the animal to be placed in a genus separate from *Felis.*

Order.—Several related families may fall together, by the possession in common of characters denied to others, into a larger category known as an order. A familiar example is the order Carnivora, embracing the families of cats, dogs, civets, weasels, bears, etc., because all these exhibit an organization developed along lines of differentiation from other mammals, tending to fit them to prey upon other animals and digest a flesh diet. The various lines and degrees of specialization are recognized by subordinate groupings in families and genera.

Class.—Groups of orders are found to agree in certain very general and fundamental characteristics of organization, such as having six legs or eight legs; the production, by the skin, of hair, feathers, or scales; the integument being leathery or calcareous—and so on; and such groups form the next larger category, called a class. Even here, however, there is large room for difference of opinion as to limits; and, in some classes, an intermediate category called subclass seems necessary, as in the case of the prime division of the class Mammalia into monodelphic and didelphic, or of the class Cephalopoda into dibranchiate and tetrabranchiate. The same difficulty has led to naming groups of intermediate rank elsewhere—such as superfamilies, subfamilies, subgenera, etc.

Phylum.—Classes combine into several grand divisions of the animal kingdom, called subkingdoms, or phyla, by having in common a single or a few characteristics so broad and ancestral that they are spoken of as "plan of structure." Thus, all the mammals, birds, reptiles, amphibians, and fishes, together with several lowly representatives, such as the ascidians, are united by a single characteristic of structure possessed by no other animals—the presence of a backbone, or its essential equivalent, the notochord. This character is so wide-reaching and fundamental that it springs from the very root of the phylogenetic tree, and is of prime importance. By similar broad and fundamental "plans of structure" are the other phyla of the 12 now recognized by most zoölogists characterized. Their origin is lost to view in the mists of primeval time, but even here two divisions may be recognized—the Protozoa and the Metazoa—the former embracing the single phylum Protozoa, or one-celled animals; the latter, all the rest which agree in consisting of many cells, having a two-layered embryonic development.

Historical Sketch of Classification. The Greeks had considerable knowledge concerning animals, which Aristotle recorded, added to, and arranged, for the first time of which we have any knowledge, in an orderly fashion. Aristotle had some conception of genera and species. It is true that his γένος (*genos*) was a rather elastic term, since it was applied both to small and large groups of animals. Aristotle also conceived a difference between vertebrates and invertebrates, although he made the distinction by means of an erroneous definition. The following are the eight groups of animals as defined by Aristotle:

Animals with Blood—Vertebrates:

1. Viviparous animals (four-footed), and in a special γένος (*genos*) of this the whale was placed. 2. Birds. 3. Oviparous, four-footed animals. 4. Fishes.

Animals without (red) Blood—Invertebrates:

5. Soft animals (μαλάκια, *malakia*, i.e., Cephalopoda). 6. Animals with soft shells (μαλακόστρακα, *malakostraka*, i.e., Crustacea). 7. Insects. 8. Shelled animals (sea urchins, snails, mussels).

The elder Pliny added little to our knowledge of animals. He was simply a compiler, who copied freely from Aristotle, whom he sometimes misunderstood, and he admitted much of the error and superstition of his time to rank with fact. It was not until the seventeenth century that any very great addition to our knowledge of the structure, development, and relations of animals was made.

Linnæus to Cuvier.—Ray wrote a *Synopsis of Mammalia and Reptilia* (London, 1693), which was used by the master systematizer, Linnæus (1707–78), in his *Systema Naturæ*, as the foundation upon which he built that part of his classification that had to do with vertebrates. Linnæus did not add much to our knowledge as an investigator; but he sifted and sorted, rejected and retained, from the accumulations of his predecessors, and out of this more or less chaotic mass he erected his orderly system—the first great classification of animals. His *Systema Naturæ* went through 13 editions, 12 of which were published during his lifetime, and 5 of these were revisions by his own hand. The arrangement by Linnæus was into "classes," as follows: 1. Mammalia. 2. Aves. 3. Amphibia (including reptiles). 4. Pisces. 5. Insects (including insects proper, myriapods, arachnids, and crustaceans). 6. Vermes (radiates, mollusks, worms, cirripeds, and a fish, myxine).

This classification was based mainly on external appearance and some internal anatomy; and, though imperfect and incomplete, it gave a great impulse to the study of zoölogy and to more orderly arrangements of animals, based on anatomical characters. It was Linnæus who introduced binary nomenclature, since he first gave every animal a generic and a specific name of Latin origin.

The next great systematist was Cuvier (1769–1832). "Cuvier did not," says Claus, "as most zoötomists have done, look upon anatomical discoveries and facts as in themselves the aim of his researches; but he contemplated them from a comparative point of view, which led him to the establishment of general principles." Moreover, Cuvier appreciated fully the idea of "correlation." "The organism," he declared, "consists of a single and complete whole, in which single parts cannot be changed without causing changes in all the other parts." Cuvier became convinced, from a study of the nervous system and the arrangement of the systems of organs, that the animal kingdom is divided into four great branches (*Tableau élémentaire de l'histoire naturelle des animaux*, Paris, 1798) as follows:

Branch 1. *Animalia Vertebrata.* Classes: 1. Mammalia. 2. Aves. 3. Reptilia. 4. Pisces.

Branch 2. *Animalia Mollusca.* Classes: 1. Cephalopoda (not subdivided). 2. Pteropoda (not subdivided). 3. Gastropoda. (Orders: Pulmonata, Nudibranchia, Inferobranchia, Tectibranchia, Heteropoda, Pectinibranchia, Tubulibranchia, Scutibranchia, Cyclobranchia.) 4. Acephala. (Orders: Testacea, Tunicata.) 5. Brachiopoda (no subdivisions). 6. Cirrhopoda.

Branch 3. *Animalia Articulata.* Classes: 1. Annelides. (Orders: Tubicolæ, Dorsibranchiæ, Abranchiæ.) 2. Crustacea. (Section 1: Malacostraca. Orders: Decapoda, Stomatopoda, Amphipoda, Læmodipoda, Isopoda. Section 2: Entomostraca. Orders: Brachiopoda, Pœciloda, Trilobitæ.) 3. Arachnides. (Orders: Pulmonariæ, Trachearіæ.) 4. Insects. (Orders: Myriapoda, Thysanura, Parasita, Suctoria, Colcoptera, Orthoptera, Hemiptera, Neuroptera, Hymenoptera, Rhipiptera, Diptera.)

Branch 4. *Animalia Radiata.* Classes: 1. Echinoderms. (Orders: Pedicellata, Apoda.) 2. Intestinal Worms. (Orders: Nematoidea, Parenchymatosa.) 3. Acalephæ. (Orders: Simplices, Hydrostaticæ.) 4. Polypi (Anthozoa, Hydroida, Bryozoa, Corallinæ, Spongiæ). (Orders: Carnosi, Gelatinosi, Polypiarii.) 5. Infusoria. (Orders: Rotifera, Homogenea.)

Lamarck to Leuckart.—Probably to Lamarck, more than to any other systematist, we are indebted for the term "Invertebrata" and to the arrangement of groups in an ascending series. In his *Histoire naturelle des animaux sans vertèbres* (Paris, 1801), he classifies the invertebrates as follows (accepting the vertebrates as arranged by Cuvier):

I. *Apathetic Animals.* Do not feel; no brain, no senses; rarely articulated.

Class 1. Infusoria. Orders: Nuda, Appendiculata.

Class 2. Polypi. Orders: Ciliata (Rotifera), Denudati (hydroids), Vaginati (Anthozoa and Bryozoa), and Natantes (crinoids and some halcyonoids).

Class 3. Radiaria. Orders: Mollia (Acalephæ), echinoderms (including Holothuriæ and Actiniæ).

Class 4. Tunicata. Orders: Botryllaria (compound ascidians), Ascidia (simple ascidians).

Class 5. Vermes. Orders: Molles and Rigiduli (intestinal worms and gordius), Hispiduli (Nais), Epizoariæ (epizoa and lernæans).

II. *Sensitive Animals.*

Class 6. Insects (hexapods). Orders: Aptera, Diptera, Hemiptera, Lepidoptera, Hymenoptera, Neuroptera, Orthoptera, Coleoptera.

Class 7. Arachnids. Orders: Antennatotracheales (Thysanura and Myriapoda), Exantennatotracheales and Exantennatobrancheales (Arachnida proper).

Class 8. Crustacea. Orders: Heterobranchia (Branchiopoda, Isopoda, Amphipoda, Stomapoda) and Homobranchia (Decapoda).

Class 9. Annelids. Orders: Apoda, Antennata, Sedentaria.

Class 10. Cirripeds. Orders: Sessilia and Pedunculata.

Class 11. Conchifera. Orders: Dimyaria, Monomyaria.

Class 12. Mollusks. Orders: Pteropoda, Gastropoda, Trachelipoda, Cephalopoda, Heteropoda.

Siebold and Stannius (1845) also divided the animal kingdom into vertebrates and invertebrates; and among the invertebrates the Protozoa were recognized as a separate type, and Vermes came to have very much the significance that it has in our modern classifications.

The classification of Leuckart is interesting, because it comes near to our present conceptions of the fact that its author was a great teacher of zoölogy; and, hence, his classification has had

great influence in education. Leuckart, *Die Morphologie und die Verwandtschaftsverhältnisse der wirbellosen Thiere* (Brunswick, 1848), divides animals above Protozoa (to which he paid no attention) into six "types," as follows:

Type I. *Cœlenterata.*

Class 1. Polypi. (Orders: Anthozoa and Cylicozoa.)

Class 2. Acalephæ. (Orders: Discophoræ and Ctenophoræ.)

Type II. *Echinodermata.*

Class 3. Pelmatozoa. (Orders: Cystidea and Crinoidea.)

Class 4. Actinozoa. (Orders: Echinida and Asterida.)

Class 5. Scytodermata. (Orders: Holothuriæ and Sipunculida.)

Type III. *Vermes.*

Class 6. Anenterati. (Orders: Cestodes and Acanthocephali.)

Class 7. Apodes. (Orders: Nemertini, Turbellarii, Trematodes, and Hirudinei.)

Class 8. Ciliati. (Orders: Bryozoa and Rotiferi.)

Class 9. Annelides. (Orders: Nematodes, Lumbricini, and Branchiati.)

Type IV. *Arthropoda.*

Class 10. Crustacea. (Orders: Entomostraca and Malacostraca.)

Class 11. Insecta. (Orders: Myriapoda, Arachnida, and Hexapoda.)

Type V. *Mollusca.*

Class 12. Tunicata. (Orders: Ascidiæ and Salpæ.)

Class 13. Acephala. (Orders: Lamellibranchiata and Brachiopoda.)

Class 14. Gastropoda. (Orders: Heterobranchiata, Dermatobranchia, Heteropoda, Ctenobranchia, Pulmonata, and Cyclobranchia.)

Class 15. Cephalopoda.

Type VI. *Vertebrata* (according to Cuvier).

Oken, Von Baer, and Agassiz.—The foregoing and certain other classifications had been developed in England, France, and Germany, under the guidance of anatomy; but, in many of them, the idea of the complexity of structure of animals seemed to outweigh the idea of unity of structure. During the early part of the nineteenth century another school developed in Germany, under the leadership of Schelling—the School of Natural Philosophy—which has extended its influence to all the physical sciences. Of its doctrines such men as Geoffroy Saint Hilaire in France, and Goethe and Oken in Germany, became expounders, and taught that unity prevailed everywhere; hence, the animal kingdom was composed of an unbroken series of animals. The most important system of classification evolved by this school is that of Oken. Corresponding with the invertebrates is Oken's intestinal body, or touch animals, as he called them (*Lehrbuch der Naturphilosophie*, Jena, 1810).

Grade 1. Intestinal Animals.

Cycle I. *Digestive Animals* (Radiata).

Class 1. Infusoria (Stomach Animals).

Class 2. Polypi (Intestine Animals).

Class 3. Acalephæ (Lacteal Animals).

Cycle II. *Circulative Animals* (Mollusks).

Class 4. Acephala (Biauriculate Animals).

Class 5. Gastropoda (Uniauriculate Animals).

Class 6. Cephalopoda (Bicardial Animals).

Cycle III. *Respirative Animals* (Articulata).

Class 7. Worms (Skin Animals).

Class 8. Crustacea (Branchial Animals).

Class 9. Insects (Tracheal Animals).

At the time that the School of Natural Philosophy was thriving, another school had arisen in Germany, which was rapidly accumulating a new set of facts. This was the School of Embryologists, which seems to have arisen under the influence of Döllinger and such men as Rathke, Van Beneden, Von Baer, Kölliker, and Vogt as disciples. Von Baer early got the idea that the ontogenetic development of animals is a recapitulation of their phylogenetic history; and, in conformity with his embryological investigations, he proposed the following classification of animals:

I. Peripheral Type (Radiata).

II. Massive Type (Mollusca).

III. Longitudinal Type (Articulata).

IV. Doubly Symmetrical Type (Vertebrata).

Thus, Von Baer, with his classification based on embryological principles, and Cuvier, with his founded on comparative anatomy, arrived at very similar general conclusions; viz., that animals are built on four general plans, fall into four general types. In the end the system of Cuvier triumphed over that of the Natural Philosophers. The later advances in the classification of animals have been mainly made in filling gaps and correcting errors. The number of types has been increased. The Protozoa have become a distinct type, Cœlenterata and Echinodermata have been separated; likewise Arthropoda and Annelida, and the old group Mollusca has been broken up. The earlier classifications, founded mainly on external resemblances and grosser anatomical likenesses, were then greatly improved by the refinement of anatomical technique —by the use of the microscope, by the study of embryology, by the distinction between analogy and homology, by a knowledge of the fertility of animals in cross breeding, and by the study of fossil forms. With the discovery of so many intermediate forms we are coming back towards the views of the Natural Philosophers, who maintained that unity rules throughout the animal kingdom, as well as in all others; that intermediate forms connect the various types, and that there is no sharp line of demarcation to be drawn between the various groups of animals.

Two systems which have had great influence, especially in directing the study of the different invertebrates, were those of Louis Agassiz and Huxley. Agassiz retained the four types of Cuvier. Most of the Protozoa he considered to be algæ, and such forms as the Vorticella he thought would be found to be closely related to the Bryozoa. Following is an outline of Agassiz's arrangement, from his *Essay on Classification* (Boston, 1859):

I. *Radiata.*

1. Polypi: Actinoids and Halcyonoids.

2. Acalephæ: Hydroids, Discophoræ, and Ctenophoræ.

3. Echinoderms: Crinoids, Asteroids, Echinoids, Holothurioids.

II. *Mollusca.*

1. Acephala: Bryozoa, Brachiopods, Tunicata, Lamellibranchiata.

2. Gastropoda: Pteropoda, Heteropoda, and Gastropoda.

3. Cephalopoda: Tetrabranchiata and Dibranchiata.

III. *Articulata.*

1. Worms: Trematodes, Nematodes, Annelids.

2. Crustacea: Rotifera, Entomostraca, Tetradecapods, and Decapods.

3. Insecta: Myriapods, Arachnids, and Insects proper.

Huxley arranges the invertebrates in nine sections, as follows:

Section I. Monera (Foraminifera; Heliozoa); Radiolaria, Protoplasta, Gregarinidæ, Catallacta, Infusoria (Opalinina, Ciliata, Flagellata, Tentaculifera).

Section II. Porifera, Hydrozoa, Coralligena (Ctenophora).

Section III. Turbellaria, Rotifera (Nematorhyncha), Trematoda, Cestoidea.

Section IV. Hirudinea, Oligochæta, Polychæta, Gephyrea.

Section V. Crustacea, Arachnida (Pycnogonida, Tardigrada, Pentastomida), Myriapoda, Insecta.

Section VI. Polyzoa, Brachiopoda, Lamellibranchiata, Odontophora.

Section VII. Echinodermata.

Section VIII. Tunicata.

Section IX. Groups of uncertain place: Peripatidea, Myzostomata, Enteropneusta, Chætognatha, Nematoidea, Physemaria, Acanthocephala, Dicyemida.

"Our knowledge," says Huxley, "of the anatomy, and especially of the development of the Invertebrata, is increasing with such prodigious rapidity, that the views of taxonomists in regard to the proper manner of expressing that knowledge by classification are undergoing, and, for some time to come, are likely to undergo, incessant modification. To the beginner, who is apt to make the mistake of looking upon classification as the foundation and essence of morphology, instead of what it really is, the superstructure and outcome thereof, this state of things is distressing. Every handbook presents him with a different system of classification; and he may, not unnaturally, despair of finding any stability in science, the most general results of which are capable of being stated in such different ways. If, however, the student will attend to the facts which constitute the subject matter of classification, rather than to the modes of generalizing them which are expressed in taxonomic systems, he will find that, however apparently divergent these systems may be, they have a great deal in common."

It has seemed desirable to dwell somewhat on the history of the classification of the Invertebrata, because invertebrates have been the battling ground, the bone of contention, with systematists since the time of Linnæus. The classification of vertebrates was early agreed upon; indeed, four of the six classes now accepted have come down to us from Aristotle's time.

Classification of Vertebrates. *Fishes.*—Ichthyology began as a science with Artedi, who made a division into five classes, in a useful but very artificial manner. This continued substantially unchanged until the gigantic labors of Cuvier resulted in a revised classification, much nearer nature, recognizing clearly the distinction between the fishes with bony skeletons and those with cartilaginous skeletons. Agassiz followed with a classification based upon the forms of the scales, the most important feature of which was the recognition of the group Ganoidei. The next great generalization in this direction of systematic arrangement was that of J. Müller, who developed the distinctness of Amphioxus and the lampreys from other cartilaginous fishes, and so established the new groups Cyclostomi and Leptocardii; he also proposed the group Dipnoi for Lepidosiren. Huxley's studies and new material threw new light upon the subject, and aided Gunther to form a classification of fishes which, with one important exception, is still held by ichthyologists. For details, see FISH.

Amphibia.—The Amphibia were for a long time confused with the Reptilia. Thus Linnæus, 1767, who first used the term Amphibia as a group name, included under it: 1. *Reptiles pedati*, including turtles (Testudo); Draco Lacerta (including crocodiles, lizards, and newts); and Rana. 2. *Serpentes apodi.* 3. *Nantes pinnati*, including certain fishes. Brongniart, 1800, classifies reptiles as: Chelonia, Saurii, Ophidii, and Batrachii (the last including frogs, toads, and newts). Latreille, 1804; Duméril, 1806; and Oppel, 1811, while more sharply discerning the true subdivisions of amphibians, still retain them under the head of reptiles. First, De Blainville, writing in 1816, makes Reptilia and Amphibia coördinate, but subdivisions of the "Amphibiens"; so likewise Stannius, as late as 1856. Latreille, 1821, however, proposes a classification which is essentially the same as that we now accept.

Reptiles.—Reptiles were put by Linnæus under the class Amphibia, and it was not until Brongniart separated them that herpetology began upon a philosophic basis. It was further advanced by Duméril (1807) and Oppel (1811), who placed Cæcilia with the amphibians. Cuvier and other writers did little to establish a rational system within this group; and even Duméril and Bibron, in their great *Erpétologie générale* (1834–54), cling to the idea that the batrachians are only separable as an order from reptiles. Although De Blainville, Leuckart, and others had advocated a much deeper separation, it was not until Huxley's investigations demonstrated the necessity of regarding the Amphibia and Reptilia as distinct classes that they were so set apart. See REPTILE.

Huxley, in his *Anatomy of Vertebrated Animals* (1871), divided the Vertebrata into Ichthyopsida (fishes, leptocardians, marsipobranchs, and Amphibia), Sauropsida (birds and reptiles), and Mammalia.

Mammals and Birds.—Birds were too easily distinguished and too compact a class to have been much confounded with anything else, though mediæval writers often put bats, bees, etc., under the name. The history of their classification, therefore, falls within lines agreed upon from the first, and belongs to the article BIRD. The same may be said of the class Mammalia, where the only confusion arose from the foolishness of a few mediæval authors, who classed bats among birds, and whales with fishes; the history of its classification will be found under MAMMALIA.

Outline of Modern Classification. The earlier writers always classified the animal kingdom in a linear series; usually beginning with mankind, and "descending" to the creatures deemed most inferior. This was not with them, as it is with us, a mere matter of convenience in making a list of the groups, but expressed their belief in the doctrine, unchallenged from antiquity to the time of Lamarck and Cuvier, that there existed what they called a *scala naturæ*. They meant by that their belief that all animals could be arranged in an ascending

scale of organization—the infusorians being succeeded by polyps, these by radiated forms, these by worms, and so on to fishes, reptiles, birds, and mammals. The orders within each class, the genera within each family, conformed to the same scale of increasing complexity; so that a linear classification, from the lower invertebrates to the highest vertebrates, was the expression of their belief in an even progress of structure. Cuvier broke into this by his arrangement of the animal kingdom, into four groups, unrelated to each other—Radiata, Articulata, Mollusca, and Vertebrata—to be classified in parallel columns, if at all; and this, again, has been superseded by the conception of a form of classification which simulates a branching tree, and tries to express a true genetic arrangement (see PHYLOGENY), the first attempt at which was made by Lamarck. It is, however, impracticable in the present work to attempt such an expression of the classification of animals, except for restricted groups; and, in general, the linear arrangement must be used, bearing in mind that it is a convenient, not a scientific, expression.

The classification outlined below, and followed throughout this ENCYCLOPÆDIA, is that made by Profs. T. Jeffrey Parker and William A. Haswell (*Text-Book of Zoölogy*, London and New York, 1910). It is one of the most satisfactory formulations of scientific conclusions, has a wide acceptance, and is generally accessible to students and readers. These considerations outweigh, for the purposes of a popular encyclopædia, any objections likely to be urged against these authorities by specialists. The advantage of taking and keeping a uniform standard of classification and nomenclature throughout a work of this kind is too evident to require argument; and should there be good reason to differ from it, here and there, these exceptions and divergences may easily be treated as they arise. It is a fact that in many ways any scientific work such as the one mentioned is out of date as soon as published, so rapid is the advance of knowledge and discovery in the scientific field, but some general standard is necessary. In paleontology this scheme is supplemented by the substantially identical classification of Zittel-Eastman (Karl A. Von Zittel, *Grundzüge der Paläontologie*, Munich, 1895; translated and modified by C. R. Eastman, as *Text-Book of Paleontology*, New York and London, 1900).

It is needful here only to sketch the arrangement of the larger groups, leaving the treatment of orders, families, and lesser divisions to be given in the descriptive articles under the titles of groups, as BIRD, FISH, PROTOZOA, ETC.

CLASSIFICATION OF ANIMALS

LIST OF PHYLA, CLASSES, AND SUBCLASSES

SUBDIVISION PROTOZOA
(*Unicellular Animals*).

Phylum I. PROTOZOA (Protozoans). Animals composed of a single cell; or, if of several cells, these are of one kind.

- Class 1. RHIZOPODA. Protozoa with retractile pseudopodia (Amœba, etc.).
- Class 2. MYCETOZOA. Terrestrial protozoa, plasmodial, and forming large and complex cysts (Slimes).
- Class 3. MASTIGOPHORA. Protozoa without cilia, but with one or more flagella.
- Class 4. SPOROZOA. Protozoa, without appendages; internal parasites.
- Class 5. INFUSORIA. Protozoa with cilia, or sucking tentacles.

SUBDIVISION METAZOA
(*Multicellular Animals*).

Phylum II. PORIFERA (Sponges). Fixed aquatic Metazoa, whose body wall is perforated by incurrent pores.

- Class PORIFERA. Equivalent to the Phylum.
  - Subclass 1. *Calcarea*. Sponges with skeleton of calcareous spicules.
  - Subclass 2. *Non-Calcarea*. Skeleton, when present, composed of siliceous spicules or of spongin fibres.

Phylum III. CŒLENTERATA (Polyps, etc.). Animals of radial structure, whose digestive cavity is lined by the body wall, and which have nettling organs.

- Class 1. HYDROZOA. Cœlenterates, whose body is composed of more than two rays, and contains a single cavity (Hydroids, Siphonophores, etc.).
- Class 2. SCYPHOZOA. Cœlenterates with many radii, and with radial partitions in the cavity of the body (Jellyfishes).
- Class 3. ACTINOZOA. Attached individuals or colonies.
  - Subclass 1. *Zoantharia*. Tentacles numerous, and usually in multiples of five (Sea Anemones, Madrepores, and Corals).
  - Subclass 2. *Alcyonaria*. Tentacles, eight only (Red Corals, Sea Fans, etc.).
- Class 4. CTENOPHORA. Cœlenterates with only two radii, and rows of cilia plates.

Phylum IV. PLATYHELMINTHES (Flatworms). Bilaterally symmetrical, soft-bodied animals, without true segmentation of the body; flattened in a dorso ventral direction, and having the body cavity filled with a loose meshwork of cells.

- Class 1. TURBELLARIA. Free-living flatworms, whose body is covered by cilia; alimentary tract with only one opening to the exterior (Planarians).
- Class 2. TREMATODA. Parasitic, unsegmented, without cilia in the adult, and with a well-developed digestive apparatus (Flukes).
- Class 3. CESTODA. Elongated, usually unsegmented hermaphrodite endoparasites, without mouth or alimentary canal (Tapeworms, etc.).
- Class 4. NEMERTINEA. Body more or less flattened; food canal with mouth and arms; aquatic, carnivorous.
  - Subclass 1. *Palæonemertinea*.
  - Subclass 2. *Schizonemertea*.
  - Subclass 3. *Hoplonemertea*.

Phylum V. NEMATHELMINTHES (Roundworms). Bilateral, unsegmented, round-bodied; usually with alimentary tract, mouth, and arms.

- Class 1. NEMATODA. With intestinal canal; without proboscis; free-living in fresh or salt water, or parasitic (Threadworms).
- Class 2. ACANTHOCEPHALA. Mouth and intestines wanting; parasitic.
- Class 3. CHÆTOGNATHA. Pelagic "arrow worms"; spiny, and with a well-developed nervous system.

Phylum VI. TROCHELMINTHES (Wheel Animalcules). Characterized by having the larva in the form of a trochosphere.

Class 1. ROTIFERA. Microscopic wheel animalcules, with a ciliated band around the mouth, and a special organ for attachment.

Class 2. DINOPHILEA. Minute, wormlike, having five to eight segments, usually ciliated; and nephridia in pairs; marine.

Class 3. GASTROTRICHA. Minute, spindle-shaped, flattened and ciliated on the ventral surface; fresh waters.

Phylum VII. MOLLUSCOIDA (Sea Mats and Brachiopods). Small aquatic animals, having a true body cavity (except in Endoprocta) and suspended alimentary canal; dorsal region abbreviated and surmounted by lophophore.

Class 1. POLYZOA. Molluscoida that form colonies connected by one organic substance; the ciliated band of the lophophore is drawn out into tentacles (Bryozoans).

Subclass 1. *Ectoprocta.* Anus outside tentacular corona.

Subclass 2. *Endoprocta.* Anus internal; form colonies by budding.

Class 2. PHORONIDA. Wormlike polyzoans, living in associations of individuals born from ova, not by buds.

Class 3. BRACHIOPODA. Polyzoa with the body inclosed in a shell of two valves; body usually attached by a stalk (Lamp Shells).

Phylum VIII. ECHINODERMATA (Echinoderms). Animals of prevailingly radical structure, with intestinal wall distinct from body wall, and with calcareous plates in the skin.

Class 1. ASTEROIDEA. Star-shaped echinoderms, with a furrow (ambulacrum) along the underside of the arms (Starfish).

Class 2. OPHIUROIDEA. Star-shaped echinoderms, with the arms sharply marked off from the body, and not grooved (Brittle Stars).

Class 3. ECHINOIDEA. Echinoderms with the body globular or disk-shaped, and armless (Sea Urchins).

Class 4. HOLOTHUROIDEA. Echinoderms elongated, wormlike, usually soft, and with tentacles about the mouth (Trepangs).

Class 5. CRINOIDEA. Sessile, and having a cup-shaped body (Crinoids).

Class 6. CYSTOIDEA. Globular, sessile, or stalked (Fossil).

Class 7. BLASTOIDEA. Ovate, stalked (Fossil).

Phylum IX. ANNULATA (Worms). Bilateral segmented worms without jointed legs.

Class 1. CHÆTOPODA. Worms made up of a series of metameres, each bearing parapodia and cirri (Annelids).

Subclass 1. *Polychæta.* Sexes distinct; ovaries and testes simple and metamerically repeated (Marine Annelids).

Subclass 2. *Oligochæta.* Sexes united; ovaries and testes few and compact (Terrestrial and fresh-water).

Class 2. MYZOSTOMIDA. Disk-shaped, unsegmented (Parasites of Crinoids).

Class 3. GEPHYREA. Sessile annelids, without external segmentation in the adult (Marine).

Class 4. ARCHI-ANNELIDA. Minute marine annelids, faintly segmented, often parasitic.

Class 5. HIRUDINEA. Annelids with short rings or none at all, and with ventral suckers (Leeches).

Phylum X. ARTHROPODA (Insects, Crustaceans, etc.). Symmetrical segmented animals, with jointed appendages.

Class 1. CRUSTACEA. Typically aquatic and gill-bearing; usually two pairs of antennæ (Crustaceans).

Subclass 1. *Entomostraca.* Usually small, and with a varied number of appendages (Water Fleas, etc.).

Subclass 2. *Malacostraca.* Crustacea with nineteen pairs of appendages (Crabs, Crayfish, etc.).

Class 2. TRILOBITA. Body depressed, oval, and divided into head, thorax, and abdomen (Extinct Trilobites).

Class 3. ONYCHOPHORA. Cylindrical, unsegmented, papillose, and with a series of short walking appendages (Peripatus).

Class 4. MYRIAPODA. Tracheate arthropods, consisting of several segments, each bearing one or two pairs of legs (Centipedes and Millipedes).

Class 5. INSECTA. Arthropods with the body in three divisions—head, thorax, and abdomen—with six thoracic legs, and usually with wings (Insects).

Class 6. ARACHNIDA. Air-breathing arthropods, without antennæ (Spiders, Scorpions, etc.).

Phylum XI. MOLLUSCA (Mollusks). Animals with unsegmented body, and without jointed appendages; usually with a shell, and with a muscular organ of locomotion (the foot).

Class 1. PELECYPODA. Mollusks with a nearly symmetrical body, leaf-like gills, and a two-valved shell (Bivalves).

Class 2. AMPHINEURA. Bilaterally symmetrical; anus at end of body (Chitons).

Class 3. GASTROPODA. Body unsymmetrical, with head, feelers, eyes, and unpaired foot; shell (when present) univalve (Gastropods).

Subclass 1. *Streptoneura.* Visceral commissures twisted into a figure-of-8; sexes distinct (Limpets, Whelks, etc.).

Subclass 2. *Euthyneura.* Visceral commissures not twisted into a figure-of-8; sexes united (Pulmonates, Nudibranchs, etc.).

Class 4. SCAPHOPODA. Head rudimentary; mouth lobes formed into a tube, inclosing the delicate shell (Marine).

NOTE. The *Pycnogonida, Linguatulida,* and *Tardigrada,* "though not in any way related to one another, and of doubtful relationships to the Arachnida, are, as a matter of convenience, mentioned together here."—*Parker and Haswell.*

Subclass 1. *Scaphopoda.* As above (Tusk Shells).

Subclass 2. *Rhodope.* Minute, ciliated; no shell.

Class 5. CEPHALOPODA. Head large; mouth surrounded by arms; foot funnel-shaped (Cuttlefish).

Subclass 1. *Dibranchiata.* Two symmetrical branchiæ; funnel tubular (Squids and Octopods).

Subclass 2. *Tetrabranchiata.* Four branchiæ; shell multilocular (Nautilus and Ammonites).

Phylum XII. CHORDATA (Chordates). Animals having a notochord, which may (Subphylum C) persist from birth, and become "in the adult replaced more or less completely by a segmented bony or cartilaginous axis—the spinal or vertebral column."

Subphylum and Class A. ADELOCHORDA. Marine wormlike animals, having a notochord as larvæ (Balanoglossus, etc.).

Subphylum and Class B. UROCHORDA. Animals, simple or compound, marine, inclosed in a coriaceous test, composed largely of cellulose, and having a notochord when larvæ (Ascidians).

Subphylum C. VERTEBRATA. Animals bilaterally symmetrical, and having a backbone (Vertebrates).

SEC. I. ACRANIA. *Without a head* (includes only the family Branchiostomidæ, Amphioxus, etc.).

SEC. II. CRANIATA. *With a head* (Fishes, Reptiles, Birds, Mammals).

Class 1. CYCLOSTOMATA. Eel-like vertebrates, without a lower jaw; mouth suctorial, and armed with horny teeth (Lampreys).

Class 2. PISCES. Aquatic vertebrates, with persistent gills and paired fins (Fishes).

Subclass 1. *Elasmobranchii.* Fishes with a cartilaginous skeleton, in which the cranium is never ossified, nor contains membrane bones; gill openings usually in five pairs (Sharks and Rays).

Subclass 2. *Holocephali.* Cartilaginous fishes with four pairs of gill slits, nearly concealed by a fold of skin (Chimæras).

Subclass 3. *Teleostomi.* Fishes with the skeleton complicated by membrane bones and ossifications, or completely bony (Sturgeons and ordinary Fish).

Subclass 4. *Dipnoi.* Fishlike animals, having an apparatus for breathing atmospheric air (Lungfishes).

Subclass 5. *Ostracodermi.* Paleozoic fishes, with an exoskeleton extraordinarily developed about the head, and apparently with no endoskeleton (Cephalaspis, etc.).

Class 3. AMPHIBIA. Amphibious vertebrates, breathing by gills in the larval condition, and (usually) by lungs when adult, and having legs and five-toed feet (Amphibians).

Class 4. REPTILIA. Elongated, air-breathing vertebrates, with a horny epidermal skeleton of scales and one occipital condyle (Reptiles).

Class 5. AVES. Vertebrates clothed with feathers (Birds).

Subclass 1. *Archæornithes.* Birds having a prolonged tail of many vertebræ (Archæopteryx).

Subclass 2. *Neornithes.* Birds having the tail vertebræ compacted into a pygostyle (Modern Birds).

Class 6. MAMMALIA. Vertebrates which suckle their young, and are more or less clothed with hair (Mammals).

Subclass 1. *Prototheria.* Mammals with oviducts separated (Didelphia).

Subclass 2. *Theria.* Mammals with oviducts united for a longer or shorter part of their length (Monodelphia).

A. *Metatheria.* Young born in rudimentary condition, and sheltered in a pouch (Marsupials).

B. *Eutheria.* Young born in a uterus; no pouch present (Higher Mammals).

CLASSIFICATION OF PLANTS. See TAXONOMY.

CLASSIFICATION OF SHIPS. See A1; and LLOYDS.

CLAS'SIS (Lat., assembly). In the Reformed church of Holland and America, the name of an ecclesiastical body, made up of ministers and elders representative of churches, corresponding to a presbytery. The classis hears appeals from the consistories, which are the official boards of local churches, and the synod hears appeals from the classis. The classis also confirms and dissolves pastoral connections, ordains and deposes ministers, and sends delegates to the local and general synods. See REFORMED CHURCH IN AMERICA, THE.

CLAS'TIC ROCKS (Fr. *clastique*, from Gk. *κλαστός, klastos*, broken, from *κλᾶν, klan*, to break), or FRAGMENTAL ROCKS. A petrographic division which includes all rocks composed of

fragmental materials. See ÆOLIAN ACCUMULATIONS; AQUEOUS ROCKS; BRECCIA.

CLAT'SOP. An Indian tribe of the Chinookan stock. See CHINOOK.

CLAUDE, klôd, JEAN (1619–87). A French Protestant preacher and controversialist. He was born at La Sauvetat-du-Dropt, southwest France (ancient District of Agenais). He studied at Montauban, became pastor at Nîmes in 1654, and was also professor of theology in the Protestant college there, where in 1661 he was forbidden to preach, on account of his opposition to the proposed union with the Roman Catholics. In the next year he obtained a post at Montauban, but was removed from it also. He then went to Paris and was pastor at Charenton from 1666 until 1685. On the revocation of the Edict of Nantes (1685), he was ordered to leave France within 24 hours, and, being welcomed by William of Orange, preached at The Hague until his death, Jan. 13, 1687. He was the greatest leader of the French Reformed churches, their ablest disputant, their favorite preacher, and their truest representative. He is especially notable for the polemic he carried on against the school of Port Royal. His works include: *A Defense of the Reformation* (1671; Eng. trans., 1815), written in reply to an attack on the Calvinistic faith by Pierre Nicole, the celebrated Jansenist writer; *Complaints and Cruel Prosecutions of the Protestants* (1686; Eng. trans., 1707); and especially, as more familiar to English readers, *Essay on the Composition of a Sermon* (2 vols., 1778–79)—a much-used manual of homiletics, frequently reprinted from the edition of Charles Siméon. His son published *Œuvres posthumes de Jean Claude* (5 vols., Amsterdam, 1688). Consult *La Devèze* (Amsterdam, 1687).

CLAUDE LORRAIN, klôd lôr'răN'. See GELÉE, CLAUDE.

CLAU'DIA GENS (Lat., Claudian clan). A clan at Rome, of Sabine origin, the families of which were in part patrician, in part plebeian. The clan was established at Rome, about 504 B.C., by Appius Sabinus Regillensis, who came to Rome from Regillum, a town in the Sabine territory. He was consul in 495. His severity in enforcing the laws relating to debt was largely responsible for the secession of the plebs to the Sacred Mount. (See under ROME, *History of Rome during the Earliest or Regal Period.*) The names (see COGNOMEN) of the patrician families, distinguished for their arrogance and pride, are Cæcus, Caudex, Centho, Crassus, Pulcher, Regillensis, and Sabinus. The plebeian *cognomina* are Asellus, Canina, Centumalus, Cicero, Flamen, and Marcellus. Consult Mommsen, "Die patricischen Claudier," in *Römische Forschungen* (Berlin, 1865). See APPIUS CLAUDIUS CRASSUS; CLAUDIUS CÆCUS, APPIUS; MARCELLUS, MARCUS CLAUDIUS.

CLAU'DIAN AQUEDUCT. See AQUEDUCT; CLAUDIUS I.

CLAU'DIAN HARBOR. A harbor at the mouth of the Tiber, 2 miles west of Ostia, constructed in the face of great natural difficulties by the Emperor Claudius. Its area exceeded 6,000,000 square feet, with a depth of 15 to 18 feet; it was inclosed by two curving jetties, each 2400 feet long. An artificial island was constructed between the jetties by filling with concrete the great ship which had transported the Vatican obelisk from Egypt, sinking her, and from this foundation building above the level of the water. On the island rose a lighthouse 200 feet high, built in imitation of the Pharos of Alexandria. In time the Claudian harbor became inadequate to the needs of the city, and an inner harbor was constructed by Trajan, now 2 miles inland. The Claudian harbor, now inaccessible on account of marshes, is depicted on a bas-relief discovered in 1863. Consult Lanciani, *Ancient Rome in the Light of Recent Discoveries* (New York, 1889).

CLAU'DIA'NUS, CLAUDIUS. A Latin poet, born at Alexandria, who lived at the end of the fourth and the beginning of the fifth century. He came to Rome in 395 and there secured the patronage of Stilicho and, through him, of the Emperor Honorius. His love and admiration for Stilicho are voiced in a number of his minor poems. As Gibbon says, he "assumed in his mature age the familiar use and absolute command of the Latin language, soared above the heads of his feeble contemporaries, and placed himself, after an interval of 300 years, among the poets of ancient Rome." At the request of the Senate, the emperors Arcadius and Honorius erected a statue in his honor in the Forum of Trajan. The productions of Claudianus that have come down to us consist of three epic poems—*The Rape of Proserpine*, the incomplete *Battle of the Giants*, and a poem on the downfall of Rufinus, Minister of Arcadius at Constantinople, besides panegyrics on Honorius and Stilicho, idyls, epigrams, and occasional poems. Claudianus displays a brilliant fancy and rich coloring, with variety and distinctness in his pictures, especially in those pieces which deal with contemporary affairs. The best editions are by Birt (Berlin, 1892), in *Monumenta Germaniæ Historica*, x, and Koch (Leipzig, 1893). A poor English translation was executed by Hawkins (London, 1817). Consult: Hodgkin, *Claudian: The Last of the Roman Poets* (London, 1875); Crees, *Claudian as an Historian* (1908); C. H. Moore, "Rome's Past in the Poems of Claudian," in *The Classical Journal*, vol. vi, pp. 108–115 (1910).

CLAUDIANUS MAMER'TUS (c.425–c.474). A Christian poet and philosopher. A younger brother of St. Mamertus, Bishop of Vienna, he was consecrated by the latter to the priesthood and became his assistant. He systematized the liturgy and wrote the hymns known as the *Small Liturgies*, sometimes heard in Catholic churches during the services preceding Ascension Day. The hymns "Contra Poetas Varios" and "Pange lingua gloriosi lauream certaminis" have been ascribed to him. In his famous philosophical treatise, *De Statu Animæ* (published by Mosellanus, Basel, 1520, and, with notes, by C. Barth, Zwickau, 1655), he shows that "thought is inseparable from the essence of the soul, and that its spiritual activity is indestructible" (Neander, *History of Dogmas*), and urges the dualism of soul and body. He was highly praised by the poet Sidonius Apollinaris. His complete works were edited by Engelbrecht and published in *Corpus Scriptorum Ecclesiasticorum Latinorum*, vol. xi (Vienna, 1885). Consult Engelbrecht, *Untersuchungen über die Sprache des Claudianus Mamertus* (ib., 1885).

CLAU'DIA QUIN'TA. A Roman woman who strikingly disproved the charge of unchasteness brought against her. When the ship carrying the image of Cybele to Rome from Pessinus, in 204 B.C., grounded on a shoal at the mouth

of the Tiber, the soothsayers declared that it could be moved only by a pure woman; Claudia, seizing the rope, towed the ship to Rome.

CLAU'DIO. 1. In Shakespeare's *Much Ado About Nothing*, a young Florentine lord. 2. In Shakespeare's *Measure for Measure*, the lover of Juliet.

CLAU'DIUS. In Shakespeare's *Hamlet*, the King of Denmark, who poisons his brother, Hamlet's father, and marries the widow.

CLAUDIUS I (TIBERIUS CLAUDIUS NERO DRUSUS; officially TI. CLAUDIUS CÆSAR AUGUSTUS GERMANICUS) (10 B.C.–54 A.D.). Roman Emperor (41–54 A.D.). Youngest son of Nero Claudius Drusus, stepson of the Emperor Augustus, born at Lugdunum (Lyons). Since he was sickly and infirm, his education was neglected, or left to women and freedmen. His supposed imbecility saved him from the cruelty of Caligula; but Claudius in his privacy had made considerable progress in the study of history and wrote in Latin and Greek several extensive historical works now lost, on Rome, Carthage, and Etruria. After the assassination of Caligula the Pretorians, having found Claudius hiding in the palace, carried him forth, proclaimed him Emperor, and compelled his recognition by the Senate. By his payment of the troops, who had raised him to the throne, he inaugurated a baneful practice which, under the succeeding emperors, subjected Rome to a military despotism. The first acts of his reign gave promise of mild and just government; but in 42, when a conspiracy against his life was detected, his timidity led him to yield himself entirely to the guidance of his wife Messalina (q.v.), who, with the freedmen Pallas and Narcissus, practiced cruelties and extortions without restraint. Claudius lived in retirement, partly occupied in studies, and expended enormous sums in building, especially in the construction of the famous Claudian Aqueduct. This great work occupied 30,000 laborers during 11 years. He sought, too, to drain the Lacinus Fucinus. (See AVEZZANO. See also CLAUDIAN HARBOR.) He sought to introduce three new letters into the Latin alphabet. He showed himself also an able administrator, anxious for the good of his people. Abroad the armies of Claudius were victorious. Mauretania was made a Roman province, the conquest of Britain was commenced under the personal command of the Emperor, and some progress was made in Germany. After the execution of Messalina Claudius married his niece, Agrippina (q.v.), under whose influence he deprived his son Britannicus of the succession to the Imperial power and adopted Nero, son of Agrippina. When Claudius showed some inclination to deprive Nero of the succession, Agrippina caused him to be poisoned with a dish of mushrooms. After his death Claudius was deified, giving occasion to the bitter satire of Seneca, *Apocolocyntosis, Gourdification*, or *Pumpkinification*.

CLAUDIUS II (MARCUS AURELIUS CLAUDIUS, better known as CLAUDIUS GOTHICUS) (214–270), Roman Emperor (268–270). He had been Governor of Illyria and after the death of Gallienus, in 268, was proclaimed Emperor by the soldiers. In 268 he overthrew his rival, Aureolus, and conquered the Alemanni (q.v.); in 269 he defeated the Goths that menaced Mœsia, and 50,000 of them perished in battle. From this victory he gained the title *Gothicus*. Claudius died of the pest at Sirmium.

CLAUDIUS, ARCH OF. A triumphal arch at Rome, erected on the Via Lata in the Campus Martius, to commemorate the victories won by Claudius in Britain in 51–52 A.D. It was in ruins already in the eighth century.

CLAUDIUS, klou'dē-us, MATTHIAS (1740–1815). A German poet and author, associated with the *Göttingen Hainbund*, and known as "Asmus," or "Der Wandsbecker Bote." He was born at Reinfeld, Holstein; studied from 1759 to 1763 at the University of Jena; from 1771 to 1775 was editor, under the name of "Asmus," of the newly established *Wandsbecker Bote* (whence his surnames), and in 1776 of the *Landzeitung*, at Darmstadt. In the following year he returned to Wandsbeck, where he henceforth lived. He was appointed in 1788 auditor of the provincial bank of Altona, by the Crown Prince Frederick of Denmark, who had also, in 1785, granted him a small annuity. His collected works, published in 1775–1812 (eight parts), with the quaint title *Asmus Omnia Sua Secum Portans*, were in great part taken from his contributions to the *Wandsbecker Bote*. His prose is shrewd, aphoristic, with a certain naïve humor; his verse, now buoyantly merry, now patriotic, now in the best sense religious, is always fresh, simple, and sincere. Many of his lyrics, such as "Der Mond ist aufgegangen" and the "Rheinweinlied" beginning "Bekränzt mit Laub," and "Das Kartoffellied" have continued to be popular favorites throughout Germany. He also translated into German Fénelon and other writers, French and English. The collected works have been excellently edited by Redlich (12th ed., Gotha, 1882). For his biography, consult Herbst (Gotha, 1878) and Gerok (Darmstadt, 1881).

CLAUDIUS CÆ'CUS, APPIUS. A Roman patrician of the fourth and third centuries B.C. When censor, in 312 B.C., he gained many adherents by invading the traditional rights of the patricians and admitting men of low birth to senatorial rank; but his nominations were quickly set aside. At the same time he constructed the great Appian Way from Rome to Capua, and also the first aqueduct (Aqua Appia) to bring a supply of water into the city. To complete these works, he arbitrarily continued his censorship for five years, though the legal period was 18 months. (See CENSOR.) He was consul in 307 and 296 B.C., and met with success in several campaigns against the Samnites and the Etruscans. When Pyrrhus of Epirus sent Cineas to Rome with terms of peace unfavorable to Rome, it was only the eloquence of the aged Claudius that prevented the Senate from accepting them. His speech on this occasion was extant in Cicero's time. By this speech, as well as by a collection of aphorisms, and a work *De Usurpationibus*, he laid the foundations of Latin prose. In his old age Claudius is said to have become blind, whence his cognomen "Cæcus."

CLAUDIUS CRAS'SUS, APPIUS. See APPIUS CLAUDIUS CRASSUS.

CLAUDIUS NERO. See NERO.

CLAUDIUS OF TU'RIN (Lat. *Claudius Turinensis*) (?–c.830). A Spanish-Italian bishop. At first a preacher at the court of Louis the Pious, he became Bishop of Turin in 820. He was one of the most radical iconoclasts of his time and protested against the use of images, the invocation of saints, and the veneration of relics. His attitude kept him in constant controversy with Pope Paschal I. Claudius wrote

an *Apologeticum*, directed against the Abbot Theodemir, of the convent of Psalmody, near Nîmes. The abbot's part was taken by Dungall, an Irish scholar and teacher. Jonas of Orléans, at the request of the Emperor, also wrote against Claudius, but both Louis and Claudius died before the publication of his work. Claudius opposed the growing power of the Bishop of Rome. Consult a dissertation by Rudelbach (Copenhagen, 1824).

CLAUDIUS PULCHER, Appius. A Roman author, orator, administrator, and brother-in-law of Lucullus, under whom he served in Asia against Tigranes and Mithridates, in 72–71 B.C. In 57 he was prætor, in 54 proprætor in Spain; in 54 he was consul. In 53, while he was governor of Cilicia, he corresponded with Cicero (consult Cicero's *Ad Familiares*, iii). After his return to Rome, he was impeached on charges of having exceeded his authority, as governor of Cilicia, but was acquitted. In 50, as censor, he won fame by the severity with which he expelled many from the Senate; he ejected, for instance, Sallust, on charges of immorality. He favored Pompey against Cæsar and went with Pompey to Greece; he died in Eubœa, about 48 B.C. The first book of his work on augury he dedicated to Cicero, who rated him highly as an orator and respected his knowledge of augury and Roman history (*Brutus*, 267).

CLAUDIUS PULCHER, Publius. Son of Appius Claudius Cæcus, best known for a story told to explain his defeat, in 249 B.C., by the Carthaginians in a naval battle in the harbor of Drepanum. When, before the battle, he sought the *auspicia ex tripudiis* (see Auguries and Auspices), the sacred chickens refused to eat. Undeterred by this evil omen, he flung the chickens into the sea, crying, "Let them drink then." He died before 246 B.C.

CLAUS, klous, Karl Friedrich Wilhelm (1835–99). A German zoölogist, born in Cassel. He studied the natural sciences in Giessen, under Leuckart; in 1863 became professor of zoölogy in Marburg, in 1870 in Göttingen, and in 1873 in Vienna. He was also director of the zoölogical station at Triest. He was very active in the investigation of the Crustacea and is also widely known because of his *Text-Book of Zoölogy*. Of his numerous works the following are important: *Die freilebenden Copepoden* (1863); *Beiträge zur Kenntnis der Ostracoden* (1868); *Grundzüge der Zoölogie* (1868); *Ueber den Bau und die Entwicklung der Cumaceen* (1870); *Die Metamorphose der Squilliden* (1872); *Ueber die Entwicklung, Organisation und systematische Stellung der Argiliden* (1875); *Lehrbuch der Zoölogie* (6th ed., 1897; trans. into English, under the title of *Text-Book of Zoölogy*, by Claus and Sedgwick, London, 1897).

CLAUSEL, klō'zĕl', Bertrand (1772–1842). A French marshal, born at Mirepoix, in the Department of Ariège, Dec. 12, 1772. He entered the army at an early age and commanded a brigade in the Italian campaign of 1799. He was made a general of division of the Army of the North in 1802, distinguished himself in the campaign of 1809 against Austria and subsequently in the war in Spain, where, after the battle of Salamanca, July 22, 1812, he succeeded Marmont in the chief command. He conducted the very difficult retreat from Portugal with the greatest circumspection, fighting a succession of battles. Although he stood by Napoleon to the last, Louis XVIII, in 1814, named him inspector general of infantry. When Napoleon returned to France in 1815, Clausel immediately declared for him, was made a peer, and received the command of the Army of the Pyrenees. On the return of the Bourbons he was declared a traitor. He escaped to the United States and lived several years at Mobile, where he wrote his *Exposé justificatif*. During his absence he was condemned to death, but was subsequently permitted to return to France, was elected deputy in 1827 and 1830, and after the July revolution was put in command of the troops in Algeria. For his services in that capacity he was made marshal of France in 1831, but was soon afterward recalled. He was appointed Governor-General of Algeria in 1835 and once more recalled in 1837. He returned to France and defended himself, though not quite successfully, both through the press and from the tribune, against the attacks made upon him. He died at Secourrieu (Haute-Garonne), near Toulouse, April 21, 1842. Consult Clausel, *Explications du Maréchal Clausel* (Paris, 1837). See Algeria.

CLAUSEN, George (1852–). An English genre, landscape, and portrait painter. He was born in London of Danish parents, studied at the South Kensington Art Schools, was assistant to the painter Edwin Long, and afterward worked under Bouguereau and Fleury at Paris. His early pictures show the influence of various models—"La Pensee" (1880, Glasgow Museum) for instance, that of Whistler—but after a visit to Paris in 1883 he adopted the plein-air methods of Bastien-Lepage, and gradually developed an individual style with peculiarly beautiful atmospheric effects, which has placed him in the front rank of English painters with Impressionistic tendencies. His pictures usually depict the life of the English country laborer with a style of poetic conception closely approaching Millet's. Among the best known are: "The Ploughboy" (1888); "The Girl at the Gate" (1889, Tate Gallery, London); "The Mowers" (1892, Sharpley-Bainbridge collection, Lincoln); "The Ploughman's Breakfast" (1905, Melbourne Gallery); "The Gleaners Returning" (1908, Tate Gallery); "Twilight" (1909). He became known also as a painter of portraits and still life. Clausen received many medals, was elected a member and served for a time as professor in the Royal Academy. His lectures were published under the titles *Six Lectures on Painting* (1904), and *Aims and Ideals in Art* (1906).

CLAUSEN, klou'zen, Thomas (1801–85). A German astronomer, born at Nübel, in Schleswig. He early devoted himself to the study of astronomy, was for several years assistant at the observatory of Altona, and from 1842 to 1872 was connected with the observatory of Dorpat (now Yuryev), first in the capacity of observer, later as director. During his scientific career Clausen made many important contributions to astronomy and carried out elaborate calculations of the paths of comets.

CLAUSENBURG, klou'zen-bŭrk. See Klausenburg.

CLAUSEWITZ, klou'ze-vĭts, Karl von (1780–1831). A Prussian general and military writer, born at Burg. He entered the army in 1792, took part in the campaigns on the Rhine in 1793–94, and in 1801–03 attended the Berlin Academy for young officers, where he attracted the attention and won the favor of Scharnhorst.

He was adjutant to Prince Augustus in 1803–06, was captured with him by the French at Prenzlau, and, after being exchanged, served until 1812 as major in the Prussian General Staff, being employed after 1809 in the Ministry of War, under Scharnhorst. In 1810–12 he was military instructor to the Crown Prince of Prussia and to Prince Frederick of the Netherlands. At the outbreak of the Russian War in 1812 he entered the Russian service and aided Diebitsch in concluding the convention of Tauroggen. He accompanied Blücher as Russian staff officer during the campaign of 1813, the history of which he wrote, at the instance of Gneisenau. He reëntered the service of Prussia in 1814, was appointed chief of staff under Thielmann in the following year, and remained in that position at Coblenz until 1818, when he was made major general and director of the Allgemeine Kriegsschule. Finally, he was appointed, in 1831, chief of staff to Field Marshal Gneisenau and served first in Berlin, then on the Polish frontier. His writings are marked by keen analytic power, e.g., in his famous analogy between war and unrestricted competition in business. They were published after his death as *Hinterlassene Werke über Krieg und Kriegführung* (10 vols., 1832–37), of which the most noteworthy are: *Vom Kriege* (3 vols., Eng. trans. by Graham, *On War*, London, 1873); *Der Feldzug von 1796 in Italien; Uebersicht des Feldzuges von 1813; Der Feldzug von 1815; Ueber das Leben und den Charakter von Scharnhorst.* Consult Schwartz's biography (2 vols., Berlin, 1877).

CLAUSIUS, klou'zê-ụs, Rudolf Julius Emanuel (1822–88). A German physicist, born at Köslin. In 1855 he became professor in the Polytechnic Institute of Zurich, in 1867 professor in the University of Würzburg, and in 1869 professor at Bonn. Clausius is one of the founders of the modern science of thermodynamics (q.v.), and in a paper before the Berlin Academy of Sciences (1850) stated the second law of thermodynamics, that "heat cannot of itself pass from a colder to a hotter body." The theory of electrolysis advanced by Clausius has also played a conspicuous part in electricity. He assumed that the ions are not in complete union, but that a part of them are free to unite with other ions. These uncombined ions, accordingly, are brought together under the action of the current at the anode and cathode. Clausius was one of the most celebrated mathematical physicists of the nineteenth century, and his researches and writings in heat, electricity, and molecular physics were of the greatest value. His most important works are: *Die mechanische Wärmetheorie* (1876); *Die Potentialfunktion und das Potential* (1859); and *Ueber das Wesen der Wärme, verglichen mit Licht und Schall* (1857). For a biography of Clausius, consult Riecke, *Rudolf Clausius* (Göttingen, 1889).

CLAUSON-KAAS, klou'zôn-käs', Adolf von (1826–1906). A Danish promoter of manual training. He was born near Altona, Holstein, and, after serving in the Danish cavalry, devoted himself entirely to the advancement of education. In 1870 he founded the Danish Clubs for Home Industry. On the occasion of the international expositions of 1873 and 1878, he gave a series of public lectures on manual training in several cities of Germany, Holland, Russia, France and elsewhere, and also established a series of teachers' courses. In this way he encouraged the revival of working schools for boys, his primary aim being the mechanical development of the hand and of the eye in association with mental training. He conducted a number of training schools in Saxony and introduced a course of modeling and drawing in the institution for the blind at Dresden.

CLAUSS-SZAVARDY, Wilhelmina (1834–1907). One of the great pianists of the last century. She received her entire musical education at the Proksch Institute in her native city, Prague. When only 15 years old, she made her first tour of Germany and attracted considerable attention. In spite of the interest Berlioz showed in her she did not immediately succeed in Paris; but when the singer Madame Ungher-Sabastier took her under her special protection, she conquered Paris and from there in a short time France, Germany, and England. She was especially great as an interpreter of Bach and Beethoven. In 1857 she was married to the author Frederick Szavardy, who died in 1882. After 1852 her home was in Paris.

CLAUSTHAL, klous'tâl (Ger., closed valley, from Lat. *clausum*, p.p. of *cludere*, to close + Ger. *Thal*, valley). An important mining town in the Prussian Province of Hanover, situated on a plateau of the Upper Harz Mountains, about 1800 feet above sea level, and 25 miles northeast of Göttingen (Map: Prussia, D 3). It forms practically one town with Zellerfeld, which contains the Upper Harz Museum. Among its public buildings the most noteworthy is the church of the Holy Ghost, the largest wooden church in the world. The mines of Clausthal yield silver, lead, copper, iron, and zinc, and are among the most valuable and productive in Germany. They are owned and operated by the Prussian government, which has established in connection therewith a mining academy, with an experimental laboratory, model workshop, and a library of over 40,000 volumes; the number of its students in 1913 was 138. The greater portion of the male population finds employment in the mines and smelting works, while the women are occupied in the knitting mills. Pop., 1900, 8565; 1905, 8632; 1910, 8266. Clausthal was founded in the twelfth century, and a new settlement was established there by the dukes of Brunswick in the sixteenth century.

CLAVA'RIA (Neo-Lat. nom. pl., from Lat. *clava*, club). A genus of fungi belonging to the Hymenomycetes. They are known in general as the coral fungi, their fleshy sporophores often simulating branching coral in form. The spores are produced over the whole surface of the branches. There are also forms with unbranched, club-shaped sporophores. Some of the forms are edible and seem to be used in Germany more than in other countries. *Clavaria botrytis*, a species common in oak and beech woods, growing on the ground among moss, grass, heath, etc., is gathered when young, and used as food, having a very agreeable sweetish taste. Another German species, *Clavaria flava*, which grows on sandy ground in fir woods, is used in the same way. Other species appear to possess similar properties, and Liebig found them to contain the saccharine substance called "mannite." *Clavaria botrytis* is the *Keulenpilz*, and *Clavaria flava* the *Ziegenbart* (goat's beard) of the Germans. See Colored Plate of Edible Fungi accompanying the article Fungi.

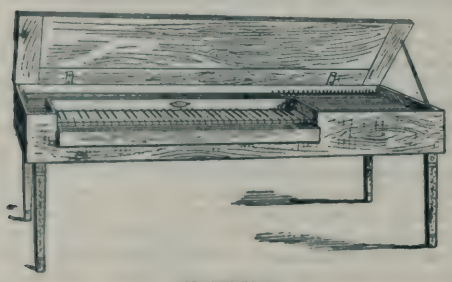
CLAVENNA. See Chiavenna.

CLAVERACK, klăv'ẽr-ak. A town in Co-

lumbia Co., N. Y., including Philmont village, 30 miles south of Albany, and 3 miles east-southeast of Hudson, its banking point, on the Boston and Albany Railroad (Map: New York, G 6). Among the points of interest are a Dutch Reformed Church, built in 1767, an old court-house, erected in 1784, a home for crippled children, public library, and *Tribune* Fresh Air Home, for children. The chief industries are agriculture and the manufacture of flour and farm implements. Settled as early as 1660, Claverack (named "Klauver Rachen," 'clover reaches,' by the Dutch) was organized as a town in 1778 and was the county seat from 1786 to 1806. The government is administered by town meetings, held every two years. Pop., 1900, 4416; 1910, 4114.

CLA'VERHOUSE. See GRAHAM, JOHN.

CLAVICHORD, klăv'ĭ-kôrd (Fr. *clavicorde*, ML. *clavichordium*, from Lat. *clavis*, key + *chorda*, string). An instrument of the harpsichord family and an important step in the evolution of the pianoforte. Its history previous to the fifteenth century is unknown, but it is generally believed that the instrument originated by applying to the monochord (q.v.) the keyboard of the organ. The clavichord was shaped like the square pianoforte, having a keyboard of



CLAVICHORD.

four octaves and strings of brass wire set in vibration by the action of tangents or "jacks" covered with metal. Its tone, though weak, was delicate, and, unlike the harpsichord, or spinet, in which the strings were plucked or twanged by quills or pieces of hard leather, it responded in a measure to the gradations of the player's touch. The clavichord was used in Germany until the beginning of the nineteenth century. Bach preferred it to the pianoforte of his day and wrote an essay for his son, *Versuch über die wahre Art Klavier zu spielen*, for this instrument. Mozart used the clavichord in composition, and Beethoven preferred it to other keyed instruments, for upon it, he said, "one could best control tone and expressive interpretation." As recently as 1896 Mr. Arnold Dolmetsch of Boston had several clavichords built after old models for use in his concerts of ancient music. Consult: A. J. Hopkins, *Old Keyboard Instruments* (London, 1887); K. Krebs, *Die besaiteten Klavierinstrumente bis zum Anfang des 17 Jahrhunderts* (Leipzig, 1892); F. A. Goehlinger, *Geschichte des Klavichords* (Basel, 1910). See HARPSICHORD; SPINET.

CLAV'ICLE (Lat. *clavicula*, a little key, dim. of *clavis*, key), or COLLAR BONE. A long bone, curved somewhat like the italic letter *f*, and placed at the upper and anterior part of the thorax, in a nearly horizontal position. In connection with the scapula or shoulder blade, the clavicle forms the shoulder and is the only bony connection between the upper extremity and the trunk. The inner extremity of the clavicle articulates with the sternum (breastbone) and the cartilage of the first rib, while the outer extremity articulates with the scapula. The range of motion in the clavicle is extensive—especially in a vertical direction—and the various movements of the arm are in this way readily accommodated. In the female the clavicle is smoother, slenderer, and presents a less marked curve than that of the male. The length, also, is slightly less, and the position more nearly horizontal. Manual labor, which brings the shoulder into constant exercise, renders the clavicle thicker and tougher, and therefore in right-handed people the right clavicle shows greater development.

Since the clavicle favors the lateral movements of the upper extremities, we do not find it in animals whose fore limbs are used only for progression; but it is present in almost all animals whose anterior extremities are clawed and used for prehension.

The clavicle is frequently fractured by direct violence and also by indirect force, as in falling upon the hand. Dislocations are of less frequent occurrence.

Ossification of the clavicle begins very early—even as soon as the thirtieth day, according to Béclard—and at birth this process is almost complete.

CLAVIER, klă-vēr' (from Lat. *clavis*, key). The German name for the pianoforte, and the prototype of the clavichord (q.v.). In French, "clavier" designates the keyboard of an organ or pianoforte. For the practice clavier, see PIANOFORTE.

CLAVIGO, *Span. pron.* klä-vē'gô. A play by Goethe (1774), based on an episode in the life of José Clavijo y Fajardo, a Spanish official and journalist.

CLAVIJERO, or **CLAVIGERO,** klä'vê-hā'rô, FRANCISCO XAVIER (1731–87). A Mexican historian, born in Vera Cruz. He early entered the Order of the Jesuits and became a teacher of rhetoric and philosophy. He lived among the Indians in various parts of Mexico as a missionary for many years and made himself fully acquainted with the languages, traditions, and antiquities of the aboriginal tribes. On the expulsion of the Mexican Jesuits by Spain, in 1767, he sailed for Italy, and with others of his order settled in Ferrara, passing later to Bologna, where he founded an academy. He wrote, in Spanish, a work on early Mexican history; but, in order to publish it, he was obliged to translate it into Italian. The work finally appeared as *Storia antica del Messico* (1780); it is a comprehensive and valuable history of the Aztec period. An English translation was made by C. Cullen (London, 1787; 2d ed., ib., 1807). Clavijero also wrote works on physics and philosophy, and the *Storia della California* (1789), which was translated into Spanish by Nicolás García de San Vicente, as *Historia de la Antigua ó Baja California* (Mexico, 1852).

CLAVIJO, RUY GONZÁLEZ DE (?–1412). A Spanish traveler in the Orient. He was born in Madrid and in 1403 was sent by Henry III of Castile as Ambassador to Tamerlane. The route followed by him from his point of departure, Cadiz, took him to Trebizond, Armenia, Persia, and Khorasan. He arrived at Samarkand in 1404 and was well received at the court of Tamerlane. The return journey was accom-

plished (partly after the death of Tamerlane) amid the greatest dangers and difficulties. Upon his arrival in Spain in 1406 he reported at once to the King, whose court was then at Alcalá de Henares, and served thereafter as chamberlain, until the King's death in 1407. The "journal" of Clavijo was published under the title *Historia del gran Tamerlán ó itinerario y narración del viaje*, etc. (1582; reprinted in 1782). It is valuable, not only because of its high literary merit, but also for its historical importance. There are editions, equipped with dissertations and notes, by Gonzalo Argote de Molina (Sevilla, 1582) and Antonio de Sancha (Madrid, 1782). An English version by Sir Clements Markham bore the title *Narrative of the Embassy of R . . . G . . . , de Clavijo to the Court of Timour* (Hakluyt Society, 1859).

CLAVILEÑO, *Sp. pron.* klä'vê-lā'nyô, El Aligero. The wooden horse, said to have been constructed by Merlin, which was managed by a wooden pin in its forehead; whence its name, "the winged pin timber."

CLAXTON, Kate (Mrs. Charles A. Stevenson) (1850–). An American actress, born at Somerville, N. J. She made her first appearance on the stage in Chicago with Miss Lotta in 1870, and in the same year joined Augustin Daly's Fifth Avenue Theatre in New York. In 1872 she became a member of A. M. Palmer's Union Square Theatre, playing largely comedy rôles. She created the part of Louise in *The Two Orphans* and then became known as one of the best emotional actresses of her time. Her first starring tour was in 1876. In 1878 she was married to Charles A. Stevenson.

CLAXTON, Philander Priestly (1862–). An American educator, born in Bedford Co., Tenn. He was educated at the University of Tennessee and at Johns Hopkins. From 1883 to 1893 he was a superintendent of schools in North Carolina. In the latter year he became professor of pedagogy and German at the North Carolina State Normal and Industrial College, and in 1896 director of that institution's Practice and Observation School. From 1902 to 1911 he was professor of education, and from 1906 to 1911 also professor of secondary education and inspector of high schools at the University of Tennessee. He was also editor of the *North Carolina Journal of Education* (1897–1901) and of the *Atlantic Educational Journal* (1901–03), and was superintendent of the Summer School of the South from 1902 to 1911. In the latter year he was appointed United States Commissioner of Education.

CLAXTON, Thomas Folkes (1874–). An English astronomer, born in London. In 1890 he became an assistant at the Royal Observatory, Greenwich, and after one year (1895) as assistant director of the Royal Alfred Observatory, Mauritius, he served as director until in 1912 he went to Hongkong to be director of the Royal Observatory there. His publications include: *Annual Magnetic and Meteorological Observations, Mauritius* (1896–1910); *Seismological Observations* (1898–1910); "Magnetic Survey, Pamplemousses," in the *Proceedings of the Royal Society*, vol. lxxvi (1905).

CLAY (AS. *clæg*, Ger. *Klei;* ultimately connected with Lat. *glus, gluten*, glue, Gk. γλοιός, *gloios*, gum, OCh. Slav. *glĕnŭ*, slime). A term applied to earthy material or soil which shows plasticity when wet, thus permitting it to be molded into any desired form, which it retains when dry. Its distinguishing character is a physical one; for clay varies widely in other respects, being made up of fine mineral fragments, the most prominent of which may be the mineral kaolinite, a hydrated silicate of alumina. Clay is formed primarily by the decomposition of feldspathic or other silicate rocks in situ; such a clay is said to be *residual* in its nature and shows a gradation into the parent rock below. Residual clays from limestone are formed by a leaching out of the lime carbonate, the clayey impurities of the rock being left behind, and in these there is no transition zone. The residual material is often washed down into the lakes or ocean by the surface waters and there spread out over the bottom as an aluminous sediment; such a clay deposit being known as a *sedimentary* one, which is not only stratified, but may also be more extensive than a residual. Sedimentary clay sometimes becomes consolidated by the pressure of other sediments which have been deposited on top of it, and it is then termed shale. These shales, on grinding and mixing with water, develop the same plasticity as does soft clay. Glacial clays, while of transported character like the other sedimentary ones, consist of a variable mixture of ground-up rock flour and residual material gathered up by the ice.

The chief chemical constituents of clay are silica and alumina; but, in addition to these, variable quantities of iron oxide, lime, magnesia, alkalies, water, and even rarer substances are often present. These ingredients affect the physical properties of the clay; such as its color when burned, air and fire shrinkage, refractoriness, plasticity, and thus indirectly its uses. The lime, magnesia, iron oxide, and alkalies exert a fluxing action in burning, and the greater their quantity the lower the fusing point of the clay. Silica decreases the air and fire shrinkage of a clay, while alumina and water have the reverse effect.

The property of plasticity, together with that of hardening under fire, makes clay an article of great value in the plastic arts. Those clays which are low in plasticity are said to be "lean," while the highly plastic varieties are "fat." It is now believed that the plasticity depends in part on the fineness of grain and in part on the amount of colloidal substances present. Clay does not fuse suddenly, but softens gradually under the influence of heat. In very fusible clays this sintering may begin at 1500° or 1700° F., while in very refractory kinds it does not take place until a temperature of 3000° F. or more is reached. The red color of a burned clay is due to considerable iron oxide, while buff is produced by a small quantity of iron or by an excess of lime. The following table gives the composition of several grades of clay:

	1	2	3	4	5	6
	%	%	%	%	%	%
SiO_2	62.40	45.78	54.23	68.54	63.31	60.59
Al_2O_3	26.51	36.46	32.80	18.49	16.57	12.46
Fe_2O_3	1.14	1.08	.21	3.38	4.06	5.79
CaO	.86	.50	....	1.03	1.11	6.84
MgO	.01	.04	....	.88	1.10	3.28
Alkalies	.10	.25	....	2.37	3.16	4.39
H_2O	13.35	13.40	11.24	4.62	6.89	4.36
Moisture	....	2.05	....	1.52	3.76	1.46

(1) Crude kaolin, Webster, N. C.; (2) Washed kaolin, Webster, N. C.; (3) Fire clay, Wymp's Gap, Pa.; (4) Paving-brick shale, Kansas City, Mo.; (5) Brick clay, Indianola, Iowa; (6) Calcareous slip clay, Albany, N. Y.

Clay is used in the manufacture of common, pressed, and paving brick; terra cotta, fireproofing, terra cotta lumber; roofing, floor, and glazed tile; fire brick, retorts, crucibles, muffles, and other refractory goods; all grades of pottery, stoves, sewer pipe, door knobs, electrical insulators, turbine wheels, closets, bathtubs, and washtubs; filters, mineral paint, food adulterants, Portland cement, paper fillers, emery wheels (as a cement therein), ultramarine, modeling, soap, etc.

Clay is widely distributed geographically, and also geologically, i.e., in the formations of different ages. In the United States deposits are found at a great number of localities. The Cretaceous clays of New Jersey are much used in the manufacture of refractory goods, while the Carboniferous clays of Pennsylvania and Ohio are extensively employed for making fire brick. In Colorado and California the Cretaceous and Tertiary formations are worked at many points for fire clays. Kaolin is quarried at several points in North Carolina and Georgia; much white ball clay is found in Florida, Tennessee, and Kentucky, and stoneware clay in Illinois and Missouri. Clays suitable for brick, terra cotta, and sewer pipe occur at many points all over the United States. In the Central States clays suitable for the manufacture of vitrified paving brick are actively worked. With all this supply, however, much ball clay and kaolin is imported, the material coming chiefly from England. Over $172,000,000 worth of clay products are produced annually in the United States alone.

The different varieties of clay are as follows:

KAOLIN (q.v.) or CHINA CLAY. A white-burning clay, used in the manufacture of porcelain and white earthenware. It is of residual origin and often occurs in the form of veins.

FIRE CLAYS (q.v.). Clays containing a low percentage of fluxes and hence capable of resisting high temperatures. They are used in the manufacture of all classes of refractory goods and sometimes also for making pressed brick and terra cotta.

FLINT CLAY. A dense, hard, nonplastic fire clay, found chiefly in the Carboniferous formations of Pennsylvania, Ohio, and Kentucky.

PIPE CLAY. A term applied to many smooth, highly plastic clays.

BRICK CLAY. A term including almost any impure clay which can be molded into bricks.

TERRA-COTTA CLAY. A grade of clay used for making terra cotta (q.v.). It includes many varieties.

SLIP CLAY. An easily fusible clay, which melts to a translucent glass and is used for glazing the cheaper grades of pottery.

POTTERY CLAY. A term applied to any clay used in the manufacture of pottery.

SAGGAR CLAY. A grade of fire clay used for making saggars, or vessels in which fine pottery is placed during baking in the kiln.

ALUM CLAY. A clay containing a large amount of alum.

MARLY CLAY. A clay containing from 20 to 30 per cent of lime carbonate.

GUMBO CLAY. A very plastic, sticky clay, found in many localities in the Central States and often used in the manufacture of railroad ballast.

BALL CLAY. A plastic, white-burning clay, used as a bonding ingredient in white ware and porcelain bodies.

PAPER CLAY. One of very fine texture and white color, used for filling paper.

ADOBE. A sandy, often calcareous, clay used in the West and Southwest for making sun-dried brick.

Clay Mining and Working. Deposits of clay and shales lying at or near the surface are worked as open pits. The surface dirt is first removed by digging, scrapers, steam shovels, or hydraulicking. The clay, if hard, is loosened by blasting and then dug by any of the methods (except hydraulicking) mentioned above. Beds of clay or shale lying under heavy overburden are worked by underground methods if the clay is of sufficient value to make such wares as fine brick, sewer pipe, or face brick.

Kaolins and some ball clays are put through a washing process to remove sandy impurities. This consists in dumping the clay with plenty of water into a disintegrating machine, from which the water and suspended clay traverse a great length of troughing, in which the sand settles out and finally reaches the settling tanks. Here in quiet water the clay settles to the bottom of the vat. The supernatant water is drawn off, and the creamy mixture of clay and water in bottom is forced by means of pumps into filter presses, where the water is squeezed out. The clay is then dried and shipped to market.

Clay working or tempering of some sort is generally required before clay can be used, and particularly before it can be molded into brick, pottery, sewer pipe, or tiles. Reduction to a plastic state may be effected by wet or dry grinding, screening, pugging, washing, or by the more natural process of weathering; or a combination of two or more of these methods may be employed. The screening and washing may be so arranged as to remove foreign material. It must be understood that the term "clay working," as here used, is limited to the preparation of the raw material for molding or forming, the other processes being treated separately, under the various clay products, as will be the matter of drying; while burning, for the most part, will be discussed under KILN.

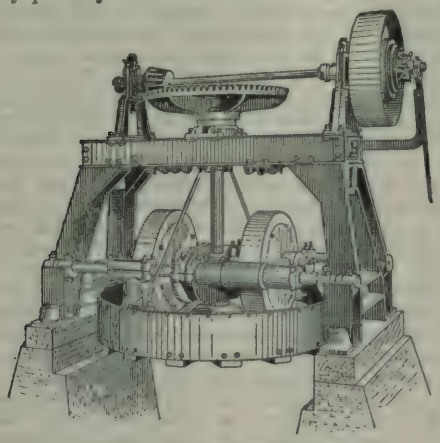
Weathering is a self-explanatory term. The time involved may range from months to years, but is more often the shorter period. With improvements in machinery and methods, less dependence is placed on this process than formerly.

Soaking, like weathering, is a natural process, but it is now used only under primitive conditions, and where the clay is molded in a soft form, without other working. The clay is simply shoveled into pits, say 4 × 6 feet in extent, and soaked in water over night.

Ring pits are 25 to 30 feet in diameter, 3 feet deep, lined with brick or boards. An iron wheel is passed over or through the clay, back and forth, mixing in the sand, in case any is used. Clay for some 30,000 bricks may be tempered in six hours.

Grinding is accomplished by passing the clay between rolls, or in dry pans, the former process being particularly applicable to shales. The pans are 7 to 9 feet in diameter, with perforated floors, through which the material falls as soon as it has reached the desired fineness. The pan revolves horizontally and by means of friction motion is imparted to two iron wheels, mounted

in the pan, 6 to 14 inches wide, weighing 2000 to 6500 pounds each. A pan with one-eighth-inch holes has an average capacity of 100 tons of clay per day of 10 hours.

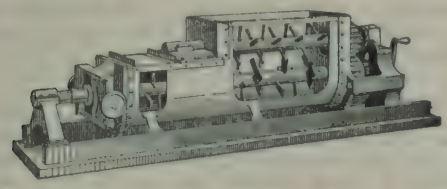


DRY-PAN CLAY-GRINDING MACHINE.

Screening is sometimes employed for clay which has passed the dry pan. Screens may be inclined sieves, either fixed or shaking, and rotary cylindrical or octagonal in form. Some demand much attention to prevent clogging, and require heavy repairs, but nevertheless are cheap and simple in operation.

Wet pans are much like dry pans, only their bottoms are not perforated, and scrapers are placed in front of the wheels, to throw up the clay. They may be discharged through a trap-door or by means of an automatic shovel. One of their chief advantages is rapidity, only two or three minutes being required to temper a charge for brick and four or five minutes for sewer pipe.

Pug mills appear to be used more than other classes of tempering machines. They are either vertical or horizontal, but in either case they have a central revolving shaft, fitted with radial knives extending nearly to the surrounding cylinder in which the clay is placed. The knives



PUG MILL FOR MIXING CLAY.

force the clay forward, as well as work it thoroughly, and by changing the angle of the adjustable knives the speed of the passing clay may be regulated. Water is admitted as desired and needed. Pug mills are compact and require less power than ring pits.

CLAY, ALBERT TOBIAS (1866–). An American Semitic archæologist, born in Hanover, Pa. He graduated at Franklin and Marshall College in 1889 and at the Lutheran Theological Seminary in 1892; was ordained to the Lutheran ministry in the latter year; was fellow in Assyrian and instructor in Hebrew at the University of Pennsylvania, to which, after being instructor in Old Testament theology at the Chicago Lutheran Seminary in 1895–99, he returned as lecturer in Semitic archæology. He was assistant professor of Semitic philology and archæology there in 1903–09, and full professor for one year; and in 1910 became Laffan professor of Assyriology and Babylonian literature. His most important publications were Babylonian business and legal documents, especially *Business Documents of Murashû Sons of Nippur* (1898 et seq.). Clay also wrote "Personal Names," an article in *Studies in Memory of W. R. Harper from Cuneiform Inscriptions of the Cassite Period* (1912), and in an article (1908) on Aramaic indorsements on these documents he points out the value of Aramaic transliterations of Babylonian proper names. His *Amurru, the Home of the Northern Semites* (1909) shows the non-Babylonian origin of Israelite culture and religion.

CLAY, BERTHA M. The pen name of THOMAS W. HANSHEW (q.v.).

CLAY, CASSIUS MARCELLUS (1810–1903). An American abolitionist and politician, born in Madison Co., Ky. He graduated at Yale in 1832, returned to Kentucky to practice law, and was elected to the State Legislature in 1835, in 1837, and in 1840, but in 1841 failed of reëlection on account of his strong antislavery opinions. In 1844 he made speeches in the Northern States in advocacy of the election of Henry Clay to the presidency, and in the following year opposed the annexation of Texas and established at Lexington, Ky., the *True American*, a vigorous antislavery paper, which, however, was suppressed by a mob, but was revived by Clay and was published thereafter in Cincinnati. He volunteered for service in the Mexican War in 1846 and was taken prisoner. In 1850 he left the Whig party and was the antislavery candidate for Governor. In 1860 he supported Lincoln and in 1861 was appointed Minister to Russia, but returned to the United States in 1862 and was made major general of volunteers. In 1863, however, he resigned and was again appointed Minister to Russia, where he remained until 1869. He supported Greeley in 1872 and Tilden in 1876, but went over to the Republican party to vote for Blaine in 1884. In the campaign of 1896 he was in the gold-standard wing of the Democratic party. Consult Greeley, *The*

Life, Memoirs, Writings, and Speeches of Cassius Marcellus Clay (2 vols., Cincinnati, 1886).

CLAY, CLEMENT CLAIBORNE (1819–82). An American politician, born at Huntsville, Ala. He graduated at the University of Alabama in 1835 and was admitted to the bar in 1840. From 1842 to 1845 he was a member of the State Legislature, from 1846 to 1848 was judge of the Madison County Court, and in 1853 was elected to the United States Senate. Upon the secession of his State he withdrew from the Senate and was forthwith elected to the Confederate Congress. Having taken refuge in Canada at the overthrow of the Confederacy, he later gave himself up, and in 1865–66 was imprisoned at Fortress Monroe with Jefferson Davis.

CLAY, GREEN (1757–1826). An American soldier. He was born in Powhatan Co., Va., became a pioneer settler in Kentucky, then a part of Virginia, about 1776, represented the district for some time in the Virginia Legislature, and was a member of the State Constitutional Convention of 1799. In 1813 he led the force of 3000 which relieved General Harrison, then besieged by the British and Indians at Fort Meigs, and afterward defended that fort against General Proctor and Tecumseh. He was the father of Cassius Marcellus Clay and a cousin of Henry Clay. See FORT MEIGS.

CLAY, HENRY (1777–1852). A noted American statesman and party leader, born on April 12, 1777, in a district known as the "Slashes," in Hanover Co., Va., whence he derived his first popular nickname of "The Mill Boy of the Slashes." His father was a Baptist clergyman, who died when young Clay was only four years old. His mother soon after married again, and her second husband, one Henry Watkins, placed Clay in a retail business house in Richmond, where he remained for four years (1791–95). He showed much diligence in his daily work, but read assiduously during his leisure hours. He was one of seven sons, but he alone manifested, at an early age, qualities of mind which attracted the notice of all who met him. Consequently he was employed by Chancellor George Wythe of the High Court as an amanuensis, and his quick intelligence led his accomplished employer to recognize great possibilities in the youth. His intercourse with Wythe did a great deal to stimulate Clay's natural ambition and to lay the foundation of his subsequent career as a party leader. Clay's personality was, even at this time, remarkable. With no physical attractions, he nevertheless possessed that indescribable quality called magnetism, and this was destined to win for him the intense devotion of a great party and the liking of a host of his countrymen. In Richmond he pursued some desultory studies and a special course of one year in the office of Attorney-General Brooke. He mastered so readily the principles of law that he was admitted to the bar at the age of 20, when he left Richmond and began practice in Lexington, Ky., at that time a frontier "city." Clay afterward regretted what he called his "neglected education" and the lack of systematic instruction. However, among the pioneers and frontiersmen these defects were not perceptible, and, compared with associates, Clay was well read. His boldness, ardor, and frankness soon won him a host of friends, and he soon attained more than a local reputation as a jury lawyer. Naturally enough, he entered politics and in 1799 was a member of the convention which revised the constitution of the State. It is to be noted that here he first took a definite stand, with some loss of personal prestige, in opposing the perpetuation of slavery. He soon regained his popularity, however, by his effective attacks upon the much-hated alien and sedition laws (q.v.). In the year last mentioned he married Miss Lucretia Hart, whose father was a man of some wealth and social standing, and this marriage gave him a certain independence as well as domestic happiness. By his wife he had 11 children, to whom he showed himself always a devoted father. About the year 1800 he purchased an estate of 600 acres near Lexington, to which he gave the name of Ashland, and which for 50 years was destined to be a sort of Mecca to political pilgrims on every kind of errand. Here he kept open house, gained more and more reputation as an orator and a lawyer, and finally gave up criminal practice, which was always distasteful to him, the more so because of his success in defending persons accused of murder, not one of whom was ever convicted as soon as Clay appeared in his behalf. As Clay once said himself, "I fear that I have saved too many who ought to be hanged."

From defending criminals, Clay became the public prosecutor; but in 1803 he was sent to the Kentucky Legislature. In 1806 he was appointed to fill an unexpired term in the United States Senate, where at once he became a national figure, showing great ability in debates and as a member of important committees. He advocated internal improvements at the national expense, the construction of great roads, the application of surplus revenue to promote public education and for the improvement and facilitation of every means of intercourse throughout the rapidly growing Republic. At this time Clay was described, by William Plumer of New Hampshire, as "intelligent, frank, and candid," "a man of talents," and also as "a man of pleasure—fond of amusements." Mr. Plumer's summing up is also interesting: "He declaims more than he reasons. He is a gentlemanly and pleasant companion, a man of honor and integrity." Clay's term lasted for only a few months; and he declined to be a candidate for the next Congress, preferring to continue his practice of law in Kentucky. He had already appeared before the Supreme Court of the United States and was now widely known. In 1808 he was reëlected to the State Legislature, where he became Speaker. It was in no spirit of localism, however, that the body over which he presided was now to act. American feeling had been deeply stirred by the impressment and blockade policy of Great Britain; and in the South and West this feeling flamed out intensely. The Kentucky Legislature sought to pass a law providing that no decision of any British court nor any elementary British work on law should thereafter be cited as an authority. This resolution would certainly have been passed by an immense majority, had not Clay left the Speaker's chair and delivered an impassioned appeal which was never reported, but which has become traditional as an oration of remarkable power. Carl Schurz describes it as "saving for Kentucky the treasures of English jurisprudence." Nevertheless, Clay took the lead among those who favored a war with Great Britain, and he, with John C. Calhoun (q.v.), soon became known as "the War Hawks." He was personally involved in the first of several duels which he

was destined to fight, the most notable of them being his affair with the brilliant and irascible John Randolph (q.v.) of Roanoke. In 1809 Clay was again appointed to fill a vacancy in the United States Senate, where he continued his former policy and championed the protection of American industry, though he opposed the plan for chartering a United States Bank on the ground that such a measure was corrupt and unconstitutional—an opinion which he afterward reversed and thereby made himself much criticized for inconsistency.

In 1811 Clay was sent to the national House of Representatives, where he was immediately chosen Speaker. His bold and vigorous course did much to precipitate the War of 1812, for the prosecution of which he advocated an increase in the army and of other measures which greatly enhanced his popularity throughout the country. In 1814 he was one of the commissioners sent to negotiate a treaty of peace with Great Britain, being associated with John Quincy Adams, Bayard, Jonathan Russell, and Albert Gallatin. This commission succeeded in arranging the Treaty of Ghent (q.v.). Upon Clay's return in 1815 he received a magnificent reception from his countrymen, to whom peace was now as grateful as war had once seemed to be inspiring. Clay received the offer of a mission to Russia, but declined it so that he might enter once more the House of Representatives, to which he had been reëlected in his absence and of which he once more became Speaker. This office he preferred to a cabinet position which was tendered him, on the ground that it gave him a wider field as a party leader and for the advocacy of great measures which he viewed as essential to the future welfare of the United States. Clay, indeed, was one of the few statesmen of that time who had sufficient imagination to see the coming greatness of his country; and in this respect his political sagacity was even in advance of that of Daniel Webster (q.v.), whose intense nationalism was of slower, if of more steady and substantial, growth than Clay's. In 1816 Clay urged the passage of a moderately protective tariff bill and the resumption of specie payments; while with Calhoun he helped pass an act providing for internal improvements and succeeded in having it made a law over the veto of President Madison. When the Fifteenth Congress met in 1817, Clay was again chosen Speaker. He now ardently advocated the recognition by the United States of the South American republics which had declared their independence of Spain and of whose interest Clay remained consistently a vigorous champion. He continued to act as Speaker in the following Congress, where he was one of the few prominent statesmen who sharply criticized the administration of President Monroe during what was popularly known as "the Era of Good Feeling." In 1820 there was brought about the famous Missouri Compromise (q.v.), which for the time insured fairly harmonious relations between the North and the South. In 1821 Clay effected an arrangement by which Missouri might be admitted as a slave State, but on the understanding that citizens of other States should be permitted to settle in Missouri. These arrangements gave Clay a third popular nickname, "The Great Pacificator." Two years later, Clay refused a further reëlection to Congress and for a time engaged in highly profitable legal practice, being retained as permanent counsel for the Bank of the United States in Ohio and Kentucky. It was impossible, however, for Clay to remain long outside the sphere of national politics. In 1823 he was once more elected to the national House and was again chosen Speaker. He had long been regarded as an eligible candidate for the presidency, and in 1824 he became such a candidate, his competitors being Andrew Jackson (q.v.), William H. Crawford of Georgia, and John Quincy Adams. In the election no candidate received a majority of the electoral votes, Clay standing fourth upon the list. Therefore, when the election was thrown into the House, Clay's name could not be presented according to the Constitution, and he gave his personal support to Adams, who was chosen. Clay thereby gained the title of "President Maker." When Adams subsequently appointed Clay to be Secretary of State, a great outcry arose to the effect that Clay's appointment was the result of a corrupt bargain between himself and Adams—a charge which the character of the two men ought to have been sufficient to refute, but which, nevertheless, long cast a blight upon Clay's reputation for political integrity. It was then that John Randolph spoke of Clay's association with Adams as "a combination of the Puritan with the blackleg," a bitter denunciation which led to the duel between Clay and Randolph. This duel was fought with pistols, and at the first discharge neither combatant was wounded. Randolph refused to fire a second time, thus ending the encounter.

The secretaryship of state, formerly regarded as a stepping stone to the presidency, proved an obstacle to Clay, and though he made an excellent official, he regretted his long absence from Congress, where he could always lead. A strong opponent of General Jackson as a candidate for the presidency, he retired with Mr. Adams after the latter's defeat in 1829. Two years later, he was elected to the Senate. Here, in the difficult rôle of Senator and presidential candidate, he was prominent in his advocacy of the protective system, which he dubbed unreasonably, but successfully, the "American system." Unanimously nominated by the Whigs, Clay was overwhelmingly defeated by Jackson (1832), largely on account of his tariff theories, and his unwise choice, as a party issue, of the defense of the National Bank. When the Nullification (q.v.) controversy arose, Clay's compromise of 1833 prevented a resort to arms by satisfying South Carolina with regard to the reduction of the obnoxious tariff and rendering the Force Bill unnecessary. In the subsequent antislavery agitation he occupied a moderate position, but lost few opportunities of opposing the administration of Jackson. Throughout this period of his career Clay shared the honors of the Senate in its time of meridian glory with Daniel Webster, John C. Calhoun, and Thomas H. Benton (qq.v.).

During the Democratic administration of Martin Van Buren (q.v.) Clay led the opposition to an independent treasury system, though his opposition was unsuccessful. In 1840, much to his chagrin, he failed to receive the Whig nomination for the presidency, but loyally supported General Harrison, after whose election Clay endeavored successfully to repeal the subtreasury act, but was unsuccessful in his endeavor to have a new United States Bank incorporated. A law incorporating such a bank was passed by Congress, but was vetoed by President Tyler, who had succeeded Harrison on the latter's death.

Clay quite unwisely succeeded in forcing through both houses of Congress (1841) a bill providing for the distribution among the several States of the proceeds from the sale of public lands. When Tyler broke away from the Whig party which had elected him, Clay showed himself to be a great master of men; and he headed the Whigs in their bitter opposition to a President who was popularly regarded as a "renegade." He resigned his seat in the Senate (1842), and two years later was nominated for the presidency against James K. Polk of Tennessee. The presidency was lost to Clay because he had hesitated to take firm ground against the annexation of Texas. He was therefore opposed by the abolition party ("Liberty Party"), which supported James G. Birney (q.v.). Clay's defeat was extremely bitter to him and was absolutely crushing to those who had followed him so loyally and with so much ardent devotion for many years. Never again was there any real chance of his securing the one great prize for which he had contended; and, like Daniel Webster, he was doomed to disappointment in the Convention of 1848 which nominated General Taylor. In that year, however, he was reëlected to the Senate and did everything in his power to allay the increasing friction between the Northern and the Southern States, which grew fiercer and more intense after the close of the war with Mexico. Clay now showed himself a genuine patriot and lover of his country. He himself once said, "If any one desires to know the leading and paramount object of my public life, the preservation of this Union will furnish him the key." This sentence was strictly true; and his series of resolutions, which became known as the Compromise of 1850 (see COMPROMISE MEASURES), undoubtedly postponed for at least a decade the outbreak of a civil war. Clay, like Webster, was censured as showing weakness in his willingness to compromise; but time made clear the wisdom of his action. The country was not yet ready to pass through the storm and stress which came in 1861 and with which Abraham Lincoln had to deal. The 10 years which followed the great Compromise so strengthened the feeling of nationality which both Clay and Webster had done their best to foster and to stimulate as to make possible the preservation of the Union and the transformation of the United States into a compact and permanent political entity. By his eloquence and his grasp upon the imagination of his countrymen Clay stood forth as the embodiment of national unity, and for this he must always be remembered as one of the greatest of American party leaders. The principle for which he contended was positive and not negative, and he fought for it with all the ardor and brilliancy of his nature. His last speech in the Senate was on the subject of a revision of the tariff of 1846. Unable to occupy his seat for more than a few days of the session of 1851–52, owing to his failing health, he continued to the end to manifest an interest in public affairs. The last incident of importance in his career was his interview with Kossuth, when, a short time before his death, he warned the Hungarian patriot of the futility of soliciting the interference of the United States in the internal affairs of Europe and declared the true policy of this country in dealing with foreign nations to be that set forth by Washington in his Farewell Address. Sinking rapidly after this, he died in Washington, June 29, 1852, in the seventy-sixth year of his age.

Perhaps no American statesman has ever possessed so attractive a personality as Henry Clay. He lacked the grim determination of Andrew Jackson. He had not the depth nor the incisive logic of Webster. He must be held inferior to Lincoln in a certain indescribable instinct for the absolute right, even though he himself was the author of the famous saying that he would rather be right than be President. But there was about him a chivalrous gallantry, a fire, and an intensely magnetic quality that are very rare in men. His love of country cannot be questioned. His personal integrity was without a blemish. If he was not a strict moralist, he was at least a man of honor; and he was loved with a devotion that few men in American public life have ever won. Carl Schurz ranks him above Webster as an orator, yet this estimate is incorrect. Clay's speeches, so far as they have been preserved, do not explain the extraordinary effect which they produced in those who heard them. This effect must be ascribed less to the substance of what he said than to the power of his personality, whereas Webster both impressed his auditors by his presence and swayed them by a remarkable combination of clear thought and magnificence of diction. Clay never spoke such sentences as those which continue to thrill the reader of Webster's great reply to Hayne. He must therefore be set in the second rate of orators rather than in the first; yet the impression that he made on his contemporaries is described in Lincoln's dictum that Clay was "the *beau idéal* of a statesman."

Bibliography. For Clay's speeches and writings, see Colton, *The Life and Times of Henry Clay* in the revised edition (6 vols., New York, 1864). The standard biography is that of Schurz in the *American Statesmen Series* (2 vols., Boston and New York, 1887). For an estimate of his oratory, see H. T. Peck, "Some Notes on Political Oratory," in *The Personal Equation* (New York, 1898); and id., in G. R. Carpenter's *American Prose*, pp. 101 et seq. (last reprint, ib., 1913). On Clay in general, consult also: C. H. Peck, *The Jacksonian Epoch* (ib., 1906); Orth, *Five American Politicians* (Cleveland, 1906); the histories of Schouler and J. F. Rhodes; and H. T. Peck, *American Party Leaders*, chap. ii (New York, 1914).

CLAY'BORNE, WILLIAM. See CLAIBORNE, WILLIAM.

CLAY CENTER. A city and the county seat of Clay Co., Kans., about 80 miles (direct) west-northwest of Topeka; on the Republican River, and on the Union Pacific and the Chicago, Rock Island, and Pacific railroads (Map: Kansas, E 4). It contains two private hospitals, a Carnegie library, and a fine courthouse. The principal industrial establishments are flour mills, cigar, steel-tank, broom, and cement-block factories and brickworks. The city has good water power, which is utilized by the electric light and power plants, both of which are owned by the municipality. There are two large greenhouses, which make extensive shipments to all parts of the State. Pop., 1910, 3438.

CLAY IRONSTONE. The name applied to compact, argillaceous varieties of siderite, the carbonate of iron. It frequently occurs in the form of concretions, which may be so close to-

gether in some particular layer as to form a continuous band. They are especially abundant in some beds of the Carboniferous and at times serve as a low grade of iron ore. See IRON; BLACKBAND IRONSTONE.

CLAY MARL. A calcareous variety of clay, containing from 40 to 60 per cent of carbonate of lime. It is used as a fertilizer and also in the manufacture of Portland cement. Clay marls are found in many parts of New York, New Jersey, Michigan, Illinois, Indiana, and other northern States, and in the West. They grade into true marls. See MARL; SOILS.

CLAY PLANTS. The early stages of vegetation on clay soil resemble those on rock areas, and are treated under the head of ROCK PLANTS. The late stages are Mesophytic (q.v.). See FORESTS; GRASS LANDS.

CLAY'POLE, NOAH. A character in Dickens's *Oliver Twist.*

CLAYS, klās, PAUL JEAN (1819–1900). A Belgian marine painter. He was born at Bruges, and studied in Paris under Horace Vernet and Gudin. On his return to Belgium he exhibited in Antwerp and Brussels, but had no success until, under the influence of the French Realists, he adopted a broader style of painting. His favorite subjects were the waters of Holland and Belgium, and he showed a remarkable knowledge and comprehension of the sea in all its phases, but preferred to depict it in the sunlight. His drawing is sometimes defective, but his color is luminous and delicate, and his work is full of simplicity and charm. His pictures are to be found in most of the important modern galleries. Among the best are "Calm on the Escant" (Antwerp), "The Bay of Ostende" (Brussels), "Shipwreck on the Shetland Islands" (ib.), two Dutch marine views (National Gallery, London), "Open Sea" (Munich), and "Celebration of the Freedom of the Port of Antwerp" (Metropolitan Museum, New York).

CLAY SLATE. See SHALE.

CLAY'TON, AUGUSTINE SMITH (1783–1839). An American jurist, born at Fredericksburg, Va. He graduated at the University of Georgia in 1804, and in 1819 was elected judge of the Superior Court of the Western Circuit in Georgia. While holding that office he supported the State authorities in their occupation of territory of the Cherokee Nation, but the United States Supreme Court decided against the legality of the State's action. For differing with the Legislature on one point of the controversy, however, he was removed from office. He was elected to Congress in 1831, served two terms, took an active part in the opposition to the tariff and to the United States Bank. He was reputed to be the author of *Crockett's Life of Van Buren.*

CLAYTON, ESTELLE. An American actress and dramatic writer, whose family name was Evesson. She went on the stage in 1878 and attracted favorable notice in a number of popular plays, some of which she wrote or adapted herself. She is also the author of the texts of the operas *Paulita* (1890) and *The Viking* (1895).

CLAYTON, HENRY DELAMAR (1857–). An American political leader, born in Barbour Co., Ala. He was educated at the University of Alabama. In 1878–80 he practiced law at Clayton, Ala., and after that time at Eufaula, Ala. In 1880–84 he was register in chancery for Barbour County, and in 1890–91 was a member of the Alabama General Assembly. He was also United States district attorney in 1893–96, member of the Democratic National Committee after 1888, and permanent chairman of the Democratic National Convention at Denver in 1908. From 1897 to 1913 he was a member of Congress. In the latter year he was named United States Senator by Governor O'Neal of Alabama, but his appointment was declared illegal by the other Senators, and he finally withdrew his candidacy.

CLAYTON, JAMES BENJAMIN (1867–). An American clergyman and writer on ethnology, born at Washington, D. C. He was educated at Columbian (now George Washington) University, Southern Baptist Theological Seminary, and Potomac University. From 1887 to 1898 he was in evangelistic work. He was also pastor at Norfolk and Falls Church, Va. (1890–91); Hannibal, Mo. (1897–98); Hynesboro Park, Md. (1898–99); Anacostia, D. C. (1900–01), and First and Immanuel churches, Washington, D. C. (1909, 1910). In 1903–09 he was chief clerk of the Bureau of American Ethnology, and in 1911 he became dean of the theological department of Potomac University. His writings on folklore, symbolism, and comparative religion have appeared in periodicals.

CLAYTON, JOHN (1686–1773). An American botanist. He was born in Fulham, London, but in 1705 emigrated to Virginia, where for 51 years he was clerk of Gloucester County. Two great volumes and a *hortus siccus* of Virginia plants were left by him; but the manuscripts were destroyed by fire, together with the records of Gloucester, at the beginning of the Revolution. See CLAYTONIA.

CLAYTON, JOHN MIDDLETON (1796–1856). An American jurist and politician, born in Dagsboro, Del. He graduated at Yale in 1815, was admitted to the bar in 1818, and became a leading lawyer in his State. He was for many years (1829–37, 1845–49, and 1851–57) a leading member of the United States Senate and in 1849 became Secretary of State in the cabinet of President Taylor. In 1850 he negotiated with the British government the famous Clayton-Bulwer Treaty (q.v.). Consult the "Memoir" by J. P. Comegys, No. 4 in the *Papers of the Historical Society of Delaware* (Wilmington, 1882).

CLAYTON, POWELL (1833–**1914**). An American soldier and politician, born in Bethel, Pa. He followed his profession of civil engineering at Leavenworth, Kans., and at the outbreak of the Civil War became captain in the First Kansas Infantry in the Federal army. He rose to the rank of brigadier general during the struggle and at its close became a planter in Arkansas, becoming Governor of the State in 1868. He was a member of the United States Senate from 1871 to 1877 and was a member of every National Republican Convention from 1872 to 1896. In 1897–1905 he was Minister and Ambassador to Mexico.

CLAYTON-BULWER TREATY. A treaty between the United States and Great Britain, signed, after prolonged negotiations between Secretary of State John M. Clayton (q.v.), on the one side, and Sir Henry Bulwer, special Ambassador of Great Britain, on the other, on April 19, 1850, the ratifications being exchanged on July 4. Its aim was, mainly, to facilitate the construction of an interoceanic canal across the American Isthmus, and incidentally to pre-

vent the encroachment of either contracting power upon the territory of the Central American States; and its main provisions were as follows: 1. Neither power was ever to "obtain or maintain for itself any exclusive control over the said ship canal," or to "occupy, or fortify, or colonize, or assume or exercise any dominion over Nicaragua, . . . or any part of Central America." 2. The two powers formally agreed to guarantee the protection and neutrality of the canal. 3. They further agreed to invite friendly powers "to enter into stipulations with them similar to those they had entered into with each other," and also to enter into treaties with the Central American States "for the purpose of more effectually carrying out the great design of this convention." 4. Vessels of the two powers were, while traversing the canal in time of war, to be exempt from detention, blockade, or capture. 5. The protection of the two powers was extended to any other practicable communications across the Isthmus, whether by railroad or canal, the intention being "to establish a general principle," as well as to settle one particular object. At the time the ratifications were exchanged both powers issued explanatory declarations, Great Britain announcing that "her Majesty's government do not understand the engagements of that convention as applying to her Majesty's settlement at Honduras, or its dependencies"; the United States, that the treaty was not understood "to include the British settlement in Honduras, commonly called 'British Honduras,' as distinct from the State of Honduras, nor the small islands in the neighborhood of that settlement, which may be known as its dependencies." Disputes arose over the territorial claims of Great Britain in Central America, and her assumption of a protectorate over the Mosquito Indians, conflicting interpretations being placed on various provisions of the treaty by the two powers. Another treaty, the Dallas-Clarendon Treaty, designed to settle the pending disputes, was signed in October, 1856, and was ratified by the Senate soon afterward, with the addition of various amendments, which, however, the British government refused to accept. Disputes continued almost up to the time of the Civil War; but in 1860 Great Britain concluded treaties with Honduras and Nicaragua, which provided for the cession to the former of the Bay Islands, and the relinquishment of the British protectorate over the Mosquito Indians. President Buchanan thereupon announced, in his message for 1860, that "the discordant constructions of the Clayton-Bulwer Treaty between the two governments . . . have resulted in a final settlement, entirely satisfactory to this government." Nevertheless, after the close of the war, controversies again arose, and in 1881 the treaty was the subject of a compromise between Lord Granville and Secretary of State Blaine, the latter contending that any interoceanic canal across the American Isthmus should be under the political control of the United States; that the United States would view with grave concern the interference of European powers; and that the treaty should be so modified as to make it conform to conditions which had materially changed since 1850. Secretary of State Frelinghuysen, who succeeded Blaine, in December, 1881, went further, and contended that the treaty had become obsolete and was in reality no longer binding on either power; while, on the other hand, Lord Granville asserted that the treaty had never been abrogated and was still in force. Finally, by the Hay-Pauncefote Treaty, which was ratified by the United States Senate in December, 1901, the Clayton-Bulwer Treaty was formally annulled. Consult Travis, "The History of the Clayton-Bulwer Treaty" (Ann Arbor, Mich., 1900)—vol. iii of the *Publications of the Michigan Political Science Association*. The question of the various treaties with Great Britain affecting the opening of an interoceanic canal across the American Isthmus assumed an international importance in 1912, when Great Britain protested against the passing of an act by Congress admitting American ships engaged in coastwise traffic to free use of the canal. It was generally held in America that the terms of the treaties were being observed, or that circumstances were so different from those contemplated by the treaties that the treaties should be held to have lapsed. This phase of the question will be found more fully explained in the article PANAMA CANAL.

CLAYTO'NIA (after John *Clayton*, a Virginian botanist), or SPRING BEAUTY. One of the most beautiful of the early spring flowers of the United States. The plants are low, succulent herbs, growing in rich ground of bottom lands. The delicate, rose-colored flowers are striped with pink veins, and the leaves are linear or oblong. Two species, *Claytonia virginica* and *Claytonia caroliniana*, are common in the United States. *Claytonia perfoliata* is found on the Pacific coast and in Mexico and Cuba. Other species of this genus are known in Europe and Asia, one of them, *Claytonia tuberosa*, affording tubers which are eaten by the peasants of Siberia. For illustration see article GEOPHYTE.

CLAZOMENÆ, klâ-zŏm'ê-nê (Lat., from Gk. Κλαζομεναί, *Klazomenai*). One of the twelve cities of Ionia, on the west coast of Asia Minor. It was situated at first on the south shore of the Hermæan Gulf, west of Smyrna. Later, the inhabitants seem to have moved to an island near the coast. Alexander the Great connected the island with the mainland by a dike, and the city subsequently extended over the peninsula thus formed. It was famous as the birthplace of the philosopher Anaxagoras (q.v.). The site has furnished a number of terra-cotta sarcophagi, which supply the best existing examples of Ionic ceramic painting. Consult Fowler-Wheeler, *Greek Archæology* (New York, 1909).

CLEAN'THE. In Fletcher's *Mad Lover*, the sister of Siphax of Paphos.

CLEANTHES, klê-ăn'thēz (Lat., from Gk. Κλεάνθης, *Kleanthēs*) (c.300–220 B.C.). A Stoic philosopher, born at Assos, in Troas. His poverty was such that he had to work all night at drawing water, to obtain money for his support and to pay his class fee while attending the lectures of Zeno, whom he succeeded as head of the Stoic school about 263 B.C. He died of voluntary starvation.

Of his many writings none is extant, except a "Hymn to Zeus," much admired, preserved by Stobæus (Ecl. i, 2, 12). It is an admirable union of religious feeling and philosophic thought. The fragments of Cleanthes have been collected by Wachsmuth, *Commentatio de Zenone et Cleanthe* (1874), and by Pearson (Cam-

bridge, 1891). Consult: Ritter and Preller, *Historia Philosophiæ Græcæ* (Gotha, 1888); Zeller, *Philosophie der Griechen* (Leipzig, 1869–82); Zeller, *The Stoics, Epicureans and Sceptics*, trans. by Reichel (London, 1892); Hicks, *Stoic and Epicurean* (New York, 1910); Adam, *The Religious Teachers of Greece* (Edinburgh, 1908), and for a good translation of the "Hymn to Zeus," id., *The Vitality of Platonism* (Cambridge, 1911).

CLEANTHES. 1. In Dryden's *Cleomenes*, the friend of Cleomenes. 2. In Massinger, Middleton, and Rowley's play, *The Old Law*, the son of Leonides.

CLEAR, CAPE. See CAPE CLEAR.

CLEARANCE. In the mercantile marine, a permission from the customhouse officers, or the emigration officers, or both, for the departure of a ship from a port, showing that all the formalities have been observed, and all dues, etc., paid. If a foreign vessel, she must also be certified by the consul of the nation to which she belongs. Hence the expression "cleared out" originally used in reference to the departure of a particular ship.

CLEARCHUS, klē-är'kŭs (Lat., from Gk. Κλέαρχος, *Klearchos*). A Spartan commander of the fifth century B.C., the son of Ramphias. After serving in the Hellespont he became Governor of Byzantium, 411 B.C., where he ruled with tyrannical harshness. During his absence in Asia the town was surrendered to the Athenians (409), and Clearchus was punished by a fine. He was afterward sent back to Byzantium to settle political dissensions there and to protect the Greek colonies against the Thracians; but, having set himself up as tyrant, he was condemned to death by the Ephors. He joined the younger Cyrus, for whom he levied an army of Greek mercenaries, and whom he accompanied on the famous "March of the Ten Thousand." He alone, of the Greeks, knew the real intentions of Cyrus; but it was not until they had proceeded too far to retire with safety that he disclosed them. At the battle of Cunaxa (401 B.C.) he commanded the right wing of the Greeks and was tacitly recognized as commander in chief when the retreat had begun. He was, however, treacherously seized by the Persian general, Tissaphernes, and put to death.

CLEAR'FIELD. A borough and the county seat of Clearfield Co., Pa., 90 miles (direct) east-northeast of Pittsburgh; on the west branch of the Susquehanna River, and on the Pennsylvania, the New York Central and Hudson River, and the Buffalo, Rochester, and Pittsburgh railroads (Map: Pennsylvania, D 4). It is situated in a region containing large deposits of coal and fire clay, and has several novelty works, lumber mills, flouring mills, planing mills, brickyards, and a steel plant, and has manufactories of sewer pipe, clay-working machinery, refrigerators, cut glass, silk velvet, knitting machines, wagons, swings, foundry products, tanned leather, etc. Clearfield was settled in 1805, and in 1840 was incorporated as a borough. Pop., 1900, 5081; 1910, 6851.

CLEARING HOUSE. Clearing-house associations are unions of banks, for the purpose of securing a speedy settlement of the claims of banks against one another. The oldest of these is the London Clearing House, which appears to have been established about 1775. The most important clearing house in the United States is that of the city of New York, which was established in 1853. Before the establishment of clearing houses the process of settling the mutual claims of banks upon one another was cumbersome and tardy. Each bank was forced to send out runners, carrying to every other bank the checks and claims that it had upon them. As each bank settled periodically its bills with every other bank, there was a continual interchange of money between them. All this has been obviated by the establishment of clearing houses, in which representatives of the several banks meet daily, for the purpose of adjusting the claims of the banks upon one another.

An insight into the workings of clearing houses can best be obtained by a brief description of the methods pursued in the New York Clearing House, which may be taken as typical of all the rest. The banks represented send daily to the clearing house at least two clerks —a delivery clerk and a settling clerk. At the clearing house each bank has a desk at which the settling clerk or clerks are seated. They bring to the clearing house in bundles the checks, drafts, and other obligations due them from other banks, each bank being represented by a separate package. They bring also a list of the amounts due them from each of the banks in question. Before clearing begins, transcriptions of these lists are handed to the inspector. The sum total represents the aggregate amount to be settled for the day. Promptly at 10 o'clock the delivery clerks begin passing from one desk to another, delivering to each the package of claims of all sorts that their banks have against other banks. These claims are accepted in bulk, without examination of the items. As soon as all of the packages have been delivered, they are carried back to the banks, where an examination of the items takes place; and if there are any that are not valid, the adjustment takes place between the bank which has received them and that which presented them, without intervention of the clearing house or rectification of the accounts drawn up there. When all of the packages have been received by the settling clerks at the clearing house, the latter draw up a statement of the demands made upon them. As these never balance the claims made by their banks, it is obvious that at the close of each day's business some of the banks will be entitled to receive money and others obliged to make payments, to settle the accounts. When each clerk has made up his account, he forwards a statement of the aggregates, with the amount of the balance to be paid or to be received. When all have forwarded their accounts to the manager, and the accounts are proved by the equality of the debit and credit aggregates and balances, the manager certifies the amounts which each bank owes to the associated banks or is entitled to receive from them.

In the London Clearing House for the settlement of balances a different rule prevails. Debit balances are settled by checks on the Bank of England in favor of the associated banks, and credit balances by similar checks drawn by the associated banks in favor of the creditor banks. In New York the amounts due by debtor banks are paid in cash to the clearing-house manager, who in turn pays the creditor banks. For this purpose gold certificates issued by the United States government are used, and also clearing-

house gold certificates, which represent gold coin deposited with the clearing house, and which are valid only in the settlement of clearing-house balances.

By the aid of the clearing house, each bank can settle all of its relations to the banks of the city by a single payment, instead of adjusting its relations with each bank separately. Furthermore, settlements are effected by the transfer of a much smaller quantity of cash than would be otherwise required. Thus, in the first year of the New York Clearing House, average daily clearings of $19,104,594.94 were effected by average daily payments of $988,078.06—but 5.17 per cent. In some years the percentage of balances paid in money has fallen as low as 3 per cent, and during the entire history of the New York Clearing House has never reached so much as 7 per cent. The aggregate New York clearings were $5,750,455,987 in 1854, and $103,754,100,091 in 1906—the year of maximum exchanges. The aggregate exchanges reflect not only the growth of the city in importance as a commercial centre, but also the business conditions throughout the country—rising in times of notable prosperity and sinking in eras of depression. Thus, we may contrast the clearings of $35,461,052,826 in 1873, $48,565,818,212 in 1881, and $37,660,686,572 in 1890, with clearings of $22,000,000,000 in 1874, $25,250,791,440 in 1885, and $24,230,145,368 in 1894. In the depression following 1906 clearings declined to $95,315,421,238 in 1907 and to $73,630,971,913 in 1908. In 1910 they had risen again to very near the level of 1906—$102,553,959,069.

The New York Clearing House is by far the most important in the United States. The excellence of the system embodied in it and the facilities which it affords to banks have been so generally appreciated that the institution has been widely copied, even in some of the smaller cities. On Jan. 1, 1914, there were in the United States not less than 120 clearing organizations which had transacted clearings in the year ending with that date in excess of $170,000,000,000. It must be said, however, that one-half of the aggregate belonged to New York City. The London Clearing House in 1912 transacted clearings to the extent of £15,961,773,000. Clearing houses exist on the continent of Europe, though the use of checks in daily life is far less frequent there than in England and in the United States, and the clearings are not so important. On the other hand, the institution is widely known in Canada, Australia, and other English colonies.

In the United States the clearing-house associations not only furnish the facilities for settlements among banks which have been described, but also enable the banks to act as units in matters of banking policy. They establish rules of banking practice in the interest of the banks, as a whole, which individual banks would not be strong enough to maintain. Thus, many associations fix the rates to be charged for the collection of out-of-town checks. Certain associations prohibit the issue of certified checks by the members. Many details of practice are thus regulated by clearing-house rules. These associations, too, foster among the banks a feeling of solidarity of interest and furnish an organ through which this can find expression. In times of financial distress it may be a matter of supreme importance to all the banks that none go to the wall; for such an occurrence may cause a run upon all the banks and a general catastrophe. The stronger banks, under such circumstances, come to the aid of their weaker brethren.

Nowhere is the function of the clearing house in sustaining the interests of the banks, and the general credit of the community, more apparent than in the issue of clearing-house loan certificates. The ordinary clearing-house gold certificate differs from a government gold certificate only in the fact that the clearing house, and not the government, is the custodian of the gold. It is preferred over the government certificate because it can be issued in denominations better suited to the needs of the banks. With these certificates the loan certificates have nothing in common. They are issued only in times of panic, to meet temporary emergencies, and are called in and canceled as soon as their work is done. In times of panic there is an unusual demand for means of payment. Under the national banking system of reserves, which permits the country banks to deposit a portion of their legal reserves in the commercial centres, this strain is felt quite severely in the money centres. It is only to a limited extent that such emergencies can be met by restricting discounts. In preparation for a demand which can be foreseen, this usually takes place; but at the moment of the crisis credits must be expanded and loans discounted freely, if the storm is to be weathered. Where free banking exists, this is usually done through increased note issues; but the banking system of the United States does not admit of such an increase. The clearing-house loan certificate relieves the situation by substituting certificates based, not on cash, but on securities for the cash ordinarily used in clearing-house operations —thereby placing this cash at the disposal of the banks for the use of their customers.

The clearing house requires a deposit of securities with a committee and issues certificates bearing a relatively high interest—in New York City, 6 per cent—up to a certain per cent of the securities deposited, generally 75 per cent. It generally provides that any loss arising from the issue of the certificates shall be assessed pro rata, either upon the capital and surplus or upon the average clearings of the banks. Thus the entire credit of the associated banks is pledged for the redemption of the certificates. The interest charge makes it to the advantage of the banks to redeem as soon as possible the certificates issued to them, and they rarely last more than a few months. This expedient was first tried by the New York Clearing House in 1860 and has been repeated in 1862, 1863, 1873, 1884, 1890, 1893, and 1907–08. In the panic of 1907–08 the first issue of certificates took place on October 26 and amounted to $11,235,000. Since this issue failed to bring relief, further issues were made, until the aggregate of issues was $101,060,000, although the maximum outstanding at any one date was $88,420,000 (Dec. 16, 1907). March 28, 1908, the certificates were finally canceled. Simultaneously with the action of the New York Clearing House, the Chicago Clearing House, for the first time in its history, resorted to a similar device. Further, the Chicago Clearing House authorized its members to surrender such certificates to the Clearing House Committee and receive in lieu thereof checks in denominations of $2, $5, and $10 (noninterest-

bearing) which might be used in general circulation. This action was widely copied by clearing houses throughout the country. It is conservatively estimated that $250,000,000 of such instruments were issued. In a few cases such issues were unsupported by adequate collateral, but all were retired without loss to the holder. In effect, the action of the clearing houses overcame the inelasticity of the American currency through the issue of a circulating medium resting upon the combined resources of the banks. The device of clearing is also employed in the stock and produce exchanges. See STOCK EXCHANGE.

Y., 1913).

CLEARING NUT. See STRYCHNOS.

CLEAR LAKE. A body of water in Lake Co., Cal., about 90 miles north of San Francisco (Map: California, C 3). It is about 20 miles long by from 2 to 6 miles wide; there is a contraction in its southern part, which is known as "Lower Lake," and has an outlet into Cache Creek. Lakeport is on the west shore, Lower Lake at the southeastern end, and Upper Lake at the northern end.

CLEAR LAKE INDIANS. See POMO.

CLEARNESS. A quality in painting, in which light and shade (see CHIAROSCURO) are successfully achieved without a sacrifice of purity of color.

CLEAR'STO'RY, or CLERE'STO'RY. A wall pierced with windows, which rises above the roof of a lower adjacent portion of the building, intervening between it and the roof of the higher central part, which it serves to light. Thus in most churches the central aisle or nave is lighted by a clearstory from above the side-aisle roofs, but the device may occur in any type of building having a lofty central hall. The earliest known is that of the great Hypostyle Hall at Karnak (q.v.). The Romans lighted their lofty bath halls by huge semicircular windows above the roofs of the lateral chambers, and the same arrangement is seen in the basilica of Maxentius and in modern halls of the same type, e.g., the Pennsylvania Railway Station in New York. The clearstory was an essential feature of the Christian basilicas; occurs also in Hagia Sophia (q.v.) and Byzantine churches; was developed into a magnificent feature of Gothic architecture, especially in France, in connection with groin-ribbed vaulting and the flying buttress, though used also in Romanesque churches; and is frequent though of less importance in Renaissance buildings. The drum of a dome is really a form of clearstory. See ARCHITECTURE; CHRISTIAN ART; CHURCH; GOTHIC ARCHITECTURE.

CLEARWING. Any of the small moths of the family Sesiidæ or Ægeriidæ, with transparent wings, the caterpillars of which bore into the stems of trees or plants and hibernate there. Many of the clearwings are so small, brilliantly colored, and unlike moths, that they are easily mistaken for wasps or flies. The most common is the currant borer (*Sesia tipuliformis*), imported to America from Europe, and sometimes highly destructive to currant and gooseberry bushes. The peach borer (*Sanninoidea exitiosa*) is a pest in peach orchards.

CLEAVAGE (from *cleave*, AS. *clēofan*, Ger. *klieben*, to cleave, Lat. *glubere*, to peel, Gk. *γλύφειν, glyphein*, to hollow out). In geology, a property induced, under certain conditions, during deformation in a rock by virtue of which the rock may be readily split into parallel layers or rods, i.e., parallel to a plane or line. In a strict sense it is a secondary feature and therefore distinct from the property possessed by many sediments of parting along their planes of stratification. Cleavage, in rare cases, may be parallel to planes of bedding that may be present in the rock mass. The essential condition of rock cleavage is a parallel dimensional arrangement of the constituent mineral particles of the rock. In certain minerals, such as mica, parallel dimensional arrangement carries with it a parallelism of the mineral cleavage. The cleavage of a rock may be observed to occur parallel to the greater diameters of the mineral particles or to the parallel mineral cleavages. When the two coincide, as in the case of mica, the rock cleavage produced is parallel to one plane. Where they do not coincide, two rock cleavages may be produced at angles to each other, as in the case of feldspar, although one may be conspicuous and the other obscure. The property of rock cleavage is observed in rocks that have yielded to pressure by deformation without conspicuous fracture. This deformation can be induced only where the rock is under such great pressure from all sides that it flows rather than fractures. The planes or lines of rock cleavage are further observed to be normal to the directions in which the rock masses have been most shortened.

A number of processes probably coöperate to induce the parallel arrangement of mineral particles during the shortening of the rock mass. Chief among these is the recrystallization of old mineral particles and the crystallization of new particles through the agency of contained water. This process results in the elongation of the mineral particles of the rock in the plane or line of greatest elongation of the rock mass as a whole, and in shortening normal to this direction; in other words, it results in the flattening of the mineral particles through solution and deposition of mineral material. Other processes which produce rock cleavage are the rotation into parallel position of previously existing particles whose axes have unequal length, and the flattening in situ of original mineral particles through the process known as gliding, i.e., differential movement along certain definite planes and crystals without fracture. Cleavage is particularly characteristic of the finer-grained rocks like slates and shales. The coarsely textured rocks under pressure metamorphism develop a parallel arrangement, but do not split so readily or smoothly; such structure is known as foliation, or schistosity.

(Basel, 1878); Tyndall, "Comparative View of the Cleavage of Crystals and Slate-Rocks," in *Philosophical Magazine*, 4th series, vol. xii (London, 1856); Daubrée, *Géologie expérimentale*, vol. i (Paris, 1879); Van Hise, "Principles of North American Pre-Cambrian Geology," in *Sixteenth Annual Report of the United States Geological Survey* (Washington, 1896); Becker, "Current Theories of Slaty Cleavage," in *American Journal of Science*, 4th series, vol. xxiv (New Haven, 1907).

CLEAVAGE OF CRYSTALS. Most crystals, owing to the regular arrangement of the molecules, possess directions along which cohesion is at a minimum. They therefore tend to fracture along planes normal to these directions, which are called "planes of cleavage." The tendency of a crystal to cleave is necessarily the same for any plane as for any other parallel plane; in other words, cleavage planes have direction rather than position. Cleavage planes, in their relative perfection and number, conform to the symmetry of the crystal in which they occur and are usually parallel to the faces of some crystal form of fundamental or very simple crystallographic relation. Tendency to cleave along special planes determined in position as well as in direction is described as "parting." See CRYSTALLOGRAPHY; MINERALOGY.

CLEAVE'LAND, MOSES (1754–1806). An American pioneer, the founder of Cleveland, Ohio. He was born in Canterbury, Conn.; practiced law, served in the Revolutionary War, and became brigadier general of militia in 1796. In 1795 he joined a number of others in purchasing from Connecticut, for $1,200,000, the tract in Ohio known as the "Connecticut Western Reserve." He directed the surveyors who laid out the site of the present Cleveland, which was named after him. The form of the name was altered, in 1831, to Cleveland by the editor of the *Cleveland Advertiser*, who wished to economize space for a headline.

CLEAVELAND, PARKER (1780–1858). An American geologist and mineralogist, identified with the early progress of the natural sciences. He was born in Rowley, Mass., graduated at Harvard in 1799, was tutor in mathematics there from 1803 to 1805, was chosen professor of mathematics and natural philosophy and lecturer on chemistry and mineralogy in Bowdoin College—a position which he retained until his death, although many professorships in other colleges and the presidency of his own were offered to him. He gathered a valuable collection of minerals and published a treatise on *Mineralogy and Geology* (1816; 3d ed., 1856), which earned for him the title of "Father of American Mineralogy."

CLEAVERS. See GOOSE GRASS.

CLEBSCH, klāpsh, RUDOLF FRIEDRICH ALFRED (1833–72). A German mathematician, born at Königsberg, Prussia. He studied at Königsberg, where he was a pupil of Hesse, Richelot, and F. Neumann. He held the chair of theoretical mechanics at the polytechnic school in Karlsruhe from 1858 to 1863; was made professor of mathematics at Giessen in 1863 and at Göttingen in 1868. His attention was drawn to algebra and geometry by the study of Salmon's works. In 1868 he founded, with Neumann, the *Mathematische Annalen*. His vast contributions to the theory of invariants; his use of the notion of the deficiency of a curve; his applications of the theory of elliptic and Abelian functions to geometry and to the study of rational and elliptic curves, have secured for him a pre-eminent place among those who have advanced the science of geometry. His works upon the general theory of algebraic curves and surfaces began with the determination of those points upon an algebraic surface at which a straight line has four-point contact. Clebsch undertook to render the notion of "deficiency" fruitful for geometry—a notion found first in Riemann's *Theorie der Abelschen Functionen* (1857). By "deficiency" of a curve is meant the difference between the number of its double points and the maximum number possible in such a curve. (See CURVE.) Clebsch and Cremona studied the representation of cubic surfaces on a plane through a one-to-one correspondence—a notion that has led to the study of higher correspondences between surfaces by Cayley (q.v.) and Nöther. Clebsch solved, by aid of the addition theorem of elliptic functions (see FUNCTION), the generalized form of Malfatti's Problem. He also solved (1862) the so-called "Pfaffian Problem" of differential equations, by making it depend upon a system of simultaneous linear, partial differential equations whose statement is possible without integration. Clebsch took a leading part in showing the great significance of the theory of invariants for the theory of hyperelliptic and Abelian functions; and to him is due the transformation of the theory of binary to that of ternary forms. (See FORMS.) He died at Göttingen, Nov. 7, 1872. Vol. vii of the *Mathematische Annalen* contains an excellent article on Clebsch, in which the value of his works is estimated by Brill, Gordan, Klein, Mayer, Nöther, and other contemporaries. His *Vorlesungen über Geometrie* were edited by Lindemann (Leipzig, vol. i, 1875–76; vol. ii, 1891; new ed., 1906).

CLE'BURNE. A city and the county seat of Johnson Co., Tex., 54 miles southwest of Dallas, on the Gulf, Colorado, and Santa Fe, the Trinity and Brazos Valley, and the Missouri, Kansas, and Texas railroads (Map: Texas, D 3). It carries on a large trade in grain, live stock, cotton, wool, hides, and produce, and has cotton compresses, cottonseed-oil mills, flour mills, foundry and machine shop, and shops of the Gulf, Colorado, and Santa Fe Railroad and of the Trinity and Brazos Valley Railroad. The courthouse, Carnegie library, and high school are the notable features. There are municipal water works. Pop., 1890, 3278; 1900, 7493; 1910, 10,364; 1920, 12,820.

CLEBURNE, PATRICK RONAYNE (1828–64). An American soldier. He was born in County Cork, Ireland; studied medicine for a time at Trinity College, Dublin; ran away from home and served for several years in the British army. In 1855 he emigrated to the United States and settled in Helena, Ark., where he studied law, was admitted to the bar, and practiced with considerable success. On the outbreak of the Civil War he enlisted in the Confederate army as a private, but by March, 1862, rose to the rank of brigadier general. He commanded a brigade at the battle of Shiloh; was wounded in the battle of Perryville, Ky., on Oct. 8, 1862; was promoted to be major general in December of that year; was distinguished for gallantry at Murfreesboro, and at Chickamauga led a brilliant charge and earned the title "The Stonewall of the West." In the battle of Missionary Ridge he commanded the right wing of the

Confederate army; subsequently took an important part, as division commander under Johnston, against Sherman, and as a corps commander under Hood, in the Atlanta campaign against Sherman, and later in the Tennessee campaign against Thomas and Schofield; and at the battle of Franklin, on Nov. 30, 1864, he was killed while leading a charge on the Federal works. He was an organizer of the "Order of the Southern Cross" and was one of the first men in the Confederacy to advocate the use of colored troops. Consult the biographical sketch, by General Gordon, in *Southern Historical Society Papers*, vol. xviii (Richmond, 1889).

CLECKHEATON, klĕk'ê-tŭn. A town in the West Riding of Yorkshire, England, 5½ miles southwest of Bradford (Map: England, E 3). It has manufactures of woolens, worsteds, blankets, chemicals, wire cord, and machinery. Pop., 1901, 12,524; 1911, 12,866.

CLEDON'ISMAN'CY. See SUPERSTITION.

CLE ELUM. A city in Kittitas Co., Wash., 100 miles southeast of Seattle, on the Northern Pacific and the Chicago, Milwaukee, and St. Paul railroads, and on the Yakima River (Map: Washington, E 3). It is in a coal-mining and agricultural region, and has dairying, fruit-growing, and lumbering interests. There are municipal water works and a hospital. Cle Elum was founded in 1887 and was incorporated as a city in 1905. Pop., 1910, 2749.

CLEETHORPES, klē'thôrps. A town and watering place in Lincolnshire, England, 3 miles east-southeast of Great Grimsby (Map: England, F 3). It owns a new market and recreation pier. There is an electric-lighting plant. Pop., 1901, 12,578; 1911, 21,417.

CLEF. See MUSICAL NOTATION, *The Clefs*.

CLEFT PALATE. See PALATE.

CLEISHBOTHAM, klēsh'bŏTH-*am*, JEDEDIAH. The imaginary "collector" in Scott's series of novels, *Tales of my Landlord*.

CLEISTHENES, klīs'thê-nēz. See CLISTHENES.

CLEISTOG'AMOUS FLOWERS (Gk. *κλειστός, kleistos*, that which may be closed, from *κλείειν, kleiein*, to close + *γάμος, gamos*, marriage). Relatively inconspicuous and never-open flowers, which occur, along with the ordinary flowers, in many plants, representing all of the principal groups of the flowering plants. Cleistogamous flowers are seldom in a conspicuous position. One of the best-known illustrations is in the stemless species of violets. In these, in addition to the well-known conspicuous flowers, cleistogamous flowers occur more or less concealed near the base of the cluster of leaves and flower stalks. Since these flowers are never open, they are necessarily self-pollinated; but they are very fertile and produce an abundance of seed. The significance of this dimorphism in the flowers of so many plants is not clear. It has been suggested that, in case cross-pollination is not secured by the showy flowers, the presence of self-pollinating cleistogamous flowers makes seed production secure. However, some plants with cleistogamous flowers, as grasses and rushes, are anemophilous (wind-pollinated), so that it is not a habit entirely related to the uncertainties of pollination by insects. In comparing the development of the cleistogamous and ordinary flowers it is discovered that the former are like the latter at various stages of development.

The following quotation from Darwin's *Different Forms of Flowers* presents some detailed differences: "In cleistogamous flowers the petals are rudimentary or quite aborted; their stamens are often reduced in number, with anthers of very small size, containing few pollen grains, which have remarkably thin, transparent coats, and generally emit their tubes while still inclosed within the anther cells; and, lastly, the

CLEISTOGAMY.

A plant of *Polygala polygama*, showing ordinary flowers of erect aërial stems, and numerous cleistogamous flowers on underground stems.

pistil is much reduced in size, with the stigma in some cases hardly at all developed. These flowers do not secrete nectar or emit any odor; from their small size, as well as from the corolla being rudimentary, they are singularly inconspicuous. Consequently, insects do not visit them; nor, if they did, could they find an entrance. Such flowers are, therefore, invariably self-fertilized; yet they produce an abundance of seed. In several cases the young capsules bury themselves beneath the ground, and the seeds are there matured. These flowers are developed before, or after, or simultaneously with the perfect ones." See authorities cited under BOTANY.

CLEISTOG'AMY. See POLLINATION.

CLEIVELAND, JOHN. See CLEVELAND, J.

CLE'LAND, WILLIAM (c.1661–89). A Scottish Covenanting poet. He is supposed to have been born in Lanarkshire, Scotland. After leaving St. Andrews University he joined the Covenanters and at Bothwell Bridge acted as captain. He twice escaped to Holland, returning to Scotland in 1685 and 1688, the last time as agent of William of Orange, and was made lieutenant colonel of the Cameronian Regiment, under Lord Angus Cameron, which was sent to put down the uprising that followed the fall of Claverhouse at Killiecrankie. The Cameronians held out after a whole day's fighting at Dunkeld (Aug. 21, 1689) against heavy odds; but in the action Cleland was killed. He wrote *Several Poems and Verses*, which appeared posthumously in 1697, but he is better known through his connection with the Cameronian Regiment.

CLÉLIE, klā'lē'. The heroine of a romance

of the same name, by Mademoiselle de Scudéry, originally issued under her brother's name (1656).

CLÉMANGES, klā'mänzh', NICOLAS DE (c.1360–c.1434). A French theologian—one of the ablest Roman Catholic theologians of the Middle Ages. He was educated in Paris, where he studied theology under Pierre d'Ailly. He was rector of the university from 1393 to 1395 and was esteemed, with his teacher and Gerson, the glory of the institution. He was an ardent advocate of reform in the church, wrote strongly against the immoral lives of many of the higher clergy, and labored with great pertinacity to heal the schism then existing—especially by preventing the election of another Antipope in place of the so-called Clement VII. But when Pedro de Luna (q.v.) was elected by the Avignon cardinals in 1394, taking the name of Benedict XIII, Clémanges became his secretary, thinking that in this position he could render a service to the divided church. When, in 1407, a breach came between Benedict and the French court, Clémanges, unjustly suspected of being the author of the bull of excommunication launched by Benedict against the King, left Avignon, and went first to his canonry at Langres, and then into the retirement of the Carthusian monasteries at Valprofonds and Fontaine-du-Bosc. Here he pursued his studies and produced several important works upon the study of the Bible and upon the corruptions then existing in the church. In 1415 he exercised a great influence on the Council of Constance and made a strong plea for church unity and purity, and in 1421 defended the liberties of the Gallician church at the Council of Chartres. In 1425 he returned to Paris and lectured on rhetoric and theology in the College of Navarre and there died, probably in 1434. His collected works, with a life by J. M. Lydius, appeared at Leyden in 1613. The often-quoted *De Ruina Ecclesiæ seu de Corrupto Ecclesiæ Statu*, while frequently attributed to Clémanges, is demonstrably not his. Consult Müntz, *Nicolas de Clémanges, sa vie et ses écrits* (Strassburg, 1846), and Creighton, *A History of the Papacy* (London, 1882).

CLEM'ATIS (Gk. κληματίς, *klēmatis*, brushwood, from κλῆμα, *klēma*, vine shoot, from κλᾶν, *klan*, to break). A genus of plants of the family Ranunculaceæ, having 4–6 colored sepals, petals small or none, and numerous one-seeded achenes, with long, generally feathery, awns. The species, which number about 150, are herbs or shrubs, generally with climbing stems, mostly natives of temperate climates, and much scattered over the world. They possess more or less active properties. The long awns of some species give the plants a beautiful appearance even in winter. The flowers of many species are also beautiful. *Clematis vitalba*, the common traveler's joy, is the only native of Great Britain, where it is common in the south, but becomes rarer towards the north and is scarcely found in Scotland. The stems are capable of being made into baskets. It rapidly covers walls or unsightly objects. The fruit and leaves are acrid and vesicant; the leaves are used as a rubefacient in rheumatism, and those of other species are also employed in the same way. About 20 species are indigenous to North America, and of these *Clematis virginiana*, or virgin's bower, is very widely distributed, making a very showy appearance with its graceful sprays of white flowers. Its fertile flowers are succeeded by fruit with conspicuous feathery tails. *Clematis verticillaris*, with peduncles bearing large, single, bluish-purple, and drooping flowers, is a rare species, found in rocky woods, from Maine to western New England and thence to Virginia, Wisconsin, and northwestward. *Clematis viorna*, popularly called "leather flower," grows in rich soils in the Middle and Southern States. *Clematis pitcheri*, a species found along the Mississippi from Illinois southward, has a bell-shaped calyx, dull, purplish sepals, and noticeably reticulated leaves. *Clematis paniculata*, a native of Japan, is one of the most popular climbers for porches, etc. It resembles the virgin's bower, but its flowers are quite fragrant. Among the many species seen in our gardens are *Clematis viticella*, with its solitary, bell-shaped blossoms, and *Clematis florida* and *Clematis patens*, with large blue and purple flowers, natives of Japan. One of the most pleasing, an evergreen, with large white flowers, is *Clematis indivisa*, a native of New Zealand. Some species, as *Clematis flammula*, are found in southern Europe and in the mountainous parts of northern Africa. The colors of the blossoms in this genus vary from pure white to yellow, deep purple, and ruby or scarlet. A serious disease affecting clematis is due to attacks of nematode worms on the roots. Fresh soil, or soil in which the worms are killed by heat or cold, is about the only remedy. See authorities cited under BOTANY.

CLEMENCEAU, klā'mäN'sō', GEORGES BENJAMIN EUGENE (1841–). A French politician and journalist, born at Mouillerou-en-Pareds in Vendée. He was educated to be a physician, but soon drifted into politics and was elected maire of the district of Montmartre in Paris. In 1876 he was chosen as Republican member for the Chamber of Deputies and became a bitter opponent of the Royalist Broglie ministry. From the very outset of his parliamentary career he attracted public attention by his pithy utterances and independent action. His political influence was made greater by his journalistic activities; for in 1880 he founded the daily paper, *La Justice*, of which he became chief editor. When General Boulanger appeared on the political horizon, Clemenceau espoused his cause; but when he discovered that the general was plotting to destroy the Republic, he promptly deserted him. In 1893 Clemenceau lost his seat in the Chamber because of suspicions that he was concerned in the Panama scandal; later, in 1902, he was elected Senator from the Department of the Var, an office which he still held in 1914. During the Dreyfus affair he was a strong believer in the innocence of the accused captain and founded a new daily, *L'Aurore*, to champion his cause. It was in this paper that Zola published the famous letter, *J'accuse*. In 1906 Clemenceau became Minister of the Interior in the Sarrien cabinet, and shortly succeeded to the premiership, which he held till 1909, when he was defeated as a result of a debate on the condition of the navy. This did not end Clemenceau's political activities; he continued in power if not in office and was instrumental in overthrowing the Briand ministry (July 12, 1913) on the issue of proportional representation. He became the editor of a paper called *L'Homme Libre*, which is widely read in Paris.

M. Clemenceau has been, and still is, the stormy petrel of French politics. He is a type

of journalist politician that is quite common in France, brilliant, irresponsible, and influential in attack. Many cabinets have been overthrown by him, and he is popularly known as the Destroyer of Ministries. In politics he has been a consistent Radical and faithful to the tradition of Gambetta. As Prime Minister, he proved himself to be a bitter enemy of the church and carried out the law separating church and state with great firmness. The most important event that happened while he was in office was the great miners' strike organized by the Socialists. Clemenceau personally went down to the mining districts to investigate the complaints of the workmen, who, knowing his revolutionary temperament, expected his sympathy. "We are not fighting on the same side of the barricades now," was the reply of Clemenceau. When the miners became riotous, they were sternly put down by the military, and the strike was lost. For this the ministry was bitterly attacked by the Socialists, and a great debate took place between Jean Jaures, the Socialist leader, and Clemenceau, which attracted wide attention because the fundamental principles of Socialism were attacked and defended with unusual brilliancy. To the charge of Jaures that the ministry had used the government to crush the working class, Clemenceau replied that he had crushed no class, but only individuals who were rioting. He then asked Jaures whether he would have acted differently had he been in office. To this Jaures made no answer. "You do not reply!" exclaimed Clemenceau triumphantly, "and in failing to reply, you do reply." Although strongly opposed to Socialism, Clemenceau is no individualist, but a believer in radical social legislation and government ownership of monopolies. In 1907 there occurred the uprising of the wine growers in the south of France against the wine merchants who were adulterating their wares. This came near being a revolution; it was avoided mainly through the prompt action of Premier Clemenceau, who sternly put down all attempts at rioting. For later career see VOLUME XXIV.

M. Clemenceau is a brilliant speaker and writer. His style is clear, incisive, and forcible. No man in France has a sharper tongue or readier pen. He is very witty, and ministries fear his epigrams as much as his arguments. Like many other French public men, his intellectual interests are not limited to politics only; he is very versatile and has written plays, novels, philosophic essays, and sociological studies.

CLEMENS, klĕm′enz, JEREMIAH (1814–65). An American lawyer and politician. He was born at Huntsville, Ala., and graduated at the University of Alabama in 1833. He was admitted to the bar in 1834, served for several terms in the State Legislature, and distinguished himself in the Mexican War. He was United States Senator from 1849 to 1853, was presidential elector in 1856, and during the Civil War accepted office under the Confederacy, though he never favored secession. In 1864 he became a Unionist and advocated the reëlection of Lincoln. He was the author of several novels, including: *Bernard Lyle* (1853); *Mustang Gray* (1857); *The Rivals: A Tale of the Times of Aaron Burr and Alexander Hamilton* (1859; 1900); *Tobias Wilson: A Tale of the Great Rebellion* (1865).

CLEMENS, SAMUEL LANGHORNE (1835–1910). An American novelist and humorist, better known as "Mark Twain"—a name derived from calls used in taking soundings on the Mississippi, and first employed by Mr. Clemens in newspaper work in 1863. It had previously been taken as a pen name by Capt. Isaiah Sellers in the New Orleans *Picayune*. Mr. Clemens was born at Florida, Mo., Nov. 30, 1835. He received the common-school education of a frontier town and, becoming an expert compositor, worked at this trade in St. Louis, New York, and other cities. In 1851 he gave up printing and became a steamboat pilot on the Mississippi, accumulating a fund of experience that he was later to turn to unique literary account in his *Life on the Mississippi* and other books. The Civil War closed this livelihood to him. He joined a volunteer squad of Confederate sympathizers, remaining with the command for a few weeks, but seeing no active service. Then he went to Nevada with his brother, who had received a political appointment there, and at Virginia City became a reporter and staff writer for the *Territorial Enterprise*, revealing here first to the public his powers of humorously exaggerated description and sarcastic wit. From Nevada he followed the trend to San Francisco, tried mining in Calaveras County, made a voyage to the Sandwich Islands, and attracted attention as a humorous lecturer and writer of localized fiction. The success of his lectures and a book called by the name of the first story, *The Jumping Frog of Calaveras County* (1867), led to his participating, with journalistic intent, in an excursion to the Orient. His letters about his trip, in revised form, became the well-known *Innocents Abroad* (1869), which won him fame on both continents. Then for two years (1869–71) Clemens edited the Buffalo *Express*. In the last-named year he married Miss Olivia L. Langdon, and established himself in Hartford, Conn. In 1872 he gathered reminiscences of Far-Western life in *Roughing It*, and became a frequent contributor to magazines and journals, chiefly in a vein of exaggerated humor. His next book was *The Gilded Age* (1873), written in collaboration with Charles Dudley Warner, and afterward successfully dramatized. Then came *The Adventures of Tom Sawyer* (1876). A second trip to Europe furnished material for *A Tramp Abroad* (1880); then followed *The Stolen White Elephant* (1882); *The Prince and the Pauper* (1882), an historical romance; *Life on the Mississippi* (1883); and *Huckleberry Finn* (1885). In 1884 he engaged in the publishing enterprise of Charles L. Webster and Company, the failure of which, about a decade later, led him to make a lecture tour around the world (1895–96), by means of which he reëstablished his fortune and more than cleared his commercial honor. For 10 years after 1889 Mr. Clemens lived chiefly in Europe. During this period he published: *A Connecticut Yankee at King Arthur's Court* (1889); *The American Claimant* (1892); *Merry Tales* (1892); *The £1,000,000 Bank Note* (1893); *The Tragedy of Pudd'nhead Wilson* (1894); *Tom Sawyer Abroad* (1894); *Personal Recollections of Joan of Arc* (1896); *Following the Equator* (1897), known in England as *More Tramps Abroad; The Man that Corrupted Hadleyburg* (1900), a collection of sketches; and after his return to America, *A Double-Barreled Detective Story* (1902), *Christian Science* (1903), *A Dog's Tale* (1904), *Eve's Diary* (1906), and *The $30,000 Bequest* (1906). In 1907 he made a sojourn in England, which was a long ovation to him. Everywhere

he was received with the warmest regard and esteem, and Oxford honored him with the degree of Litt.D. Although best known, and rightly so, as a humorist, Mr. Clemens had a thoroughly serious side to his character, as shown in later years by his public discussion in articles or speeches of various questions that aroused his sympathy or indignation. But his best, and perhaps his most permanent work, was done as a picaresque novelist in the *Adventures of Tom Sawyer* and the *Adventures of Huckleberry Finn*, stories which preserve, as only works of genius can, frontier types that now have vanished forever or survive only in remote corners of the land, and which are peopled with characters, old and young, that well deserve literary immortality. No other writer has so vividly portrayed the irresponsible American boy, or given his readers so adequate an impression of the large, homely, spontaneous life led by native Americans in the great valley of the Mississippi, as has Samuel Clemens.

His humor, like Lincoln's, characteristically American, has its coarser side, to be sure. "Mark Twain's" fun often sins against good taste and is irreverent and flippant at wrong times and places. But his comic force and fertility offset all defects; and beneath what seems reckless levity there is sound morality as well as clear-eyed shrewdness and hard common sense. The predilection which he vaunts in much of his work for exploiting the mean aspect of things venerable or impressive betrays a touch of the spirit of American philistinism. Of this the *Innocents Abroad* is an instance. But not so *Huckleberry Finn* and *Tom Sawyer;* in those, his best books, he appears as a master of humor and pathetic suggestion, and a truly creative genius.

An edition of Mark Twain's collected writings, *Writings of Mark Twain*, was published in 25 vols. (New York, 1910). *Mark Twain's Speeches*, ed. by W. D. Howells, also was first published in New York in the year of the author's death. For biography, consult A. B. Paine, *Mark Twain: A Biography* (New York, 1912); for bibliography, see M. Johnson, *Bibliography of Mark Twain* (ib., 1910). Among the many books concerned with this author may be mentioned: A. Henderson, *Mark Twain* (New York, 1911); H. Sedgwick, "Mark Twain," in *The New American Type* (Boston, 1908); W. D. Howells, *My Mark Twain* (New York, 1910); J. Macy, "Mark Twain," in *The Spirit of American Literature* (ib., 1913).

CLEMENS, klĕ'mĕnz, TITUS FLAVIUS. See CLEMENT OF ALEXANDRIA.

CLEM'ENT (Lat. *clemens*, merciful, Gk. κλήμης, *klēmēs*). The name of 14 popes.—CLEMENT I, commonly known, in historical theology, as "Clement of Rome" and listed among the "Apostolic Fathers," is probably not identical with the Clement mentioned in Phil. iv. 3. After the Apostles, however, no one stood in higher honor among the early Christians; in fact, he is sometimes, as by Clement of Alexandria, called an "apostle." In the lists of bishops which began to be produced in the latter half of the second century Clement stands third from Peter in the Roman succession—the best order being Linus, Anacletus, Clement. The provisional dates assigned to him by the best modern historians are 88–97 A.D.; but there is much uncertainty about them. According to Jerome, Clement lived until the third year of Trajan (101 A.D.). His Epistle may be dated with high probability in the year 95 or 96. It was written in the name of the church in Rome to that in Corinth and contains fraternal advice and counsel in view of disturbances which had arisen in the latter church. It is an important source for the history of primitive Christianity. It was for a long time honored as "Scripture" and read in public worship as late as the fourth century. The other documents which bear Clement's name are not from him. What is known as II Clement appears to be a second-century homily, of unknown origin. Several spurious epistles are attributed to him, besides the pseudo-Clementine "Recognitions and Homilies," on which see CLEMENTINA. Consult: J. B. Lightfoot, *The Apostolic Fathers*, part i; *St. Clement of Rome* (London, 1890); Knopf, *Der erste Clemensbrief* (Leipzig, 1899); Gregg, *The Epistle of St. Clement, Bishop of Rome* (London, 1899); Krüger, *History of Early Christian Literature* (New York, 1897); Harnack, *Chronologie der altchristlichen Litteratur* (Leipzig, 1897); Wrede, *Untersuchungen zum ersten Clemensbrief* (Göttingen, 1891).—CLEMENT II, Pope 1046–47. He was a Saxon, Suidger by name, and Bishop of Bamberg. The Emperor Henry III, whose chancellor he had been, made him Pope on the setting aside of the three rival claimants, Benedict IX, Gregory VI, and Sylvester III; and he crowned Henry the next day. He was a determined opponent of simony, against which he held a synod a few months before his death.—CLEMENT III, Pope 1187–91. He was a Roman by birth, and Cardinal Bishop of Palestrina. He settled some of the troubles between the popes and the Roman people, incited Philip Augustus and Henry II of England to undertake the Third Crusade, and in 1188 made the Scottish church directly dependent upon Rome, removing it from the jurisdiction of the archbishops of York. The title of CLEMENT III was also assumed by Wibert (Guibert), Antipope from 1080 to 1099 (died 1100).—CLEMENT IV, Pope 1265–68. Gui Foulquois le Gros, born at Saint-Gilles, on the Rhône, of a noble Provençal family, at first a soldier, later Archbishop of Narbonne and Cardinal Bishop of Sabina. He supported Charles of Anjou in his claim to the crown of the Two Sicilies, against Manfred, the natural son of the Emperor Frederick II. He was a man of austere piety and set his face steadfastly against nepotism. He encouraged and protected Roger Bacon.—CLEMENT V, Pope 1305–14. Bertrand d'Agoust, or de Goth, Archbishop of Bordeaux. He was strongly under the influence of Philip the Fair, at whose bidding he suppressed the Order of Templars (see TEMPLARS, KNIGHTS), and was the first of the popes to reside at Avignon, which continued to be the seat of the papacy for nearly 70 years. Consult: Rabanis, *Clément V et Philippe le Bel* (Paris, 1858); Lacoste, *Nouvelles études sur Clément V* (Bordeaux, 1896).—CLEMENT VI, Pope 1342–52. Pierre Roger, Archbishop of Rouen, and, like his three predecessors, a Frenchman. He, too, was entirely under French influence and refused to return from Avignon to Rome, in spite of a formal invitation delivered by a delegation headed by Petrarch. He excommunicated the Emperor Louis of Bavaria and compelled him to submit to the most humiliating conditions. As suzerain of the Kingdom of Naples, he acquitted Queen Joanna of the murder of her hus-

band and purchased the territory of Avignon from her for 80,000 crowns. He maintained the ecclesiastical jurisdiction against the encroachments of Edward III of England and made some negotiations for a reunion with the Eastern church. He lived in great splendor and contributed largely to the beautifying of the Avignon residence.—CLEMENT VII, Pope 1523–34. Giulio de' Medici, born about 1475. Before his elevation he had acquired some reputation for capacity in affairs which the unfortunate events of his pontificate showed to have been ill-founded. His worldliness and lack of insight into the tendencies of the age disqualified him from comprehending the great upheaval which threatened the Church, while his timidity and indecision no less disabled him from following a consistent policy in secular affairs. He was at first attached to the Imperial interest, but by the overwhelming success of the Emperor Charles V in the battle of Pavia was terrified into joining the other Italian powers in a league with France. But his zeal was soon cooled, and by want of foresight and unreasonable economy he laid himself open to an attack from the turbulent Roman nobles, which obliged him to invoke the mediation of the Emperor. When this danger seemed past, he veered back to his former engagements, and ended by drawing upon himself the army of the Constable de Bourbon. On May 6, 1527, followed the memorable and terrible sack of Rome by the Imperial troops. The Pope retired to the castle of Sant' Angelo, where he was kept a prisoner for over six months. He was released upon very onerous conditions and fled immediately to Orvieto. The following year he returned to Rome, and in 1529 he made his peace with Charles V, who undertook to assist in the restoration of the Medici in Florence, and whom the Pope crowned at Bologna in 1530. For several years Clement followed a policy of subserviency to the Emperor, on the one hand endeavoring to induce him to act with severity against the Lutherans of Germany, and on the other striving to elude his demand for a general council. The loss of half of Germany to the Church and the breach with England, occasioned by the Pope's refusal to sanction the divorce of Henry VIII, made this a most unfortunate pontificate. Consult: Creighton, *History of the Papacy during the Reformation* (London, 1882); Vaughan, *The Medici Popes* (ib., 1908). The title of CLEMENT VII was also assumed by Robert of Geneva, Antipope (see ANTIPOPE), 1378–94.—CLEMENT VIII, Pope 1592–1605. Ippolito Aldobrandini, born about 1536. He brought about the reconciliation of Henry IV of France with the Church (1593), and, on the extinction of the male line of the house of Este, annexed Ferrara, the last addition of importance to the States of the Church. He acted as mediator in the negotiations which resulted in the Peace of Vervins. The last years of his pontificate were occupied, among other important questions, by the controversy between the Jesuits and Dominicans on the question of grace, which led him to establish in 1597 the celebrated *Congregatio de Auxiliis Divinæ Gratiæ*. He was a man of marked piety; he confessed daily to Philip Neri, and after the latter's death to his successor in the headship of the Oratorians, Cardinal Baronius. His love for letters was shown by his promotion of a number of learned scholars to the purple, and the issue of revised editions of the Vulgate, the breviary, and the liturgical books. The title CLEMENT VIII was also assumed by Ægidius Muñoz, Antipope, 1425–29.—CLEMENT IX, Pope 1667–69. Giulio Rospigliosi. He was born in 1600 and studied in the Roman Seminary. As nuncio to Spain, he acquired an insight into political affairs and an influence which enabled him, after his elevation to the papal throne, to bring about the Peace of Aix-la-Chapelle (1668) between France and Spain. He endeavored to adjust the Jansenist (q.v.) difficulties in France, but his efforts failed to bring about a permanent peace. —CLEMENT X, Pope 1670–76. Emilio Altieri, born 1590. He was the immediate successor of Clement IX, who had made him Cardinal but a few months before his death, and with his last breath designated him as his choice for the papal throne. In consequence of his advanced age he left much of the government to his nephew, Cardinal Paluzzo Paluzzi.—CLEMENT XI, Pope 1700–21. Giovanni Francesco Albani, born 1649. He was employed in many important diplomatic affairs and made Cardinal a few months before his election to the papacy. His pontificate was troubled by many disputes, with Prussia, with the Empire, and with the recalcitrant Jansenists in France, against whom he launched the famous constitutions *Vineam Domini Sabaoth* (1705) and *Unigenitus* (1713). Another important decision by this Pope forbade the Jesuit missionaries in China to employ certain pagan customs which they had adopted to overcome native prejudices.—CLEMENT XII, Pope 1730–40. Lorenzo Corsini, born 1652, made Cardinal 1706. He was distinguished as a wise and kind-hearted temporal sovereign, who did much for both art and industry in his dominions, and who labored for union with the Greek church. In 1738 he condemned the Freemasons. —CLEMENT XIII, Pope 1758–69. Carlo Rezzonico, born 1693; made Cardinal 1737, on the recommendation of Venice, his native state. His reign was occupied with unceasing struggles for the rights of the Church and for the preservation of their ardent champions, the Jesuits, against the liberalizing governments of his day, such as those controlled by Pombal in Portugal and Choiseul and Madame de Pompadour in France. He witnessed, however, the expulsion of the Jesuits from Portugal, France, and Spain. It was believed that he was about to yield to the demand for the suppression of the order, when he died, leaving these thorny questions to his successor, Clement XIV.—CLEMENT XIV, Pope 1769–74. Giovanni Vincenzio Antonio Ganganelli, born 1705 at Sant' Arcangelo, near Rimini, where his father was a physician. At the age of 18 he entered the Order of Minorites and studied philosophy and theology, which he afterward successfully taught. His merits were appreciated by the keen-sighted Benedict XIV, who appointed him to the important post of counselor to the Inquisition, and under Clement XIII he was made Cardinal. No Pope had ever confronted greater difficulties on his accession. The kings of Portugal, France, Spain, and Naples were at variance with him, chiefly on account of his support of the Jesuits; Venice wished to reform the religious orders without his interference; Poland was seeking to diminish his influence; the Romans themselves were discontented. He first set about reconciling the monarchs; he sent a nuncio to Lisbon, suspended the bull *In Cena Domini*, and entered into negotiations with Spain and France. After several

years of negotiation he signed, much against his will, on July 21, 1773, the famous brief *Dominus ac Redemptor noster*, suppressing the Society of the Jesuits. The motive assigned in the brief is, "regard to the peace of the Church." Soon after, his health gave way, it was rumored on account of his disquietude of conscience. He died of a scorbutic disease, Sept. 22, 1774. Clement XIV was remarkable for liberality of mind, address as a statesman, sound learning, and mildness of character. He cherished the arts and sciences and was the founder of the Clementine Museum, which, by the additions of Pius VI and Pius VII, became the chief ornament of the Vatican. Consult: A. Theiner, *Geschichte des Pontificats Clement XIV* (Paris, 1853); Von Reumont, *Ganganelli (Papst Clement XIV), seine Briefe und seine Zeit* (Berlin, 1847); Ravignan, *Clément XIII et Clément XIV* (Paris, 1854).

CLÉMENT, klā'mäN', (Frédéric Jean) Edmond (1867–). A French dramatic tenor, born in Paris. He was educated at the Institution Nôtre-Dame de Chartres and at the Conservatory in Paris. He made his début at the Opéra Comique in *Mereille*. Later he appeared in *Mignon, La fille du régiment, Fra Diavolo, Lakmé, Don Juan, L'Eclair, Haydée, Don Pasquale, Proserpine*. He also created important rôles in *Benvenuto, Phryné, Falstaff, Xavière, L'Amour à la Bastille, L'Ile du rêve, Beaucoup de bruit pour rien, Le Juif polonais*, and *La petite maison*.

CLEM'ENT, Ernest Wilson (1860–). An American educator and writer on Japan. He was born in Dubuque, Iowa; graduated at the University of Chicago in 1880; taught in secondary schools in the United States until 1887, and then for four years in the Mito High School in Japan. He was teaching in America again until 1894, was principal of the Duncan Academy in Tokio until 1911, and then became a teacher in the First Higher School in that city. He was acting interpreter of the American legation, librarian and recording secretary of the Asiatic Society of Japan, editor of the *Japanese Evangelist* (1899–1909) and of the *Christian Movement in Japan* (1907–09), and a contributor to American and Japanese periodicals. He published: *A Handbook of Modern Japan* (1903; 9th ed., 1913); *Japanese Floral Calendar* (1904; 2d ed., 1911); *Christianity in Modern Japan* (1905); a revision of Hildreth's *Japan as It Was and Is* (1906); *Japanese Chronology* (1910).

CLÉMENT, klā'mäN', Jacques (1567–89). The assassin of Henry III of France. He was born at Sorbon, in the Department of Ardennes, and in early life seems to have been a soldier. Later he entered a Dominican convent in Paris. Ignorant, passionate, and probably also demented, Clément became a fanatic partisan of the League in its struggle against the French King and Henry of Navarre. After the murder of the Duke of Guise and his brother, at Blois, in 1588, Clément began to think of himself as the instrument selected by Heaven to overthrow the "tyrant," i.e., Henry of Valois, and to avenge the death of the two great leaders of the League. He is said to have confided his plan to assassinate the King to Bourgoing, the prior of his convent, and to have received the latter's approbation. It is asserted also by historians friendly to the cause of Henry of Navarre that the plan was brought to the knowledge of the Cardinal of Mayenne and his sister, the Duchesse de Montpensier, and that it was, in fact, carried out with their assistance; but historians friendly to the League deny that its leaders had any previous knowledge whatever of Clément's murderous scheme. Letters of introduction to the King were obtained for Clément from the president, Harlay, and the Count de Brienne, who were then prisoners of the League in Paris. On July 31, 1589, Clément set out for Saint-Cloud, from where Henry III was directing the operations against the capital. On the morning of August 1 he was admitted to the presence of the King as the bearer of an important letter and, while the King was reading it, stabbed him. Henry threw the knife into the assassin's face, exclaiming: "Oh! the wicked monk; he has killed me! Put him to death!" Clément was immediately cut down, and his body was subsequently quartered and burned. The King died the next day. By the zealots among the Leaguers the deed was received with undisguised rejoicing, and according to Daubigné, a Protestant, the act of Clément was praised from the pulpit, and the monk declared a martyr. De Thou, a partisan of Henry IV, asserts that Pope Sixtus V lauded Clément, but both Daubigné's and De Thou's statements have no authority beyond their own assertion. For a defense of the assassination of Henry III, consult Pinselet, *Le martyre du frère Jacques Clément* (Paris, 1589). Consult also Baird, *The Huguenots and Henry of Navarre*, vol. ii, chap. 10 (New York, 1886), and authorities cited under Henry III.

CLÉMENT, Jean Pierre (1809–70). A French political economist and historian, born at Draguignan. He was in the Ministry of Finance and a member of the Institute and wrote, with the aid of original documents, works on French financial administration, particularly in the epoch of Colbert, including: *Histoire de la vie et de l'administration de Colbert* (1846); *Histoire du système protecteur en France depuis Colbert jusqu'à la révolution de 1848* (1854); *Études financières et d'économie sociale* (1859); and *Lettres, instructions, et mémoires de Colbert* (7 vols., 1861–82). Clément's prefaces to the last work were collected and edited by his widow under the title *Histoire de Colbert et de son administration* (1874; 3d ed., 1892).

CLEM'ENT, Justice. An "old merry magistrate" in Jonson's *Every Man in his Humour*.

CLEMENTI, klā-mēn'tē, Jacopo di, da Empoli (often called Chimenti) (1554–1640). An Italian painter of the Florentine school, born in Florence. He was a pupil of Tommaso di San Friano (or Tridano) and was influenced by the works of Andrea del Sarto and Pontormo. Clementi's art marks the transition from the style of the Mannerists to the baroque. His manner is severe to rigidity, his treatment often realistic. His two principal works are "St. Ives in the Midst of the Widows and Orphans" (Uffizi), and the altarpiece of "San Borromeo with Members of the Rospigliosi Family," in San Domenico, Pistoia. Others are "Christ in Gethsemane" (Prado Museum, Madrid) and the "Sacrifice of Isaac" in the Serragli Church, Florence. He also painted excellent portraits. His only fresco is on the staircase of the Certosa, near Florence. Consult Giglioli, *Empoli artistica* (Rome, 1906).

CLEMENTI, klā-mĕn'tē, Muzio (1752–1832). An Italian piano virtuoso and composer, born in Rome. His father, a goldsmith and fervent music lover, placed him under a relative, Buroni, for lessons in piano and harmony, and in 1761 Clementi became an organist. Later on, Carpani taught him counterpoint; and Sartarelli, singing. In 1766 an Englishman, Beckford, delighted with his playing, took him to England, where he continued his musical studies until 1770. He was now a finished virtuoso and published three piano sonatas (Op. 2)—the first works of this kind that bear the modern form. His success as a performer in London was extraordinary, and in 1777–80 he was cembalist (conductor) at the Italian opera there. His first tour (1781) included Strassburg, Munich, and Vienna, where his public contest with Mozart became an historic event, though the palm was awarded to neither. He aroused great enthusiasm in Paris (1785), but, in spite of it, decided to enter business. He returned to London, secured an interest in the publishing and piano-manufacturing firm of Longman and Broderip, and after its failure formed a partnership with Collard. The mechanical perfection of the piano absorbed most of his energies, yet he found time to write theoretical works and to give instruction—a field in which he had no rival. His concert tours in Russia (1802) and afterward in Germany and Italy were wonderfully successful; but his enterprises in London, by which he amassed a fortune, claimed most of his attention. He retired in old age to his estate at Evesham, outside London, and died there March 10, 1832. Among Clementi's pupils, Field, Cramer, Moscheles, Kalkbrenner, and Meyerbeer are the most noteworthy. Even Beethoven owes much to Clementi in his works for the piano. His style as a performer was that of a virtuoso, characterized by polish, vigor, and brilliancy, and a beautiful singing tone; and he especially excelled in improvisation. Of his works the sonatas, 106 in number, are brilliant and melodious, while his series of exercises, *Gradus ad Parnassum* (1817), remains an indispensable work in every pianist's equipment. Consult: Ferris, *Great Violinists and Pianists* (New York, 1894); Shedlock, *The Pianoforte Sonata* (London, 1895); Frojo, *Muzio Clementi, la sua vita, le sue opere e la sua influenza sul progresso dell' arte* (Milan, 1878).

CLEM'ENTI'NA, or **PSEUDO-CLEMENTINE** (sū'dō-klĕm'en-tīn) **WRITINGS** (Lat. nom. pl., from Gk. Κλημέντια, *Klēmentia*, from Lat. *Clemens*, Clement). 1. The "Second Epistle of Clement," a homily, perhaps originating in the East between 120 and 140 (see Clement I). 2. Two Epistles to Virgins, discussing certain problems which had arisen in the growing practice of celibacy in the Church, of Syrian origin, dating from the third century. 3. The most important are the *Homilies*, *Recognitions*, and *Epitomes*, a collection of discourses and stories, bearing the name of Clement of Rome, of uncertain authorship and date, but in their present form not earlier than the beginning of the third century. The first external testimony to their existence is found in the *History* of Eusebius. The groundwork upon which the compilation rests may, perhaps, date from the second century. The pseudo-Clementine literature includes 20 *Homilies*, 10 *Recognitions*, and an *Epitome*, which were all written in Greek. The last is relatively unimportant. In the *Homilies* and *Recognitions* we have what purports to be the story of Clement's career, in company with his teacher, the Apostle Peter. The bulk of the narrative consists of an unsystematic and frequently interrupted account of the experiences of Peter with the archheretic Simon Magus, with whom he carries on doctrinal and ethical discussions, and whom he victoriously follows from place to place, founding churches on the way.

The theological position of the writer is clearly discernible. He is a Jewish Christian Gnostic, perhaps of the sect of Elkesaites (q.v.). He ignores (some would say, opposes) Paul and exalts the person of James, "the Lord's brother." The *Homilies* were compiled for the sake of the teaching contained, rather than for the sake of any historical narration. The *Recognitions* traverse the same general ground, but with variation of treatment and with greater attention to the story. Historical criticism has not yet reached definite conclusions on all the problems presented by these curious writings. That there has been more or less working over of earlier material is generally conceded. They seem to be based on a common source. Recent opinion inclines towards Syria as the probable home of the work on which the writings are based (Uhlhorn) and towards Rome as a possible source for the books in their present form (Harnack). But we have thus far no means of constructing even a plausible hypothesis as to the person or persons by whom they were recast.

Bibliography. Among editions of the pseudo-Clementine writings may be mentioned: the edition of the *Homilies* by Lagarde (Leipzig, 1865); of the *Recognitions* by Gersdorf (ib., 1838); of the *Epitome* by Dressel (ib., 1859); Eng. trans. in the *Ante-Nicene Fathers*, ed. by A. C. Coxe, vol. viii. Consult, in general: G. Krüger, *History of Early Christian Literature* (Eng. trans., New York, 1897); Harnack, *Geschichte der altchristlichen Litteratur*, vol. i (Leipzig, 1893); C. Bigg, "The Clementine Homilies," in *Studia Biblica et Ecclesiastica*, vol. ii (Oxford, 1890); Hort, *Notes Introductory to the Study of Clementina Recognitions* (London, 1901); Waitz, "Die Pseudo-Klementinen," in *Text und Untersuchungen zur Geschichte der altchristlichen Litteratur*, vol. x, p. 4 (Leipzig, 1904).

CLEMENTINA, klā'mĕn-tē'nà, Lady. A character in Richardson's novel *Sir Charles Grandison*.

CLEM'ENTINES (Lat. *Clementinæ*, sc. *leges*, laws, from *Clemens*, Clement). A collection of decrees and constitutions published by Pope Clement V in 1313. They constitute five books and 52 titles in the *Corpus Juris Canonici* and were edited and published by the Benedictines in 9 vols., with an appendix (1885–92).

CLEMENT OF ALEXANDRIA (Lat. *Clemens Alexandrinus*, Gk. Κλήμης Ἀλεξανδρεῖος, *Klēmēs Alexandreios*) (c.150–c215). Titus Flavius Clemens, a celebrated Greek father of the Church. He was probably of heathen parentage, and his birthplace is unknown. He received a liberal education and sought out many teachers in his search for truth. He finally resorted to the Christian Pantænus, who presided over the catechetical school at Alexandria, and here he entered the Church. He was ordained a presbyter and succeeded Pantænus as head of the famous school, which was destined to achieve much greater renown because of the influence

of his own and Origen's teaching. During the persecution in the reign of Septimius Severus (c.203 A.D.) Clement left Alexandria. We hear of him afterward in Palestine and Asia Minor; but his later life is veiled in obscurity, and we know neither the place nor the date of his death.

Clement was a man of wide learning and was proficient in Greek philosophy, literature, and history. Jerome called him "the most learned of men"; but this is mere friendly exaggeration. As a theologian he ranks high, although inferior to his famous pupil, Origen (q.v.). According to his system, the divine Logos exhorts, educates, and perfects the true Christian gnostic, through a gradual process which is marked out, in three stages, in Clement's chief works—the *Exhortation to the Greeks*, the *Instructor*, and the *Stromata* ("miscellanies"), which together form a kind of trilogy. The first is a defense of the faith, designed to win converts. The second contains instructions in manners and morals for everyday life. In this Clement has not hesitated to draw freely from Stoic sources. The third is an unsystematic discussion of various points of doctrinal theology, designed to guide the mature Christian to a perfect knowledge (gnosis). He regarded Greek philosophy as a divinely inspired preparation for Christianity. Appended to the *Stromata* is one of the earliest Christian hymns, familiar to the modern world in the version beginning, "Shepherd of tender youth." Of Clement's other writings the best known is the tractate, *Who is the Rich Man that Shall be Saved?* In his interpretation of Scripture Clement followed the allegorical method, so much in vogue in Alexandria. The best edition of Clement's works is by Potter (Oxford, 1715), reprinted in Migne's *Patrol. Græc.*, vols. viii and ix (Paris, 1857). An English translation may be found in the *Ante-Nicene Fathers*, vol. ii, ed. by A. C. Coxe (New York, 1885). Consult, in general, the article "Clement," in Smith and Wace, *Dictionary of Christian Biography* (London, 1877–87); Charles Bigg, *The Christian Platonists of Alexandria* (Oxford, 1886); F. R. M. Hitchcock, *Clement of Alexandria* (London, 1899); Eugène de Faye, *Clément d'Alexandrie* (Paris, 1898).

CLEMENT OF ROME. See CLEMENT I.

CLEMENTS, FREDERIC EDWARD (1874–). An American botanist, born at Lincoln, Neb. He was educated at the University of Nebraska, where in 1894–1906 he was assistant professor of botany and then for a year professor of plant physiology. In 1907 he became professor and head of the department of botany at the University of Minnesota. His publications include: *The Phytogeography of Nebraska* (1898; 2d ed., 1900); *Histogenesis of Caryophyllales* (1899); *Laboratory Manual of High School Botany* (1900); *Greek and Latin in Biological Nomenclature* (1902); *Herbaria Formationum Coloradensium* (1902); *Development and Structure of Vegetation* (1904); *Research Methods in Ecology* (1905); *Plant Physiology and Ecology* (1907); *Cryptogamæ Formationum Coloradensium* (1908); *Genera of Fungi* (1909); *Minnesota Mushrooms* (1910); *Guide to the Trees and Shrubs of Minnesota* (1908); *Guide to the Spring Flowers of Minnesota* (1908; 3d ed., 1913); *Guide to the Autumn Flowers of Minnesota, Field and Garden* (1913).

CLEMENTS, JUDSON C(LAUDIUS) (1846–1917). An American politician and commerce expert, born in Walker Co., Ga. He was admitted to the bar in 1869 and practiced at LaFayette, Ga., from 1869 to 1892. He was county school commissioner in 1871, a member of the Georgia House of Representatives in 1872–76, and a member of the State Senate in 1877. From 1881 to 1891 he was in Congress and from 1892 to 1912 was a member of the Interstate Commerce Commission. He was reappointed to the commission in 1913. He published *Moral Results of Modern Transportation and Transmission Facilities* (1911).

CLEM'ENT'S INN. An Inn of Chancery, attached to the Inner Temple, in London. It originally served as a place of entertainment for those who made use of the waters of St. Clement's Well near by.

CLEMOW, FRANK GERARD. A British physician, educated in Liverpool, at Edinburgh University, and in Paris. He spent 15 months in India, served as medical officer to the British Seaman's Hospital, Cronstadt, and later became physician to the British Embassy at Constantinople. He was British delegate and plenipotentiary at the International Sanitary Conference in Paris in 1903 and in 1911–12. His publications include: *The Cholera Epidemic of 1892 in the Russian Empire* (1893); *The Medicinal Waters and Muds of Russia* (1897); *Medicine Past and Present in Russia* (1897); *Des formes cliniques de la peste* (1900); *The Geography of Disease* (1903); *Etude sur la défense sanitaire du chemin du fer du Hedjaz* (1910).

CLEMSON COLLEGE. An institution at Clemson College, S. C., chartered in 1889 and opened in 1893. Courses are offered in agriculture, mechanic arts, and electricity, chemistry, and textile arts. There are also military and academic departments. The institution is engaged in State work, such as the inspection of fertilizers, the protection of farmers against injurious insects and the diseases of animals, and in extension work among the farmers, teachers, etc. The student enrollment in 1912–13 was 834, and the instructors numbered 64. The college has an endowment fund of $154,439, and a total income of about $300,000. The value of grounds, buildings, and appliances in 1913 was $1,330,000. The president in 1914 was W. M. Riggs, B.S., LL.D.

CLE'OBU'LUS (Lat., from Gk. Κλεόβουλος, *Kleoboulos*). One of the seven wise men of Greece. He was the son of Evagoras and a native and ruler of Lindus, in Rhodes. He lived between 628 and 558 B.C., and was perhaps the first to give a literary form to riddles. He also wrote lyric poetry. Diogenes Laërtius has preserved for us several of his riddles. Consult Bergk, *Poetæ Lyrici Græci* (Leipzig, 1900).

CLE'OFAS, DON. The Spanish student for whose benefit Asmodeus exposes to view the secret life of all Madrid by unroofing the houses, in Le Sage's *Le diable boiteux*.

CLÉOMADÈS, klā'ō'mà'dēs', THE ADVENTURES OF (Fr. *Les aventures de Cléomadès*). A French poem, of some 20,000 lines, written by Adenès le Roi towards the close of the thirteenth century.

CLEOM'BROTUS I (Lat., from Gk. Κλεόμβροτος, *Kleombrotos* (?–371 B.C.). A king of Sparta (380–371 B.C.). He was a son of Pausanias and succeeded his brother, Agesipolis I. He commanded the Spartan army which was sent against Thebes in 378 B.C.; two years later he led into Bœotia a second equally un-

successful expedition. He was defeated and killed in the battle of Leuctra (371 B.C.).

CLEOMEDES, klē'ō-mē'dēz (Lat., from Gk. Κλεομήδης, *Kleomēdēs*). A Greek writer on astronomy of the first or second century A.D. He composed a treatise, *The Circular Theory of the Heavenly Bodies*, which contains many truths of modern science—the spherical shape of the earth, the revolution of the moon about the earth, etc. The best edition is that by Ziegler (1891).

CLEOMENES (klē-ŏm'ē-nēz) **I** (Lat., from Gk. Κλεομένης, *Kleomenēs*). A king of Sparta. He was the son of Anaxandrides and came to the throne not later than 518 or 517 B.C. At the mandate of the Delphic oracle in 510 B.C. he assisted the Athenians in expelling from their city Hippias, the last of the Pisistratidæ. Shortly after this event he joined Isagoras, the head of the Oligarchical party at Athens, in an attempt to overturn the Clisthenian constitution. Clisthenes was driven from the city, and 700 families, partisans of Clisthenes, were sent into exile; but the undertaking, as a whole, proved unsuccessful. Later he made another unsuccessful attempt to aid Isagoras. At the time of the Ionic revolt he was appealed to in vain by Aristagoras to join the Grecian cause. In the war between Sparta and Argos, about the time of the capture of Miletus by the Persians, Cleomenes, having by stratagem defeated the Argives near Tiryns, treacherously slew a number of the survivors and destroyed the rest by setting fire to the grove in which they had taken refuge. Six thousand Argive citizens perished at this time, in and after the battle. By this victory Cleomenes won for Sparta supremacy in the Peloponnese. Afterward, by bribing the Delphic oracle, he secured the dethronement of his colleague, Demaratus, on the ground of illegitimacy (consult Herodotus, vi, 50–73), and the substitution for him of Leotychides. This he did because Demaratus had thwarted his attempt, in 491, to punish Ægina for submission to Darius. In his later years he became insane, finally taking his own life. Consult Wells, *Journal of Hellenic Studies* (1905).

CLEOMENES III (?–219 B.C.). A king of Sparta. He was the son of Leonidas II and the last of the Agidæ. (See AGIS.) He became King about 235 B.C. Cleomenes was the inheritor of the aspirations of King Agis IV; his aim was to do away with the ephorate at Sparta and to reassert the power of the kings and then to raise Sparta to the position of leader in Greece. His plans caused war between Sparta and the Achæan League (see ACHÆA) in 227 B.C.; in 226 Cleomenes twice defeated the Achæans in battle—at the foot of Mount Lycæus, in Arcadia, and at Leuctra, in the territory of Megalopolis. After this he abolished the ephorate, restored the prerogatives of the kings, made a redistribution of the lands, remitted debts, and extended the franchise to certain of the periœci (q.v.). In 224 he utterly defeated the Achæans in a battle at Dyme, near Hecatombæum, but in 221 was himself defeated at Sellasia by the combined forces of the Macedonians and the Achæans, under the command of Antigonus, who had been called to the aid of the Achæans by Aratus and Philopœmen. Fleeing to Egypt, he there later endeavored to head an insurrection of the people, but, failing in that, took his own life. Cleomenes was the last great statesman that Greece produced.

CLEOMENES, or THE SPARTAN HERO. A play by Dryden and Southerne, produced in May, 1692.

CLE'ON. The Governor of Tharsus, in Shakespeare's *Pericles*.

CLEON (Lat., from Gk. Κλέων, *Kleōn*) (?–422 B.C.). An Athenian politician, champion of the democracy. He was a son of Cleænetus and was by trade a leather dealer. He first came into prominence by opposing Pericles; he caused Pericles to be convicted of maladminstration of public funds. In 427 B.C., when the matter of the treatment of the inhabitants of Mytilene, who had revolted against Athens, came up for consideration in the Athenian Assembly, he urged that all the inhabitants be put to death. In 425, when envoys arrived at Athens to treat of the release of the Spartan citizens shut up on the island of Sphacteria and to suggest peace, the Athenians, instigated by Cleon, imposed such terms upon Sparta that peace was found to be impossible. Later in the same year, owing to a casual remark made in the public assembly to the effect that, if *he* were general, the Athenians would not long remain in front of Sphacteria, Cleon himself was placed in charge of the operations against the island. He promised to end the siege within 20 days, and, in conjunction with Demosthenes, he did this. (See PYLUS.) In 422 B.C. Cleon was sent to oppose Brasidas (q.v.), in Macedonia and Thrace and to recover the city of Amphipolis. He took the towns of Torone and Galepsus, but was defeated and slain in the battle which took place beneath the walls of Amphipolis. Cleon is described by Thucydides and Aristophanes as an insolent and venal politician and a demagogue of low type. Both writers, however, had strong incentives to prejudices against him. Cleon was for many years the foremost man in Athens; he was a persuasive speaker, clever at managing public business in a popular way, and a strong advocate of war with Sparta. His death paved the way for the Peace of Nicias (q.v.), in 421. Consult: Grote, *History of Greece*, vol. vi (London, 1888); Beloch, *Die Attische Politik seit Perikles* (Leipzig, 1884); Holm, *History of Greece*, Eng. trans., vol. ii, chap. 23 (New York, 1902).

CLÉONTE, klā'ôNt'. A character in Molière's *Le bourgeois gentilhomme*.

CLE'OPA'TRA (Gk. Κλεοπάτρα). The name of several queens and princesses of Egypt of the family of the Ptolemies (q.v.). The most famous of them, CLEOPATRA VI, daughter of Ptolemy XIII, Auletes, was born in 69 or 68 B.C. Budge calls her the seventh; but Mahaffy declines to admit a Cleopatra VI (Tryphæna). Her father died in 51, leaving a will wherein he appointed as his successors, his elder daughter, Cleopatra, and his elder son, Ptolemy, and requested the Roman people to see his testamentary dispositions carried into effect. Two copies of this will were drawn up—one to be preserved at Alexandria (consult Cæsar, *De Bell. Civ.*, iii, 108), the other to be sent to Rome to be deposited in the public archives. Owing, however, to the unsettled state of the Empire, the latter will never reached its destination, but remained in the possession of Pompey. Cleopatra, then about 17 years old, and her brother, Ptolemy XIV, a child of about 12 years, succeeded jointly to the throne of Egypt, with the understanding that they should shortly marry. In the third year of their reign Ptolemy, urged by his advisers, assumed sole control of the government and drove

his sister into exile. She promptly gathered an army in Syria and prepared to assert her claims. It was at this time that Pompey, seeking refuge with the King of Egypt, after his defeat at Pharsalia, was murdered by the King's advisers. Cleopatra seems to have been unable to make good her claim by force of arms; but, shortly after Pompey's death, Cæsar arrived at Alexandria and, yielding to the fascinations of the Egyptian Queen, became her lover and espoused her cause. He was for a time hard pressed by the Egyptians, but ultimately triumphed, and Ptolemy lost his life. Arsinoë, the younger daughter of Ptolemy Auletes, was carried off to grace Cæsar's triumph at Rome. Cleopatra now nominally married her younger brother, Ptolemy XV, and, after settling their joint government upon a secure basis, went to Rome, where she lived as Cæsar's mistress until his assassination in 44 B.C. After Cæsar's death, having, it is said, poisoned her brother, Ptolemy XV, she returned to Egypt, where she associated with her on the throne her son by Cæsar, called Cæsarion. In the civil war following Cæsar's death, since Cleopatra had hesitated to take sides with either party, Antony, after the battle of Philippi (42), summoned her to meet him at Tarsus in Cilicia to explain her conduct. When she appeared upon the Cydnus on a splendidly adorned vessel, in the garb of the goddess Aphrodite, the Roman triumvir fell a victim to her charms and returned with her to Egypt. After living with her for some time, in the course of which she bore him twin children, Alexander Helios and Cleopatra Selene, Antony was compelled to return to Rome, where he married Octavia, a sister of Octavius. When, in 36, he went to the East in command of an expedition against the Parthians, he sent for Cleopatra, and she joined him at Antioch, and after his defeat she met him in Syria with troops and supplies. In 34, after a more successful campaign against the Parthians, he celebrated his triumph at Alexandria and continued to reside in Egypt. In 32 Octavianus declared war against Cleopatra, and Antony, in revenge, divorced his wife Octavia. Against the counsel of Antony's advisers Cleopatra insisted on taking part in the ensuing campaign. At the naval battle of Actium (31), believing Antony's defeat to be inevitable, she withdrew her fleet from action and fled to Alexandria. Her lover, beholding her flight, made no further effort to retrieve his fortunes, but retired from the battle and followed her. On the approach of Octavianus, Antony, deceived by the false report of the Queen's death, fell by his own hand. Cleopatra made some attempts to bring Octavianus under the influence of her charms, but, failing in this and hearing that he intended to exhibit her in his triumph at Rome, she killed herself (30 B.C.), probably by poison, and, according to an old tradition, by the bite of a venomous serpent. Cleopatra combined rare intellectual gifts with physical charms, and she is immortal as one of the most fascinating women of all time; so that ever since her death she has been a constant theme for artists, dramatists, and poets. There is no authentic portrait of Cleopatra extant, except in her effigy upon coins. A composite photograph has been made of these by Gorringe in his book, *Egyptian Obelisks* (New York, 1885).

Cæsarion, her son by Cæsar, was put to death by Octavius. Of her three children by Antony, her daughter CLEOPATRA married Juba, King of Mauretania, who was allowed by Octavius to take under his protection his wife's two brothers, Alexander and Ptolemy. In 40 A.D. Ptolemy, son of Juba and the younger Cleopatra, was slain by Caligula, and with him ended the line of the Ptolemies. (See PTOLEMY.) Consult: Strack, *Die Dynastie der Ptolemäer* (1896); Mahaffy, *The Empire of the Ptolemies* and *History of Egypt under the Ptolemaic Dynasty* (1899); Lombroso, *L'Egitto dei Greci e dei Romani* (1895).

CLEOPATRA. An opera by Enna (q.v.), first produced in Copenhagen, Feb. 9, 1894.

CLEOPATRA'S NEEDLES. The name given to two Egyptian obelisks of red syenite, which were transported from Heliopolis to Alexandria about 14 B.C., and remained there until 1877, when they were presented to the governments of Great Britain and of the United States by the Khedive, Ismail Pasha. One has been standing on the Thames Embankment, London, since 1878, the other in Central Park, New York, since 1880. The latter is 69 feet high, with a base 7 feet 7 inches square, and weighs 200 tons. It is supported on four bronze crabs, reproductions from the originals preserved in the neighboring Metropolitan Museum. The obelisk bears inscriptions of Thothmes III (about 1500 B.C.) and Rameses II. The London obelisk is slightly smaller than its companion in New York. Consult Gorringe, *Egyptian Obelisks* (New York, 1885). See OBELISK.

CLEP'SYDRA (Gk. κλεψύδρα, *klepsydra*, from κλέπτειν, *kleptein*, to steal + ὕδωρ, *hydōr*, water). An ancient instrument for measuring time by the efflux of water through a small orifice. Two kinds have been in use. In the simpler form the water was allowed to escape from one vessel into another. This form was used in the Athenian courts, where a speaker was allowed a certain quantity of water for his speech, the quantity depending on the importance of the suit. The more complicated form was said by some to have been invented by Plato, while others gave the honor to Ctesibius of Alexandria. In this form the water was allowed to flow at a uniform rate into a receptacle, on which was marked a scale of hours. Both forms are said to have been introduced into Rome in 159 B.C. and were widely used. (See CLOCK.) Athenæus (vol. iv, p. 174) applies the name to a variety of the hydraulic organ.

CLERC, klâr, JEAN LE. See LE CLERC, JEAN.

CLERC, LAURENT (1785–1869). A French deaf-mute and educator, born near Lyons. He was a favorite pupil of the Abbé Sicard at the institution of the deaf and dumb founded in Paris by the Abbé de l'Epée, and after eight years of study became a teacher. In 1816 he came to the United States with Dr. Gallaudet (q.v.), and the next year the two opened an institution for the deaf and dumb in Hartford, Conn., where Clerc taught successfully for more than 40 years. He married a deaf-mute, who bore him several children, all of whom had the sense of hearing and could speak. See DEAF-MUTE.

CLERESTORY. See CLEARSTORY.

CLERFAYT, or **CLAIRFAIT,** klâr'fâ', CHARLES DE CROIX, COUNT (1733–98). An Austrian field marshal, born at the castle of Bruille, Hainaut, Low Countries. He entered the Austrian service in 1753, fought with distinction in the Seven Years' War, and was advanced to the rank of colonel. During the Turkish War of 1787–91 he commanded an army

corps which won battles at Mehadia and Kalafat. In 1792 he commanded the Austrian corps sent to assist the Duke of Brunswick and defeated the French at Croix-aux-Bois (September 15). Having withdrawn into Belgium, he defeated the French at Aldenhoven (March 1, 1793), relieved Maestricht, decided the battle of Neerwinden (March 18), and took Le Quesnoy (September 11). After this series of brilliant victories he met with reverses at Wattignies (October 15 and 16), Mouscron (April 29, 1794), and Hoogleede (June 13). In 1795 he was appointed field marshal and commander in chief of the Imperial armies on the Rhine, in which capacity he defeated Jourdan at Höchst (October 11) and relieved Mainz, storming the almost impregnable works of the besiegers, which were defended by an army of 80,000 men. After concluding an armistice with the French Republic he returned to Vienna, where he was hailed as the savior of the Empire. Because of differences with the Imperial Minister Thugut over the armistice, he left the army. Consult Vivenot, *Thugut, Clerfait, und Wurmser* (Vienna, 1869).

CLERGUE, Francis Hector (1856–). An American manufacturer, born in Bangor, Me., of French Huguenot ancestry, and educated at the University of Maine. He studied law and was admitted to the bar in 1876, but in 1880 became interested in street railways and other developments. In 1888 he attempted unsuccessfully to organize a railway and electric light and water works companies in Teheran. In 1896 he began to develop hydraulic power at the falls of the St. Mary, and it was largely through his efforts, and in some cases his inventions, that in Sault Ste. Marie, Mich., and in the city of the same name in Ontario, great wood-pulp factories and reduction works were built.

CLERGY (OF. *clergie*, Lat. *clericus*, from Gk. κληρικός, *klērikos*, clergyman, from κλῆρος, *klēros*, lot). A term very generally applied to the ministers of the Christian religion in contradistinction to the laity (q.v.). This use of the term is very ancient and appears to have gradually become prevalent, as the ministers of religion more and more exclusively, instead of the members of the Christian Church equally, began to be regarded as God's "heritage" and "priesthood" (1 Pet. ii. 9, and v. 3), consecrated to Him, and peculiarly His. The distinction between the clergy and the laity became more marked through the multiplication of offices and titles among the clergy, the ascription to them of a place in the Christian Church similar to that of the priests and Levites in the Jewish church, with peculiar rights and privileges, their assumption of a peculiar dress and of official insignia, the growth of monastic institutions, and the introduction of celibacy. In harmony with the notions on which this distinction is founded is that of an indelible, sacramentally stamped character derived from ordination, so that a renunciation of the clerical office is either viewed as an impossibility or a sort of apostasy. These notions in their highest degree belong to the Church of Rome. In the Protestant churches the distinction between clergy and laity is much less wide, and, although the same terms are often used, it is rather conventionally than in their full signification. The employment of official robes by the clergy preceded their assumption of a peculiar ordinary dress and is not so intimately connected with any peculiar pretensions. Among the privileges accorded to the clergy by the Roman emperors and in the Middle Ages was exemption from civil offices; among the rights asserted by them, and occasioning much dispute, was exemption from lay jurisdiction, even in cases of felony. (See Benefit of Clergy.) The clergy were distinguished into the *higher* clergy and the *lower* clergy; the latter including ostiarii, acolytes, lectors, exorcists, etc. The term *secular* clergy is the designation of priests of the Church of Rome who are not of any religious order, but have the care of parishes. Monks who are in holy orders are designated *regular clergy* (from *regula*, rule). See Orders, Holy; Bishop; Priest; Deacon.

CLERGY, Benefit of. See Benefit of Clergy.

CLERICUS, Johannes (1657–1736). See Le Clerc, Jean.

CLERIDÆ. See Checkered Beetles.

CLERK (AS. *clerc, cleric*, from Lat. *clericus*, clergyman). In the Middle Ages, an appellation for an ecclesiastic, extended at a later period to mean a complimentary title for men of learning, whether of the Church or not. In modern times it indicates any one who makes and keeps records, public or private, or one employed in some subordinate position in a store, an office, etc. "Clerk in holy orders" and "clerk in minor orders" are phrases, still used in England as the legal designations of a minister of the Established church, which preserve the mediæval use of this term. See Clergy.

CLERK, Parish. See Parish Clerk.

CLERK, Paymaster's. In the United States navy a paymaster's clerk is appointed by the Secretary of the Navy at the request of the paymaster for whom he is to perform duty and serves until his appointment is revoked. Paymasters' clerks have the same pay and allowances as warrant officers, and, while holding appointments in the naval service, they have the same rights of retirement as warrant officers of a like length of service. The uniform is similar to that of warrant officers (see Boatswain), and they belong to the warrant officers' mess.

CLERK, Dugald (1854–). A British engineer and inventor, born at Glasgow, and educated at Anderson's and the West of Scotland Technical colleges (now merged). He was professor of technical chemistry at Glasgow and also in the Yorkshire College of Science at Leeds, became a director of the National Gas Engine Company, and invented the Clerk cycle gas engine. Besides his scientific papers he is author of: *The Theory of Gas Engines* (2d ed., 1891); *The Gas and Oil Engine* (7th ed., 1896); *The Gas, Petrol, and Oil Engine* (2 vols., 1909–13).

CLERKE, Agnes Mary (1842–1907). A British astronomer, born in Ireland. While living in Italy in 1870–77 she contributed to the *Edinburgh Review*. In 1888 she made astronomical observations at the Cape of Good Hope, South Africa, and in 1890 further observations aboard the yacht *Palatine* in the Baltic Sea. She won the Actonian prize for her work in astronomy in 1893. Her publications include: *A Popular History of Astronomy* (1885; 4th ed. rev., 1902); *The Systems of the Stars* (1890; 2d ed., 1905); *The Herschels and Modern Astronomy* (1895); *Astronomy* (1898);

Problems in Astrophysics (1903); *Modern Cosmogonies* (1905).

CLERKENWELL, klär'ken-wĕl (clerks' well, Lat. *Fons Clericorum*, from its well, which was a meeting point for the parish clerks of London). A parish of London (q.v.), England, north of St. Paul's Cathedral, between Holborn Viaduct and Islington. It is a noted district for the manufacture of metal articles, watches, and optical instruments. Northampton Polytechnic Institute, a branch of the City Polytechnic Institute, is situated on Northampton Square.

CLERK-MAXWELL. See MAXWELL.

CLERMONT-EN-BEAUVAISIS, klār'môn'-ôn-bō'vā'sĕ', **CLERMONT-DE-L'OISE** (ML. *Clarus Mons*, fair hill, from *clarus*, clear, and *mons*, mountain). An ancient town in the Department of Oise, France, 36 miles north of Paris (Map: France, N., H 3). The town hall and church of St. Samson date from the fourteenth century, and above the town is an old castle of the tenth or eleventh century, now used as a penitentiary for women. Founded on the site of an ancient camp of the Gauls and Romans, Clermont was important in the Middle Ages, was frequently taken and retaken in the wars with the English, and in 1487 was surrendered to them as a ransom for the French leader, La Hire. It manufactures felt and corsets, and its trade consists of horses, cattle, and grain. Pop., 1901, 5723; 1911 (commune), 6004.

CLERMONT-FERRAND, .-fĕr'răN'. The capital of the Department of Puy-de-Dôme, France, 215 miles south-southeast of Paris (Map: France, N., J 7). It is finely situated, on a gentle elevation, between the rivers Bedat and Allier, at the foot of a range of extinct volcanoes, crowned by the peak of Puy-de-Dôme, about 5 miles distant from the town. It consists of the two towns of Clermont and Montferrand, connected by a fine avenue of trees, but has a generally gloomy aspect. It contains several remarkable buildings; such as the old Gothic cathedral of the thirteenth century, the corn and linen hall, the theatre, museum of natural history, hospital, including a college of pharmacy, medicine, academy of sciences, belles lettres and arts, and a public library, in which are over 113,000 printed volumes and 1100 manuscripts. In the park outside of the library is a statue of Pascal, who was born here. It is the centre of the French manufacture of India rubber. Other manufactures include woolen and linen goods, machinery, straw hats, chocolate, chemicals, rope, candles, hats, yarn, thread, animal oils, and needles, while there is an extensive traffic in the produce of the district, and considerable transit trade between Paris and the south of France. It is an active market for horses. There are two hot mineral springs in the town, which are used for bathing. Clermont-Ferrand is the seat of a bishop. Pop. (commune), 1901, 52,933; 1911, 65,386. It succeeds the ancient Gallic city, Augusta Nemetum, later called Clarus Mons. In the Middle Ages Clermont was the residence of the counts of the same name, and the capital of the Province of Auvergne, and became the seat of one of the oldest bishoprics of France. Several ecclesiastical councils were held here, the most remarkable of which was that in 1095, at which the First Crusade was decreed by Urban II.

CLERMONT-GANNEAU, -gà'nō', CHARLES SIMON (1846–). A French Orientalist, born in Paris and educated at the Ecole des Langues Orientales. Becoming an attaché to the Jerusalem consulate, he took an important part in the discovery of the "Moabite Stone" (q.v.) and its piecing together. The British government made him head of an expedition to Palestine in 1874, and the French government afterward sent him on archæological missions in Syria, Tripolitana, Cyrenaica, etc. He became Vice Consul at Jaffa in 1880, Oriental "secrétaire interprète" in Paris in 1882, Consul of the first class (1886), Consul General (1896), Minister Plenipotentiary (1906), and professor of Semitic epigraphy and antiquities at the Collège de France. He exposed various forgeries, notably the "Moabite" pottery sold to the Prussian government by Shapira, Shapira's pretended fragments of Deuteronomy, and the tiara of Saïtaphernes. He published: *Etudes d'archéologie orientale* (1880); *Palestine inconnue* (1886); *Les fraudes archéologiques* (1885); *Archæological Researches in Palestine* (2 vols., 1896–99); *Recueil d'archéologie orientale* (1885–1905).

CLERMONT L'HÉRAULT, -lâ'rō', or CLERMONT DE LODÈVE. The capital of a canton in the Department of Hérault, France, situated on a castle-crowned hill, rising from the banks of the Ydromiel, 10 miles south of Lodève by rail (Map: France, S., H 5). Its Gothic church is a fine building of the thirteenth and fourteenth centuries. Clermont is noted for its woolen manufactures, especially army clothing, which date from 1678; it has also tanneries, potteries, manufactures of cutlery, hats, wine, lime and stone quarries, and a considerable trade in agricultural and commercial products. Pop., 1901, 5280; 1911, 5177. Consult Brien, *Histoire de la ville de Clermont l'Herault et de ses environs* (Clermont l'Herault, 1838).

CLERMONT TONNERRE, -tô'nâr'. A well-known French family. It originated in Dauphine in the eleventh century.—STANISLAS MARIE ADELAIDE, COUNT DE (1757–92), was born at Pont-à-Mousson. He entered the States-General in 1789 as representative of the nobility, and there, as well as in the National Assembly, acquired great influence. He was moderate in his views, argued for the English system of two legislative houses and for the King's right to veto. With Malouet he founded, in 1790, in order to counteract the Jacobins, the Club des Impartiaux (later called Amis de la Monarchie), and with Fontanes he published the *Journal des Impartiaux*. He perished in the massacre of Aug. 10, 1792. A great orator, he collected his speeches, *Recueil des opinions* (Paris, 1791).—AIMÉ MARIE GASPARD, MARQUIS, and afterward DUKE DE (1779–1865), born in Paris, was a French general and minister. He was educated at the Ecole Polytechnique, entered the army, and served in the campaigns in Italy, Germany, and Spain. He was made aid-de-camp to Napoleon's brother Joseph, King of Spain. After the restoration of Louis XVIII he was Minister of Marine and in 1823–27 Minister of War. After the July revolution he refused the oath of allegiance to the new government and retired from politics.

CLERON. See HAUSSONVILLE.

CLE'RUCHY. See COLONY.

CLÉRY, klâ'rĕ', JEAN BAPTISTE ANTOINE HANET (1759–1809). The valet de chambre of Louis XVI. He was born near Versailles. By his own choice he followed the King to the Tem-

ple and attended him with the greatest devotion. After his death he remained in imprisonment for some time and then rejoined the royal family in Germany. In London he published a popular account of Louis's captivity, *Journal de ce qui s'est passé à la tour du Temple pendant la captivité de Louis XVI, roi de France* (1798), which greatly aided the Royalist cause and may have been written by some one else.

CLÉSINGER, klā'zăN'zhā' (JEAN BAPTISTE) AUGUSTE (1814–83). A French sculptor and painter. He was born at Besançon, studied with his father and in Italy, and first attracted attention with a bust of Eugène Scribe (1844), and with his "Woman Bitten by a Serpent" (1847). Other important works are: Rachel as "Phædra," "Tragedy" (vestibule of Théâtre Français), "Cleopatra before Cæsar," the silver statue of "Phryne," "Louise of Savoy" (Luxembourg Gardens), "George Sand" (Théâtre Français), and the statue of "Music" on Chopin's grave (Père Lachaise). His work is of masterly technique and refined in composition, but is often lacking in content. He occasionally exhibited paintings of scenery and architecture. In 1847 he married a daughter of George Sand. He died in Paris, Jan. 7, 1883.

CLETUS. See ANACLETUS I.

CLEVEDON, klēv'don. A watering place in Somerset, England, on the Bristol Channel and Severn Estuary, 9 miles northeast of Weston-super-Mare (Map: England, D 5). It has a fine beach, a marine promenade, a pier, and a coast-guard station. It is noted for literary associations with Coleridge; also with Henry Hallam, the historian, and his son Arthur, commemorated by "In Memoriam," whose graves are in the parish church of St. Andrew. Clevedon Court, a mediæval mansion, is supposed to be "Castlewood" of Thackeray's *Henry Esmond.* Pop., 1901, 5900; 1911, 6111.

CLEVELAND (ME. *clif, clef,* pl. *clives, cleves,* cliffs + *land*). A hilly region with some picturesque fertile valleys, forming the eastern part of the North Riding of Yorkshire, England, between Whitby and the Tees (Map: England, E 2). Some of the heights are marked by mounds called "houes." Many archæological relics have been found among the hills. Since 1851 it has become a populous mining district, owing to the discovery of ironstone. See MIDDLESBROUGH.

CLEVELAND. The county seat of Cuyahoga Co., Ohio, the largest city of the State, and the sixth in the United States, the chief port of entry of the Great Lakes, and an important industrial and commercial centre, situated on the south shore of Lake Erie, at the mouth of the Cuyahoga River, in lat. 41° 30′ 5″ N., long. 81° 42′ 6″ W. (Map: Ohio, G 2). It is 138 miles by rail northeast of Columbus, 263 miles northeast of Cincinnati, 357 miles east of Chicago, 623 miles west by north of New York, and 527 miles northwest of Washington.

The city, 689 feet above sea level, and, at its highest point, 302 feet above the lake, is beautifully situated on elevated land, which slopes gently towards the lake, and occupies an area of 51.8 square miles, with a river frontage of 18 miles, and a lake frontage of 12 miles, extending back more than half that distance. It is divided unevenly by the winding course of the Cuyahoga River, the largest portion lying on the east side of that stream. It is intersected also by Kingsbury and Walworth "runs," the east and west tributaries of the Cuyahoga. The land bordering the river is low and flat, and here lie many of the industrial works—lumber and coal yards, ore docks, blast furnaces, steel mills, etc.—almost hidden from view. Owing to the variation in level of different parts of the city, there are several elevated viaducts and many bridges (nearly all of which are owned by the municipality) spanning the Cuyahoga and uniting the sections of the city. The most remarkable of these is Superior Avenue Viaduct of stone and iron, completed in 1878, at a cost of $2,250,000, 3211 feet long and 64 feet wide, with a central drawbridge 68 feet above the water level. This structure will soon be supplanted by a magnificent high-level bridge, affording mast clearance for any boat, having separate decks for different kinds of traffic, and costing $4,000,000. The Central Viaduct, completed in 1888, and reconstructed into a high-level bridge in 1913, crosses the river and is 2838 feet long. The Abbey Street Viaduct, crossing Walworth Run, is 1092 feet long. A smaller one (835 feet) spans Kingsbury Run. Just outside the city, spanning Rocky River, is to be found the second largest concrete bridge in the country.

Cleveland has features of beauty in its broad streets, ranging from 40 to 132 feet in width, which are so abundantly shaded that the city has acquired the name of "Forest City." There are 769.8 miles of streets (excluding Newburgh), 458 miles of which are paved, brick and asphalt being extensively used. The public-park system includes about 1902 acres, exclusive of land acquired for the "group plan," distributed in areas of varying extent throughout the city, and its suburban districts to the east and west are thoroughly accessible by the street railways, which operate 300 miles of track. In contrast with its extensive industrial and commercial interests, Cleveland has very few large tenements, with congested population. Detached houses with gardens are the rule. In 1910 it had 90,465 dwellings, which, when compared with its population, makes Cleveland preëminently a city of homes.

The lake-shore front, the valley of the Cuyahoga and the area along the Pennsylvania Railroad from St. Clair Avenue south to Harvard Avenue and along the Erie Railroad from East Fifty-fifth Street to East Ninety-third Street, are centres of the manufacturing industry, while the business area extends from the lower part of the river east along Superior Avenue, which is 132 feet wide, and along Euclid Avenue to East Twenty-second Street. The Public Square, or Monumental Park, containing the statue of Gen. Moses Cleaveland and the Soldiers' and Sailors' Monument, forms a park of 4½ acres about the intersection of Superior Avenue and Ontario Street; from this centre and from Ontario Street, which extends north and south, the principal streets of the east side of the city diverge. The far-famed Euclid Avenue, 83 to 90 feet wide, begins at the southeast corner of the Public Square and extends beyond Lake View Cemetery, through the suburbs of East Cleveland, the continuation beyond there being Euclid Road. Once called by Bayard Taylor the most beautiful thoroughfare in the country, in recent years it has lost much of its former natural attractiveness and character as a residence street by reason of the steady encroachment of the business district. Among the fine residence streets of the city are Bellflower

Road, Magnolia and Juniper Drives, East and Lake Shore boulevards, East Seventy-fifth, East Seventy-ninth, East Ninety-third, East One Hundred and Fifteenth, and West Fourteenth streets. Lying partly in the city are Lake Avenue and Clifton Boulevard, while outside of Cleveland, but maintained by the city, are the beautiful boulevards of Euclid Heights and Shaker Lakes.

Buildings. The more prominent buildings of the city include the new County Courthouse, new City Hall, Federal Building, Art Museum, Western Reserve Historical Society Building, Chamber of Commerce, Central Armory, Cleveland Grays' Armory, Adelbert College, Women's College, Case School of Applied Science, Northern Ohio Insane Asylum, new Young Men's Christian Association Building, American League Park buildings, Sheriff Street Market House (400 by 120 feet), and the new West-Side Market House, reputed to be the finest in America. Cleveland has come to be a "City of Arcades." The largest, the Superior Arcade, 400 by 180 feet, built in 1889 at a cost of $850,000, has a fine interior; arranged on both sides of a central court are the several tiers of stores and offices fronted by balconies. Between East Sixth and East Ninth streets, on the opposite side of Euclid Avenue, and extending through to Prospect Avenue S. E., are successively the Euclid, Colonial, and Taylor arcades. At the Prospect Avenue end of the Colonial Arcade is the Colonial Hotel. Other structures worthy of note are the *Leader-News*, Engineers (national headquarters of the Brotherhood of Locomotive Engineers), Williamson, New England, Society for Savings, Citizens, American Trust, Schofield, Rose, Perry-Payne, Garfield, Cuyahoga, Illuminating, Park, Marshall, Union Club, Kinney-Levan, Cleveland Athletic Club, Caxton, and Hippodrome buildings. The Euclid Avenue and Pilgrim (Congregational), St. Paul's and Trinity (Protestant Episcopal), the First Methodist Episcopal and Epworth Memorial, Calvary (Presbyterian), East End Baptist, Euclid Avenue Christian Church, St. Michael's, St. Prokop's, and the Roman Catholic Cathedral and the Euclid Avenue Synagogue are among the finest ecclesiastical edifices.

In the early part of the century a plan was conceived by the late Mayor Tom L. Johnson and initially projected by architects Arnold Brunner, John M. Carrere, and D. H. Burnham, systematically to beautify the city by grouping the public buildings that are gradually replacing the present structures—an undertaking to which $35,000,000 will ultimately be devoted. The public buildings are being arranged in a quadrangle inclosing a mall, the whole occupying a plot of land in the heart of the city one-eighth of a mile wide by one-half a mile long. With the erection of the Federal Building, the County Courthouse, and the City Hall, one-half of the "group plan" is now finished. There still remain to be erected the Public Library Building and Museum at the south end, and the new monumental union railroad station at the north end of the mall. An imposing Court of Honor will join the buildings at each end of the mall.

Parks and Cemeteries. Among the many fine parks belonging to the city, the largest within the city limits is Rockefeller Park, of 273 acres, a part of which was given by the millionaire whose name it bears. It includes the Valley of Doan Brook, with several smaller parks and parkways, and is connected with Gordon and Wade parks by the boulevard which extends also between these two. Gordon Park, on the lake front, comprises 112 acres and, with Wade Park (85 acres) to the southeast, is noted for its gardens. The former contains the statue of Commodore Perry, formerly in Monumental Park, the Goethe-Schiller Monument and the new Art Museum. Edgewater Park (126 acres) has well-kept lawns, walks, and a beach, with facilities for boating and bathing, a municipal dance hall, and contains the Wagner Monument. Brookside Park (159 acres), containing the city's zoölogical gardens; Garfield Park (181 acres); Woodland Hills Park (113 acres); Shaker-Heights Park (279 acres), just outside the city limits, and named from the community which once occupied the land; Lakeview Park, on the lake shore; Lincoln Park; Washington Park (98 acres); Forest Hill Parkway (81 acres); University Circle on the east side, and Franklin Circle on the west side of the river, are noteworthy. Besides Euclid Avenue, the more attractive drives are the boulevard system of 33 miles, connecting the parks, and Lake Avenue and Clifton Boulevard.

Cleveland has a number of cemeteries, the largest of which are Woodland, Riverside, and Lakeview. The last, one of the most beautiful in the country, contains more than 300 acres, with great natural advantages skillfully improved. Here, on an eminence 250 feet above the level of the lake, stands the Garfield Memorial, completed in 1890 at a cost of $225,000—the balcony near the top, 165 feet high, affording a fine view of the city and its suburbs. It is built principally of Ohio sandstone and contains a chapel with symbolical panels and reliefs of scenes from the President's career and his statue. His remains lie in a crypt beneath.

In Lakeview Cemetery is situated the Wade Memorial Chapel, which cost more than $350,000.

Educational Institutions and Libraries. Cleveland has the normal equipment of a great city in the matter of public schools, with a sufficient number of high, technical, and commercial schools, besides numerous private and parochial institutions. The public-school system is conducted under the supervision of a small elective board, and its plan of instruction prohibits all corporal punishment, eliminates mechanical methods, introduces manual and domestic training in all grades, and practically abolishes stated written examinations in the primary and grammar grades—the teacher's judgment being accepted as the general basis of promotion. Cleveland was one of the first cities in the United States to establish a free high school, and the first west of the Alleghany Mountains, the date being July 13, 1846. It is the seat of Western Reserve University (q.v.), with its departments of Adelbert College, Women's College, Graduate School, and schools of medicine, law, pharmacy, library, domestic science, journalism, and dentistry; Case School of Applied Science (q.v.); and St. Ignatius College (Roman Catholic). It contains also St. Mary's Theological Seminary (Roman Catholic), Baldwin University Law School, Cleveland College of Law, and Cleveland Pulte Medical College. Cleveland is also the home of the National Mouth Hygiene Association, whose purpose is to correct general mouth evils existing in the schools.

In addition to libraries of the various educational institutions, Cleveland has a Public Library of nearly 550,000 volumes, the Case Library (subscription) of 85,000 volumes, the Hatch Library (Adelbert College) of 80,000 volumes, Cleveland Medical Library Association, Law Library Association, and the Western Reserve Historical Society.

Charities. The State Institution for the Insane, founded in 1855, has 103 acres of ground and buildings that accommodate 1750 patients. The City Infirmary and Hospital treat annually 4500 patients and maintain a department for outdoor relief. A tract of over 2000 acres, lying south of the city, has been purchased for the purpose of colonizing the inmates of the infirmary and workhouse and for maintaining a tuberculosis sanitarium. Other hospitals include the Lakeside Hospital, Federal Marine, Cleveland General, Cleveland Homeopathic, St. Alexis, St. Clair, St. John's, and St. Vincent's Charity. Other institutions are industrial schools, homes for the aged, and Jewish, Roman Catholic, and Protestant orphanages. Prominent in the charitable work is the Goodrich House, incorporated in 1897—a social settlement in the poorer part of the city, which contains clubs, kindergartens, a gymnasium, baths, sewing rooms, a public laundry, and parlors and reading rooms. With this equipment the Goodrich House stands among the foremost institutional houses in the United States. The Hiram House and Alta House are prominent social settlements. It is estimated that the charitable institutions control property exceeding in value $5,000,000.

A unique innovation in coöperative benevolence is to be found in the Cleveland Federation for Charity and Philanthropy, established in 1913. Its purpose is to secure greater efficiency and economy in giving by harmonizing the work of the charitable and philanthropic organizations of the city. The federation is controlled by a board of 30 trustees, one-third elected by the participating philanthropic organizations, one-third by the givers, and one-third by the Chamber of Commerce to represent the city at large. Another remarkable institution is the Cleveland Foundation, a "Community Trust," organized in 1913, and controlling millions of dollars bequeathed for educational and charitable purposes. The income from the foundation funds is expended by an impartial, nonsectarian, nonpolitical committee, serving without compensation. No two members may be of the same religious denomination, the *personnel* changes by one member each year, and the committee is composed of residents who are informed concerning the educational, social, civic, and charitable needs of the city.

Clubs, Theatres, and Hotels. The Union, Roadside, Tavern, Colonial, Rowfant, Excelsior, and the Euclid and Country clubs, all owning the houses in which they are installed, are representative organizations. Among the principal places of amusement are the Euclid Avenue Opera House, Keith's Hippodrome, and the Colonial, Metropolitan, and Duchess theatres. The more prominent hotels include the Hollenden, Colonial, Hotel Euclid, Statler, Gillsy, Tavistock, Forest City, and American.

Commerce and Industry. The construction of the Ohio Canal—completed in 1832—connecting Lake Erie with the Ohio River, the northern terminus being the Cuyahoga River, gave Cleveland commercial advantages over other cities on Lake Erie; and, though the canal has since declined greatly in importance, the city has now other and greater advantages by virtue of its location. Chief of these is its proximity to the coal and oil fields of Ohio and Pennsylvania and to the iron-producing regions of Lake Superior, Cleveland being one of the most convenient points for the collection and distribution of the products of both districts. The city has thus become an important commercial centre and also a manufacturing place of the first rank.

The bulk of the lake traffic consists of coal, coke, and iron. The receipts of coal and coke in 1913 by lake, rail, and canal amounted to 9,817,000 tons; and the shipments for the same year were 4,986,000 tons. The coal is distributed among the various lake ports farther west and north. The receipts of iron ore in 1913 were 8,783,000 tons; and the shipments for the same year were 6,141,000 tons. Grain and live stock ranked next in importance. Cleveland is the largest market for fresh-water fish in America.

The city has remarkable advantages for the accommodation of its shipping—two parallel piers, built out 1500 feet into the lake, form a channel 200 feet wide and 21 feet deep at the mouth of the Cuyahoga; and the many windings of the latter afford 18 miles of river frontage, over five miles of which are docked. A branch of the Cuyahoga flowing westward, not far from the lake and parallel with it, has been dredged so as to afford room for excellent shipyards and docks. In 1878 the United States government began a breakwater to inclose a harbor of refuge 360 acres in extent, with an opening of 500 feet, opposite the mouth of the river. Later plans and appropriations, however, provide for an opening of 700 feet and a breakwater 4 miles in length, inclosing a harbor of 800 acres. There are now nearly 6 miles of breakwater constructed at a cost of about $6,000,000. The harbor has been dredged to 25 feet. In the number of tons of freight received and shipped by vessel, Cleveland ranks second among the ports of the Great Lakes. Cleveland is on nine railways, some of which are the leading trunk lines of the country, including several of the Vanderbilt lines and the Pennsylvania system. It is also the centre of seven interurban railroads, which radiate to important towns and cities in northern Ohio.

Cleveland is now the largest manufacturing centre in Ohio and the second largest on the Great Lakes. During the decade 1900–10 the value of its product increased from $139,356,000 to $271,961,000, or 95 per cent. In 1910 there were employed in factories 84,728 wage earners. As above intimated, the most important group of manufactures consists of iron and steel, and the large number of industries which depend upon iron and steel as their raw material. According to the census of 1910, the iron and steel products were valued at $38,463,000, and the foundry and machine-shop products ranked a close second with a value of $37,443,000. The third industry in the city was the manufacture of automobiles, including bodies and trucks, the output of which was valued at $21,404,000, which represents an increase over 1904 of over 360 per cent, and forms 55.1 per cent of the value reported for the State for this industry. Other industries of importance, and the value of their products in 1909, are women's clothing, $12,789,000; printing and publishing, $9,635,000; paint and varnish, $6,138,000; and

men's clothing, $5,953,000. In the production of wire and wire nails Cleveland outranks all other American cities, and in hardware it takes second place. Bridges, electrical apparatus and supplies, printing presses and shipbuilding are also important. From an early date Cleveland led in the construction of wooden vessels for the lake traffic and, with the change from wood to iron, has continued in the lead, producing to-day more steel merchant vessels than any other American city. The chief industries which depend upon agricultural resources are slaughtering and meat packing, and the manufacture of malt liquors, the former exceeding a value of $17,192,000 in 1910, and the latter having a value of $5,124,000. The Standard Oil Company has here one of its principal refining establishments.

Government, Finance, and Municipal Enterprise. A charter, providing for the so-called "Federal Plan" of government, in which the distinction between executive and legislative functions was clearly drawn, was obtained from the State in 1891 and continued in force until supplanted by a municipal code enacted by the Ohio Legislature, Oct. 22, 1902. This code provided for the following biennially elective officials: a city council of 32 members, a mayor, a vice mayor (who acted as president of the council and had the deciding vote), three members of a board of public service, a solicitor, a treasurer, and an auditor. A board of public safety of two members was appointed by the mayor, subject to the approval of the city council. This code stood until 1910, when it was amended by the consolidation respectively of the boards of public service and safety into two officials, the directors of public service and safety, and, thus amended, continued in force until the first day of July, 1913, when the voters of Cleveland adopted a home-rule charter drafted by a commission of 15 citizens.

The provisions of this instrument make it one of the advanced municipal charters of the country. Party primaries are eliminated, and candidates for elective offices are nominated by petition only. No party emblems or designations appear on the ballot, and the preferential system of voting is used. There are only two elective offices, that of mayor and that of councilman, and the incumbents are subject to recall upon petitions signed by 15,000 electors in the case of the mayor and 600 electors in the case of a councilman. The council is made up of 26 members elected from wards for a term of two years, and its functions are limited strictly to legislation, the members being forbidden any part in administration. On the other hand, the mayor and heads of departments have seats in the council with the right to take part in discussions, but without the right to vote. The mayor is elected for a term of two years, his salary is fixed by the council, he is granted broad supervisory powers, and responsibility is definitely fixed on him for the proper administration of the affairs of the city. He is surrounded by six departmental directors, whom he appoints or dismisses at will. These are the directors of law (vice mayor), of public service, of public welfare, of public safety, of finance, and of public utilities. Departments are then subdivided into divisions, with commissioners appointed by the respective directors. Appropriate functions are assigned to these departments and divisions. Power is given to the council, with the concurrence of the board of control (the mayor and the directors), to create, discontinue, rearrange, or abolish departments and divisions, except that the department of public utilities may not be discontinued. This department has control of all municipal enterprises which derive no revenue from taxation, and its reports are required to be kept separate and distinct and to show clearly the results of municipal ownership. The department of finance is patterned after the best modern accounting systems, and a continuous audit by competent accountants, under direction of the council, is provided. Health, charities and corrections, recreation, and employment are gathered together in the department of public welfare, and their work correlated. A civil service commission of three members, appointed by the mayor for terms of six years, is provided, and the commission given authority to see that officers and employees are appointed on the basis of merit and fitness and promoted according to competency. Exclusive franchises are prohibited, and grants or renewals must reserve to the city the power to regulate the right to terminate the same, and the right of recaption. The commissioner of the division of franchises is charged with the enforcement of the provisions of all public-utility grants. A bureau of information and publicity is established, which has charge of all city printing, reports, statistics, the publication of a city record, and the collection of municipal information. Finally, the initiative and referendum are provided. A proposed ordinance may be placed before the council by an initiative petition signed by 5000 electors. If not passed by the council, it must be submitted to the voters at the next regular election, or an additional petition containing the signatures of 5000 additional electors will compel its submission to a vote of the people at a special election. A petition of 10 per cent of the total vote at the last municipal election will compel the submission of an ordinance to a referendum.

The total indebtedness, Jan. 1, 1913, was $39,471,886, for which a sinking fund provided $5,277,311. The net per capita debt was $70.48. The total tax rate was $13.60 per $1000, of which $4.87 was for school and library purposes, $5.78 for city and sinking fund purposes, $2.48 for county, and $0.45 for State purposes. The total actual income for 1912 was $17,505,522, of which the property tax was $3,993,057. The total expenditures for maintenance and operation were $7,496,874, and for construction and other capital outlays, $6,518,753. The assessed valuation for the year 1912 was $765,754,880.

The ample water supply is provided from several reservoirs and tunnels sunk into the lake, which run out from 1½ miles to 4 miles to five different cribs. A gigantic 10-foot tunnel is now in process of construction, as is a mechanical filtration plant, and together with sewage-disposal plants which are being built, will insure a permanent supply of pure water. There are 799 miles of water mains and 619 miles of sewers.

Cleveland has attained much distinction in recent years by its unique plan of regulating the street railways. By the terms of the settlement ordinance which went into operation March 1, 1910, the public gets transportation at cost, the city controls service and the upkeep of the property, and the company manages and operates the lines for a fixed return on an agreed

valuation. Cost of transportation includes legitimate operating expenses, maintenance, renewal, and depreciation charges, interest and taxes. There are 10 possible rates of fare, ranging from the maximum, four cents cash fare or seven tickets for 25 cents and one cent for a transfer, to the minimum, flat two cents cash fare. The prevailing rate of fare is determined by a barometer reserve called the Interest Fund, containing $500,000 in the beginning. When the fund goes over $700,000, the fare is lowered to the next lower rate; when it goes below $300,000 the fare is raised to the next higher rate. The initial rate of fare was three cents and one cent for transfer; this was lowered to flat three-cent fare on June 1, 1911. The city controls and specifies service through the city council and the latter's technical adviser, the street railroad commissioner. The company runs the road on fixed allowances for operation and maintenance, employs or discharges all officers, operatives, clerks, etc., expends revenues subject to the supervision of city authorities, and its stockholders receive a guaranteed and fixed return of 6 per cent. Differences between the company and the city which cannot be adjusted amicably are settled by arbitration. The city reserves the right either to purchase the property upon six months' notice, or, after Jan. 1, 1918, to designate a purchaser, the purchase price to be the ordinance value plus future additions. If the purchase is made before the expiration of the grant, a 10 per cent bonus is added to capital value less bonds and floating debt, which latter the city assumes. The company's franchise expires May 1, 1934. The city has the option of renewing it for a longer period upon the same terms as the original grant.

Population. Cleveland rose during the decade 1900–10 from seventh to sixth rank among the cities of the United States, and is the third largest city west of the Alleghanies and the second largest of the Great Lake cities. The following gives her population by decades: 1830, 1076; 1840, 6071; 1850, 17,034; 1860, 43,419; 1870, 92,829; 1880, 160,146; 1890, 261,353; 1900, 381,768; 1910, 560,663; 1920, 796,836. Cleveland during the last decade increased nearly three times as fast as the State of Ohio as a whole. There are few negroes, but many foreigners, the foreign born in 1910 numbering 195,700, or more than one-third of the total. Among the foreign born the Germans are predominant, constituting in 1910 about 29 per cent. Bohemians and other Slavs come next with 18 per cent, and thereafter the Hungarians with 11 per cent, the Russians with 9 per cent, the Irish with 8 per cent, the English with 6 per cent, the Italians with 4 per cent, and the Canadians with less than 4 per cent. The native whites of foreign parents numbered 171,560, and with the foreign-born inhabitants made up 75 per cent of the city's population.

History. In 1795 the Connecticut Land Company bought from Connecticut a large part of that State's Western Reserve (q.v.), and in the following year sent out a party under Gen. Moses Cleaveland to survey their purchase. Cleaveland selected the mouth of the Cuyahoga as the site for a settlement, and in July, 1796, laid out on the east bank a village, which took his name, though the spelling was changed in 1831 to meet the exigencies of a newspaper editor's headlines. In 1800, by Act of Congress, the Western Reserve was included for administrative purposes in the Northwest Territory, and Trumbull County was erected to include the land about the mouth of the Cuyahoga. Of this, Cleveland, then having a population of about 57, became the county seat in 1809. In 1814, Trumbull County having previously been subdivided, the village of Cleaveland, in the county of Cuyahoga, was incorporated with a population of less than 100. In 1818 the first newspaper, *The Cleveland Gazette and Commercial Register*, began publication, and in 1827 the Ohio Canal, which five years later was completed to the Ohio, was opened between Cleveland and Akron, giving such an impetus to the former that her population increased tenfold (from 600 to 6000) between 1825 and 1835. In 1836 Cleveland was chartered as a city. In the early fifties it was first connected by rail with the East and with the other cities in Ohio, and from this period dates its rapid growth. In 1853 Ohio City, which had been founded in 1817, was united to Cleveland. During the Civil War a number of manufacturing establishments were set up, and in the interval 1861–65, owing to its ability to supply articles for which there was a great demand, Cleveland attracted many investors; its lake traffic was doubled, and its population increased 50 per cent. In 1872 it annexed East Cleveland, in 1873 Newburg, and in 1893 West Cleveland and Brooklyn. In 1905–06 Glenville and South Brooklyn were annexed, followed by Collinwood (1910), Nottingham and Newburgh City (1912), and a part of Euclid Village (1913).

CLEVELAND. A city and the county seat of Bradley Co., Tenn., 30 miles east by north of Chattanooga; on the Southern Railroad (Map: Tennessee, F 4). It is the seat of the Centenary Female College. The city is in an agricultural district with important peach-raising interests, and has woolen and flour mills, stove works, chair factory, hosiery mills, ice and cold-storage plant, lumber and planing mills, and a coffin factory. Settled about 1820, Cleveland was incorporated about 1880. The water works are owned by the city. Pop., 1900, 3858; 1910, 5549.

CLEVELAND, Charles Dexter (1802–69). An American educator, born in Massachusetts. He graduated at Dartmouth in 1827 and was professor of Latin and Greek in Dickinson College and of Latin in the University of the City of New York. From 1861 to 1867 he was United States Consul at Cardiff, Wales. Among his books are his compendiums of *English Literature* (1847), *American Literature* (1858), and *Classical Literature* (1861); *English Literature in the Nineteenth Century* (1851); an edition of *Milton's Poetical Works*, with a *Life* (1851); *A Complete Concordance to the Poetical Works of John Milton* (1867).

CLEVELAND, Frederick Albert (1865–1914). An American economist, born in Sterling, Ill. He graduated at De Pauw University in 1890, then studied law, but in 1896 gave up practice to devote himself to economics, first at the University of Chicago and then at the University of Pennsylvania, where he was instructor in finance in 1900–03. He was professor

of finance in the New York University School of Commerce in 1903–05, and then served as an accountancy expert on many important commissions, notably that on New York City finances (1905), and President Taft's commission on economy and efficiency (1911), which recommended a national budget and many other simplifications of Federal business. In 1907 he became director of the Bureau of Municipal Research (New York and Philadelphia). His more important books are: *Growth of Democracy in the United States* (1898); *Funds and Their Uses* (1902; revised for schools, 1903, as *First Lessons in Finance*); *The Bank and the Treasury* (1905); *Chapters on Municipal Administration and Accounting* (1909); *Organized Democracy: an Introduction to the Study of American Politics* (1913). With F. W. Powell he wrote *Railroad Promotion and Capitalization* (1908), and *Railroad Finance* (1912).

CLEVELAND (STEPHEN), GROVER (1837–1908). An American statesman who was the twenty-second and twenty-fourth President of the United States, and whose administrations signalize an epoch in American political history. He was born at Caldwell, N. J., on March 18, 1837, the son of a Presbyterian clergyman (Yale, 1824). The family moved from Caldwell to New York State, and it was in Fayetteville, near Syracuse, and in Clinton that young Cleveland received a somewhat elementary education. Upon the death of his father (1853) he became a teacher in the New York Institution for the Blind, but presently was induced by his uncle, Lewis F. Allen, to make his home in Buffalo, where he studied law and was in 1859 admitted to the bar. Four years later he became assistant district attorney for Erie County, but was defeated as a Democratic candidate for district attorney in 1865. In 1870 he was elected sheriff of the county—a position which he held for three years. He then resumed the practice of law and acquired a local reputation for firmness and integrity. While sheriff he had given a marked proof of a trait that was always characteristic of him, by hanging a condemned criminal with his own hands instead of deputing this unpleasant duty to a deputy. This was in accordance with Cleveland's own conception of the manner in which a public office should be conducted, as he held that officials should not delegate any of their important functions to others. In the same manner, when Governor of New York, he wrote most of his letters personally, instead of employing a secretary; and when President, he himself minutely examined even the most unimportant bill before signing it, leaving nothing to subordinates. At the time, however, and subsequently, his execution of the criminal was wrongly interpreted as evincing parsimony; and in 1884 his political opponents gave him the offensive nickname of "the Hangman of Buffalo." In November, 1881, however, he had so impressed his fellow citizens that men of all parties joined in electing him as mayor of Buffalo, in the belief that he would suppress the political and social corruption that was making that city notorious. Cleveland more than met the expectations of his followers and showed himself so unflinchingly courageous and so indifferent to all insidious influences as to work something like a municipal revolution. Although he incurred the hatred of many dishonest and disreputable combinations, his services were so notable as to win for him the Democratic nomination for the governorship of New York in 1882, his opponent being Judge Charles J. Folger (q.v.), then Secretary of the Treasury under President Arthur. Cleveland was elected by the extraordinary plurality of 192,854 votes —the size of this plurality, however, being due very largely to bitter dissensions in the Republican party, which had become divided into two factions, known respectively as the Half Breeds (q.v.) and the Stalwarts (q.v.).

As Governor of New York, Cleveland showed such good judgment and such independence as to make him a prominent candidate for the presidency. He cared nothing for popularity, but used the veto power so unsparingly as to offend alike the Catholic voters of Tammany Hall, the labor element, and a large number of citizens who took umbrage at his veto of a bill intended to compel the elevated railways to reduce their passenger rates. Nevertheless, Cleveland's perfect fearlessness won him a strong following throughout his party, and in 1884 the Democratic National Convention, held in July, gave him the necessary two-thirds of all its votes, so that he was selected on the second ballot. In the campaign which followed, Cleveland's opponent was the brilliant and magnetic James G. Blaine (q.v.). This campaign was immensely important as showing that the issues relating to the period of the Civil War and reconstruction had ceased to interest the younger generation of Americans, and that even the alarmist cry of "free trade" no longer terrified any but the most timid and unthinking. The contest, which began immediately after the nominations, was very long and very bitter, and was marked by a personal antagonism such as fortunately remains unique in the history of American politics. Blaine was attacked for alleged political and personal dishonesty. Cleveland had to face a charge based upon a single incident of his private life dating back a number of years and frankly dealt with. This episode is said to have inspired Paul Leicester Ford to write his remarkable political novel, *The Honorable Peter Stirling* (New York, 1886). On the day after the election in November the result was still in doubt, and victory was claimed by the Republicans; but within two days the official count showed that a very small plurality in New York State had given Cleveland a majority of 37 votes in the Electoral College. This result was largely due to the support of Cleveland by the independent Republican voters, popularly known as "Mugwumps" (q.v.), and of certain indiscretions on the part of Blaine near the close of the contest. The Democrats also won the national House of Representatives, though the Senate remained Republican by the small majority of six votes.

Cleveland assumed the presidency with the same independence of spirit that he had shown when mayor and governor. It was written of him at the time: "We have now as personal a government as we ever had under Grant." The President accepted the responsibility for every act of his administration. His cabinet officers, though men of great ability, were little more than his private secretaries. The Vice President, Mr. Hendricks, was almost studiously ignored. Cleveland, while many changes were made, refused to sweep all Republicans out of office without cause, and thereby incurred the enmity of the spoilsmen of his own party by enlarging the powers of the Federal Civil Ser-

vice Commission. He vigorously opposed the abuse of the pension system and thus became detested by the Grand Army of the Republic (q.v.) as a body. He declared himself in favor of a lower tariff and in so doing estranged the manufacturing interests. When the Senate demanded that he make public certain papers relating to removals from office of various officials, he laid down the constitutional doctrine of his predecessors that a President's papers were not subject to congressional supervision. Finally, in a message which he sent to Congress in 1885, he declared that the compulsory coinage of silver dollars as directed by the Bland-Allison Act would become a source of financial disturbance, and he recommended the repeal of that act. Other measures of his administration were marked by equal courage and vigor, such as the suppression of an insurrection on the Isthmus of Panama, which he occupied with 3000 United States marines and soldiers; the quashing of a threatened Mormon outbreak in Utah through the concentration of both infantry and artillery at Salt Lake City; and during a dispute over the Canadian fisheries, a threat to prohibit Canadian traffic from entering the United States by any except American railways. All of these measures made him new enemies, though they also intensified the admiration of his friends. His marriage with Miss Frances C. Folsom in 1885 was the second marriage of a President in his term. His hold upon his own party at large remained strong enough to secure his renomination at the National Democratic Convention held at St. Louis on June 7, 1888, and he was praised by many lifelong Republicans, among whom James Russell Lowell and Theodore Roosevelt were conspicuous. Although Congress had been partly Republican and partly Democratic, much valuable legislation had been enacted, among the principal measures being the creation of the Interstate Commerce Commission, the admission of four new States, the passage of an Anti-Polygamy Bill, of a Chinese Exclusion Act, of a Presidential Succession Bill, and of a bill limiting the powers of Congress in counting the electoral votes. A tariff measure, known as the Mills Bill, passed the Democratic House, but it was radically amended in the Republican Senate and never became a law. All this legislative activity showed that new issues were beginning to interest the country. At the presidential election of 1888 Cleveland was defeated by Gen. Benjamin Harrison (q.v.) of Indiana, who had 233 electoral votes against 168 for Cleveland. This result was largely due to a division in the Democratic party in New York State, which gave its electoral votes to General Harrison, while choosing a Democrat, David B. Hill, for Governor.

At the close of his first term, in 1889, Cleveland retired to New York City, where for four years he engaged in the practice of law. His political career was at first supposed to have been ended by his defeat; but with each year he gained a new popularity throughout the country until at last, against his own wishes, he became the most conspicuous candidate for the presidential nomination in 1892. Though defeated in 1888 in the Electoral College, he had, none the less, a majority of some 100,000 ballots in the popular vote; and the sentiment in his favor was now very strong. General Harrison was by no means popular, and he had antagonized Mr. Blaine. Furthermore, the McKinley tariff measure (see McKINLEY, WILLIAM) with its high duties was generally regarded as a mistake. Therefore, when the Democratic National Convention met at Chicago on June 21, an ardent supporter of Cleveland was made chairman and, before the convention met, many States had instructed their delegates to support the ex-President, so that he was sure on the first ballot of at least a majority. The delegates of his own State of New York, however, owing to Tammany Hall and the opposition of Senator Hill, were against him, and this was supposed by politicians to be fatal to his chances. But when the convention reached the stage of balloting, all opposition to Cleveland was overcome. The session lasted until long after midnight. A display of fervid eloquence by Mr. Bourke Cockran on behalf of Tammany Hall merely put the delegates into a still more aggressive mood; and in the early hours of the morning the first roll call showed at once that Cleveland had secured even more than the two-thirds vote necessary to give him the nomination. The scene was one of indescribable enthusiasm, as Cleveland had broken all precedents; and, though his enemies had spoken of him as the "Stuffed Prophet" and the "Perpetual Candidate," he had been selected against his own desires, against the opposition of his own State, and through a perfectly spontaneous uprising of the people. In the very dignified campaign which followed, President Harrison had no chance of being reëlected, and in the November election Cleveland swept the country. Not merely did he carry all the Southern States, but likewise the four "doubtful States"—Connecticut, Indiana, New Jersey, and New York—and, to the surprise of all political prophets, California, Illinois, and Wisconsin solidly, while he also received some electoral votes from Michigan and Ohio. In the Electoral College he had 277 votes as against 145 that were cast for President Harrison. For the first time since the birth of the Republican party, a third candidate, Gen. James B. Weaver (q.v.) of Iowa, had also received electoral votes and to the number of 22, and in the popular vote no less than a million votes had been cast for him by the Populists. (See POPULIST PARTY.) This was ominous for the future; but in 1893 Cleveland resumed the presidency bound by no personal pledges, and free to carry out whatever policies he might choose, since both the Senate and the House were controlled by a majority of his own party.

His second administration proved to be one of the most remarkable in the history of American politics. Cleveland's personality was a determining factor in whatever he achieved and in whatever he failed to carry out. His independence had naturally developed into something like arrogance. His natural tactlessness had grown into an utter lack of consideration for the weakness and prejudice of other men. On the other hand, his robust courage had grown still more indomitable, and it stood him in good stead, despite all the virulence and hatred which his subsequent course engendered. No President ever did more unpopular things. No President ever estranged in different ways so many of his countrymen at various times. Yet it must be added that no President showed such utter fearlessness or so determined a purpose to carry out unflinchingly and uncompromisingly what he believed to be his duty. Almost his first act was

unpopular in reversing the policy of President Harrison towards the annexation of Hawaii and in endeavoring to replace upon the Hawaiian throne a queen who had been dethroned by a revolution led by men of American blood. (See HAWAII.) In this he failed, though he went to the very verge of using force against the new government of Hawaii. Coincident with this fiasco came a great money panic, based upon the evils springing from the Silver Coinage Act of 1890 for which both parties voted and supported in their party platforms. (Consult Laughlin, *The History of Bimetallism in the United States*, published at New York in 1897.) After a long and bitter contest in Congress, the Silver Act of 1890 was repealed, but not until President Cleveland had boldly used the whole power of his office and of its patronage to secure the repeal. In fact, in the Senate, his own party was seriously divided, and he carried his measure only by the assistance of Republicans. In the teeth of the opposition which he had aroused, Cleveland set himself energetically to reform the tariff. The so-called Wilson Bill (see WILSON, W. L.) looking to that end was introduced confessedly as an administration measure. It sought to lower the tariff duties on many necessities of life, especially upon wool and sugar. Here, again, Cleveland encountered the opposition of a large section of his own party, and when the bill was finally passed, after a great deal of scandal affecting the reputation of Democratic senators, it had been so emasculated that the President allowed it to become law without his signature, causing a personal letter of his to be read in Congress, that contained a denunciation of those Democrats whom he declared to be guilty of "party perfidy and party dishonor." A third measure of Cleveland's was the issuing of bonds in order to retain intact the gold reserve in the treasury and to secure the parity of gold and silver under existing legislation. These bond issues were first effected through a great banking syndicate, which made a profit of nearly 16 per cent upon its purchases of bonds; and now the President incurred the violent hostility of the whole West, which had become strongly Populistic. He himself was obliged to yield to the indignation which was everywhere expressed, and the last issue was by popular subscription, which proved a great success and stopped the drain of gold from the treasury. An income tax was enacted into law, but was declared by the Supreme Court to be unconstitutional. In 1894 a great railway strike, centring in Chicago, was crushed when President Cleveland ordered United States troops to enter the metropolis of the West "to prevent the obstruction of the mails," even though the Democratic Governor Altgeld of Illinois protested vehemently and had his protest rudely brushed aside by the President. Much acrimony was caused by the use of injunctions obtained from the United States courts against the strikers; and even in the East and among the most conservative, "government by injunction" was everywhere denounced. (See DEBS, EUGENE V.) But the most lasting mark upon American history made by Cleveland is to be found in his extension of the Monroe Doctrine (q.v.) by his Venezuelan Message, sent to Congress on Dec. 17, 1895. Great Britain had for a long time been encroaching on the territory of Venezuela (q.v.) and had refused to arbitrate the subject or to delimit the boundaries of British Guiana and Venezuela. Cleveland and his Secretary of State, Richard B. Olney, had taken up the subject and had urged the British government to submit the whole question to arbitration. Lord Salisbury replied in two notes which denied the right of the United States to intervene in such a question, and these notes were couched in terms of sneering civility. Immediately upon their receipt in Washington President Cleveland sent a terse, dignified, and haughty message to Congress, setting forth the merits of the question and declaring that it was "the duty of the United States to resist by every means in its power" a willful aggression upon its rights and interests by Great Britain in Venezuela. A single sentence showed that he was prepared to carry out this policy by war if necessary. His pregnant words produced a profound impression throughout the whole world. Great Britain was thrown into something like a panic, and so were the money markets of the United States; but both parties in Congress supported the President, and in the end the British government capitulated and accepted the arbitration which it had hitherto refused. The inflexible courage of the President, following a precedent set by Daniel Webster (q.v.) in his famous Hülsemann Letter, raised the United States to the position of a great world power, enhancing its prestige in spite of the academic criticism which came to him from American closet politicians. Dr. Edward Stanwood, a Republican, an intimate friend of Blaine, and a close student of American politics, summed up the Venezuelan episode as "the most signal victory of American diplomacy in modern times."

This was the last and most striking feature of Cleveland's public career. When he went out of office in 1896 he did so under a black cloud of disapproval almost unique in the history of politics. He was hated in the West because of his attitude towards silver. The labor element was violently antagonistic to him because he had crushed the Chicago strike. His Venezuelan Message, by causing a panic in Wall Street, had lost him the sympathy of the great financiers. His private life had been bitterly though unjustly assailed. Every corrupt element in national politics was against him. At the Democratic National Convention in 1896, contrary to all precedents, a resolution mildly commending his course as President was hooted down with jeers and curses. Even one of his strongest supporters could find little more to say of him than that he had been "successful in his failures." Yet it was Cleveland's good fortune to outlive this obloquy. The Republicans who succeeded him adopted and perfected his policies. The whole country came to appreciate the services which he had rendered by his indomitable courage. His mistakes were condoned, and his successes were universally praised. He had, indeed, saved the United States from practical repudiation; he had enforced order with a strong hand; and he had raised the nation to a foremost rank among the great powers of the world. During the campaign of 1904 his name was tremendously applauded at the national conventions of both parties.

After retiring from the presidency Cleveland made his home at Princeton, N. J., becoming a trustee of the University there and an occasional lecturer in it. The substance of his lectures will be found in a book which he wrote, entitled *Presidential Problems* (New York,

1904). In 1895 he was appointed a trustee of the majority stock of the Equitable Life Assurance Society, at the instance of Thomas F. Ryan, a position which he retained until his death, in 1908. It is somewhat characteristic of his career that at least one member of the committee which arranged a great memorial meeting in New York in Cleveland's honor should have been during the latter's public life a bitter assailant of him and a propagator of the vilest stories concerning him.

As a public speaker, Cleveland was always sensible, though somewhat ponderous in manner. He had a clear tenor voice which was easily heard at the very outskirts of immense audiences. His public papers show much felicity of diction, pungent and sometimes tipped with an acid wit, as may be seen in reading over his numerous vetoes of private pension bills. His Venezuelan Message was characterized, even in England, as "full of stateliness and force." As a phrase maker he is comparable with General Grant, and some of his sayings, such as a "public office is a public trust," "ghoulish glee," "pernicious activity," and "the communism of pelf," were widely quoted and still remain a part of the politicians' vocabulary.

Bibliography. For the facts of Cleveland's public life, consult: Hensel and Parker, *The Life and Public Services of Grover Cleveland* (New York, 1906); Gilder, *Grover Cleveland* (ib., 1910); Parker, *Recollections of Grover Cleveland* (ib., 1909). A caustic criticism of Cleveland, put forth under the pseudonym of "Siva," was published in 1885 under the title of *A Man of Destiny*. Comments upon Cleveland's extension of the Monroe Doctrine (favorable) will be found in Foster, *A Century of American Diplomacy* (ib., 1900); Stanwood, *A History of the Presidency* (Boston, 1898); Henderson, *American Diplomatic Questions* (New York, 1901); McClure, *Our Presidents* (3d ed., ib., 1905); and (unfavorable) by J. W. Burgess and J. B. Moore in *The Political Science Quarterly* for March, 1896. Consult also Reynolds, *National Platforms and Political History* (Chicago, 1898); H. T. Peck, *Twenty Years of the Republic*, chaps. i, ii, iv, vi, x, last reprint (New York, 1913); and id., *American Party Leaders* (ib., 1914). For an English view of Cleveland, especially with reference to the Venezuelan affair, consult Whittle, *President Cleveland* (London, 1896), and Gretton, *A Modern History of the English People*, vol. i (London and Boston, 1913).

CLEVELAND (or **CLEIVELAND**), John (1613–58). An English Cavalier poet. He was born at Loughborough, Leicester, and educated at Cambridge, where in 1634 he became a fellow of St. John's. Six years later he strenuously opposed Cromwell, and in consequence lost his fellowship in 1645. Joining the Royalists, he was appointed judge advocate in the King's army. In 1655 he was seized at Norwich and imprisoned at Yarmouth for three months, when he was released by Cromwell. After that he lived in retirement. Cleveland had a great reputation as a wit and satirist. A volume of his poems in circulation before 1656 was reissued in that year. In 1687 appeared his collection entitled *Clevelandi Vindiciæ*, which attempts to combine several of his preceding publications. The bibliography of Cleveland is too complicated for treatment here. Cleveland still awaits a competent editor. Thomas Fuller describes him as "a general artist, pure Latinist, exquisite orator, and eminent poet." Consult *Cambridge History of English Literature*, vol. vii (New York and London, 1907–13), and *The Poems of John Cleveland*, ed. J. Burdan (New York, n. d., but about 1910).

CLE'VENGER, Shobal Vail (1812–43). An American sculptor, born at Middletown, Ohio. He first became known through his work as a stone carver in the workshop of David Guion in Cincinnati, and afterward under the patronage of Nicholas Longworth visited the large cities of the East, where he executed busts of Clay (Metropolitan Museum, New York), Webster, Van Buren, Allston (Pennsylvania Academy), Everett, and others. His portrait bust of Webster has been used on a United States postage stamp and is considered the best likeness of that statesman. In 1840 he went to Rome, and while there he produced his "North American Indian," which cannot at present be located, but was hailed in his day as the "first distinctively American sculpture." His work is characterized by sincere, bold treatment and skill in handling his material. But for his early death, which occurred while he was on his way home, he would probably have attained a high rank in his profession. Consult Lorado Taft, *History of American Sculpture* (New York, 1903).

CLEVES, klēvz (Dutch *Kleefs*, Ger. *Kleve*, Fr. *Clèves*). A German town of Dutch origin, situated in the Rhine Province of Prussia, 23 miles northwest of Wesel and about 5 miles from the frontier of the Netherlands (Map: Prussia, B 3). It is built on three hills and has still retained some of its Dutch characteristics. It contains an old palace, the former abode of the dukes of Cleves, now used as a law court; the tower known as Swan Tower is used as a prison. Commemorating the Knight of the Swan made famous by Wagner's opera, a monument has been erected. An old Rathaus, with a number of antiquities and paintings, and an old Catholic church, built in Gothic style and containing the tombs of the counts of Cleves, still remain. In the vicinity of the town are situated chalybeate springs. Cleves is frequented as a summer resort by the Dutch. The chief manufactures are paper, paint, hats, linen, cotton, tobacco, boots, shoes, and machinery. Pop., 1900, 14,684; 1905, 16,433; 1910, 18,135. The Duchy of Cleves, which arose in the Middle Ages and which at the time of the Reformation was united with the duchies of Jülich and Berg, passed in 1666 into the possession of Brandenburg. It was wrested from Prussia in the course of the Napoleonic wars, but restored in 1815.

Bibliography. Char, *Geschichte des Herzogtums Kleve* (Cleves, 1845); Nelsen, *Die Stadt Kleve* (ib., 1846); R. Scholten, *Die Stadt Kleve* (ib., 1879–81).

CLEW. See Sail.

CLEWS, Henry (1836–). An American banker, born in Staffordshire, England. He entered mercantile pursuits in New York City in 1845, became a member of various firms, was United States financial agent during the Civil War, and in 1877 organized the firm of Henry Clews & Co. He was a founder of the Union League Club, New York City, and also originated the Committee of Seventy in New York and nominated 65 of its members. He published: *Twenty-eight Years in Wall Street* (1887); *The Wall Street Point of View* (1900);

Fifty Years in Wall Street (1908); *Speeches and Essays* (1910).

CLICHÉ, klē'shā' (Fr., stereotyped). An electrotype plate, the impression of a die in a mass of fusible metal. It is employed by medalists and die sinkers to make proofs of their work and in order to judge the stage of their work before the die is hardened. The term is also applied to any stereotype plate used in modern reproductive processes, such as photographic proofs on glass, either positives or negatives.

CLICHY, or **CLICHY-LA-GARENNE**, klē'shē'lä-gä'rĕn'. A northwestern suburb of Paris, France, between the river Seine and the fortifications of Paris (Map: Paris). Pop., 1901, 39,291; 1911, 46,676.

CLICK BEETLE. A beetle of the family Elateridæ, also known as elater, snapping bug, and skipjack, on account of its acrobatic performances. When disturbed, these beetles curl up their legs and fall to the ground, where they lie rigid on their backs for some moments and then begin a series of springs into the air, accompanied by a clicking sound. When the beetle succeeds in landing on its feet, it runs off. In regard to the springing, Le Conte says: "This is effected by extending the prothorax so as to bring the prosternal spine to the anterior part of the mesosternal cavity; then, suddenly relaxing the muscles, so that the spine descends violently into the cavity, the force given by this sudden movement causes the base of the elytra to strike the supporting surface, and by their elasticity the whole body is propelled upward." The larvæ, known as wireworms, are hard, brownish yellow, and may live several years before gaining maturity. Most of them are found under bark and in rotten wood, but some live on the ground on the roots of grass, Indian corn, and other grains, as well as on those of certain vegetables. When numerous enough, they may do considerable damage. Fall plowing is said to be the most effective remedy against them. Of the 7000 described species of elaters 500 occur in North America. The most conspicuous click beetle found in the United States is the eyed elater (*Alaus oculatus*), a grayish-black beetle with two large black eyelike spots on the prothorax; its larvæ live in rotting stumps. In the tropics of America there are luminous species belonging to the genus *Pyrophorus*, as the cucuyo (*Pyrophorus noctilucus*) and others. For illustration, see ELATERIDÆ.

Bibliography. De Candeze, *Monographie des élaterides* (4 vols. and 3 supplements, Liège, 1857–81); Le Conte, "Revision of the Elateridæ of the United States," in *Transactions of Philosophical Society*, vol. x (Philadelphia, 1853); Horn, papers in *Transactions of American Entomological Society*, vols. xii, xiii, xviii (Philadelphia, 1885, 1886, 1891). See FIREFLY.

CLI'DOMAN'CY. See SUPERSTITION.

CLI'ENT (Lat. *cliens, cluens*, hearer, from *cluere*, Gk. κλύειν, *klyein*, Skt. *śru*, to hear; connected remotely with AS. *hlūd*, Eng. *loud*). In law, one who consults or retains an attorney or counselor at law for advice, or to prosecute, manage, or defend an action at law, or to represent him in any legal proceedings or in the adjustment of business troubles. The client's relations with his attorney are in the highest degree confidential, and the client is protected by the most stringent rules of law against the disclosure of his private affairs by his legal adviser. (See ATTORNEY; PRIVILEGED COMMUNICATION.) In the civil and political life of ancient Rome the term "client" was employed to describe the persons who stood in a relation of quasi-dependence to men of position and influence, usually patricians, who in their relation to their clients were known as patrons. The relation was not unlike that which in the United States frequently subsists between local political leaders and their supporters ("henchmen"), and the reciprocal rights and obligations of patron and client were defined by custom rather than by rules of law. Among these were the duty of the patron to advise and protect his clients in their legal and political rights, in return for which he was entitled to their support in any legal or political contest in which he became engaged.

CLIEN'TES. In ancient Rome, the inhabitants who had given up or had lost citizenship in their own cities and had settled in Rome or on Roman territory. See, under ROME, *History of Rome during the Earliest or Regal Period.*

CLIFF (AS. *clif*, Icel., OS., Dutch *klif*, from Icel. *klifa*, ME. *cliven*, to climb). A precipitous slope of the land surface. Cliffs may be formed in three ways: (1) by the erosive action of water; (2) by the disintegrating influence of rain, frosts, and the atmosphere, or weathering; (3) by dislocations of the earth's crust. On rocky coasts cliffs are carved out by the force of waves, which beat against the shore line, and by weathering of the rock that lies above the reach of the waves. The cliffs of Dover and of the Orkney and Shetland islands are notable examples of sea cliffs. Gorges, cañons, and ravines, which are characterized by steep walls, are excavated by the erosion of running water; they are usually found along the upper courses of rivers. Cliffs may mark the line of outcrop of stratified rocks, and in such cases are usually to be traced to differential weathering of hard and soft strata. In regions of disturbance cliffs are formed by faulting, which exposes a vertical rock face or scarp. Many of the notable elevations in the Adirondack Mountains in New York are characterized by faulted scarps. See SHORE; CAÑON; FAULT; ETC.

CLIFF DWELLER. A name frequently used to designate the supposed extinct builders of the numerous ancient cliff ruins scattered throughout the cañons and mesas of the arid Southwest, along the upper waters of the Colorado and Rio Grande—in Utah, Colorado, Arizona, and New Mexico. The ruins are either upon the summits of the mesas or on shelves in the rock walls of the cañons. For a long time their origin was a subject of much speculation; but recent ethnological investigation has proved that these ruins are not the work of any extinct or distinct race, but were built by the immediate ancestors of the modern Pueblo Indians (q.v.), some of whom, in fact, notably the Hopi, still have their villages upon the summits of almost inaccessible mesas, where they formerly located them for better protection against the wilder Navajo and Apache, by whom they were surrounded. Consult G. Nordenskiöld, *The Cliff Dwellers of the Mesa Verde, Southwestern Colorado* (New York, 1902), and numerous articles in the Annual Reports of the Bureau of American Ethnology. See ARCHÆOLOGY, AMERICAN.

CLIF'FORD, GEORGE, EARL OF CUMBERLAND (1558–1605). An English naval commander and buccaneer, born in Westmoreland. He succeeded

to the earldom in 1570, took the degree of M.A. at Cambridge in 1576, and in 1588 commanded the *Elizabeth Bonaventure* in the actions against the Spanish Armada. He fitted out and led several buccaneering expeditions; the most important were one undertaken with seven sail, in 1589, which captured several rich prizes, and one with 20 sail, in 1598, which took San Juan de Puerto Rico, but failed in an attempt to intercept the Spanish treasure galleons.

CLIFFORD, HARRY ELLSWORTH (1866–). An American electrical engineer, born at Lowell, Mass. He was educated at the Massachusetts Institute of Technology and at Harvard University. At the former institution he was assistant in physics (1886–88), instructor in theoretical physics (1888–95), assistant professor of theoretical physics (1895–1902), associate professor of theoretical electricity (1902–04), and professor of theoretical and applied electricity (1904–09). At Harvard he became professor of electrical engineering in 1909.

CLIFFORD, SIR HUGH [CHARLES] (1866–). A British colonial administrator, born in London. In 1883 he entered the Malay States Civil Service, and from 1887 to 1903 in one capacity or another was a representative of the English government at Pahang, taking a prominent part in the suppression of the rebellion of 1892. In 1903 he left the post of British Resident in Pahang, which he had held, with few breaks, since 1890, to become Secretary of Trinidad and Tobago; and he was Colonial Secretary of Ceylon from 1907 until August, 1912, when he was appointed Governor and Commander in Chief of the Gold Coast. Besides contributions to *Blackwood's*, he published important works on the Malays, including *In Court and Kampong* (1897), *Studies in Brown Humanity* (1898), *In a Corner of Asia* (1899), *Bush-Whacking* (1901), *Further India* (1904), *Downfall of the Gods* (1911), and *Malayan Monochromes* (1913). With Sir Frank Swettenham he began in 1894, at Perak, the publication of a *Dictionary of the Malay Language*. He wrote on the Malay states in the *Journal of the Royal Geographical Society* (1896) and in the *Journal of the Royal Colonial Institute* (especially vol. xxx). In 1910 he married as his second wife the novelist Mrs. Henry de la Pasture.

CLIFFORD, LUCY LANE (Mrs. William Kingdon). An English novelist. She was the daughter of John Lane of Barbados, and in 1875 married William Kingdon Clifford, the distinguished mathematician. Mrs. Clifford is best known by *Love Letters of a Worldly Woman* (1891) and *Aunt Anne* (1892). Among her other books are: *Any How Stories* (1882; reissued with additions, 1899); *Mrs. Keith's Crime* (1885); *The Last Touches* (1893); *A Wild Proxy* (1894); *A Flash of Summer* (1895); *Mere Stories* (1896); *The Dominant Note and Other Stories* (1897); *Margaret Vincent* (1902); and *Sir George's Objection* (1911). She also produced several plays, three of which were collected under the title *Three Plays* (1909), and the most notable of which was *The Likeness of the Night* (1900).

CLIFFORD, NATHAN (1803–81). An American jurist, born in Rumney, N. H. He graduated at the Hampton Literary Institution, was admitted to the bar, and commenced practice in York Co., Me., in 1827. He was a member of the State Legislature from 1830 to 1834, was Speaker of the House for the last two years, and was Attorney-General from 1834 until 1838. He served in Congress from 1839 to 1843, and in 1846 was Attorney-General in President Polk's cabinet. At the close of the Mexican War he went as a special United States envoy to Mexico and negotiated a treaty by which California and other territories became a part of the United States. In 1858 he became, by President Buchanan's appointment, an associate justice of the United States Supreme Court and in 1877 was president of the Electoral Commission (q.v.) that decided the Hayes-Tilden presidential controversy. He published *United States Circuit Court Reports* (2 vols., 1869).

CLIFFORD, PAUL. The hero of Bulwer's novel of the same name, a highwayman who is finally reformed through love.

CLIFFORD, WILLIAM KINGDON (1845–79). An English mathematician and physicist, born at Exeter. He was educated at a school in his native town, at King's College, London, and at Trinity College, Cambridge, where he was second wrangler in the mathematical tripos of 1867. In August, 1871, he was elected to the chair of mathematics and mechanics at University College, London, which post he retained until his untimely death at Madeira, March 3, 1879. Clifford first established his reputation as an original thinker in the realm of higher mathematics and philosophy, with the faculty of expressing scientific thought in plain and simple language by a lecture at the Royal Institution, *On Some of the Conditions of Mental Development*. He was a valued member of the London Mathematical Society, contributing to the *Proceedings;* for a time he acted as secretary, and afterward vice president, of the mathematical and physical section of the British Association; he also lectured to the Sunday Lecture Society on such subjects as *Ether, Atoms,* and *The Sun's Place in the Universe,* and took an active interest in popularizing science. The versatility of his mind in philosophical and scientific discussion was further shown by his varied contributions to periodical literature. Besides these articles, and many papers on mathematics, he issued the first part of a larger textbook, *Elements of Dynamics* (1878). Consult Clifford's *Lectures and Essays,* ed. by Leslie Stephen and F. Pollock (London, 1879), which contains a biographical sketch by the latter editor. After his death his *Mathematical Papers,* ed. by R. Tucker and with an introduction by Henry J. S. Smith, were published (1882), as was also *The Common Sense of the Exact Sciences,* which was completed by Karl Pearson and published in 1885.

CLIFFORD'S INN. An inn of Chancery, attached to the Inner Temple, in London, built in 1345, and named after Robert de Clifford, who lived in Edward II's reign. Like the other inns of Chancery, it is now used for office and business purposes.

CLIFF PALACE. A noted ruin in Walnut Cañon, Mesa Verde, Colo., a good example of the buildings of the cliff dwellers (q.v.).

CLIFF PLANTS. A group of drought plants, xerophytes (q.v.), found chiefly on river, lake, or sea cliffs. See ROCK PLANTS.

CLIFFSIDE PARK. A borough in Bergen Co., N. J., opposite New York City, with which it has connection by trolley and ferry. It is purely residential. Pop., 1900, 968; 1910, 3395.

CLIFF SWALLOW, or EAVES SWALLOW. A swallow (*Petrochelidon lunifrons*) familiar throughout North America as one of those that make their nests about barns and outhouses. (See BARN SWALLOW.) It is distinguished from other semidomestic swallows by its short, *square* tail, reddish rump, grayish breast and collar, and white forehead; and by the fact that it places its flask-shaped nests of mud always on the *outside* of the building, unlike the fork-tailed true barn swallows, which go inside the building to nest. These swallows originally nested in colonies wherever a rocky cliff afforded a chance to fasten their nests in close companies upon its face. (See Plate of FAMILIAR SWALLOWS, with the article SWALLOW.) These nests were globular, with a spout-like neck, forming the entrance, and were formed of pellets of mud and lined with grass and feathers. As soon as human settlements began near their resorts, they abandoned the cliffs for the more secure, better-sheltered place under the eaves of such buildings as they were permitted to occupy; and as the spread of civilization has finally covered most of the range of the species, only a few places in the remote West remain where these birds may be seen nesting after their primitive habit. In the eastern part of the country interesting modifications of habit have followed their long-continued association with man—among others, a disposition to make a much simpler style of nest, leaving off the domed roof and flasklike entrance, and forming little more than a cup in its place, since the overhanging eaves keep off the rain and conceal the sitting bird. This genus is almost cosmopolitan, has similar habits nearly everywhere, and in all countries attaches itself to and is welcomed by civilization. Consult Knowlton, *Birds of the World* (New York, 1909).

CLIF'TON. A beautiful and favorite watering place in the southwest of Gloucestershire, England, forming the western suburb and part of the parliamentary borough of Bristol (Map: England, D 5). It has a tepid spring of 73° F., which contains carbonic acid and salts of magnesia. It has a college with 700 students. Earthworks date from the beginning of the city. The deep valley of the Avon is here spanned by a suspension bridge 245 feet above the water. Pop., 1911, 15,968. See BRISTOL.

CLIFTON. A city and the county seat of Graham Co., Ariz., 121 miles (direct) north by east of Bisbee, on the Arizona and New Mexico, the Morenci Southern, and the Shannon Arizona railroads, and on the San Francisco River (Map: Arizona, F 4). The chief industries are copper mining and stock raising. There are division offices of the Arizona and New Mexico Railway. Pop., 1910, 4874.

CLIFTON, or SUSPENSION BRIDGE. Former name of the town of Niagara Falls (q.v.), Ontario, Canada.

CLIFTON FORGE. An independent city of Virginia, 192 miles west by north of Richmond, on the Chesapeake and Ohio Railroad (Map: Virginia, E 4). It contains a railway hospital, and there are extensive railway shops, foundry and machine works, flouring and planing mills, and an ice-cream factory. Iron ore and limestone abound in the vicinity. The water works are owned by the city. Pop., 1910, 5748.

CLIFTON HEIGHTS. A borough in Delaware Co., Pa., 6 miles southwest of Philadelphia, on the Philadelphia, Baltimore, and Washington Railroad, and on Darby River (Map: Pennsylvania, L 8). It has manufactories of woolen and cotton goods, hosiery, and towels. The borough contains a public library. Pop., 1900, 2330; 1910, 3155.

CLIFTON SPRINGS. A village in Ontario Co., N. Y., about 28 miles (direct) southeast of Rochester, on the Lehigh Valley and the New York Central and Hudson River railroads (Map: New York, C 5). It is well known for its sulphur springs and contains the Clifton Springs Sanitarium, the latter surrounded by three parks. There are manufactories of pumps, insect sprayers, automobiles, bicycles, and tinware. Settled about 1850, Clifton Springs was incorporated as a village in 1859. The water works and electric-light plant are owned by the municipality. Pop., 1900, 1617; 1910, 1600.

CLIM, klĭm, or **CLYM OF THE CLOUGH,** klŭf (Clim of the valley, Icel. *klofi*, ravine, from *klūfa*, to split, AS. *clēofan*, to cleave). An English archer, said to have lived one generation previous to Robin Hood. He is known through the old ballad *Adam Bell, Clym of the Cloughe, and Wyllyam of Cloudeslee.* The ballad is far older than the oldest copy extant, printed by Copeland about 1550. A fragment of an older one exists, recovered by Payne Collier. In this ballad William of Cloudeslee shoots an apple from his son's head after the manner of William Tell of the continental legend.

CLIMAC'TERIC YEAR (Lat. *climactericus*, Gk. *κλιμακτηρικός, klimaktērikos*, climacteric, from *κλιμάκτηρ, klimaktēr*, round of a ladder, dangerous point in life, from *κλῖμαξ, klimax*, ladder, staircase). The year in the life of a woman during which she undergoes what is commonly called the "change of life," and which generally falls between her forty-fifth and fiftieth years. Cessation of menstruation (the menopause) takes place, and there are vague nervous disturbances, or indigestion, hot flushes, etc. As a matter of fact, the menopause may extend over a period of two or more years. Many entirely unrelated symptoms are ascribed to it, as in the case of children during dentition. The headaches, e.g., may be due to presbyopia (see SIGHT, DEFECTS OF), which sets in at about the same time and which may be relieved by eyeglasses. The term "climacteric years" was once applied also to certain years in man's life, which were long believed by the disciples of astrology to have been the critical points of his health and fortune. Crises of this kind were, viz., supposed to be reached in the twenty-first, the thirty-fifth, the forty-ninth, and the sixty-third years of man's life. The most important of all was the sixty-third year, which was called, by way of eminence, *the* climacteric year, or the "grand climacteric." This year was supposed to be fatal to most men, owing to the fact that 63 is the product of the two mystical numbers seven and nine.

CLI'MATE (OF. *climat*, from Lat. *clima*, Gk. *κλῖμα, klima*, region, slope, from *κλίνειν, klinein*, to incline). In its broadest sense climate is the sum total or aggregate characteristics of a given geographic locality with respect to atmospheric conditions, such as temperature, rainfall, wind, etc., that prevail. Thus we may conceive of the climate of the sun, for

example. In a more restricted and usual significance the word is used in meteorology to indicate the summation or general result of all the solar and terrestrial influences that affect animal or vegetable life. It is possible, in fact, to disregard the relation to life and consider only the meteorological phenomena as such, or the phenomena that affect any phase of our activity. Thus, one may ask, How does the climate favor navigation by sailing vessels, or the use of the wind as a motive power? In one region the climate may favor the development of a certain disease; in another it may favor the development of special varieties of plants or animals. The specific features that favor the growth of either plants or animals, enabling them to make a specific spot their home, are oftentimes so obscure as to elude our observation and record; therefore climatology is, in many respects, still an unsatisfactory study; but it has made such progress in the past 50 years as to have become exceedingly important to many classes of industries, as well as to physicians, naturalists, and agriculturists. Some varieties of plants are so dependent upon the nature of the soil in which they grow that Dr. Milton Whitney, of the United States Department of Agriculture, has advocated defining climatology as that which concerns the soil around the roots of the plant; but this is too narrow a view of the subject.

According to the usage of classic Greek, climate concerned principally the temperature of a place as regulated by the altitude of the sun at midday. As this varies with latitude, the ancients divided the known globe into zones two degrees broad in latitude, each of which was supposed to have its climate. At the present time, by combining the accumulated work of thousands of observers, we divide the globe into irregular regions, each of which differs from its neighbor in some important climatic condition as to temperature, rainfall, pressure, moisture, or the inclination of the sun and the amount of cloudiness. In the extensive works of the most eminent writers on climatology, especially those of Dr. Julius Hann, of Vienna, a large number of meteorological items are enumerated as being essential to a complete study of the climate of any place. These items include not merely the mean temperature, rainfall, cloudiness, the barometric pressure and relative humidity, but also the variations of these quantities, viz., their highest and lowest values each day, or month, or year, and the liability to sudden rises or falls. For navigation and the use of windmills, we need to know the average velocity of the wind, and perhaps especially the number of hours during which the wind exceeds a specified limit. With reference to the growth or importation of tender plants, the agriculturist needs to know the mean dates of the last frost of spring and the first frost of the autumn, the difference between which is ordinarily called the growing season. Since the establishment of the fact that the germination of seed, the growth of the plant, and the ripening of the harvest require a certain amount of heat or molecular energy, efforts have been made to determine the thermal constants for many plants and for each phase in growth. This "thermal constant" is usually expressed as the sum total of the average daily temperatures when such temperatures are above 42° F. There is also a "rainfall constant" peculiar to each species of plant, the nature of which has been investigated by Linsser, who has shown that plants are able by gradual evolution to change their own thermal and aqueous constants and eventually adapt themselves to a change in climate. Linsser's laws serve as a guide to those who would transplant a species from one part of the world to another of different climate.

In the study of climate with reference to navigation, we have to consider the frequency of destructive storm winds. Charts showing this factor have been published for all the oceans and seas by the hydrographic offices of England, France, Holland, Russia, and the United States. In addition to this, for the special benefit of sailing vessels, Galton has shown how to prepare charts showing, for each square degree, the progress that a vessel of a certain size and rig would make if her sails were set so that she should go in a certain direction. From the point of view of insurance, both life insurance and fire insurance, the destruction by wind, hail, and lightning has been studied; these data, being plotted on charts, show the climate of the country from that point of view. Perhaps the most general idea of the distribution of climate is given by charts which show the frequency per month or year with which storm centres pass over a given locality, and the direction in which they pass. A map of such frequency for the eastern portion of the United States was first published in the Statistical Atlas of Gen. Francis A. Walker in 1874, and the most extensive publication of this kind was published in 1893 as *Weather Bureau Bulletin A*, showing the frequency of storm paths for all parts of the Northern Hemisphere. The wind, rain, and temperature are so distributed around a storm centre that, when its location is known, the distribution of all the others can be closely estimated. In general, in the Northern Hemisphere, the regions that lie to the south of the paths of the storm centres have prevailing warm, moist, southerly winds followed by occasional sudden changes to cool, dry, westerly winds. This change occurs with every passing storm centre, but the prevailing weather is clear and pleasant. Stations lying on the north of the paths of the storm centres have prevailing easterly winds, with cloud and rain followed by cool northwest winds; but the time occupied by the trying easterly winds is proportionately larger.

It is difficult to describe or exhibit the climatic peculiarities of any region without the use of charts. Elaborate publications of this kind, for United States weather, have issued from the Weather Bureau at Washington; the *Climatic Charts for the Years 1870–99* show the normal precipitation for each quarter of the year, the normal percentage of sunshine, the normal barometric pressure, reduced to sea level, the normal temperature of the air at the surface of the earth, the mean maximum and mean minimum temperatures, the highest and lowest recorded temperatures. In addition to these, charts of first and last frost and of prevailing winds have also been published. The ordinary popular textbooks on meteorology are very largely occupied with climatology, properly so called. Of these, that by Prof. Frank Waldo (New York, 1896) is probably the most complete for America; the treatises of Angot,

Traité élémentaire de météorologie (Paris, 1899), and Hann, *Handbuch der Klimatologie* (Stuttgart, 1908–11), are the most complete for European data. But in almost all respects the most careful work of the kind ever published is entitled "Atlas of Meteorology," vol. iii of Bartholomew's *Physical Atlas* (London, 1899). In this we have a general text on climatology accompanied by about 400 maps illustrating the climate and the weather of all parts of the globe for each month and for the whole year, and also an admirable bibliographical list of more important modern publications on this subject. A table of about 40 columns of numerical data would seem to be necessary in order to present the complete idea of climate as imagined by Hann in his great textbook on climatology; but most of these are included in the plates and diagrams collected in Bartholomew's *Physical Atlas*.

Perhaps the most important feature controlling plant life is the relative distribution of temperature and rain from month to month during the year. Climatic types have been elaborated by Harrington, Henry, and others, based upon this distribution of rain. Thus, in one region we have the prevailing summer rains; in another the prevailing winter rains; while in still other places the rains are divided into two seasons with dry weather between. Professor Hinrichs introduced the idea of a climatic distinction based upon the law governing the number of light and heavy rains that had fallen within a given space in a year's time. As the largest falls occurred least frequently, and so also the smallest falls, there is some intermediate rainfall that is most likely to happen. By counting up these different quantities, one obtains a series of numbers that may be represented by the equation of probabilities, and the constant term in this equation becomes the so-called "Hinrichs Climatic Factor."

The influence of climate on crops is a matter of continued investigation in the various agricultural experiment stations throughout the civilized globe, and the reader may refer to the *Experiment Station Record*, published regularly by the United States Department of Agriculture, for the latest information on the subject. A summary of this work has led some authorities to the conclusion that cereal crops are raised successfully only by means of careful special cultivation, so that the resulting crop is not so much an evidence of the influence of climate as of the influence of human skill and husbandry in modifying and assisting climate. In the interior of continents the clear, dry air facilitates great ranges of temperature, both diurnal and annual; the soil is dry, evaporation rapid, and delicate plants do not survive the rigors of cold and drought. On the other hand, an oceanic or insular climate is more uniform as to temperature, moisture, and cloudiness, and more favorable to the development of animals and plants. The influence of climate in disease is principally secondary in that climatic conditions affect the growth of germs, fungi, and noxious animals, through which man suffers.

There is no well-authenticated case of an appreciable change of climate within the past 2000 years. The researches of Eginitis on the climate of Greece seem to establish this principle beyond doubt. Neither is it possible that any change on the surface of the earth due to man—such as deforestation, reforestation, agriculture, canals, railroads, or telegraph lines—can have had anything more than the slightest local effect, if any, on climatic phenomena that depend upon the action of the whole atmosphere. On the other hand, it is probable that appreciable changes have taken place in the course of the very long intervals known as geological periods or æons. The phenomena of the flora, the fauna, the erosion, and the geological stratification all agree in showing that there have been times when, e.g., the Lake Region and the St. Lawrence valley, the Middle States, New England, and southeastern Canada were covered with an extensive ice sheet; a similar condition has prevailed over northwestern Europe. Such changes may have been produced by changes in the elevation of the land and distribution of the ocean, by periodic changes in latitude, by changes in the composition of the earth's atmosphere, or by changes in solar radiation. All of these are plausible causes; but at present there is no agreement of authorities as to the real cause of the changes in so-called geological climate. To these changes in the continents and the climates we may plausibly attribute the development of a great variety of flora and fauna, the migratory habits of birds, the traditions of the early history of the human race, and the extinct plants and animals of paleontology. See EVOLUTION.

One of the most evident causes of the differences of present climates is the relation of the wind to the land and ocean. When the prevailing wind is from the ocean, the land experiences moist and usually cloudy or rainy weather. This is due essentially not so much to the temperature of the water as to the mere fact that water of any temperature will evaporate largely into the air and fill it with moisture. Thus, it is an error to say that the climate of Great Britain and western Europe is affected by the Gulf Stream, or that the climate of California and British Columbia is controlled by the Japan Current; in both these cases it is the moist ocean wind that brings cloud and rain, and the amount of this latter is not influenced in the slightest degree by the Gulf Stream or the Kuro Siwo. Another important consideration in climatology is the relation of the wind to the mountain ranges. Thus, on the windward side of a range, there is ascending air which causes damp weather with cloud or rain; whereas on the leeward side of a mountain range there is descending air, which is always dry and clear and frequently quite warm.

The relation of climate to physiography has been essentially a relation of cause and effect. The surface features of the land, as we now know them, present to us hills and valleys which we may easily recognize as the result of the attacks of wind, water, frost, or heat continued for many ages.

Among the works that treat of meteorological climate, the first place must be given to Bartholomew, *Atlas*, vol. iii, "Meteorology" (London, 1899). For the United States specifically, consult the various publications of the Weather Bureau, and Waldo, *Elementary Meteorology* (New York, 1896). Consult also Woeikof, *Die Klimate der Erde* (Jena, 1887); Hann, *Handbuch der Klimatologie* (3d ed., 3 vols., Stutt-

gart, 1908–11); Solly, *Climatology* (Philadelphia, 1903); Köppen, "Versuch einer Klassifikation der Klimate," in *Geogr. Zeitschr.* (6 Jahrg., 1901); Ward, "The Climatic Zones and their Subdivisions," in *Bull. Amer. Geogr. Soc.* (July, 1905).

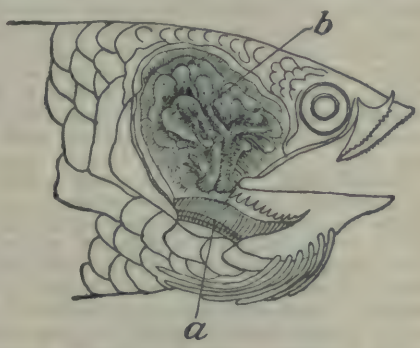
CLIMATE AND DISEASE. The selection of a proper climate is an important factor in the treatment or amelioration of many diseases. According to Barlow, we must consider atmospheric conditions according to temperature, humidity, and sunshine, atmospheric pressure (elevation), movements of winds, and purity of air. The wide variety of climatic conditions found in the United States may be roughly classified as inland, coastal, low altitude (up to 1000 feet), medium altitude (1000 to 3000 feet), high altitude (3000 to 7000 feet), and deserts. A shorter classification divides climates into enervating, of which Florida is the type; sedative or relaxing, typified by the coast of California; and stimulating, as found in mountainous regions. *Ocean or coastal climates* are in general moist and equable, with pure air and freedom from dust and disease germs. Such climatic conditions tend to strengthen the heart action and slow the pulse and have a sedative and relaxing effect on the nervous system. Respiration is made deeper and slower, and the body metabolism is increased. Certain types of chronic pulmonary disease, particularly elderly people with long-standing, inactive lesions, or those complicated with cardiorenal disease, are benefited by an ocean climate. Other cases benefited are those having myocarditis, arteriosclerosis, angina pectoris, many types of nervous diseases, and the acute and chronic bone affections of children. *Inland climates* vary with their distance from the ocean, altitude or nearness to mountain ranges. Low altitudes are generally moist and cold in winter and moist and hot in summer. They are not generally selected for the treatment of disease. Medium altitudes are beneficial to chronic invalids who are able to make a change of residence once or twice a year. In high altitudes the principal feature is purity and dryness of the air, a cool temperature in summer and an abundance of sunshine. The physiological effect of such climates consists in the stimulation of respiratory and cardiac functions, an increased appetite, and sense of well-being. The patient is forced to take more frequent breaths, owing to the rarefied atmosphere. The blood pressure is slightly decreased, and the red blood cells acquire more hæmoglobin and increase in number. Certain types of pulmonary cases are benefited by high altitude, but they must be selected with great care. A tendency towards pulmonary hemorrhage is a contraindication. Certain cases of nervous diseases, in which depression is a feature, are greatly helped by a high altitude. *Desert climates* are characterized by an abundance of sunshine, extreme dryness, warmth, purity of air, and fairly equable temperature. Patients who find most benefit in a desert climate are those having advanced pulmonary tuberculosis, chronic bronchitis or emphysema, rheumatism, gout, arthritis deformans, neuritis, and arteriosclerosis. The climatic treatment of tuberculosis will be considered under that title. Consult article by Barlow, in Hare's *Modern Treatment*, vol. i (New York, 1910).

CLI'MATOLOG'ICAL ASSO'CIA'TION, AMERICAN. A society for the study of climatology, balneology, and the diseases of the respiratory and circulatory organs. It was organized in New York City in 1884 and is composed of physicians residing in the United States and Canada. It consisted in 1912 of 136 members.

CLIMATOL'OGY, CLI'MATOG'RAPHY. See CLIMATE.

CLIMB'ING FERN, or HARTFORD FERN (*Lygodium palmatum*). A species of fern found, rarely, from Massachusetts to Kentucky and southward, remarkable for climbing or twining around weeds and shrubs. The leaves are broadly palmate, and the fertile frondlets form a panicle upon the upper portion of the stem. It is prized for interior decoration of houses. For illustration, see Plate of FERNS.

CLIMBING FISH. One of the small Oriental fishes of the family Anabantidæ, interesting because of the modification of the upper portion of their branchial apparatus into a series of leaflike structures, adapted for retaining small quantities of water. This water is sufficient to keep the gills moist for a considerable time, thus enabling the fish to subsist in mud or out of water. For a special account of this apparatus, consult Dobson, *Proceedings of the Zoölogical Society of London*, p. 312 (1874). The



HEAD OF CLIMBING PERCH.
a, gills; *b*, leaflike apparatus serving as air-breathing lungs.

numerous species live in fresh water in southeastern Asia and its neighboring islands and in South Africa. The best-known and typical species is the climbing perch (*Anabas scandens*), which is widely distributed in the Orient and especially abundant in the Ganges valley. It is about 6 inches in length, somewhat resembles a perch, and has large scales and a spiny dorsal fin. It has been reported to climb palm trees, but this needs verification. It often, however, leaves pools which are in danger of drying and travels over land in search of water, usually during the night or early morning, while the dew is still on.

CLIMBING HEMPWEED. See MIKANIA.

CLIMBING PLANTS. See LIANAS.

CLINCH. See KNOTTING AND SPLICING.

CLINCHANT, klăn'shän', JUSTIN (1820–81). A French general, born at Thiaucourt (Meurthe). He studied at the military college of Saint-Cyr, entered the infantry service in 1841, and fought in Algeria, the Crimea, the Italian campaign of 1859, and in Mexico. In 1870, as commander of a brigade of the Third Army Corps, he participated in the battles before

Metz. Having escaped from imprisonment after the capitulation, he was put in command of the Twentieth Army Corps of the Army of the East, with the rank of a general of division. He succeeded Bourbaki (q.v.) as commander of the Army of the East and, intercepted by the Germans under Von Manteuffel in an attempt at retreat, was compelled, with his 84,000 troops, to withdraw into Switzerland. In 1871 he commanded the Fifth Army Corps of the Army of Versailles against the forces of the Commune and was Military Governor of Paris from 1879 to his death.

CLINCH'ER. A character in Farquhar's comedies, *The Constant Lover* and *Sir Harry Wildair.*

CLINCHER-BUILT, or **CLINKER-BUILT.** See BOAT.

CLINCH RIVER. A tributary of the Tennessee River, rising in Tazewell Co., Va., and flowing in a southwestern direction through Virginia and Tennessee (Map: Virginia, A 5), joining the Tennessee River at Kingston. Its length is estimated at over 200 miles.

CLINE'DINST, BENJAMIN WEST (1860–). An American illustrator and painter, born at Woodstock, Va. He studied for a year in Baltimore and for five years in Paris under Cabanel and Bonnat and first attracted attention in New York with his illustrations for *Leslie's Weekly.* He is best known as the illustrator of Thomas Nelson Page's *Unc' Edinburg,* and the works of Hawthorne, Stevenson, and Mark Twain, although he works also in oils and water colors. His sympathetic collaboration with the author gives his work an especial charm. He was awarded the Evans prize of the American Water-Color Society in 1900.

CLING'MAN, THOMAS LANIER (1812–97). An American politician and soldier, born at Huntsville, N. C. He graduated at the University of North Carolina in 1832 and was elected to the State Legislature. From 1843 to 1858, with the exception of one term, he was a Whig member of Congress, where he became known as a brilliant debater. In 1858 he was selected by the Governor of his State to fill a vacancy existing in the United States Senate, whence, in 1861, he withdrew to become a colonel in the Confederate army. He was promoted to be brigadier general, served throughout the war, and in 1868 was a delegate to the National Democratic Convention. The existence in North Carolina of diamonds, rubies, corundum, platinum, and mica was first made known by him. He published *Speeches and Writings* (1877); *Follies of the Positive Philosophers* (1878); *The Tobacco Remedy* (1885).

CLINGMAN'S DOME. One of the two highest peaks of the Great Smoky Mountains, situated in Tennessee, just across the border from North Carolina (Map: North Carolina, A 4). It is 6619 feet above sea level. It was named after Thomas L. Clingman.

CLIN'IC (Lat. *clinicus,* Gk. κλινικός, *klinikos,* pertaining to a bed, from κλίνη, *klinē,* from κλίνειν, *klinein,* to recline). An institution or a department of a medical college, which is devoted to the examination and free treatment of patients. Notwithstanding the derivation of the term, "clinical" lectures have for many years been delivered, not at the bedside, but in lecture rooms, to which patients are able to come from their homes. The term "clinic" is often applied also to institutions where free medical treatment is furnished to patients who are able to walk in and return to their homes, but where there are no beds, as in a hospital. (See DISPENSARY.) The term *clinical medicine* is applied to the branch of medicine occupied with the investigation of diseases at the bedside.

CLINIC BAPTISM. In the ancient Church baptism administered to a person on a sick bed or deathbed. As such a baptism was irregular and the usual rites could not be observed, the question was discussed whether it was valid. In the third century Novatian declared that such baptized persons should not be ordained, and in 314 the Synod of Neo-Cæsarea so ordered, and this prohibition was renewed by the sixth Synod of Paris in 829. St. Cyprian insisted strongly on the validity of such baptism. See BAPTISM.

CLINK, THE (Ger. *Klinke,* Dan. *klink,* Swed. *klinka,* bolt, latch, from Ger. *klingen,* OHG. *chlingan,* Dan. *klinge,* Swed. *klinga,* to clink, to jingle). An old prison at Bankside, London, in the jurisdiction of the Bishop of Winchester, used for criminals of that part of the Manor of Southwark which was known as "The Liberty of Clink," and not embraced in the original grant to the city of London (about 1327). The later grant was made expressly for the purpose of securing jurisdiction over the malefactors of the city of London who fled to Southwark. The name has come to mean the "guardhouse," in the modern parlance of "Tommy Atkins."

CLINK'ER, HUMPHREY. The hero of Smollett's novel of the same name.

CLINKER-BUILT. See BOAT.

CLINK'ERS (from *clink,* Ger. *klingen,* to jingle). The scales or globules of black oxide of iron, obtained from red-hot iron under the blows of a hammer. The same term is applied to the slag of iron furnaces, to the calcined products of cement kilns, and, generally, to the slaglike refuse of furnaces of all kinds. The clinker produced from the burning of coal is due to the chemical combination of oxide of iron and the silica contained in the ash of the coal. The cinder-like masses which form the crust of some lava streams are called clinkers by geologists.

CLINK'STONE'. See PHONOLITE.

CLINOM'ETER (from Gk. κλίνειν, *klinein,* to incline + μέτρον, *metron,* measure; cf. Fr. *clinomètre*). An instrument used by geologists for ascertaining the dip or inclination from the horizontal of bedded rocks or veins. It consists of a graduated arc, with a pendulum or plumb line hung at the centre. When the instrument is placed on a horizontal surface, the pendulum points to 0°, while on an inclined surface the pendulum assumes a position corresponding to the angle of inclination. The clinometer is sometimes attached to a compass, which latter is required for determining the direction of outcrop or strike of rocks.

CLI'NOSTAT (from Gk. κλίνειν, *klinein,* to incline + στατός, *statos,* placed, from ἱστάναι, *histanai,* to stand). An apparatus for rotating plants, periodically or constantly, in any desired plane, for the purpose of eliminating or equalizing the effect of any directive stimulus, such as light or gravity. (See IRRITABILITY.) It consists essentially of a strong clockwork, driven by a spring or weight, with vanes or other device for controlling the speed of the mechanism, which may usually be adjusted to make one rotation in 10 to 30 minutes. Suitable tables and

clamps for holding the vessel containing the plants are provided. The intermittent clinostat is so arranged that at given intervals the mechanism is released and permitted to impart a quarter or a half rotation to the plant.

CLIN'TON. A town in Huron Co., Ontario, Canada, 130 miles west of Toronto, 50 miles north of London, on a branch of the Grand Trunk Railway (Map: Ontario, C 6). It has a collegiate institute, model and public schools, a customs office, town hall, library, park, and is the residence of a United States consular agent. Manufactured products include pianos and organs, and automobiles, and there are planing, flour, and knitting mills, and hosiery and clothing factories. Grain and live stock are shipped. Near the town are valuable salt wells. The town owns its lighting and water works. Pop., 1901, 2547; 1911, 2254.

CLINTON. A city and the county seat of Dewitt Co., Ill., 22 miles south of Bloomington, on the Illinois Central and the Illinois Traction railroads (Map: Illinois, D 3). It is in a fertile agricultural region and has railroad shops, a public library, and a hospital. Clinton has adopted the commission form of government. The city owns and operates its water works. Pop., 1900, 4452; 1910, 5165.

CLINTON. A city and the county seat of Clinton Co., Iowa, 138 miles by rail west of Chicago, Ill.; on the Mississippi River, and on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, the Chicago, Burlington, and Quincy, the Chicago, Rock Island, and Pacific, the Davenport, Rock Island, and Northwestern, and the Iowa and Illinois railroads (Map: Iowa, G 3). The Mississippi is crossed at Clinton by one railway and two wagon bridges, one of the latter being a mile long. The city contains two academies and Wartburg College (Lutheran), founded in 1894, three hospitals, a public library, and several parks. Its manufactures are extensive, including machinery, boilers, wagon boxes, furniture, locks, sashes and doors, overalls, boxes, wire, cloth, brick, paper, etc. The Chicago and Northwestern Railroad has large stockyards and machine shops in Clinton; and there are also bridge and iron works, sugar refineries, and roofing mills. Lyons, which in 1890 had 5799 inhabitants, was annexed to Clinton in 1895. Pop., 1890, 13,619; 1900, 22,698; 1910, 25,577; 1920, 24,151.

CLINTON. A town in Worcester Co., Mass., 12 miles (direct) north by east of Worcester, on the Nashua River, and on the Boston and Maine and the New York, New Haven, and Hartford railroads (Map: Massachusetts, D 3). It manufactures ginghams and plaids, machinery, wirework, worsteds, carpets, etc. The town owns and operates its water works and has a large public library, a hospital, home for aged people, a fine municipal building, and a park. The Wachusett Dam and Reservoir, which supplies water to Boston and the metropolitan district, is situated here. Clinton was a part of Lancaster until 1850, when it was separately incorporated. Its government is administered by town meetings. The board of selectmen, who are elected for three years, appoint the chief of police, engineers, and other officers. Pop., 1900, 13,667; 1910, 13,075; 1920, 12,979.

CLINTON. A town in Hinds Co., Miss., 9 miles west-northwest of Jackson, on the Alabama and Vicksburg Railroad (Map: Mississippi, E 6). It is the seat of Mississippi College (Baptist) and of Hillman College. The water works and light plant are owned by the town. Pop., 1910, 767.

CLINTON. A city and the county seat of Henry Co., Mo., 88 miles by rail southeast of Kansas City, on the Missouri, Kansas, and Texas, the St. Louis and San Francisco, and the Kansas City, Clinton, and Springfield railroads (Map: Missouri, C 3). It has large flour mills and exports hogs, cattle, coal, flour, and agricultural products. There are four artesian wells which have a considerable flow of white sulphur. The Clinton German Seminary is situated here. Settled in 1835, Clinton was incorporated as a village in 1840 and at present is governed under a general law, revised in 1899, which provides for a mayor, who holds office for two years, and a city council. The electric-light plant and street railways are owned by the city. Pop., 1890, 4737; 1910, 4992.

CLINTON. A village in Oneida Co., N. Y., 9 miles southwest of Utica, on the New York, Ontario, and Western Railroad and on Oriskany Creek (Map: New York, E 5). It is the seat of Hamilton College (q.v.) and contains a public library. Knit and canned goods are manufactured. There are iron-ore mines and mineral springs in the vicinity. The water, sewer, and electric-light distribution systems are owned by the municipality. Pop., 1900, 1340; 1910, 1236.

CLINTON. A city in Custer Co., Okla., 96 miles by rail west of Oklahoma City, on the Chicago, Rock Island, and Pacific, the Clinton and Oklahoma Western, the St. Louis and San Francisco, and the Kansas Central, Mexico, and Orient railroads, and on the Washita River (Map: Oklahoma, C 3). The chief industries are the milling of alfalfa and the manufacture of cottonseed oil and meal. The city contains a broom factory, cotton compress, municipal hospital, and superior court building. Clinton owns its water works and electric-light plant. Pop., 1900, 1278; 1910, 2781.

CLINTON. A town in Laurens Co., S. C., 60 miles northwest of Columbia, on the Seaboard Air Line and the Columbia, Newberry, and Laurens systems (Map: South Carolina, C 2). It contains the Presbyterian College of South Carolina and the Thorwell Orphanage. The leading industry is the manufacture of cotton. The water works and electric-light plant are owned by the town. Pop., 1900, 1869; 1910, 3272.

CLINTON, DEWITT (1769–1828). An American statesman. He was born at Little Britain, Orange Co., N. Y., March 2, 1769, the son of James Clinton, and was educated at Columbia College, graduating with high honors in 1786. Choosing the law for his vocation, he studied under Samuel Jones and was admitted to the bar in 1788. He entered immediately into political life, opposing the adoption of the Federal Constitution, and becoming an ardent supporter of his uncle, George Clinton (q.v.), who was then Governor of the State and a leader of the Anti-Federalist party. In 1797 he was elected to the State Assembly as a representative of New York City, where he made his residence, and the next year was chosen State Senator for four years. He also became a member of the Council of Appointment. Up to this time the Governor had exercised the exclusive right to make nominations; but Clinton vigorously attacked the system, succeeded in 1801 in procuring an amendment to the Constitution giving

the members of the Council of Appointment equal rights of nomination with the Governor, and by this means introduced the "spoils system" into New York politics, though it seems he was really opposed to the wholesale proscription of opponents. During this period he found time to devote himself to scientific and social questions—especially the use of steam in navigation, and the abolition of slavery and its kindred barbarism, imprisonment for debt. In 1802, when but 33 years of age, he became a member of the United States Senate, but soon resigned to accept the office of mayor of New York—an appointment made by his uncle, the Governor, and the Council of Appointment; and this position he held, with two short intermissions, until 1815. While mayor, he was also at various times State Senator, a member of the Council of Appointment, a commissioner on the Erie Canal route, and from 1811 to 1813 Lieutenant Governor of the State. After the retirement of his uncle from active participation in State politics in 1804, he speedily became the leader of the Republican party in New York and in 1812 was chosen as its candidate for President. Madison was nominated by the Republican Congressional Caucus; but the New York section of the party, tired of Virginian control, insisted on running Clinton and made a coalition with the Federalists for that purpose. Clinton, however, received only 89 electoral votes to 128 for Madison. The canvass had been hardly creditable to Clinton, and he was not henceforth an important figure in national politics; but as a great benefactor of his State in his later years he won fame and success. He took a leading part in establishing the free-school system of New York City and in the establishment and promotion of various institutions of science, in the improvement and modification of criminal laws, in the extension of agriculture and manufactures, in the relief of the poor, and the improvement of morals. But his greatest service was his promotion of the Erie Canal project. As citizen and commissioner, his zeal, energy, and optimism in planning and urging on the completion of this great waterway inseparably connected his name with the enterprise, both in the minds of its friends and in the minds of those who sneered at "Clinton's Folly." The canal became a political question, and on this issue Clinton was elected Governor in 1817. One of his first duties as Governor was to break ground for the canal at Rome. He was reëlected in 1820, but declined a hopeless nomination in 1822. His political opponents, led by Martin Van Buren and the "Albany Regency" (q.v.), sought to end his political career, and in 1824 removed him from the office of canal commissioner. This partisan act provoked a storm of public indignation, which elected Clinton Governor in that year—an office which he held until his death. The next year he opened the Erie Canal. He wrote: *Discourse before the New York Historical Society; Memoir on the Antiquities of Western New York; Letters on the Natural History and Internal Resources of New York; Speeches to the Legislature.* Consult: *Lives*, Hosack (New York, 1829) and Renwick (New York, 1840); Campbell, *Life and Writings of De Witt Clinton* (New York, 1849); Alexander, *Political History of the State of New York*, vol. i (New York, 1906); Orth, *Five American Politicians* (Cleveland, 1906); McBain's *De Witt Clinton and the Origin of the Spoils System in New York* (New York, 1907).

CLINTON, George (1739–1812). An American statesman, born in Little Britain, N. Y. In the French and Indian War he served as a lieutenant in the expedition against Fort Frontenac and after the war entered law and politics. He was chosen to the Colonial Assembly and to the Continental Congress, was made brigadier general in the Revolutionary army, and in 1777 was elected first Governor of New York. He was reëlected and occupied the executive chair for 18 years and in 1801 was chosen for one more term. From 1805 until his death he was Vice President of the United States. While Governor, his discretion in civil affairs and his military services were of great value to the State. He opposed the ratification of the Federal Constitution in the belief that it granted too great powers to the national officers, and while presiding officer of the Senate, during his term as Vice President, defeated by his deciding vote the rechartering of the United States Bank (1811). Consult the *Public Papers of George Clinton* (6 vols., New York, 1899–1902).

CLINTON, George Perkins (1867–). An American botanist, born at Polo, Ill. He was educated at the University of Illinois and at Harvard University. From 1890 to 1902 he was assistant botanist at the Illinois Agricultural Experiment Station and assistant in botany at the University of Illinois; thereafter he served as botanist at the Connecticut Experiment Station and as botanist of the Connecticut State Board of Agriculture. He was a vice president of the American Association for the Advancement of Science (Section of Botany) in 1914. He is author of experiment-station bulletins, including *The Russian Thistle* (1895); *Broom-Corn Smut* (1897); *The Smuts of Illinois Agricultural Plants* (1900); *Apple Scab* (1901); *Apple Rots in Illinois* (1902); *Test of Summer Sprays on Apples, Peaches, etc.* (1912).

CLINTON, George Wylie (1859–1921). An American negro bishop, born in Lancaster Co., S. C., of slave parents. He studied at Brainerd Institute (Chester, S. C.), at South Carolina University, and at Livingstone College, Salisbury, N. C. He entered the ministry of the African Methodist Episcopal Zion church in 1879; founded in 1889 the *Quarterly Review* of that denomination, which he edited for two years, and also edited the *Star of Zion* (1902–06); and was elected Bishop in 1896. He had taught in South Carolina and had been for a time president of the Atkinson Literary and Industrial College in Madisonville, Ky. He wrote: *The Negro in the Ecumenical Conference of 1901* (he was delegate to the Ecumenical Council); *The Three Alarm Cries* (1906); *Tuskegee Lectures* (1907); *Christianity under the Searchlight* (1909).

CLINTON, Sir Henry (c.1738–95). A British general in the American Revolution. He was the son of Admiral George Clinton (Governor of Newfoundland from 1732 to 1741 and of New York from 1741 to 1751), and the grandson of Francis, sixth Earl of Lincoln. He was a member of Parliament for Boroughbridge and for Newark between 1772 and 1784, during which time he was in the army in America. He served as major general (local lieutenant general) at the battle of Bunker Hill and took possession of New York after the defeat of Washington's forces in the battle of Long Island

(Aug. 27, 1776). For his part in that battle he was promoted lieutenant general and knighted. In 1778 he succeeded Sir William Howe as commander in chief, and, on his march from Philadelphia to New York, fought the unsuccessful battle of Monmouth (q.v.). In December, 1779, he led an expedition to South Carolina, and on May 12, 1780, captured Charleston, with General Lincoln's army of 6000 men. Replaced in command by Sir Guy Carleton in 1782, Clinton returned to England. Soon afterward he published his *Narrative of the Campaign of 1781 in North America* (1783), over which he and Cornwallis had a bitter controversy. He was again elected to Parliament in 1790, was made a general in 1793, and from 1794 until his death was Governor of Gibraltar.

CLINTON, HENRY FYNES (1781–1852). An English classical scholar, born at Gamston, in Nottinghamshire. He graduated at Oxford in 1805 and was a member of Parliament from 1806 to 1826. His two great works are the *Fasti Hellenici* (1824–34), and the *Fasti Romani* (1845–50), dealing respectively with the civil and literary chronology of Greece, and the civil and literary chronology of Rome and Constantinople. These works set classical chronology upon a solid and scientific basis. Consult *The Literary Remains of Henry Fynes Clinton*, by his brother (London, 1854).

CLINTON, JAMES (1736–1812). An American soldier, born in Ulster Co., N. Y. He was a brother of George Clinton (1739–1812) and the father of De Witt Clinton. He early entered the English army, served as a captain in the French and Indian War, and distinguished himself at the capture of Fort Frontenac. On the outbreak of the Revolution he took the side of the Colonies and was made a colonel. He accompanied Montgomery to Quebec as brigadier general and in 1777 was in command of Fort Clinton when it was captured by the British, after a brilliant defense, in which he received a bayonet wound. He was engaged against the Indians in General Sullivan's Iroquois expedition (1779) and was present at the siege of Yorktown. He was delegate to the New York Convention which ratified the Federal Constitution and was afterward a commissioner to adjust the boundary line between Pennsylvania and New York.

CLINTON STAGE. A name given to a subdivision of the Silurian system. The Clinton stage takes its name from the type locality at Clinton, N. Y.; but the strata are widely distributed in the eastern part of the United States, occurring along the Appalachians from New York to Alabama, and also in Ohio, Indiana, Kentucky, Wisconsin, and in Ontario, Canada. The prevailing rocks are sandstones, limestones, and shales, which attain a maximum thickness in the aggregate of about 1000 feet. A noteworthy feature of the Clinton stage is a persistent bed of oölitic iron ore that is the basis of an active mining industry in New York, Tennessee, and Alabama. See SILURIAN SYSTEM.

CLINTON STATE PRISON. A prison located in Dannemora, Clinton Co., N. Y. It was begun in 1844 and comprises a number of buildings inclosed in a stockade which surrounds 37 acres of land. This location was chosen for the purpose of employing convicts in the mining and manufacture of iron, there being abundance of that ore on the tract belonging to the prison or to the State. The industries at present conducted in the prison include the making of clothing, tinware, wooden ware, and cotton spinning.

CLI'O (Lat., from Gk. Κλειώ, *Kleiō*, from κλεῖν, *klein*, to celebrate, from κλέος, *kleos*, glory). In Grecian mythology, one of the Nine Muses (q.v.). When to the individual muses specific functions were assigned, Clio was at first called muse of epic poetry; later, and more commonly, she was regarded as the muse of history. In ancient art her common attribute is a partly opened roll.

CLIO. A prominent genus of pteropod molluskS. See PTEROPODA.

CLIO. A pen name of Addison, suggested by the letters "C," "L," "I," "O," with which, respectively, he signed his articles in the *Spectator*, according as he wrote at Chelsea, London, Islington, or "The Office."

CLIP'EUS. See SHIELD.

CLIP HOOKS. Two hooks, with points lying in opposite directions, made in such a manner that they overlap and fit closely so as to form a single eye when the necks are lashed together; the eyes of the separate hooks are in the same thimble or on the same pivot and also fit closely to each other when the necks are brought together.

CLIP OR SISTER HOOK.

CLIP'PER (probably connected with Dutch *klepper*, fast horse, from *kleppen*, to run swiftly, and thus with Eng. *clap*). A sailing vessel built with very sharp lines, more or less raking masts, and great spread of canvas, with a view to speed; a development of a model for the mercantile marine, first built in the United States at Baltimore, and called the *Baltimore Clipper*. The clippers, becoming famous for quick runs and occasionally making better time than the steamers, were especially employed in the South American trade, in the China trade (for tea and opium), and in the early California trade, via Cape Horn. For many years the "fruit clippers" were celebrated for their rapid passages; and the "opium clippers" and "slavers" attained an unenviable notoriety for speed. A "clipper ship," as compared with the ordinary sailing ship, is longer and generally of less beam in proportion to her length; very sharp at the bows, which are hollowed more or less below the water line; gracefully fined away towards the stern, which is almost always elliptical; and, in fact, the comparison of the race horse to the beast of burden holds good in comparing the clipper to the ordinary sailing ship. The first American clipper was the *Rainbow*, a vessel of 750 tons, built in 1843 for the China trade. The largest of these craft was the *Great Republic*, 325 feet in length, 53 feet beam, and 37 feet depth of hold, of 4000 tons' capacity. The Aberdeen builders and Mr. Scott Russell, in England, built some of the most magnificent clipper ships that have sailed the ocean. Among the fastest passages are those made by the *Flying Cloud* in 1851, New York to San Francisco in 89 days and 18 hours, making 374 miles in one day. This record, however, was reduced by the *Comet*, which made the same trip

in 83 days; in 1854, by the *Lightning*, Boston to Liverpool, 2827 miles, in 13 days, and Melbourne to Liverpool, 12,190 miles, in 64 days; in 1865, by the *Nightingale* from Melbourne to New York, 12,720 miles, in 73 days; the *Thornton*, Sandy Hook to Liverpool, 3000 miles, in 13 days, 9 hours; this record was equaled by the *Dreadnaught* in 1859; 1869, the *Golden Gate*, an iron clipper ship, from Liverpool to San Francisco, 13,800 miles in 100 days. The clipper, which was at its prime during the period from 1840 to 1855, at the advent of the steamship underwent numerous transformations as the ends of commerce demanded a greater cargo-carrying capacity at the expense of speed, and as a type gradually passed away; changes were made in the lines and rig, and smaller crews were carried, with the object of increasing tonnage capacity and competing with steamships by lower freight rates. The effect of the model, however, was shown in many subsequent ships and yachts.

CLIPPER BOW. The overhanging bow, with short bowsprit (chiefly ornamental), which is found in some wooden steamers. The bow of most steamers has a vertical stem. The clipper bow differs from the old sailing-ship bow in rising in a smooth curve from the cutwater to the scrollhead, while the latter had a reverse curve as it approached the bowsprit.

CLISSON, klē'sôN', Olivier de (1336–1407). A French soldier, born in Brittany. He fought in the Hundred Years' War, at Auray (1364), on the English side; later, after his quarrel with Duke John IV of Brittany, he took part under Bertrand de Guesclin in the campaigns (1370–80) against the English. In 1380, upon De Guesclin's death, Clisson succeeded him as constable of France, and thereafter he commanded the army in Poitou and in Flanders, where he defeated (1382) the citizens of Ghent at Roosebek. In 1385 he sailed with a fleet of 62 vessels to invade England, but was driven back by a great storm. Forced into exile in Brittany by the uncles of Charles VI, Clisson made his peace with Duke John IV, after whose death (1399) he was regent of the duchy. Consult A. Lefranc, *Olivier de Clisson* (Paris, 1898).

CLIS'THENES, klĭs'thē-nēz (Lat., from Gk. Κλεισθένης, *Kleisthenēs*). An Athenian statesman, son of Megacles and Agariste, daughter of Clisthenes of Sicyon. He was, on his father's side, a member of the celebrated family of the Alcmæonidæ (q.v.). He took a prominent part in the expulsion of Hippias in 510 B.C. When Isagoras (q.v.), the head of the oligarchical party at Athens, called in Cleomenes I (q.v.), King of Sparta, Clisthenes, with 700 heads of families, was forced to retire from the city, but was afterward recalled. He made important changes in the Athenian Constitution, which he rendered more democratic. The basis of his reform was the redistribution of the people; instead of four tribes, or phylæ, which had previously existed, he made the number 10, and distributed among these the demes into which the Attic territory was divided. For the nature of these arrangements and their purpose, see Athens, *History*. He also instituted ostracism, and, according to Ælian, was the first to suffer therefrom. See Boule; Deme; Ecclesia.

CLISTHENES OF SICYON. Tyrant of Sicyon, early in the sixth century B.C., grandfather of Clisthenes the Athenian. (See the preceding article.) He aided Delphi against Crisa and brought about the reëstablishment of the Pythian Games.

CLITANDRE, klē'täN'dr'. A favorite name with Molière, who calls four different characters by it: (1) the sensible lover of Henriette in *Les femmes savantes;* (2) the lover of Angélique in *Georges Dandin;* (3) a titled lover of Célimène in *Le misanthrope;* (4) the lover of Lucinde in *L'Amour médecin.*

CLITAR'CHUS. A Greek historian, who accompanied Alexander the Great on his expeditions and described Alexander's exploits down to the battle of Issus. Both Cicero (*Brutus*, 42) and Quintilian (x, i, 74) throw doubts on his trustworthiness. His importance lies in the fact that his work was popular and much used by writers on Alexander as well as by Quintus Curtius, Plutarch, Justin, and Diodorus Siculus.

CLITH'EROE (Welsh *Cled-dwyr*, cliff near the waters). A town of Lancashire, England, on the Ribble, and at the foot of the Pendle Hills, about 28 miles north of Manchester (Map: England, D 3). Its notable buildings include the church of St. Michael's, the ancient grammar school founded by Philip and Mary in 1554, and the ruins of an old castle built by one of the De Lacy family in the twelfth century. The town has a free public library and a technical school. Its industries consist of cotton and paper mills, and in the neighborhood are extensive limestone quarries and peat mines. Near Clitheroe is the Jesuit College of Stonyhurst. Pop., 1891, 10,800; 1901, 11,414; 1910, 12,500. Clitheroe and Pontefract were the two seats of the De Lacy family in Norman times.

CLITOM'ACHUS (Gk. Κλειτόμαχος, *Kleitomachos*, or possibly Κλειστόμαχος, *Kleistomachos*) (c.180–c.110 B.C.). A Greek philosopher of the New Academy, the most important among the pupils of Carneades, whose spoken philosophy he put in writing, and whom he succeeded as leader of the school. He was a Carthaginian by birth, was called Hasdrubal in his own tongue, came to Athens about 147, and became head of the New Academy in 129. Of his works, about 400 in number, we have no direct remains; Cicero, who praises him highly in his *Academica*, used Clitomachus' treatise Περὶ Ἐποχῆς, *Peri Epochēs, On Suspension of Judgment.* To some extent, also, Cicero based on Clitomachus' works his *De Natura Deorum*, his *De Fato*, and his *Tusculanæ Disputationes.* He was well known at Rome, if we are to believe Cicero's statement that Crassus heard him lecture at Athens in 111, and that he dedicated one of his books to the poet Lucilius and one to Lucius Censorinus, Consul in 149 B.C. Consult Zeller, *The Stoics, Epicureans, and Sceptics*, trans. by Reichel (London, 1892).

CLITUM'NUS. A river of Italy, famous through the description given by Pliny the Younger (*Epistles*, viii, 8) of the spring which formed its source, a spring still beautiful. It rose in Umbria, between Spoletium and Trebia, and fell into the Tiber.

CLI'TUS (Lat., from Gk. Κλεῖτος, *Kleitos*) (?–328 B.C.). The foster brother of Alexander the Great. He was the dearest friend of the King, whose life he saved at the battle of the Granicus. He held high positions in the Macedonian armies and in 328 was made satrap of Bactria. At a banquet given by Alexander in honor of the Dioscuri, the King, goaded to madness by the censures of Clitus, who re-

proached Alexander with slothfulness, seized a spear and in his drunken rage slew him. Alexander bitterly repented and showed his grief in the most extravagant manner.

CLITUS. In Shakespeare's *Julius Cæsar*, the servant of Brutus.

CLIVE, klīv, CATHERINE (1711–85). A noted English actress, familiarly called "Kitty Clive." She was a daughter of William Raftor, an Irish gentleman of reduced circumstances, living in London. There is a doubtful story about her having been overheard singing while scrubbing a doorstep where there were some members of the Beefsteak Club, and so securing a chance to begin her career. At any rate, during Colley Cibber's management of Drury Lane, she made her appearance there as a page, with a song, in Lee's tragedy of *Mithridates*, probably in 1728. She made a great hit, which she repeated in 1729 as Phillida in Cibber's *Love in a Riddle*, and in 1731 in Charles Coffey's *The Devil to Pay*. About 1732 she was married to George Clive, second cousin of the famous Lord Clive. In 1742 she sang the part of Delilah in Handel's *Samson*, then first produced. She left Drury Lane in 1743, during Fleetwood's management, but resumed her connection with that theatre when Garrick took its direction, three years later. Her last appearance was in 1769, as Violante in the comedy of *The Wonder*, Garrick himself, out of compliment to her, taking the part of Don Felix. Mrs. Clive's talents were seen to best advantage in comic parts, to which, however, she was not always satisfied to restrict herself. Her vigorous wit and sound sense made her the welcome companion of some of the notable people of her time. In her later life she was an intimate friend of Horace Walpole, who gave her a house at Strawberry Hill. She died Dec. 6, 1785, and was buried at Twickenham. Consult: Fitzgerald, *Life of Mrs. Catherine Clive* (London, 1888); Austin Dobson, in Matthews and Hutton, *Actors and Actresses of Great Britain and the United States*, vol. i (New York, 1886); Doran, *Annals of the English Stage* (London, 1888); Thos. Davies, *Memoirs of the Life of David Garrick* (ib., 1784).

CLIVE, ROBERT, BARON CLIVE OF PLASSEY (1725–74). An English general, whose achievements laid the foundations of the British Indian Empire. His father, a lawyer and small landowner, came of an ancient Shropshire family, whose manor seat, Styche, near Market Drayton, dates from the reign of Henry II. There Clive was born, Sept. 29, 1725, the eldest of 13 children. He spent several years with an uncle at Hope Hall, near Manchester, and at various schools showed more aptitude for pugilism and mischievousness than for study. At 18 years of age he shipped to Madras as a writer to the East India Company, where he dragged on an unhappy and quarrelsome existence as a mere drudge in the employ of the company until the outbreak of the great struggle between the French and the English in India. He applied for and obtained an ensign's commission and distinguished himself in Boscawen's unsuccessful siege of Pondicherry in 1748. His dauntless courage, previously exhibited in a duel which forms the idealized subject of Browning's poem "Clive," now had scope for development. English influence was almost extinct in India, through the prestige of the French and their allies. In 1751, with 500 mixed English and Sepoy troops, Clive marched from Madras and captured Arcot, a city of 100,000 inhabitants, garrisoned by 1500 of Chunda Sahib's best troops. The daring displayed in the capture of Arcot was equaled by the intrepidity and fortitude exhibited in its successful defense by Clive and his little band, reduced to 200 men, against a besieging army of 7000 natives and French, and impressed the natives with the strength and prowess of Britain. The succeeding campaign, in which successes and personal escapes were of a most dramatic character, included the victories of Arni and Kaveripak and the capture of Kovilam and Chingalpat. Henceforward Clive's name was a local tower of strength; the natives surnamed him "Sabat Jung," or "the Daring in War," and Pitt described him as "the youth of 27 years" who had done the deeds of a "heaven-born general." In 1753, with his bride, Margaret Maskelyne, sister of the astronomer, he visited England and received a diamond-hilted sword and the warm thanks of the India Company. Possessed of a moderate fortune, obtained from prize money, he expended part in redeeming the paternal estate and relieving his father from pecuniary embarrassment. The rest soon disappeared in an unsuccessful parliamentary contest and in luxurious display. He returned to India in 1755 and in 1756 was called to avenge the Black Hole (q.v.) atrocity perpetrated by Siraj-ud-Daula, Nawab of Bengal. Clive advanced against the Nawab, and in January, 1757, the English were again in possession of Calcutta. A peace was arranged; but Clive, bent upon a brilliant exhibition of his powers and eager for the riches of Bengal, soon returned to the struggle. To insure his success, he entered into a plot for the elevation to the throne of Bengal of Siraj-ud-Daula's general, Mir Jaffir, who was to desert his chief, and who promised to shower wealth on Clive and the East India Company for his services. On June 23, 1757, Siraj-ud-Daula was overthrown in the battle of Plassey. This victory decided the ascendancy of England over France in India and was followed by the rapid building up of a British Indian empire. Mir Jaffir was placed upon the throne of Bengal and kept his promises. From shares in these and other spoils and from presents and territorial grants from native princes, Clive amassed vast wealth, which yielded an annual income of £40,000. After managing the affairs of the East India Company at Calcutta for some years and winning fresh victories, he returned to England in 1760 and was loaded with thanks and honors. He became parliamentary member for Shrewsbury, was raised to the Irish peerage as Baron Clive of Plassey, and in 1764 was created Knight of the Bath. Through the dishonesty of its servants, high and low, the affairs of the company became greatly involved after his departure from India, and in 1765 he was sent out to set them right. He proved as competent an administrator as a warrior; and in less than 18 months, by raising salaries, abolishing perquisites, reorganizing the army and ruling with a rod of iron, he "restored perfect order and discipline in both the civil and military services and brought back prosperity to the well-nigh ruined finances of the company." He returned to England in 1767 and was received with the distinction to which he was entitled. But the energy he had displayed in righting Indian affairs antagonized many who suffered pecuniarily from the suppression of dishonest practices;

and they, possessing influence, employed it in raising English feeling against Clive. His Indian administration was made the subject of animadversion in Parliament in 1772, which he at first ignored, but subsequently replied to in a vigorous and eloquent speech, which elicited Pitt's admiration. A parliamentary inquiry, the following year, demonstrated that in certain particulars Clive's treatment of the natives had been questionable. A large part of his enormous wealth was shown to have come from presents from the natives, a fact justified by custom. But at the same time Clive undoubtedly, as in the case of Omichand, acted disgracefully. A qualified acquittal from Parliament, which acknowledged his "great and meritorious services," was not satisfactory to Clive, who never recovered from the disgrace implied in the trial; this, with sickness, recourse to opium to alleviate his sufferings, and mental depression, led to his suicide, Nov. 22, 1774.

Clive was an able man and got India for England. Perhaps Macaulay was justified in saying that "Clive, like most men who are born with strong passions and tried by strong temptations, committed great faults, but our island has scarcely ever produced a man more truly great either in arms or in council." Consult: Malcolm, *Life of Clive* (3 vols., London, 1836); Malleson, *Founders of the Indian Empire: Lord Clive* (ib., 1882); id., *Decisive Battles of India* (ib., 1883); Mill, *History of British India*, vol. iii (ib., 1858); Macaulay, *Essay on Clive* (ib., 1840); Arbuthnot, *Lord Clive* (ib., 1899).

CLOACA, klō-ā'kȧ (Lat., sewer). The cloacæ were subterranean drains, usually built of stone. In Rome the early city was drained by three natural streams, which were later confined within channels built of stone and vaulted, the largest of which, crossing the Argiletum, Forum, and Velabrum, was called, from its size, the Cloaca Maxima, though that of the Vallis Murcia and that near the Circus Flaminius rival it in size and solidity. A network of smaller passages empty into these main channels. The system was largely due to the Tarquins. The Cloaca Maxima was upward of 13 feet in width and of corresponding height, vaulted with three thicknesses or layers of large stones laid without cement, of the uniform size of over 5 feet long and 3 feet high. The flooring is paved like a Roman road, and the side walls are built of huge blocks of Gabii stone. The sewer was constantly flushed with the superfluous water from the aqueducts. Portions of the cloacæ are still visible, but the greater part lie far below the present level of the streets. The mouth of the Cloaca Maxima at the Tiber is still visible. During the Republic the surveillance of the Roman cloacæ was one of the duties performed by the censors. The Cloaca Maxima was repaired by Cato and his colleagues in the censorship. Agrippa, when ædile, is recorded to have passed through the cloacæ in a boat. Under the Empire officers called *curatores cloacarum urbis* were appointed for their supervision. So thoroughly was the city undermined by these large sewers that Pliny calls it *urbs pensilis*, a city suspended in the air rather than resting upon the earth. Drains of the same description, but of smaller dimensions, existed in other ancient Roman cities.

CLOACA MAXIMA. See CLOACA.

CLOCHES DE CORNEVILLE, LES, lā klôsh' de kôr'nᵉ-vēl'. A very popular operetta, in three acts, produced at the Folies Dramatiques in 1877. The amusing libretto is by Clairville and Charles Gabet; the music, from which many airs have become popular, by Robert Planquette.

CLOCK (AS. *clucge*, Icel. *klukka*, Ger. *Glocke*, bell, from ML. *clocca*, bell, from OIr. *cloc*, Ir. Gael, *clog*, bell, clock, Welsh, Corn. *cloch*, Manx *clagg*, bell). A mechanical instrument for measuring and indicating the time of day, usually by a mechanism consisting of two distinct portions: first, a train or succession of toothed wheels for transmission to a definite point of a motive force, produced by a weight or spring, or the action of an electric current on an electromagnet or system of magnets; and, second, an escapement to regulate the expenditure of this motive force with uniformity and requisite slowness. A watch is simply a portable clock, to be worn on the person, in which the motive force is a spring. A maritime chronometer is a watch of unusual size, constructed and mounted with especial care, for determining longitude at sea. See WATCH; CHRONOMETER.

Historical Development. Among the predecessors of the clock, as time measurers, are the sundial, the clepsydra, or water clock, and the hourglass. (See DIAL; CLEPSYDRA; HOURGLASS.) The clepsydra was a graduated transparent vase, in which water trickled through a hole in the bottom at such a rate that the receding water marked the passage of time. In the hourglass sand was substituted for water. Among Eastern nations a great many curious mechanical devices were introduced into the construction of the clepsydra: the water was made to flow in tears from the eyes of automata; a floating statue, falling with the liquid, pointed to the passing hour, as indicated on the side of the glass; finally, a mechanism was introduced by which the water, as it fell, drop by drop, turned a little wheel, which moved the hands on the face of a dial and so marked the hour. The next step was the construction of a time indicator, whose hands were moved by the action of falling weights instead of that of falling water. When this step was taken and the first true clock constructed is uncertain. Its invention is claimed by many peoples, from the Chinese, 2000 B.C., to the Germans of the eleventh century. Certain it is that clocks were in general use in churches and monasteries throughout the latter part of the Middle Ages, and that these ancient tower clocks were the progenitors of all our modern timekeepers.

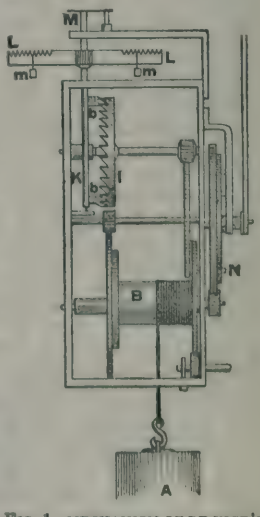


FIG. 1. MECHANISM OF DE VICK'S CLOCK.

The oldest clock of which we have a complete description was set up in the tower of the palace of Charles V of France, in 1379, by a German named Henry De Vick. This primitive clock was constructed on the mechanical principle which is the basis of most modern timekeepers. This principle, as formulated by E. A. Marsh,

is "that the power stored up in a raised weight or coiled spring shall be communicated to a train of wheels which are set revolving, and that the force or motion shall be cut up into a succession of minute but equal impulses by converting a rotary into a vibratory motion. The last and quickest wheel of the train shall have its teeth so formed that they are caught and escape alternately, and hence the wheel is called the 'scape wheel,' and, from its resemblance to a crown, the 'crown wheel.' The bar and staff, which with its projections catch and release the teeth, is termed the 'escapement,' and it is through this device that the rotary is converted into the backward and forward motion." The accompanying sketch of De Vick's clock is useful, not only from its historical interest, but also because, from its comparative simplicity, it will form a groundwork for further explanation of the mechanism of clocks in their more complicated form. It will be readily understood, from a glance at the annexed figure (Fig. 1), that as the weight *A* tends to uncoil the cord and set in motion the cylinder *B* round its axis, the motion will be successively communicated to the various toothed wheels in the figure, and finally to the crown wheel or escapement wheel, *I;* the teeth of which so act on the two small levers or pallets, *b b*, projecting from and forming part of the suspended upright spindle or vertical axis, *KM*, on which is fixed the regulator or balance, *LL*, that an alternating or vibratory instead of a circular motion of the balance itself is the result. The hands of the clock are attached to the wheel *N*, also set in motion by the cylinder *B*. Now, unless there were some check upon the motion, it is manifest that the heavy weight *A* would go rapidly to the ground, causing the wheels to rotate, the balance to vibrate, and the hands to go round with increasing velocity. In order to prevent this rapid unwinding of the clockwork, and adjust it to the more deliberate measurement of time, the balance is, in De Vick's clock, loaded with two weights, *m m;* and the farther these are removed from the axis or spindle, *KM*, the more heavily they will resist and counteract the escapement of the levers and the rapidity of the rotation of the escapement wheel, till the clock be brought to go neither too quick nor too slow.

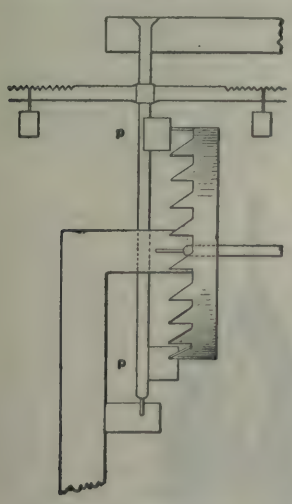

FIG. 2. BALANCE AND ESCAPEMENT OF THE FIRST CLOCK. *p p*, pallets.

Upon this simple plan it is probable that all clocks were constructed until the seventeenth century, when the principle of the pendulum was applied to the science of horology. The property of a pendulum known as its *isochronism* (q.v.) constitutes its value to clock mechanism—that, when a suspended body is swinging, any increase or decrease in its speed will not change the number of vibrations it makes in a given time, but only the length of the arc it describes. This law of the pendulum was discovered by Galileo and was first applied (probably) to clockwork by Huygens, about 1657. The two accompanying cuts show how the horizontal swing of the balance, as maintained in De Vick's clock, was converted into the vertical swing of the pendulum. By taking off one of the weights and hanging the balance in an upright position, it becomes a pendulum. Ten years later Dr. Hooke invented an escapement which enabled a weaker support to carry a heavier pendulum. Subsequent improvements in the escapement and pendulum (see ESCAPEMENT; PENDULUM), and in the use of the spring (see WATCH) in place of the pendulum, have brought the mechanism of timekeepers down to the present degree of perfection.

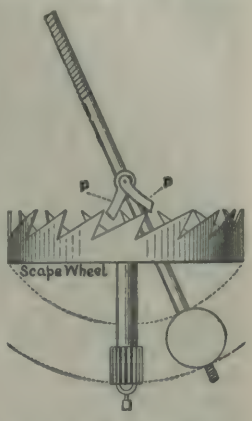

FIG. 3. DE VICK'S OLD BALANCE CONVERTED INTO THE PENDULUM. *p p*, pallets.

Striking Apparatus. The principal function of a clock, according to the mediæval conception, was that it should be a reliable instrument for automatically calling out the hours, particularly the hours for devotion. This conception of the clock is shown in the word itself, which originally meant "bell"—a meaning which has been retained in the French word *cloche*. A striking apparatus was, therefore, early invented, and it is interesting to note that the striking mechanism of De Vick's clock is similar to that used in some modern timepieces. A striking clock contains one or more extra trains of wheels to control the striker. In De Vick's clock 12 pins projected from the wheel on which the hand was attached. At each hour one of these pins, by pushing a lever, released the striking train, which lifted the hammer that strikes the bell. The number of strokes was determined by the position of the notches around the edge of a locking plate, which held the lever controlling the striking train. These notches were so placed that at 1 o'clock the catch in the lever entered a notch as soon as one blow had been struck. At 2 o'clock there was a longer space before the notch was reached, so that the bell was struck twice; at 3 o'clock the bell struck three times before the train was locked, and so on. The chief objection to this striking apparatus is that it is thrown out of order and strikes wrong every time the clock happens to run down.

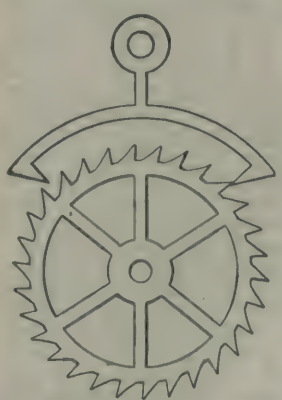

FIG. 4. DR. HOOKE'S ESCAPEMENT.

The *rack and snail repeating mechanism* has been used for over two centuries. It is a peculiar and intricate piece of mechanism. In ordinary clocks the impelling power is a weight similar to that which moves the time-measuring mechanism itself; but the pressure of this weight on the striking machinery is permitted to come into play only at stated periods in course of the workings of the timekeeping apparatus, viz., at the completion of every hour: when the minute wheel, which revolves once in an hour and carries the minute hand of the clock along with it, brings it into action by the temporary release of a catch or detent, permitting the weight wound up on the cylinder of the striking apparatus to run down a little, in doing which the hammer is forced into action, so as to strike the bell. Whether the strokes shall be one or many is determined principally by two pieces of mechanism —one called a "snail," from its form or outline, with 12 steps, and the other a "rack," with 12 teeth. The time during which the striking weight is *allowed* to descend varies according to the turning of the 12 steps of the snail on its axis, and the position of the 12 teeth of the rack at different hours of the day, being sometimes only long enough to permit one blow to be given by the hammer on the bell, and at another time long enough for 12 such blows.

It is not known when the alarm or when the striking mechanism of the clock was first applied. The alarm was adopted for the use of the priesthood, to arouse them to their morning devotions. The first striking clock probably announced the hour by a single blow, as they still do, to avoid noise in churches. During the seventeenth century there existed a great taste for striking clocks, and hence a great variety of them. Several of Tompion's clocks not only struck the quarters on eight bells, but also the hour after each quarter; at 12 o'clock 44 blows were struck, and between 12 and 1 no fewer than 113. Many struck the hour twice, like that of St. Clement Danes, in the Strand, London. Before the fifteenth century chimes had been introduced. See BELL and CHIMES; and consult authorities there cited, especially an article in the *Journal of the Society of Arts* (London, March 29, 1901), on "Clocks, Carillons, and Bells."

Clocks Provided with Automatons. The desire to construct clocks which shall perform automatically many other things besides simply recording the time of day is as old as clock making and was developed to a wonderful degree in the ancient clepsydræ of Oriental nations. Indeed, the automatons of the ancient Chinese and Arabian clocks were the models upon which all those of mediæval Europe, including the famous Strassburg clock, were based. Among the earliest of these automatons or "jacks of the clock" built in the tower clocks of Europe were those of the clocks at Dijon, Cambrai, and Linden, in each of which two figures appear and strike the hourly bell. In 1495 the clock at Lübeck was built in which the figures of the Twelve Apostles were introduced.

Probably the most widely known of these tower clocks is the one in Strassburg Cathedral. This famous clock has been reconstructed twice. The first Strassburg clock was built in 1352, under the direction of John, Bishop of Lichtenberg. It contains a calendar, an astrolabe, and a set of chimes composed of several cymbals. There were automatic figures of the Virgin, of the three Wise Men who bow before her, and a cock, which moves its beak, crows, and flaps its wings. The second Strassburg clock was built in 1570. Its mechanical works were constructed by Isaak and Josias Habrecht, of Schaffhausen, Switzerland. Early in the nineteenth century it was found that the clock required reconstruction, and the task was consigned to Charles Schwilgué, who consumed four years in its completion. Only a few of the original movements were restored by Schwilgué, most of the present mechanism being of his own design.

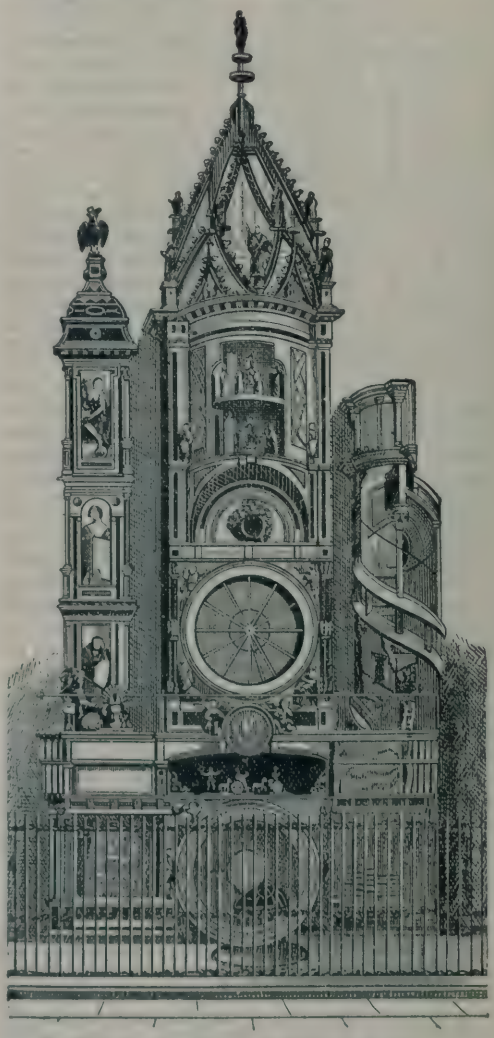

FIG. 5. STRASSBURG CATHEDRAL CLOCK.

The following description of the present Strassburg clock indicates its most important features: It is 30 feet high and 15 feet at the base. On one side of the main portion is a flight of winding stairs, surmounted by five columns. On the other side is a Gothic pillar, the panels of which are filled with figure paintings. At the base of the main portion of the clock is a celestial globe, indicating sidereal time, and showing the rising, passing over the meridian of Strassburg, and setting of all stars that appear above the horizon, visible to the naked eye. Behind the globe is a calendar,

showing the day of the month and the fixed and movable feasts. A statue of Apollo points out the day of the month. The calendar is in the form of an annular band, so arranged as to show many other astronomical events besides the day of the month. Above the calendar are figures drawn in chariots, one appearing each day. On Sunday Apollo appears, drawn by horses of the sun. On Monday Diana, emblem of the moon, drawn by stags, appears. She is succeeded in turn by Mars, Mercury, Jupiter, Venus, Cupid, and Saturn. Above these figures is the dial which tells the time of day. On each side of this dial sits a figure, one of which strikes the quarter hours, and the other holds an hour-glass and turns it every 60 minutes. The next story is devoted to a planetarium, and the next is a globe for showing the phases of the moon. Above this are movable figures, which in succession strike the quarter hour. The first figure is an infant, which strikes the bell with a rattle; the second is a youth; the third an old man; the fourth is a figure of death, which strikes the bell with a bone. In the highest compartment is a figure of Christ. Each day at noon a procession of the Apostles passes before Him; while a cock, perched above, appears and flaps its wings and crows three times.

The clock at Beauvais, France, is almost as wonderful a piece of mechanism as the Strassburg clock. It is composed of 14 different movements, includes 90,000 different pieces, and weighs 35,000 pounds. There are about 50 dials for indicating different astronomical events. The clock is 36 feet high, 16 feet broad, and nearly 9 feet deep.

The clock in Lyons Cathedral is much like the Strassburg clock. The old clock of Prague was built by one Harausch; and so jealous were the citizens of Prague lest he should build a similar clock in some other city—so the story goes—that they put out his eyes. This clock also contains various mechanical figures. The hour is rung by a skeleton, with the bell rope in his hands.

Another monumental clock is that in the clock tower on the Piazza San Marco, Venice. A Madonna sits on a platform between two doors overlaid with gold. When the time for certain religious festivals occurs, an angel comes out from one of these doors, blows a trumpet, bows to the Virgin, and passes out at the other door. The hour is struck by two giants.

Belfry clocks with automatons began to wane in popularity during the seventeenth century, and very few have been constructed since. House clocks with automatons were first made in the fifteenth century; but the height of their popularity was during the Renaissance, when wonderful skill and great artistic talent were expended in their construction. A favorite design for these clocks was that of a ship, whose crew performed numerous automatic functions. Perhaps the most beautiful as well as famous of these automatons is the ship clock of Charles V of France, now in the Cluny Museum. This clock was mounted upon rollers, on which its mechanism caused it to advance and recede. Another favorite design was a mounted huntsman, who at the stroke of the hour moved his head and arms, while the head and tail of the horse also moved. During the eighteenth century clocks with mechanically singing birds were popular. Within recent years automaton house clocks have come to be regarded as interesting examples of mechanical ingenuity and skill, to be occasionally produced and admired, rather than as necessary or desirable articles of furniture.

The United States has produced its share of automaton clocks, though most of them have been smaller than the great tower clocks of Europe. The Rittenhouse clock, made in 1767 by David Rittenhouse, of Philadelphia, has six dials, each marking off different astronomical events. The Columbus clock, made by a citizen of Columbus, Ohio, is 18 feet wide and 11 feet high. Like the clocks already described, this one records many astronomical events; in addition, miniature figures perform various movements. Three towns of Pennsylvania—Donaldson, Hazleton, and Wilkes-Barre—have possessed citizens who have added to their fame by their remarkable clocks.

In 1880 a clock was placed on exhibition in New York that was a striking illustration of the elaborateness to which clockwork may be carried. It was the work of Felix Meyer, who spent more than 10 years in its construction. The clock is 18 feet high, 8 feet wide, and 5 feet deep. It has 2000 wheels, runs by 700-pound weights, and is wound up once in 12 days. When the clock is in operation, it shows the local time in hours, minutes, and seconds; the difference in time at Chicago, Washington, San Francisco, Melbourne, Peking, Cairo, Constantinople, St. Petersburg, Vienna, London, Berlin, and Paris; the day of the week, calendar day of the month, month and season of the year, the signs of the zodiac, revolutions of the earth on its own axis and around the sun; also the phases of the moon and the movement of the planets around the sun. The quarter hour is struck by an infant, the half hour by a youth, the three quarter by an old man, and the hour by death, as in the Strassburg clock. As the hour strikes, a figure of Washington rises from a chair and extends its right hand, presenting the Declaration of Independence. A door is opened by a servant, and all the presidents, as far as and including Hayes, each dressed in the costume of his time, advance across the platform, salute Washington, and retire through another door.

Tower Clocks. As already pointed out, the earliest European clocks were all tower clocks —the house or "chamber" clock being a later invention, closely connected with the invention of watches. Among the early clock builders, ingenuity and complication of mechanism, as displayed in the automatons, was considered of more importance than accuracy as a timekeeper; but within recent years much scientific skill has been used to construct tower clocks which, in spite of their enormous size and great height, with the accompanying atmospheric disturbances at so great a distance from the earth, shall still be accurate timekeepers.

One of the largest clocks in the world is the Westminster clock, in the British House of Parliament, which was put in operation in 1860. Its four dials, situated 180 feet above the ground, are 22½ feet in diameter. Each minute hand is 14 feet long, and the hour figures on the clock are 2 feet long. The pendulum is 13½ feet long and weighs 700 pounds. There are 5 bells, weighing respectively 21 hundredweight, 26 hundredweight, 33½ hundredweight, 78 hundredweight, and 13 tons 11 hundredweight, for striking the first, second, and third quarters and the hour. These bells are hung from massive

wrought-iron framing, in a chamber above the dial. The largest, the hour-bell, popularly known as "Big Ben," is 9 feet in diameter and is struck by a hammer weighing 4 hundredweight, which is lifted 9 inches vertically from the bell before it falls. This bell and the great bell of St. Paul's Cathedral are tolled on the death of members of the royal family of Great Britain.

In the Westminster clock, as in all the tower clocks formerly constructed, the mechanism which drives the clock is located in the tower directly back of the face. But in the city-hall clock erected in Philadelphia in 1899 the

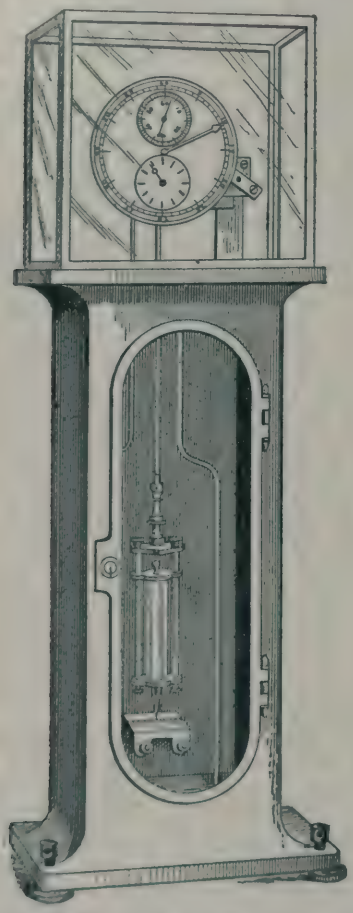

FIG. 6. ASTRONOMICAL CLOCK IN PHILADELPHIA CITY HALL.

clockwork is located in the main part of the building, and is connected with the dial mechanism in the tower by means of compressed air. The whole is based on the fundamental principle of all modern mechanisms—the governing of great forces by comparatively feeble ones. The primary clock is an astronomical clock, constructed with the greatest care, so as to be free from all disturbances from dust, moisture, and vibrations, and is so constructed that without interfering with its delicacy and accuracy it can operate four sets of hands, each weighing 500 pounds. The dials have a diameter of 25 feet. The total height of the tower is 547½ feet, and the centres of the dials are 362 feet above the pavement. The hour hand is 12 feet long and is entirely different in shape from the minute hand, so they never can be mistaken. The face of the dial is made up of several pieces, and the usual numerals are omitted from the face, not being of service at so great a height. The clock was designed by Warren S. Johnson; a detailed description of its mechanism was written by him and published in the *Journal of the Franklin Institute* (Philadelphia) for February, 1901.

The illuminated clock in the tower of the Metropolitan Life Building in New York City represents the most recent achievement in tower clocks, on the score of timekeeping and as an example of mechanical engineering, its extreme size, complication, and various adjuncts introducing many interesting and serious problems. This clock has four dials 26½ feet in diameter, which are placed on the sides of the lofty tower of the Metropolitan Life Building, nearly 350 feet above the street, the very apex of the 700-foot tower being fitted with a lantern by which signals visible over a wide range of territory are flashed for the hours and the quarters. This clock also has a set of chimes (see BELL), giving the Cambridge quarters, which sound the hours and the quarters. The minute hand is 17 feet long and the hour hand 13 feet 4 inches, and the mechanism driving them is controlled by a master clock located in the directors' room and working within an error of five seconds a month. From this clock, which is electrically driven and is of the self-winding type, through transmitters, each independently self-winding and electrically connected to relays and remote-controlled switches, the tower-clock hands, the chimes, and the flashers are all operated as well as the time service of the building. The hands are of steel-frame construction, incased in copper with fronts of wire glass, and carrying 16 incandescent lamps in the minute hand and 10 in the hour hand. Each dial is operated through a worm shaft from an electric motor which is installed in the clockroom on the twenty-sixth floor. The dial numerals are 4 feet high and the minute marks are each 10½ inches in diameter and are illuminated from behind like the figures of a stencil. The clock is so arranged that every quarter of an hour at night the time is flashed from the apex of the tower by red lamps, while white lamps flash the signals for the hour, but remain lighted ordinarily. Fifty-six red lamps and 88 white lamps giving an aggregate of 16,262 candle power are used. At 6 P.M. the chimes are cut out until 8 A.M. of the following day, and at dusk the lighting circuit is switched on. This clock was installed in 1909 and is exceeded in size only by the advertising clock at the Colgate works described below. For further description, consult *Electrical Review* (Chicago, Feb. 19, 1910).

Of a somewhat different nature, but exceeding in size the famous tower clocks described, is a clock erected on the works of Colgate and Company in Jersey City, where it may be seen from the Hudson River and from Manhattan Island. This clock has a dial 38 feet across and an area of 1134 square feet, with a minute hand 20 feet in length which, with its counterpoise, weighs nearly one-third of a ton. The mechanism is moved by a weight weighing 2000 pounds, and the whole clock weighs approximately six tons. This clock serves at night as well as in the daytime; and instead of the usual transparent dial illuminated from behind, the hands are outlined with incandescent lights, and brilliant red lights mark each numeral and an incandes-

cent lamp each minute mark, the latter being spaced 24 inches apart. The face of this clock is of skeleton form, as it was not feasible to expose so large a surface to the action of the wind without such supports that the face would be obscured. The tip end of the minute hand travels 24 inches every minute, or over half a mile a day, and the control mechanism is so regulated that the clock is maintained at a high degree of accuracy.

Electric Clocks. An electric clock is one whose mechanism is, in some way, either actuated or controlled by electricity. There are two principal types of electric clocks—(1) independent clocks, whose mechanism is kept in operation by electricity; (2) systems of clocks which are connected with a central or primary clock by an electric circuit, and are so arranged that either (*a*) the primary clock regulates its movements, at stated intervals, by forcibly moving the hands by an electric current into the proper position, or (*b*) the primary clock directly runs the hands of the secondary clocks, which are simply dials without independent machinery.

Clocks of the first class usually have some electromagnetic attachment applied to the mechanism, which keeps the pendulum in vibration, or their springs or weights constantly wound up; in other words, they are constructed like ordinary clocks, except that they are self-winding. The first self-winding clocks were made as early as 1855 by Alexander Bain, who applied electromagnetic attachments to the bob of the pendulum, which, in obedience to contacts connected with the pendulum itself, attracted it to and fro. Since that time many other means of applying the electric current to keep a clock running have been devised, and hundreds of patents for the same have been taken out. Another form of independent electric clock was put in operation in 1896, in the laboratory of Durham College, North Carolina. The clock is run directly by electromagnets, which are actuated by a current from an earth battery. The pendulum is swung by the electric current, and it is this which moves the clock. The works and dial are placed on the pendulum and swing with it. In addition to the clocks where the electric current gives an impulse to the pendulum, there are those where a spring is wound, or a weight raised, by means of a lever and ratchet working into a fine-toothed ratchet wheel. These clocks may be wound every hour or some lesser interval of time, such as every six minutes.

In the second class of electric clock the object is to keep a system of clocks correct by an automatic connection with a central and standard timekeeper. This method of time service has rapidly extended, until public buildings and private offices are supplied with time from a central clock, just as they receive a common service in heat, light, power, water, etc. Instead of employing the central clock simply as a regulator, it may be adopted as an actual propeller of the clocks on its circuit, and the secondary clocks become mere dials for indicating time, though the modern tendency is to employ self-winding time train clocks with a synchronizing system which often is one of considerable elaborateness of detail. The self-winding clocks can be connected with a continuously charged lighting circuit, thus obviating the necessity for batteries. The master clock for such a system becomes an important consideration, as well as the arrangement of the circuits. Often this time is secured in connection with the great telegraph companies, who receive on their wires the time signals from a national observatory and are enabled to maintain their local master clocks at high accuracy. Certain difficulties have been encountered in the electric connection between the main and secondary clocks, due, among other things, to induced currents from crossed telephone or other electric wires. In view of these difficulties, the Marconi wireless system has been applied to clocks, and the time signals sent out from an observatory can be received and, by means of relays, transmitted to a receiving mechanism. This device, however, has been found more useful for transmitting noon or other specified signals than a regular succession of impulses for continuous timekeeping. Though the general adoption of electrically controlled clocks is a development of the close of the nineteenth century, they have long been the subject of experimentation. In 1837 Alexander Bain began to experiment on electrically driven synchronous clocks, and in 1846 his system was in use between Glasgow and Edinburgh.

Pneumatic Clocks. A system of synchronous clocks which are connected with the central controlling clock by compressed air instead of electricity is called pneumatic. The clockwork in the city hall at Philadelphia, described above, is of this type. Under the influence of a master clock, pulsations of air are sent at regular intervals through the connecting tubes, and cause a bellows to expand at each dial, thus moving the hands.

Astronomical Clocks. An astronomical clock is one built with the simplest and most accurate mechanism possible, and with every possible protection against outside disturbances, so that its movements will be sufficiently accurate for astronomical calculations. The hour hand usually revolves but once a day, the dial being divided into 24 hours. One of the most important considerations for an accurate timekeeper of this class is that it should be maintained at a constant temperature, and often in astronomical observatories rooms are specially constructed for this particular purpose. It will be noticed, from the accompanying cut of the astronomical clock in the city hall at Philadelphia, that the dial has three circles—the minute circle above the centre, the 12-hour circle beneath the centre, and the hour circle upon the circumference of the dial. A clock regulated to keep mean solar or sidereal time is sometimes called an astronomical clock, as is also a clock having a dial on which the movements of the heavenly bodies are shown, this being the earlier application of the term.

A phonographic alarm clock was shown at the Paris Exposition of 1900, and since that time various devices have been developed by means of which the desired time, or any special message recorded on the cylinder, may be spoken when the time set on the indicator is reached. Increasing simplicity has been obtained for these devices, and while they have not attained general use, nevertheless they are available for those requiring them. Night clocks of various designs have been employed by means of which, when a button is pressed, an illuminated image of the hands and dial may be thrown upon the ceiling or wall of a room.

Clock Manufacture in the United States. American clocks were first manufactured in Connecticut, about 1800, by Eli Terry. His

clocks soon became popular, and he continued in business until his death, when his sons succeeded him, under the name of the Terry Manufacturing Company. Many neighboring establishments were soon engaged in clock manufacture, and Connecticut is still the centre of the industry in the United States. According to the census of 1850, there were 1436 clock factories and 2901 watch factories in the United States. At first the movements were constructed of wood, and in the better clocks the pendulum was of wood overlaid with gold leaf. In 1814 Terry invented the "short-shelf" clock, which rapidly displaced the long or hanging clocks previously made. Brass-wheel clocks were not made in the United States until 1837. American manufacturers introduced the system of cutting out the parts from sheet brass with a die, instead of casting them—a method which at once insured greater accuracy as well as cheapness in the product. The adoption of the die and of other forms of automatic machinery in the manufacture of clocks has now been carried to such an extent that nothing is left for the skilled hand laborer but the collocation of the parts. Coiled springs, instead of pendulums, had been used in European clocks for 200 years before their use was introduced into American factories; but they were placed only in the most expensive clocks: the invention of a reliable but cheap steel spring, which could be placed in the least expensive clocks, is due to American enterprise, and its introduction has revolutionized the clock-making industry. The small spring clocks can be manufactured and sold for less than one dollar, and are very popular.

CLOCKS AND WATCHES EXPORTED FROM THE UNITED STATES

(From the Statistical Abstract of the United States for 1913)

YEAR	Watches	Clocks	Total
1891	$ 275,707	$1,304,457	$1,580,146
1892	208,743	1,020,873	1,229,616
1893	241,758	962,423	1,204,181
1894	383,279	919,534	1,302,813
1895	357,329	846,676	1,204,005
1896	530,980	929,395	1,460,375
1897	801,491	968,911	1,770,402
1898	771,912	955,557	1,727,469
1899	819,810	1,043,621	1,863,431
1900	787,620	1,190,074	1,977,694
1910	1,228,713	1,360,218	2,588,931
1911	1,560,870	1,565,901	3,126,771
1912	1,880,677	1,661,468	3,542,145
1913	1,783,249	1,823,008	3,606,257

Bibliography. The following are general works on horology: Saunier, *Treatise on Modern Horology in Theory and Practice*, trans. from the French, by Julien Tuppier and Edward Rigg (London, 7th ed., 1906); Kendall, *History of Watches and Other Timekeepers* (London, 1897); Grimthorpe, *Rudimentary Treatise on Clocks, Watches and Bells* (London, 1883); Britten, *Old Clocks and Watches and Their Makers* (New York, 3d ed., 1911); id., *Watch and Clock Makers' Handbook, Dictionary and Guide* (London, 11th ed., 1907); Goodrich, *The Modern Clock* (Chicago, 1905); Cunnynghame, *Time and Clocks* (London, 1906); Abbott, *American Watchmaker and Jeweler* (Chicago, 1910). In the *Journal of the Society of Arts* (London) for March 7, 1890, is an interesting article by Julien Tuplin, on "Recent Progress in British Watch and Clock Making." The Supplement of the *Scientific American* for Sept. 19, 1896, contains an article on "Clocks Provided with Automatons." The *Electrician* (London) for Dec. 22, 1899, contains an article on "The Electric Time-Service." See WATCH; TIME SIGNALS; TIME, STANDARD.

CLODD, EDWARD (1840–). An English writer on evolution and allied subjects. He was born in Margate and was educated at Aldeburgh Grammar School. At the age of 15 he went to work and in 1862 became a clerk, and in 1872 secretary of the London Joint-Stock Bank. In 1896 he was for the second time president of the Folklore Society. Besides contributions to English reviews, particularly the *Quarterly* and *Fortnightly*, and to *Hastings Encyclopædia of Religion and Ethics*, he wrote: *The Childhood of the World* (1872); *The Childhood of Religions* (1875); *Jesus of Nazareth* (1880); *Myths and Dreams* (1885; 2d ed., 1891); *Story of Creation* (1888); *Story of Primitive Man* (1895); *Primer of Evolution* (1895); *Pioneers of Evolution* (1897); *Tom Tit Tot—Savage Philosophy in Folk Tale* (1898); *Story of the Alphabet* (1900); *Animism* (1906); and biographies of H. W. Bates (prefixed to an edition of *The Naturalist on the Amazons*, 1892), Grant Allen (1900), and Huxley (1902).

CLO'DIA. The infamous sister of Clodius Pulcher (q.v.), and wife of Quintus Metellus Celer, whom she is supposed to have poisoned. She is identified with the Lesbia to whom Catullus addressed his love poems. Her younger sister Clodia married Lucullus, but was put away on account of her conduct. Consult the *Prolegomena* to Ellis's ed. of Catullus, lxiii–lxxii (Oxford, 1889).

CLODION. A French sculptor. See MICHEL, CLAUDE.

CLODIUS PULCHER, klō'dĭ-ŭs pŭl'kẽr, PUBLIUS. A Roman politician. He first appears in 70 B.C., serving under Lucullus in Asia. In 65 he impeached Catiline for extortion in Africa; but Catiline bribed him and so escaped. Near the close of 62 he was said to have had an intrigue with Pompeia, wife of Julius Cæsar, on the occasion of the celebration of the rites of the Bona Dea (q.v.) in Cæsar's house. Clodius was tried for violation of the sacred mysteries, but was acquitted, it was charged, because he had bribed the judge. Having renounced his patrician status and having been adopted by a plebeian, P. Fonteius, he was elected tribune of the people in 59. One of his first acts was to exile Cicero, who had refused to defend him in the trial for sacrilege; but the great orator was soon afterward recalled in spite of Clodius' opposition. Clodius gathered around him the worst elements of the people, until he became a candidate for the prætorship (53 B.C.) in opposition to Milo. Both candidates worked with reckless energy. The contest was ended in an unexpected manner, Jan. 20, 52 B.C. Milo set out on a journey to Lanuvium. Near Bovillæ he met Clodius, who was on his road to Rome. Both were accompanied by armed followers, but passed each other without disturbance. However, some of the men in the rear guard of each party began to quarrel; a fight followed, and Clodius was killed. See MILO; and consult Cicero's oration, *Pro Milone*, which, however, is polemical and exaggerated.

CLODT-JÜRGENSBURG, klôt-yur'gens-bōōrk, PETER KARLOVITCH, BARON (1805–67). A Russian sculptor, born in St. Petersburg. He

studied at the artillery school in that city, was for a short time in the army, and gained his artistic training at the Academy of St. Petersburg, where he was appointed a professor. He was particularly successful in his depiction of horses, especially as seen in vigorous action, and those of the quadriga group on the triumphal arch at St. Petersburg are excellent specimens of this feature of his work. The four colossal groups of "Horse Tamers," in bronze, on the Anitchkov Bridge, St. Petersburg, are also by him. Replicas of two of these are in the grounds of the Schloss in Berlin and in the Piazza del Re, Naples. His son, MICHAEL PETROVITCH (1835–), is a genre painter and etcher of some note. His nephew, MICHAEL KONSTUNTINOVITCH (1832–1902), was a landscape painter, whose works are to be found in nearly all Russian galleries and many private collections.

CLŒLIA, klē'li-â. A maiden given by the Romans as a hostage to King Porsenna. She escaped from the Etruscan camp with some companions, swam the Tiber, and returned to Rome. The Romans, however, bent upon keeping good faith, sent the fugitives back to Porsenna, who, in admiration of this generous action, freed Clœlia and her fellow hostages. A statue was erected in her honor on the Via Sacra.

CLOG ALMANAC. A form of rude calendar, said to be of Danish origin, consisting of a square stick notched for months and days, and showing the saints' days, moon's phases, and other features of the almanac. Specimens are to be seen in the British Museum and other collections.

CLOISONNÉ, klwä'zô'nā'. See ENAMEL.

CLOIS'TER (from OF. *cloistre*, Fr. *cloître*, from ML. *claustrum*, inclosure, from *claudere*, to close). Strictly, the entire space inclosed by the main encircling wall of a religious establishment (Ger. *Kloster*, monastery), including church, dormitories, and all other buildings. Thus, all the buildings for the body of canons attached to a cathedral were included in the term "cloister." A "cloistered monk" is one living within monastic precincts. But common usage has recently limited the term to those rectangular courts, in the centre of the main group of monastic or canonical buildings, which are surrounded on all sides by a covered arcade. These cloisters were the centres of monastic life; from their arcades the refectory, chapter house, dormitories, and church are reached. In their central open space, or *garth*, are the well and garden. Cathedrals often had their cloisters, especially in England, where many cathedrals were at the same time abbey churches. The cathedral cloister was usually on the south side of the nave. Many large monasteries had more than one cloister; one for the lay brothers, open to all (sometimes in front of the church); one for the monks; a third, smaller, for the abbot. In such great early Benedictine monasteries as St. Gall there was a cloister for the artisans.

The earliest examples of rudimentary cloisters are in Syria; none have survived in the West earlier than the eleventh century. From that time until the fifteenth century Romanesque and Gothic cloisters abound everywhere. With the advent of the Renaissance and the decay of the orders in the fifteenth and sixteenth centuries, they ceased to be built except in Italy.

The general type of cloister is an arcade resting on a high parapet, usually with a single opening in the middle of each side of the quadrangle leading into the central garden; the passage behind the arcade being ordinarily covered with a wooden roof. Above these galleries on one or more sides there was sometimes a second story; in consequence of reconstructions this upper story is very seldom preserved. During the twelfth century the single columns gave way to coupled shafts, slenderer and higher than those of the preceding style. Sometimes, especially in the North, piers supplemented or replaced columns. The cloister followed the changes of style of other buildings. The finest Romanesque cloisters are in southern France and Italy; Germany and England enter the field particularly during the Gothic period; Italy, with few exceptions, furnishes the only fine Renaissance examples. St. Trophime at Arles and Le Puy in Velay are fine examples of French Romanesque cloisters, while those of Thoronet and Silvacanne show the French-Cistercian severity, and those of Fontfroide and Laon show transition to Gothic. In Italy at the same time there was far greater variety and richness. The northern examples at Verona (cathedral), Pomposa, and Bologna (San Stefano) are simple; but farther south the twelfth century developed richer types, as in the Oriental examples at Salerno, Ravello, and Amalfi, and the gem at Monreale (Palermo), with varied columns and mosaic decoration. These were followed by exquisite examples of the Roman school (Fossanova, S. Paolo *fuori le mura*, and the Lateran, Rome). In fact, Rome possesses an unrivaled series, from the heavy cloister of the Tre Fontane and San Lorenzo to the delicate cloister of San Paolo, through all intermediate stages. Gothic cloisters were beautiful everywhere, but the finest specimens are those of the north of Europe, especially France. The pointed arcades are sometimes, especially in England, filled with rich tracery, and the passages behind them covered with groined vaulting. In cooler climates the tracery, sometimes the entire gallery, was glazed. The cloisters of Noyon, Sémur, Soissons—the last named exquisitely rich—of Mont-Saint-Michel (with its novel alternating arrangement of shafts), of Rouen, with a beautiful second story, express the ideas of the golden age of the thirteenth century in France; while those of the fourteenth and fifteenth centuries are inferior, as at Bordeaux and Narbonne. In Germany the most interesting are the Cistercian cloisters, like those of Maulbronn, Altenberg, and Heiligenkreuz. In England, though there are some good early Gothic examples—as at Salisbury—the best are late, as at Gloucester, Hereford, Norwich, Westminster, Wells, and Canterbury. At Batalha and Belem in Portugal are extraordinarily rich cloisters in the overwrought style of the transition to the Renaissance (fifteenth century).

Cloister has a further meaning which concerns the restriction of members of religious men or women to the limits of the inclosure. By ecclesiastical legislation cloistered religious are forbidden to leave their cloister or to admit lay individuals to it. The inmates are not dispensed from this regulation save by the highest authority and only in cases of extreme necessity. The object of this rule is to prevent their being affected by any contaminating influence from outside. They may communicate by letter or even by speech provided in the latter instance

there be a veil and a grating interposing. This applies only to members of cloistered orders, not to all religious communities.

CLOISTER AND THE HEARTH, THE. An historical novel of the time of the early Renaissance, by Charles Reade (1861). The scene is laid chiefly in Holland and Italy.

CLONMEL' (Ir., honey meadow). A municipal borough in County Tipperary, Ireland, built on both banks and on an island of the Suir (Map: Ireland, D 4). Traces of its old walls, demolished by Cromwell in 1650, remain, and it has two Catholic churches, a Franciscan friary, and an endowed school. Among its industries are flour milling, brewing, and tanning. The chief exports are agricultural produce and cattle. Clonmel was an important place in Danish times. In the thirteenth century the Franciscans established universities in the town. Clonmel was the birthplace of Laurence Sterne, the novelist. Pop., 1901, 10,167; 1911, 10,209; nearly one-tenth of the houses are unoccupied.

CLONTARF' (Ir., bull's meadow). A suburb of Dublin, Ireland, about 3 miles east-northeast of Dublin (Map: Ireland, E 3). It is much frequented during the summer months for sea bathing, and there are many handsome villas in the vicinity. At Clontarf, in 1014, Brian Boroimhe (q.v.) met his death while winning a victory over the Danes. Pop., about 5000.

CLŌ'NUS. Rapid flexion and extension due to irregular nerve action in certain diseases of the spinal cord. It is elicited by flexing the foot forcibly and suddenly releasing it.

CLOOTS, klōts, or **KLOOTZ,** JEAN BAPTISTE DU VAL-DE-GRACE, BARON (1755–94). A free-thinking philosopher and republican enthusiast of the French Revolution, generally referred to as "Anacharsis Cloots, the Orator of the Human Race." He was born, June 24, 1755, at Gnadenthal, near Cleves, the son of a German baron of Dutch extraction, and was sent to Paris to be educated when he was only 11 years of age. There he imbibed extremely rationalistic ideas on religion and politics, which were strengthened by a short residence in Berlin, where he came in contact with the Potsdam philosophers, one of whom was his uncle, Cornelius de Pauw. Returning to France at the age of 21, Cloots began the campaign of Reason by an attack on revealed religion and published a curious book, entitled *Certitude des preuves du Mahométisme*—a satirical work, which fell somewhat flat. A visit to England, where he became intimate with Burke, was followed by an extended tour on the Continent. Everywhere he preached his doctrines of liberty, equality, and fraternity, and in several countries he barely escaped imprisonment. From Portugal the news of the outbreak of the French Revolution sent him posthaste to Paris, where he at once began to play an important part. He was instrumental in spreading republican principles in Brittany, and on June 19, 1790, he appeared at the bar of the National Assembly at the head of a throng of Parisians from the slums dressed up in fantastic costume to represent the nations of the earth, and delivered a magniloquent oration in behalf of "Universal Republicanism." To show the sincerity of his principles, he discarded his rank and titles (though not his large income). Cloots was made a French citizen and in 1792 was elected to the National Convention. He voted for the death of the King, "in the name of the human race." He was popular with the visionaries and with the lower orders of Paris, but incurred the enmity and suspicion of Robespierre. In consequence, Cloots was expelled first from the Jacobin Club, and later from the Convention. He was finally arrested in 1794 and after a summary trial was sent to the guillotine, with Hébert and his followers, March 24, 1794. He left a number of works, the chief of which are *L'Orateur du genre humain* (1791) and *Base constitutionelle de la république du genre humain* (1793). Consult: Avenel, *Anacharsis Cloots, l'orateur du genre humain* (Paris, 1865); Bax, *Outlines from a New Standpoint* (London, 1891).

CLOQUET, klō'kā'. A city in Carlton Co., Minn., 27 miles by rail west-southwest of Duluth, on the Northern Pacific, the Great Northern, the Chicago, Milwaukee, and St. Paul, and the Duluth and Northeastern railroads; and on the St. Louis River (Map: Minnesota, E 4). It is an important lumber centre, being especially noted for its large output of white pine, and manufactures print paper and boxes and match blocks. There are municipal water and sewage works, one hospital, and a public library. Cloquet was incorporated as a city in 1903. Pop., 1900, 3072; 1910, 7031.

CLORIDANO, klō'rē-dä'nō. A young Moor, in Ariosto's *Orlando Furioso*.

CLOSE (from OF. *clos*, p.p. of *clore*, to shut, from Lat. *claudere*, to close). A term used in heraldry. When the wings of a bird are down and close to the body, it is described as close. The word is used only with reference to birds addicted to flight. See HERALDRY.

CLOSE, klōs. A space inclosed by a wall or fence; a court, yard, or quadrangle; a narrow side street or passage leading to a court; especially the precincts of a cathedral or monastery. In England, where many of the cathedrals were originally monastic foundations, the entire cathedral property, including fields, cloisters, bishop's palace, chapter house, and ecclesiastical residences, is generally inclosed within a high wall with gates at the abutting streets, the free space within, near the cathedral, being planted with grass and trees: this wide inclosure is termed the close. On the Continent the cathedrals stand in the open, usually in the heart of the city, and thus have no close.

In a legal sense, it is a parcel of land in which some one has an interest, amounting at least to a right to present possession, and which in fiction of law is considered as inclosed by an ideal or invisible, if not real, boundary. Breaking or entering another's close is a trespass. See CURTILAGE; FEE; TRESPASS.

CLOSED SHOP. A shop or other employing enterprise which is restricted to the employment of union labor. Where trade-unions are sufficiently powerful, they seek, as a rule, to incorporate in their agreements with their employers the provision that only union members shall secure employment. The closed shop is commonly denounced by spokesmen of the middle class as a tyrannical institution, a device for securing the aid of the employer to compel men averse to unionism to become members of the organization, or worse still, a means of creating a monopoly for certain favored classes of labor. The spokesmen of labor, on the other hand, assuming that organization is absolutely necessary for the defense of the interests of

labor, urge that there is nothing improper in compelling all laborers in an industry to become members of the organization and share in its burdens. Just complaint, they assert, can only be lodged against the small minority of labor organizations that bar qualified persons from the union and still attempt to enforce the closed-shop rule.

Where the union commands only a part of the trade it is customary to insist that nonmembers shall be excluded only when the union is able to furnish the number of qualified men required. A shop working under such an agreement is known as a preference shop. See TRADE-UNIONS.

CLOSET, klŏ-zĕt′ (OF. *closet*, dim. of *clos*, close). In heraldry (q.v.), the half of the bar.

CLOS'TER-SEV'EN (KLOSTER-ZEVEN). See WILLIAM AUGUSTUS, Duke of Cumberland.

CLO'SURE, or **CLÔTURE,** klō′tụr′ (OF. *closure*, Fr. *clôture*, from Lat. *clausura*, a closing, from *claudere*, to close). A rule of procedure adopted in the English Parliament, for the purpose of terminating prolonged discussion, and bringing matters under debate to an issue. It had its origin in 1882, when the policy of obstruction adopted by the Irish members made legislation impossible. It was decided then that, at the request of 40 members, the Speaker might declare debate closed, and call for a vote on the question under discussion. As modified in 1887 the rule now stands that the Speaker may cut off discussion at the request of 200 members, or at the request of 100 only, if less than 40 members vote in the negative. In France the clôture has also been frequently used, since the coup d'état of 1851. In the United States House of Representatives, and in the State legislatures, the same object is attained by moving the "previous question."

CLOT, klō, ANTOINE BARTHÉLEMY, or CLOT BEY (1793–1868). A French physician, born at Grenoble. He studied at Montpellier, and for several years practiced medicine and surgery at Marseilles. After 1822 he lived mostly in Egypt, where by order of Viceroy Mehemet Ali he established hospitals and medical and pharmaceutical colleges and organized the medical service of the army and navy. In 1832 he was given the rank of an Egyptian bey, and in 1836 that of a general. After the death of Mehemet Ali, Clot left Egypt and resumed the practice of medicine at Marseilles. In 1854 he returned to Egypt, and became physician in ordinary to the Viceroy, Saïd Pasha. Clot's great activity as an organizer did not prevent him from carrying out important scientific observations and gathering large scientific collections. His published works include: *Relation des épidémies de choléra qui ont régné à l'Héggiaz, à Suez et en Egypte* (1832); *Compte rendu des travaux de l'école de médicine d'Abou-Zabel* (1832–33); *De la peste observée en Egypte* (1840); *Coup d'œil sur la peste et les quarantaines* (1851); *Méhémet-Ali, Vice-roi d'Egypte* (1862); *De l'ophthalmie, du trichiasis, de l'entropion et de la cataracte observés en Egypte* (1864); and *Un dernier mot sur la non-contagion de la peste* (1866).

CLOTAIRE, klō′târ′, **I** and **II.** See MEROVINGIANS.

CLOTBUR. See COCKLEBUR.

CLOTH. See WOOLEN AND WORSTED MANUFACTURES; WEAVING.

CLOTHES MOTH. Any of several small moths of the genus *Tinea*, the larvæ of which feed on woolen fabrics and furs. In the United States the depredations wrought by clothes moths, or "moth," are caused by at least three different species, which differ both in structure and habits. One (*Tinea pellionella*) is a small brown moth, with darker brown spots on the fore wings, whose larvæ live within a case composed of bits of the food material bound together with silk. As the larvæ increase in size, the silk cases are lengthened, and when the case becomes too narrow it is split open and a new part is inserted, as may be demonstrated by changing the caterpillar from time to time to differently colored materials. The larva of another, the carpet moth (*Tinea tapetzella*), lives within a winding gallery made up of bits of carpet or other cloth held together with silk. Its fore wings are blackish and yellowish white; the hind wings and head are dark gray. The straw-colored species (*Tinea biselliella*) has a naked larva that spins a little silk over its food material, but makes neither a case nor a gallery. When ready to pupate a cocoon is spun, which, like the larval cases of the foregoing, is composed of fragments of cloth bound together by silk. In the spring or early summer woolen clothes and furs should be thoroughly brushed and subjected to direct sunlight. They should then be carefully packed away in cloth bags or tight boxes, together with naphtha balls or tobacco leaves. Tarred paper and plenty of newspapers are useful for wrapping up rugs. Bits of camphor wood or cedar are also helpful in keeping out moths. A few drops of carbon bisulphide allowed to evaporate in a tight compartment containing infested goods will kill moths and eggs; but as it is very inflammable and the fumes are injurious to man, it should be used with caution. Benzine and gasoline are also useful but rather dangerous moth killers, and printer's ink is poisonous. The best preventive for rugs, etc., is constant use and "kicking about"; for small garments and furs, inclosure in tight cloth bags. Consult Howard, "Household Insects," in *Department of Agriculture, Bulletin 4* (Washington, 1902).

CLOTHES MOTH.

a, The moth; *b*, feeding larva; *c*, pupa in case.

CLO'THO (Lat., from Gk. Κλωθώ, *Klōthō*, the Spinner, from κλώθειν, *klōthein*, to spin). One of the three Fates. See PARCÆ.

CLOTIL'DA, SAINT (c.474–545). A daughter of Chilperic, King of Burgundy, and wife of Clovis, King of the Franks. She was married to Clovis (q.v.), who through her influence was converted to Athanasian Christianity in 496. After the death of Clovis Clotilda took some part in public affairs until two of her grandsons were murdered by their two uncles,

her sons. Then she retired to Tours and practiced the austerities of a devotee until her death. She was buried beside her husband in the church now called St. Geneviève, which she had built in Paris, and, although never authoritatively canonized, was soon recognized and venerated as a saint. There is a statue of her in the Luxembourg, and a fine church in her honor was built in Paris in the middle of the nineteenth century. Consult Kurth, *Sainte Clotilde* (Paris, 1905).

CLÔTURE. See Closure.

CLOTZ, Matthias. See Klotz.

CLOUD, The. One of Percy Bysshe Shelley's best-known poems (1820).

CLOUD (AS. *clūd*, mass of rock, hillock, which a cloud often resembles). In general, anything that obscures the vision through a clear atmosphere, as clouds of dust, smoke, or moisture. The clouds of smoke over cities and from forest fires and the clouds of dust over the plains of India have an important temporary influence on local climate. In meteorology, the terms denote the moisture of the atmosphere precipitated from an invisible state of vapor into minute globular particles that float for a long time in the air. These particles are so small that they cannot descend rapidly through the ordinary atmosphere, even when perfectly still, on account of its viscous resistance or so-called internal fluid friction. The gentlest ascending current or the slight vertical component of a nearly horizontal current suffices to keep the cloudy particles from falling to the ground.

The condensation of the invisible moisture of the air into particles of water cannot be accomplished in the free atmosphere without a decided reduction of temperature; and this may occur in three ways: 1. If air comes in contact with a cold solid, the latter may be covered with dew; but if two masses of warm-moist and cold-moist air come together, a slight condensation and haze or cloud may be formed where they mix with each other. These clouds by mixture have been extensively studied by Brillouin. 2. If moist air is cooled by radiation of heat, the coolest portions will soon fall to the temperature of the dew point, and the vapor therein begin to become visible as a fog; these foggy particles radiate rapidly, thereby increasing the coolness of the air and stimulating the formation of more fog. 3. But the principal method by which cooling is effected in order to form cloud is the process called "dynamic cooling," first expounded by Espy, Kelvin, Reye, and Peslin, and developed in detail by Bezold and Bigelow. Air expands when it is brought under lower barometric pressure; it may be by being pushed up over a mountain, or it may be by rising because of its own buoyancy. In either case the expansion takes place against the adjacent air, and presses the latter to one side. This operation constitutes work done on the resisting air, and work involves the action of some force which, in the present case, is almost invariably the expansive force due to the heat that is latent in the atmosphere, viz., in the air and vapor combined, or the so-called thermal content.

The work done in expansion is said to be done at the expense of the internal heat of the air; or, heat is abstracted from the expanding air in order to do work on the air that is being pushed aside. Consequently, the expanding air grows cool in proportion to the work done. When it is thereby cooled to the dew point, the vapor begins to condense upon dust particles as solid nuclei and forms liquid drops; this involves the giving up of a large amount of heat known as the latent heat of vaporization, which has to be lost by radiation from the drop, wherefore the cooling of the mass becomes much slower. In this process of condensation a given amount of cooling requires a much larger amount of expansion, and therefore of work done, than in the previous stage before cloudy condensation began. This stage is illustrated in the formation of the cumulus clouds seen with showers or thunderstorms or especially in hail weather. On these occasions the cumulus clouds grow rapidly upward to great heights. The upper parts of these clouds can be at such a low temperature as to contain snow or hail in place of water particles. The forms and the quantities of clouds, the direction and velocity of their movements, the apparent changes they undergo, and many other peculiarities have for a century past formed an item of increasing importance in the study of meteorology.

The first step towards simplifying and harmonizing the old meteorological records was taken by Luke Howard, in 1802, in his proposed classification of clouds into three primary forms (*cirrus*, *cumulus*, *stratus*), and three intermediate forms (*cirro-cumulus*, *cirro-stratus*, and *cumulo-stratus*), and these have been almost universally adopted by modern observers; but experience has shown that they do not give a

MEAN HEIGHTS AND VELOCITIES OF CLOUDS AT WASHINGTON, D. C., APRIL, 1896, TO MARCH, 1897

TYPICAL CLOUD FORMS

1. CIRRUS.
2. CIRRO-CUMULUS.
3. STRATO-CUMULUS.
4. NIMBUS.
5. CUMULUS.
6. STRATUS.

sufficient range of terms to enable one easily to classify and describe all the varieties of clouds that are to be observed. Probably no simple system of nomenclature would suffice to do this, and Cleveland Abbe has proposed for special students a system of symbols based on the methods of formation of the various kinds of clouds. The many other modifications and new terms that have been suggested are well compared and discussed in a memoir by H. H. Clayton, of the Blue Hill Meteorological Observatory, near Boston, Mass. Consult *Annals of Harvard College Observatory.*

The descriptive abbreviations and classification introduced by the International Meteorological Congress, held at Munich in 1891, is that which is now adopted more or less completely by all the national weather bureaus. Systematic observations upon the heights and movements of all clouds were made at many stations throughout the world in concert from May 1, 1896, to July 1, 1897. From these observations a general idea of the heights of the respective kinds of clouds may be gathered, as shown in the preceding list, compiled from Professor Bigelow's *Report on International Cloudwork of the United States Weather Bureau,* page 20. The titles and descriptions of the clouds are as used by the International Committee.

Cirrus (*Ci.*). Isolated feathery clouds of fine fibrous texture, generally brilliant white, frequently arranged in bands which spread like the meridians on a celestial globe over a part of the sky, and converge in perspective towards one or two opposite points of the horizon. (In the formation of such bands cirro-stratus and cirro-cumulus often take part.)

Cirro-Stratus (*Ci. S.*). Fine whitish veil, sometimes quite diffuse, giving a whitish appearance to the sky, and called by many "cirrus haze," and sometimes of more or less distinct structure, exhibiting tangled fibres. The veil often produces halos around the sun and moon when seen through it.

Cirro-Cumulus (*Ci. Cu.*). Fleecy cloud. Small white balls and wisps, without shadows, or with very faint shadows, which are arranged in groups and often in rows.

Alto-Cumulus (*A. Cu.*). Dense fleecy cloud. Larger whitish or grayish balls, with shaded portions, grouped in flocks or rows, frequently so close together that their edges meet. The different balls are generally larger and more compact (passing into strato-cumulus) towards the centre of the group, and more delicate and wispy (passing into cirro-cumulus) on its edges. They are very frequently arranged in lines in one or two directions.

Alto-Stratus (*A. S.*). Thick veil of a gray or bluish color, exhibiting in the vicinity of the sun and moon a brighter portion, which, without causing halos, may produce coronæ. This form shows gradual transitions to cirro-stratus; but, according to the measurements made at Upsala, was of only half the altitude.

Strato-Cumulus (*S. Cu.*). Large balls or rolls of dark cloud, which frequently cover the whole sky, especially in winter, and give it at times an undulated appearance. The stratum of strato-cumulus is usually not very thick, and blue sky often appears in the breaks through it. Between this form and the alto-cumulus all possible gradations are found. It is distinguished from nimbus by the ball-like or rolled form, and because it does not tend to bring rain.

Nimbus (*N.*). Rain clouds. Dense masses of dark, formless clouds, with ragged edges, from which generally continuous rain or snow is falling. Through the breaks in these clouds there is almost always seen a higher sheet of cirro-stratus or alto-stratus. If the mass of nimbus is torn up into small patches, or if low fragments of cloud are floating much below a great nimbus, they may be called *fracto-nimbus* (the "scud" of the sailors).

Cumulus (*Cu.*). Woolpack clouds. Thick clouds, whose summits are domes with protuberances, but whose bases are flat. These clouds appear to form in a diurnal ascensional movement, which is almost always apparent. When the cloud is opposite the sun, the surfaces which are usually seen by the observer are more brilliant than the edges of the protuberances. When the illumination comes from the side, this cloud shows a strong actual shadow; on the sunny side of the sky, however, it appears dark, with bright edges. The true cumulus shows a sharp border above and below. If often torn by strong winds, the detached parts (*fracto-cumulus*) present continual changes.

Cumulo-Nimbus (*Cu. N.*). Thundercloud; shower cloud. Heavy masses of clouds, rising like mountains, towers, or anvils, generally surrounded at the top by a veil or screen of fibrous texture ("false cirrus"), and below by nimbus-like masses of cloud. From their base generally fall local showers of rain or snow, and sometimes hail or sleet. The upper edges are either of compact, cumulus-like outline and form massive summits, surrounded by delicate false cirrus, or the edges themselves are drawn out into cirrus-like filaments. This last form is most common in "spring showers." The front of thunderstorm clouds of wide extent sometimes shows a great arch stretching across a portion of the sky, which is uniformly lighter in color.

Stratus (*S.*). "Lifted fog" in a horizontal stratum. When this stratum is torn by the wind or by mountain summits into irregular fragments, they may be called *fracto-stratus.*

In general the cirrus, cirro-stratus, and cirro-cumulus are the highest and swiftest; the alto-stratus, alto-cumulus, strato-cumulus, and cumulo-nimbus are median, the nimbus, cumulus, and stratus are lowest and slowest. These three groups are also generally distinctive as to their appearances and methods of formation.

There are some rarer forms of clouds that have received special or local names, such as the following: *Phosphorescent,* sometimes called iridescent, opalescent, or luminous night clouds. These are seen even at midnight in Europe as distant, pure white clouds, near the horizon. Measurements appear to show that they are from 10 to 20 miles above sea level; they may possibly be self-luminous or phosphorescent, but it is more likely that they shine by reflecting the light from a distant twilight. *Hoods,* or false cirri, envelope a mountain top, or the summit of a cumulus dome. These are formed in the air that is pushing upward over the obstructing mountain. The *tablecloth* of Table Mountain at Cape Town is formed somewhat like the hood, but covers the whole flat top of the mountain and hangs down a little way over the leeward cliffs with frayed edges as the cloud matter evaporates back into invisible moisture.

The *helm cloud* and *helm bar* are stationary clouds, formed at the summits of standing waves of air. When an east wind blows over the

Crossfell Range, in Cumberland, England, there is formed not merely a cloud or hood or helmet with rain at the summit of the range, but a series of undulations to the leeward, one or more of which may rise high enough as a standing wave to form a cloud at its summit; through this cloud, in fact, the wind is blowing, and the cloud particles formed on the windward side are carried up through the cloud and down again on the leeward side, evaporating and disappearing as they descend at about the same level as when they were formed on the windward side. *Tornado cloud* and *waterspout cloud* are the distinctive, cloudlike form that reaches down nearly to the surface of the earth or ocean from the main cloud mass above and marks the central axis of a whirling mass of air. Within such a whirl, the barometric pressure is reduced by reason of centrifugal force, and any air that is drawn inward expands, cools, and forms cloud, just as it would do if it rose upward into regions of lower pressure. When the whirl ceases, the cloud immediately disappears. *Globo-cirrus* is a cirrus cloud having a globular form, from which stream downward fibres or filaments, as though the particles of the globular mass were being pulled out by the wind, or were settling down by their own weight into air currents of a different velocity horizontal. *Mammato-cumulus* shows protuberances or pockets on the underside of an otherwise flat-bottomed cloud, as though the heavier portions of the cloud were settling down in groups from the main cloud.

The study of the movements of the clouds is our principal source of information relative to the general motion of the air at considerable heights above the sea or land. During the past fifty years an increasing amount of attention has been given to this matter, and the use of the nephoscope and photogrammeter has greatly increased the accuracy of observation. By international agreement, special observations were made in many countries in 1896 and 1897, the results of which were published in 1898–1901; of these reports the most important is that by Prof. F. H. Bigelow, published in the *Annual Report* of Prof. Willis L. Moore, chief of the United States Weather Bureau. More recently, Professor Hildebrandsson published a general report based on the international observations of clouds, which is translated in the *Quarterly Journal of the Royal Meteorological Society* for October, 1904. Consult Clayden, *Cloud Studies* (London, 1905).

The average area covered by clouds, taking the globe as a whole, is about one-half of its surface. They, therefore, play a very important part in the distribution of solar heat over the earth's surface and within the atmosphere, and the consideration of this influence alone is a very important but difficult problem in the determination of the motions of the atmosphere. See DEW; EVAPORATION; NEPHOSCOPE; RAIN; SNOW.

CLOUD'BERRY (ME. *cloud*, mass of rock, hill, AS. *clūd*, round mass, mass of rock + *berry*) (*Rubus chamæmorus*). A plant of the same genus with the dewberry, which it resembles. It has a trailing habit of growth, and never attains a height of more than 8 to 10 inches; the leaves, few, large, lobed, and somewhat kidney-shaped; the flower large and white, male and female flowers on separate plants, the female plant producing an amber-colored fruit equal in size to a dewberry, and of an agreeable flavor. It is a native of the northern parts of Europe, Asia, and America. In Great Britain it is chiefly confined to elevated moors; in Norway and Sweden it is much more abundant, and the fruit is highly valued and made into excellent preserves. In America it is found only sparingly south of the Canadian boundary, but it is common and greatly prized in Newfoundland, Labrador, Nova Scotia, and northern Quebec. It is abundant through northern Canada, extending from the Atlantic to the Pacific and north to the Arctic circle. The plant is of difficult cultivation, and no attempt to make it produce fruit freely in our gardens has yet been successful. Somewhat similar to the cloudberry is *Rubus geoides*, which yields a very agreeable fruit, as large as a raspberry, one of the few native fruits of Tierra del Fuego and the Falkland Islands. See Plate of RUBUS.

CLOUD'BURST'. A term first applied in the United States about 1840, and in India about 1860, to a sudden extraordinarily heavy local rain. No definite rate or amount of rainfall, or area covered by it, has been assigned as a limit proper for distinguishing cloudbursts from ordinary heavy rains. Many special cases of cloudbursts have been described in English and American meteorological journals, especially in the *United States Monthly Weather Review*, from which it may be seen that the term is rarely used unless six or more inches of rain fall, and at the rate of 10 or more inches per hour. Thus, in one case, 10 inches fell in an hour; in another, the extreme case, 21 inches. Nothing definite is known as to the areas covered by these heavy rains; but it is not likely that the heaviest cover more than an acre, or that the lighter ones cover more than a square mile. Several cloudbursts have occurred on the eastern slope of the Rocky Mountains; but the great rains that cause the heavy floods along the eastern slope of the Appalachians from Georgia to Pennsylvania sometimes attain the intense local character that is ordinarily attached to the term "cloudburst." Professor Ferrel has explained how a mass of water can be held within the cloud by means of rapidly ascending currents; but there is scant evidence of the actual existence of the strong ascending wind required by this explanation, and it seems equally possible that cloudbursts may result from the sudden formation of a large mass of rain in a very tall cloud, rather than from the gradual accumulation of rain in the clouds. Consult: Ferrel, *Recent Advances in Meteorology* (Washington, 1886), and his *Popular Treatise on the Winds* (New York, 1889); Hann, *Lehrbuch der Meteorologie*, pp. 361–370 (1st ed., Leipzig, 1901).

CLOUD ON TITLE. An apparent defect in the title to real estate, based on a written instrument, judgment, or order of court, which purports to create an interest or lien in or an incumbrance upon the land in question. The person whose land is so affected may have the "cloud" removed by appropriate proceeding in equity, instituted by a bill in the nature of a bill to quiet possession, known specifically as a "bill to remove cloud on title." The judgment of the court may direct the obnoxious instrument to be delivered up and canceled, or the record of such incumbrance or lien canceled, or may by decree declare a judgment, order of court, or proceedings under an invalid tax levy, to be void and of no effect so far as the land in question in concerned.

In order to obtain this remedy, however, the instrument or act purporting to create the cloud

on title must have apparent but not real validity. A deed or mortgage void upon its face does not create a cloud, and cannot be attacked by such a proceeding. See BILL IN EQUITY; INCUMBRANCE; TITLE; and consult the authorities referred to under the last-mentioned reference.

CLOUDS, THE. The most famous of the comedies of Aristophanes (q.v.).

CLOUET, klōō'â'. A family of distinguished French painters of Flemish descent. Jean (?–1540), called Janet, was probably the son of the painter Michele Clouet of Valenciennes. He came to France from Flanders in 1516, and settled at Tours, where he was appointed court painter and valet de chambre to Francis I; later he lived in Paris. He painted a few religious pictures, but his principal works are portraits. Those of the mathematician Finé and the humanist Budé are indisputably authentic, and probably also the 130 drawings in the Musée Condé, Chantilly—a unique collection of portraits of Francis I, his family and court. It follows that the portraits in oil after these drawings, viz., those of Francis I (Louvre and Uffizi), the Dauphin Francis (Antwerp), the miniature of the Duc de Brissac (Morgan collection), and others, are also by his hand. Jean is a product of the Flemish school and was a greater technician than an artist. His portraits are full of life and charm, the drawing is delicate and effective, but the color is cold and thin.—FRANÇOIS, also called JANET (before 1522–1572), the son and pupil of Jean, was born at Tours and succeeded his father as court painter to Francis I, holding the same position under Henry II, Francis II, and Charles IX. There are numerous allusions in the court documents testifying to his honorable position, and from them we learn that he molded the wax death masks of Francis I and Henry II. He was celebrated in verse by Ronsard and in prose by Pasquier. Only two signed portraits by him survive—Pierre Cutte (1562, Louvre) and a "Lady in the Bath" (Cook collection, Richmond); but critics are agreed that he drew a series of 50 colored crayon portraits of Henry II, Francis II, and Charles IX, with their families (Bibliothèque Nationale, Paris). Among the oil portraits attributed to him are full lengths of Henry II (Uffizi), Charles IX (Vienna), Elizabeth of Austria (Louvre), Marguerite de France (Chantilly), and a miniature of Catherine de' Medici (Vienna Museum). Although less subtle than his father, François is a greater artist. His portraits are characterized by unaffected simplicity and precision of execution, and the treatment of form and perspective is admirable. In some of them the influence of the younger Holbein and the Venetian school is plainly visible. There is supposed to have been still another Clouet, a brother of Jean, but of him nothing is known. Consult: Laborde, *La renaissance des arts à la cour de France* (Paris, 1855); Bouchot, *Les Clouets et Corneille de Lyon* (Paris, 1892); Moreau-Nelaton, *Les Clouets* (Paris, 1908).

CLOUGH, klŭf, ARTHUR HUGH (1819–61). An English author. He was born in Liverpool, but when only four years old was taken by his father, a merchant, to Charleston, S. C. He returned to England, however, in 1828, and was at Rugby under Dr. Arnold, whose strenuous appeal to moral responsibility in boys probably had an unhappy effect upon Clough's temperament, naturally high strung, with a tendency to more or less morbid introspection. His Oxford career had an even more decisive influence on his life. He entered the university at the height of the "Tractarian movement," with one of whose most brilliant men, William George Ward, he was intimate. For a time he was carried away by the new current, but the reaction took him further in the opposite direction. He held a fellowship at Oriel College from 1843 to 1848, but relinquished it when it became clear to him that he could no longer subscribe to the religious doctrines involved—becoming later an examiner under the Education Department, like Matthew Arnold, with whom he had much in common. His temperament was essentially skeptical—in no mere negative sense, but in that of reverent and anxious seeking for the truth at all costs. It is this characteristic which dominates the whole of his literary work, whether verse or prose. In his three longer poems, *Dipsychus*, *The Bothie of Tober-na-Vuolich*, and *Amours de voyage*, the analysis of character disturbed by spiritual conflict is the main interest; though he shows a perfect consciousness that the habit of self-analysis and suspense of judgment may be carried too far. After his death, which occurred on a tour in Italy, he was commemorated in one of the noblest elegies in the English language—Arnold's *Thyrsis;* and Lowell (whom, with Emerson, Longfellow, and other eminent men, he had met on a visit to America) expressed the feeling that he would "be thought a hundred years hence to have been the truest expression in verse of the moral and intellectual tendencies, the doubt and struggle towards settled convictions, of the age in which he lived." His *Poems and Prose Remains*, with letters and a memoir by F. T. Palgrave, were published together in 1869, both volumes having been previously more than once reprinted. Another memoir entitled *A. H. Clough: A Monograph*, appeared in 1883. Volumes of selected poems were made by Mrs. Clough in 1894, for the *Golden Treasury Series*, and by E. Rhys in 1896. *Poems*, edited by H. S. Mitford in *Oxford Library of Prose and Poetry*, appeared in 1910.

CLOUS, klous, JOHN WALTER (1837–1908). An American soldier, born and educated in Germany. He came to the United States in 1855, enlisted in the United States army in 1857, and served until 1862, when he was appointed second lieutenant of the Sixth Infantry. He fought in the Civil War, and greatly distinguished himself at Gettysburg, and for this he was brevetted first lieutenant and captain. He was made a captain in the Thirty-eighth Infantry in 1867, and from 1868 to 1886 was engaged in frontier service, and became known for his bravery and skill in engagements with the Indians. In 1886 he became major and judge advocate in the United States army, and served until 1890 as assistant to the judge-advocate-general. He subsequently served successively as professor of law at West Point; staff officer to Major General Merritt (1896–98); staff officer to Lieutenant General Miles during the Spanish-American War; brigadier general of volunteers; secretary and recorder of the Commission for the Evacuation of Cuba; deputy judge-advocate-general on the staff of Major General Brooke, and judge-advocate-general. He published a series of *Lectures on Military and Martial Law.* At his own request he was retired, with the rank of brigadier general, May 24, 1901.

CLOUSTON, SIR EDWARD SEABORNE, BART. (1849–1912). A Canadian banker. He was

born at Moose Factory, Hudson Bay, and was educated at the Montreal High School. After a year in the Hudson's Bay Company's service, he joined the Bank of Montreal as a junior clerk in 1865. In 1887 he was promoted assistant general manager, in 1889 acting general manager, and in 1890, general manager, a position he retained until his resignation in 1911. In 1906 he was elected first vice president of the bank, an office he continued to hold until his death. In 1908 he was created a baronet, and in 1911 a knight of the Order of St. John of Jerusalem. He was president or director of a large number of financial and industrial institutions, and was also prominent in charitable work.

CLOVE AND ORANGE. An Elizabethan "Tweedledee-and-Tweedledum," occurring in Jonson's *Every Man Out of His Humour*.

CLOVE BARK. The bark of the wild clove of the West Indies, *Pimenta acris*. Clove cassia, sometimes called clove bark is the bark of *Dicypellium caryophyllatum*, a little-known Brazilian tree, also found in the West Indies. As marketed, clove bark resembles cinnamon cylinders about one-half foot long and about one inch in diameter, consisting of several pieces telescoped together. The bark is usually dark brown, smooth or slightly wrinkled, with a mucilaginous, aromatic, pungent taste, which suggests a mixture of cloves and cinnamon. In medicine it is known as *Cassia caryophyllata*, and is used like, but considered inferior to, cloves. A similar bark is said to be obtained from the *Myrtis caryophyllata* of Linnæus, which grows in Ceylon. The culilawan (sometimes culilawang) of the Moluccas, which is sometimes confounded with clove bark, is derived from *Cinnamomum culilaban*.

CLOVE HITCH. See KNOTTING AND SPLICING.

CLO'VER (AS. *clœfre*, trefoil, of unknown origin), or TREFOIL (*Trifolium*). A genus of plants of the natural order Leguminosæ, suborder Papilionaceæ, containing a great number of species, natives chiefly of temperate climates, abounding most of all in Europe, although about sixty species are indigenous to the United States; some of them very important in agriculture, as affording pasturage and fodder for cattle and as a means for improving cultivated soil. The name "clover" is also popularly applied to certain plants which have compound leaves with three leaflets like the clovers, and also belong to the order Leguminosæ, but which are not included in the genus *Trifolium*—such as sweet or Bokhara clover (*Melilotus*), bur clover (*Medicago*), prairie clover (*Petalostemon*), bird's-foot clover (*Lotus*), and a number of others. The true clovers (*Trifolium*) have herbaceous, not twining, stems; roundish heads or oblong spikes of small flowers, the corolla remaining in a withered state till the ripening of the seed; the pod inclosed in the calyx, and containing one or two, rarely three or four, seeds. About 17 species belong to the flora of Great Britain. The species of most importance to the farmer is the common red clover (*Trifolium pratense*). (For illustration, see Plates of DICOTYLEDONS and Plate of BLOODROOT with article SANGUINARIA.) This is native to America and most parts of Europe, growing in meadows and pastures. It stands in the front rank of forage plants for good yields, nutritive value, and adaptability to various climates and soils. It is a perennial, but is generally treated as if it were a biennial. Its heads of flowers are oval or nearly globular, very compact, about an inch in diameter, purple, more rarely flesh-colored or white; the tube of the calyx is downy; the stipules run suddenly into a bristly point. The leaflets have very often a whitish horseshoe mark in the centre. It is supposed that clover found its way into England from the Netherlands about the time of Queen Elizabeth; but it was not until the close of the eighteenth century that it was introduced into Scotland, where it is now universally prevalent. Perennial red clover (*Trifolium pratense perenne*) is a somewhat hardier form than the ordinary forms of common red clover and of longer duration, lasting for two years or more. The zigzag clover (*Trifolium medium*), also called meadow clover, marl grass, and cow grass, much resembles the common red clover, but is easily distinguished by the smooth tube of the calyx, and by the broader, less membranaceous, and gradually acuminated stipules. The stems are also remarkably zigzag, and are more rigid than in *Trifolium pratense;* the heads of flowers are larger, more lax, more nearly globose, and of a deeper purple color, and the leaflets have no white spot. It is a common plant in Great Britain and most parts of Europe, and is also grown to some extent in the United States. White or Dutch clover (*Trifolium repens*) is also a common native of Great Britain, and of most parts of Europe as well as of North America. When a barren heath is turned up with the spade or plow, white clover almost always appears. It is more permanent than common red clover, and it grows on nearly all soils, but its yield is small. White clover is seldom grown alone, but usually in mixtures of grasses and other clover. The flowers of all kinds of clover are the delight of bees, but those of white clover perhaps particularly so. Alsike or Swedish clover (*Trifolium hybridum*), a perennial, generally regarded as an intermediate form between the common red clover and the white clover, was introduced into Great Britain from the south of Sweden in 1834. It is also common in other European countries and in North America. Crimson clover, or Italian clover (*Trifolium incarnatum*), an annual, native of the south of Europe, with oblong or cylindrical spikes of rich crimson flowers, is much cultivated in continental Europe, and is also quite extensively grown in some parts of England and the United States. Moliner's clover (*Trifolium molineri*) very much resembles crimson clover, but is biennial and has pale flowers. It is cultivated in Europe. Alexandrian clover, berseem, or Egyptian clover (*Trifolium alexandrinum*), an annual species, a native of Egypt, universally cultivated in its native country, where it is the principal fodder for cattle, is supposed to be one of the best kinds of clover for warm climates —such as, for instance, the southern United States. It has oval heads of pale yellow or whitish flowers. Yellow clover, or hop trefoil (*Trifolium procumbens*), is common in dry, gravelly soils, but is not much esteemed. It has smaller leaves and flower heads than has any of the cultivated species. The flowers are yellow, and the heads resemble miniature hop strobiles.

Clovers are of great value to agriculture, on account of the many different ways in which they may be utilized. Clover is fed as hay, as

green fodder, and as silage, and it is used for pasturage, for green manuring, and as a cover crop. It is chiefly valuable as a means of enriching the soil, being capable of appropriating free nitrogen from the air by means of its roots. It has long been recognized that clover growing has a beneficial effect on the soil; but this phenomenon was not understood until about 1888, when scientists discovered that leguminous plants, through the agency of bacteria living in the characteristic tubercles or nodules on the roots, take up free atmospheric nitrogen. In the soil this nitrogen is oxidized to nitric acid, which forms nitrates, and in this form the nitrogen is assimilated by growing plants. In addition to their power of taking up free nitrogen, clovers are very valuable because of the large and deep development of their root systems, which effects a marked improvement in the physical condition of the soil, and thus indirectly increases its fertility. Plowing clover under for green manure is a most effective method of adding humus to the soil. Crimson clover is recommended in the United States as a cover crop for orchards, to be sown late in summer when the soil is no longer cultivated, and to be plowed under the following spring. In this way the soil is kept moist, its surface is kept from hardening, and much available plant food is afforded the trees for the following season's growth. In general, the common red clover is the most important in the United States. Consult: *United States Department of Agriculture, Farmers' Bulletin No. 455, Red Clover; No. 550, Crimson Clover;* Thos. Shaw, *Clovers and How to Grow Them.*

Feeding Value.—On an average red clover (green crop) has the following percentage composition: Water, 70.8; protein, 4.4; fat, 1.1; nitrogen-free extract, 13.5; crude fibre, 8.1; mineral matter 2.1. Red-clover silage contains—water, 72.0; protein, 4.2; fat, 1.2; nitrogen-free extract, 11.6; crude fibre, 8.4; ash, 2.6 per cent. Red-clover hay contains—water, 15.3; protein, 12.3; fat, 3.3; nitrogen-free extract, 38.1; crude fibre, 24.8; and ash, 6.2 per cent. Other clovers and their cured products resemble the above quite closely. Clover forage is relatively highly nitrogenous, is relished by all farm animals, and is capable of replacing in part more expensive concentrated feeding stuffs—such as bran, linseed meal, etc.

Clover is very important for soiling, as it is available early in the season, and is relished.

Pigs do well on clover pasture, building good bone and framework, and fatten rapidly later on when given concentrated feed. Clover is very succulent in the green, uncured state, and therefore, like all such feeds, liable to cause bloat, if too much is eaten. Animals should not be turned on clover pasture when very hungry, or while the dew is on the clover. Some dry fodder should be placed in racks in the pasture, as this is said to relieve bloat.

Clover hay is not usually considered a satisfactory coarse fodder for horses, as the dust it carries proves detrimental. A limited amount may, however, be fed to all kinds of horses, with favorable results. It is a very satisfactory coarse fodder for milch cows. It furnishes the protein essential for milk, and is relished by the animals. By feeding clover hay as one-half to two-thirds of the coarse fodder of a ration, the amount of concentrated feed required may be diminished, and thus the cost of the ration lowered. For calves and young stock, clover hay is very important. No other coarse fodder is superior for sheep.

As shown by experiments with ruminants, the following percentages of the nutrients in red-clover forage are digestible: Dry matter, 66.1; protein, 67.0; fat, 64.5; nitrogen-free extract, 77.6; crude fibre, 52.6; and ash, 55.0 per cent.

Red-clover hay has the following digestibility: Dry matter, 57.4; protein, 58.0; fat, 55.2; nitrogen-free extract, 64.4; crude fibre, 54.2; and ash, 29.1 per cent. In this respect it compares favorably with other coarse-fodder crops, both green and dry.

Clover Diseases.—There are two important fungous diseases of clover—a "rust," and what has been designated as the "clover rot." The rust (*Uromyces trifolii*) is said to have first been noticed in South America, and to have come to the United States by way of Europe, where it is quite destructive. It infests the leaves, leafstalks, and stems, producing definite brown spots. The fungus passes through three phases—the first on the white clover, upon which minute cups are formed, filled with orange-colored spores; the other two phases, red and black (so called from the color of the spores occurring on red clover), are quite destructive. When a portion of a field is found affected, it is best to cover the clover with straw and burn it to prevent further spread. The "clover rot" (*Sclerotinia trifoliorum*) occurs on crimson clover in the United States, although common on red and other clovers in Europe. It also occurs on alfalfa, sainfoin, fenugreek, Bokhara clover, etc. Its presence may usually be noted by all plants being killed in patches a foot or more in diameter. Small black bodies will be seen at the base of the wilted stems in the autumn, followed by the appearance of small mushroom-like bodies in the spring. Burning, as mentioned above, and rotation of crops, are recommended for its suppression. A leaf-spot disease (*Pseudopeziza trifolii*) is sometimes quite destructive to clover and alfalfa. The diseased leaves show on their upper surfaces small black specks, which enlarge and extend through the leaf, destroying it. When present, this disease is liable to become epidemic, causing considerable loss. Burning over fields in autumn and frequent cutting prevent serious loss to the crop. Another destructive parasite of clovers, although not a fungus, is the dodder (q.v.).

CLOVER, Richardson (1846–1919). An American naval officer, born at Hagerstown, Md. After graduating from the United States Naval Academy in 1867 he was promoted through the various grades, becoming a captain in 1902 and rear admiral in 1907. He had charge of the survey in southeastern Alaska in 1885–86, was hydrographer of the Bureau of Navigation in 1889–93, and chief of the Office of Naval Intelligence in 1897–98. During the Spanish-American War he was in command of the *Bancroft.* In 1906–08 he was president of the Board of Inspection and Survey. He was retired in 1908.

CLOVER BROOM RAPE. See Parasite, Plant.

CLOVER BUTTERFLY. See Colored Plate of American Butterflies, with the article Butterflies and Moths.

CLOVER INSECTS. Various insects injuriously affect cultivated clover, of which the following are prominent: The roots are attacked by borers, and the stems by a gall-making beetle (*Languria mozardi*); also by a cutworm,

the larva of the zebra moth (q.v.). Weevils do great injury to clover in various parts of the plant; the worst species (*Hylesinus trifolii*) is an importation from Europe. These minute beetles pair in early spring, and then the female gnaws a cavity in a root of two-year-old clover and places in it four to six eggs. The larvæ, as soon as hatched, bore along the axes of the roots of the clover, causing the plants to weaken and often to die. Another beetle (*Phytonomus punctatus*), called the clover-leaf beetle, sometimes appears in swarms, coiling about the tips of the leaves. The leaves are also attacked by a midge or gall gnat, and the seeds by another (*Cecidomyia leguminicola*), the latter of which is very destructive. It lays its eggs in the blossoms of red clover in May and June, and these hatch into small reddish or yellowish maggots, which destroy the forming seed. Upon reaching full growth, they wriggle out from the floret and fall to the ground, transforming to pupæ within delicate, spherical cocoons, from which the adults issue the following spring. The larvæ leave the florets just before the time of cutting the first crop of clover for hay, so that if the time of cutting for this crop be advanced two weeks, the insect will be destroyed. Another enemy to the seeds is the greenish caterpillar of a moth (*Grapholitha interstinctana*), which devours florets and seed vessels. The clover-hay worms, caterpillars of pyralid moths, especially *Asopia costalis*, affect particularly stored hay in which clover is mixed.

CLOVES (from Fr. *clou*, from Lat. *clavus*, nail, so called from the shape). The dried flower buds of the clove tree, *Caryophyllus aromaticus*, now *Eugenia caryophyllata*, of the family Myrtaceæ. The clove tree is from 15 to 40 feet high, evergreen, with a beautiful pyramidal head. The flowers are small, but produced in great profusion in cymes. The leaves, flowers, and bark have an aromatic odor. The ripe fruit resembles an olive in shape, but is not quite so large; it is of a dark-red color; it sometimes appears in commerce in a dried state, under the curious name of "mother cloves"; it has an odor and flavor similar to cloves, but much weaker; the broken fruitstalks are sometimes also used for the same purposes as cloves, but the flower buds themselves are the principal product of the tree. They are gathered, and are dried by exposure to the smoke of wood fires, and afterward to the rays of the sun, or by the latter alone. When first gathered they are reddish, but become of a deeper brown color. The unexpanded corolla forms a little round head at the end of the calyx tube which is about half an inch long, and thus the appearance is not unlike that of a little nail, whence the name. The clove tree is a native of the Spice Islands, but is now cultivated in Sumatra, Bourbon, Mauritius, some parts of the West Indies, and elsewhere. For illustration, see Plate of Flavoring Plants. The wild clove tree of the West Indies is *Pimenta acris*. See Myrtaceæ.

The properties of cloves depend chiefly on an essential oil—oil of cloves—which forms one-fifth or one-sixth of the whole weight, and is used for flavoring dessert dishes and articles of confectionery. The oil of cloves is obtained by repeatedly distilling cloves with water, when two oils pass over, one of which is lighter and the other heavier than water. The oil has a hot, acrid taste, is light yellow when pure, and brown-red when not so carefully prepared. It has a characteristic odor, and is soluble in ether, alcohol, and the fixed oils. When taken internally in small quantities, it has the effect of aiding digestion and of stimulating the appetite. It is sometimes used in medicine as a stomachic, carminative, and antispasmodic, and is often added to scammony and castor oil to prevent the griping that is likely to be caused by those substances. Oil of cloves is further employed in scenting soaps, and by the distiller. The chief constituents of the oil are eugenol, or eugenic acid, $C_{10}H_{12}O_2$, and a terpene, $C_{15}H_{24}$.

CLOVES, Oil of. See Cloves.

CLOVIO, klō'vē-ō, Giulio, properly Giorgio (1498–1578). The most eminent Italian illuminator of the High Renaissance. He was born at Grizani in Croatia, the son of a Macedonian, and went to Italy in 1516. He was at first employed in designing medals and seals for Cardinal Grimani, then studied at Rome with Giulio Romano, upon whose advice he became a miniaturist. From 1524 to 1526 he practiced his art in Hungaria under the patronage of King Louis II, after which he returned to Rome. At the sack of Rome in 1527 he was taken prisoner by the Spaniards, and upon his release, in accordance with a vow made in captivity, he entered the monastery of San Rufino, assuming the name Giulio in religion. He removed to the house of his order at Padua, which, by reason of ill health, he was allowed to leave; he entered the service of Cardinal Grimani at Perugia. For this prince he painted some of his finest illuminations: those of Grimani's *Commentary on the Epistle to the Romans* (Sloane Museum, London), and the *Book of Hours* in the British Museum, probably also the illuminations of Petrarch's poems in the Biblioteca Trivulziana in Milan. In 1538 he returned to Rome under the patronage of Cardinal Farnesi, for whom he executed his masterpiece, the *Book of Hours of the Blessed Virgin Mary* (now in the library of J. P. Morgan, New York), upon which he is said to have labored nine years. His last years, spent at Parma and Rome chiefly under the patronage of Margaret of Austria, were blighted by a disease of the eyes, and he died at Rome early in January, 1578. Clovio was most extravagantly praised by his contemporaries and was considered the greatest illuminator of all times. His technique was indeed perfect, but, like other artists of the day, he was under the ban of Raphael and Michelangelo, whose compositions were often copied in his miniatures, and he therefore lacked creative originality. His work is unrivaled in neat and sure drawing and charm of color, but the compositions were often overcrowded. Of the many other illuminations ascribed to him, few are certainly authentic. Mention should be made of *Missals*, Nos. 3805 and 3807, in the Vatican, the *Towneley Lectionary* (New York Public Library), the "Crucifixion" (Uffizi), and the miniatures of the manuscripts of poems by Eurialo da Ascoli in the Imperial Library, Vienna. Other attributions are those of the *Lives of the Dukes of Urbino* and Dante's *Paradiso* in the Vatican, besides manuscripts in the British Museum, the Bibliothèque Nationale, Paris, the library of St. Mark's, Venice, etc. Consult: Sakcinski, *Das Leben des Giulio Clovio* (Agram, 1852); Bradley, *Life and Works of Giorgio Clovio* (London, 1871); Bertolloti, *Don Giulio Clovio, principe dei miniatori* (Modena, 1882).

CLO'VIS, CHLODWIG, or CHLODOVECH (c.466–511). A king of the Franks, of the line of the Merovingians. By the death of his father, in 481, he became King of the Salian Franks, whose capital was at Tournai, in what is now the Belgian Province of Hainault. His first achievement was the overthrow, in 486, of the Gallo-Romans under Syagrius, near Soissons, after which he extended his conquests to the Loire. Clovis did not dispossess the inhabitants, as the Franks were only few in numbers, and the public lands were sufficient for them. About 493 Clovis married Clotilda, daughter of a Burgundian prince. Clotilda was a Christian, and earnestly desired the conversion of her husband, who, like most of the Franks, was still a heathen. According to the picturesque account of Gregory of Tours, in a great battle with the Alemanni, in 496, Clovis was hard pressed and, as a last resource, invoked the God of Clotilda, vowing that he would become a Christian if he obtained the victory. The Alemanni were routed, and on Christmas Day of the same year Clovis and 3000 of his army were baptized by Remigius, Bishop of Rheims. Love of conquest concurring with zeal for the Orthodox faith, Clovis marched to the southwest of Gaul against the heretic Visigoth, Alaric II, whom he defeated and slew at Vouillé, taking possession of the whole country as far as Bordeaux and Toulouse. Clovis now took up his residence in Paris, where he died in 511. His great aim had been the subjugation of all the Frankish princes and the union of the whole Frankish people into a single powerful kingdom. The means he employed to secure this end were cruel and unscrupulous; but the end itself would have been beneficial, if he had not frustrated it at his death by redividing the newly organized realm among his four sons, and exposing it to the very perils from which he himself had rescued it. An account of the deeds of Clovis may be found in Gregory of Tours, *Historia Francorum*, bk. ii, ed. by Arndt for the *Monumenta Germaniæ Historica* (Hannover, 1885). Consult also: Junghans, *Geschichte der fränkischen Könige Childerich und Chlodwig* (Göttingen, 1857); Schultze, *Deutsche Geschichte von der Urzeit bis zu den Karolingern* (vol. ii, Stuttgart, 1896); Kurth, *Clovis* (2d ed., Paris, 1901).

CLOVIS. A city and the county seat of Curry Co., N. Mex., 107 miles southwest of Amarillo, Tex., on the Atchison, Topeka, and Santa Fe Railroad (Map: New Mexico, F 4). It contains an Elks Home and a hospital and reading room of the Santa Fe system. The chief industries are dairying and poultry raising. Pop., 1910, 3255.

CLOWES, klouz, WILLIAM LAIRD (1856–1905). An English naval critic, who wrote under the name of "Nauticus." He was born at Hampstead and was educated at King's College, London, and at Lincoln's Inn for the law, which he abandoned for journalism. He served on the *Standard* (1885), *Daily News* (1887–90), and *Times* (1890–95), and contributed largely to English and foreign magazines. His articles on needs of the navy, battleships, torpedo boats, etc., became widely known. He was editor and part author of *The Royal Navy: A History from the Earliest Times to the Present* (7 vols., 1897–1901). Among his numerous works are: *The Naval Pocket-Book* (an annual); *Confessions of an English Hachish-Eater* (1883); *Black America: A Study of the ex-Slave and his Late Master* (1892); *Blood is Thicker than Water* (1894); and a volume of poems entitled *Eclogues* (1899).

CLOWN. See JESTER; PANTOMIME.

CLUB. A word said to be derived from the Saxon *clēofan*, to divide—a club being an association the expenses of which are shared among the members. Societies of somewhat the same nature existed in ancient Greece and Rome, and mention of them is made in Aristotle, Cicero, Plutarch, and other ancient writers. The modern club, however, had its origin in the London taverns and coffeehouses. Thomas Occleve, who wrote in the reign of Henry IV, mentions "La Court de Bonne Compagnie," of which he was a member; but the first celebrated club in London is that to which belonged Shakespeare, Fletcher, Raleigh, Beaumont, and other brilliant men of letters who met at the Mermaid Tavern in Bread Street. Ben Jonson founded a club which met at the Devil Tavern, for which he is supposed to have written his *Leges Conviviales*. The Calves' Head, so named in allusion to Charles I, was a famous London club, which existed in the latter part of the seventeenth century and the early part of the eighteenth century, and whose members banqueted on January 31 on a calf's head.

In 1659 the first political club, the Rota, was established and met at the Turk's Head in New Palace Yard. The famous "October ale" was served at the October Club, another political institution, of which Swift became the leading spirit after his conversion to Toryism. The Literary Club, established in 1764 by Sir Joshua Reynolds and Dr. Johnson, of which Goldsmith, Gibbon, Garrick, Burke, and other celebrated men of letters were members, afforded a meeting place for congenial spirits, where they could freely discuss the merits of the contemporary literary productions and their authors. Its membership was limited, and Garrick found it difficult to gain admission. This club still exists in London. It is usually called the Literary Club, but its members have always claimed for it simply the title of "The Club." The King's Head Club, founded by the unscrupulous Shaftesbury, and the Mug House Club, so called on account of the ale mugs used by its members, were noted political clubs of the early part of the eighteenth century. The Kit-Kat, established about 1700, was named after Christopher Katt, a noted mutton-pie man. Its members toasted some celebrated beauty, whose name was inscribed on the toasting glass, in verse. The Dukes of Marlborough and Devonshire, Sir Robert Walpole, Congreve, Granville, and Addison were members of the Kit-Kat. About the same time existed the Tattler's Club in Shire Lane, and the famous Beefsteak Society, whose members wore badges inscribed with the motto "Beef and Liberty." Its members were called "Steaks." Hogarth, Fox, Sheridan, and the Duke of Clarence were among its noted members. As already said, these clubs had their origin in the taverns and coffeehouses of London. To this class belonged Almack's, established in 1764, and White's, established in 1698, as White's Chocolate House, and removed in 1755 to St. James Street. Brooks's was established in 1764, and Boodle's, a famous resort for country squires and hunting men, in 1762.

It is, of course, very easy to understand the

genesis of clubs such as White's and Brooks's. In those days men's personal associations depended chiefly upon party affiliation. Tories lived with Tories, and Whigs with Whigs. Intermarriages between persons of different political families were not common. Hence men flocked to those taverns and public houses where they would meet members of their own party. The next step was easy and obvious. The proprietor would agree, of course for a consideration, to exclude persons whose company would not be agreeable to the habitués of the place. It was thus that White's and Brooks's were formed, White's being a Tory and Brooks's a Whig club. These clubs are known as "proprietary clubs," to distinguish them from those of which the members were the owners. The latter class of clubs is, of course, the more recent.

About 1815, after the termination of the Napoleonic wars, the restaurant or dining room was introduced into the clubs. Many army and navy officers, being no longer needed in active service, were placed on half pay and were thus compelled to observe a strict economy. By combining their resources they could live well and much more cheaply than when having their meals alone. From that time on, the number of clubs in England increased, until at the present day there are more than 100 prominent clubs in London. These may be roughly divided into the following classes: Purely social clubs, to which belong Arthur's (established in 1765), with a membership of 600; the Bachelors' Club (established in 1881), with a membership of 920, admitting ladies as visitors; the Grosvenor (established in 1883), with a membership of 3000; the Junior Athenæum (established in 1864), with a membership of 500; the Piccadilly (established in 1893), with a membership of 1500, admitting ladies as visitors; the Union (established in 1822), with a membership of 1000; the Wellington (established in 1885), with a membership of 1400; the Travellers' Club (established in 1819), with 800 members. To this last club no one may belong who has not traveled for 500 miles in a direct line from London. This rule was made just after the cessation of the Napoleonic wars, during which traveling on the Continent was difficult. Among the clubs whose main purpose is political is the Carlton (established in 1832), which has a membership of 1800 and is Conservative; the Conservative (established in 1840), with a membership of 1300; the Constitutional (established in 1883), with a membership of 6500; the Junior Carlton (established in 1864), with a membership of 2100, and strictly Conservative. The Junior Conservative and the Junior Constitutional have each a membership of 5500 and are Conservative; the Primrose, established in 1886, has a membership of 5000 and is Conservative; the Reform, established in 1837, has a membership of 1400 and is Liberal; the City Liberal, established in 1874, has a membership of 900 and is Liberal.

Among the literary, musical, artistic, and scientific clubs stands out prëminently the Athenæum, founded in 1824 by Sir Walter Scott and Thomas Moore, its members numbering 1200. It is devoted to art, science, and literature. The Press Club, established in 1882, is strictly journalistic; the Garrick, established in 1831, is the home of actors and of the patrons of the drama; the Royal Societies, established in 1894, is composed of 1700 members belonging to the learned associations. The principal clubs patronized by military and naval officers are as follows: The Army and Navy (established in 1837), with 2400 members; and the Junior Army and Navy (established in 1869), with 2000 members, including among them officers of the army, navy, marine, yeomanry, and militia.

The two principal commercial clubs are: the City of London (established in 1832), with a membership of 800, the home of merchants and bankers; and the Gresham (established in 1843), with a membership of 475 and with a like clientèle.

Some of the leading athletic and sporting clubs are: the Alpine (established in 1857), devoted to mountain exploration; the Automobile (established in 1897), with a membership of 1036; the Hurlingham, whose members number 1200, devotees of polo and pigeon shooting. The M. C. C. (Lord's) Club (established in 1787) is the headquarters for cricket and has a membership of 4700; the Prince's Racquet and Tennis (established in 1833), with a membership of 1500, devoted to the practice of these games; the Renelagh, devoted to polo, golf, etc. (established in 1894), with a membership of 1900. The Leander and the Thames are among the principal rowing clubs in England. The New Oxford and Cambridge, composed of the members of those universities, was established in 1884 for the purpose of bringing graduates of those institutions into closer social relations and has a membership of 900; the United University, also composed of Oxford and Cambridge men, has the same aim in view; the University for Ladies (established in 1887) is composed of women educated at universities and medical colleges. These are the principal university clubs of England. The St. James Club, established in 1857, has a membership of 650 and is the rendezvous for diplomats. The Royal Yacht Squadron is the leading yacht club and is a very exclusive institution. These clubs are all housed in buildings that are remarkable for their architectural magnificence and for the completeness of their interior appointments. They combine the comforts of a home and the service of a hotel without the responsibility of the one or the publicity of the other and are conducted at a comparatively moderate expense to the individual members.

Attempts to introduce clubs in continental Europe long met with little success. In Germany such associations were discountenanced by law. The first club established in France in 1782 had politics for its main object and went by the name of "Le Club Politique." There were a number of clubs that played an important part in the French Revolution. The three which are most noted and which exercised the greatest political influence were the Jacobins, the Feuillants, and the Cordeliers. Purely social clubs have also been established in Paris. First among them are the Jockey Club and the Cercle Royal, the most fashionable and exclusive clubs in Paris. The Club de Boston was established in 1885.

In the United States clubs were first introduced in the latter part of the eighteenth century. The Hoboken Turtle Club, organized in 1797, is still in existence. Such a club was, however, of slight importance in the social life of the town. In the city of New York the

pioneer club, in a modern sense, is the Union Club, established in 1836. It is one of the oldest and most exclusive in New York City. Its membership is limited to 1600, and its object is purely social. The Century Club, organized in 1846, has the promotion of art and literature in view. Membership is limited to authors, artists, and amateurs in letters and the fine arts, and must not exceed 1300. The Union League Club was founded in 1863 for the purpose of discountenancing any attempt to impair the integrity of the United States. It has a membership of 1800. The University Club, composed of college and university graduates, was incorporated in 1865. None except degree-holding persons are eligible for membership. Its aim is literary and artistic. Graduates of Columbia, Harvard, Yale, and Princeton universities have large and prosperous clubs. One of the most exclusive clubs in New York, the Knickerbocker, was organized in 1871. Its purpose is purely social. The Lotos Club, organized in 1870, is the home of journalists, authors, artists, musicians, and friends of literature. Resident membership is limited to 500. The Catholic Club of the city of New York has for its primary interest the promotion of Roman Catholic interests in New York and has existed since 1863. The Calumet, a purely social organization, was established in 1879. Its membership is limited to 500. One of the oldest organizations of its kind is the New York Club (social), founded in 1845 and having a membership of 675. The Manhattan Club is a powerful factor in Democratic politics of New York. Its membership is limited to 1500, and it has an actual enrolled membership of 1340. It was organized in 1864, in opposition to the Union League Club. The Reform Club has for its object the promotion of good government and the abolition of the protective tariff. It was organized in 1878. The City Club was founded in 1892 and has a membership of 1300. It is an advocate of honest and efficient municipal government. The United Service Club was organized in 1889 for the promotion of military science. Membership is limited to military and naval officers. The Players' Club was organized in 1888, to promote social intercourse between the different members of the dramatic profession. This club was founded by Edwin Booth, who left the house, with its furniture and pictures, to the association.

The Metropolitan Club, organized in 1891 for social purposes, and popularly known as the Millionaires' Club, occupies one of the most costly buildings of the kind in the world and has a membership of 1400. The New York Yacht Club, organized in 1844, is the most famous body of its kind in America. It occupies a very large and picturesque building and now has a membership of 2325. The New York Athletic Club, which promotes high-class modern sports, was organized in 1868 and has a membership of 4300. The Automobile Club of America, devoted to the advancement and regulation of motoring, was established in 1890 and has 1660 members. The Aëro Club of America, founded in 1906 for the promotion of aëronautics, now has 340 members. The Republican and National Democrat clubs are large and prosperous, representative of the great political parties after which they are named. The Transportation Club has a membership of 800, largely composed of railroad and steamship companies' directors, officials, and agents. It was formed in 1895 for social purposes. The New York Press Club was founded in 1872, as a centre for journalists, and now has a membership of 800. The Lambs' and Friars' clubs are representative of theatrical circles. The former was organized in 1874, and the latter, 30 years later.

Social clubs have also been formed exclusively for women. It would seem that these should have a *raison d'être*, especially in the United States, where ladies' luncheon parties, at which the company of no man is expected or desired, are so popular. Women's clubs are, however, ancient institutions. There were a number of them in ancient Rome, among them an assembly of matrons known as the "Minor Senate." This institution received Imperial recognition. It was chiefly occupied with questions of etiquette—such as the kind of dress that ladies should wear according to their social position; the question as to who might be driven in carriages drawn by horses and who should be compelled to drive mules, whose sedan chairs should have ornaments of ivory and whose of silver; and other weighty problems. The modern ladies' clubs have, therefore, the authority of very ancient example. They would seem to have a reason for existence in the gregarious and social instincts of the sex; but it is probable that the popularity of these clubs has been affected by the admission of ladies to certain of the privileges of the men's clubs—a privilege which renders special clubs for women less necessary.

There is still another class of clubs, such as the Liederkranz and the Arion in New York, the original purpose of which was musical. These clubs have one point of special interest—they are German in their origin rather than English. If the English public house, to which, of course, it was not the custom to admit women, is to be taken as the origin of the typical club of the present day, the German beer garden may be viewed as the origin of such clubs as the Liederkranz and the Arion. The German goes to the beer garden in company with his wife and daughter or his sweetheart; and so, in the modern German clubs of New York, the men are usually accompanied by the women.

It seems to be a recent tendency of clubs, particularly in the United States, to facilitate, so far as is possible, the admission of ladies to club privileges. In many of the clubs it is possible for members to bring ladies to dine—a thing unheard of in England until 30 years ago and at that time scarcely known in America. The Bachelors' Club in London, founded about 30 years ago, admitted ladies as visitors under certain conditions; and that club is one of the most successful in London. Other clubs have been founded which have the same characteristic, but the innovation has not proved so popular in England as in the United States.

The degree to which ladies are to be permitted to share the privileges of men's clubs is becoming an interesting subject. During certain hours the club must, in the nature of things, always remain sacred to men. They cannot have that comfort and unrestraint when ladies are present which they can have by themselves. During the morning hours it is natural that the ladies should be excluded. And there are also many men to whom the presence

of women in the clubs in the evening would not be agreeable. The division of men into those who prefer to spend their evenings in their domestic circle and those who prefer to pass them with other men seems to be inevitable and permanent.

As we have seen, the modern club, originating in England, has spread all over the world. It is necessary, of course, that the club in each country shall have to some extent the characteristics of that country. For instance, in a French club, a newcomer must ask to be introduced to the members of the club, that being, in general, the French habit. His failure to do so would be resented by the members. In England, on the contrary, a man newly admitted would never think of asking to be introduced personally to the members. Certain differences between English and American society appear in the club life of the two countries. In general, it may be said that there is greater sociability in American than in English clubs. Indeed, the ideals of club life in the two countries are, or at any rate were, essentially dissimilar. Early in this century Englishmen found that it was possible for an individual to live at a club for £600 a year as well as he could live at home for £6000. In the club he could have everything that he could have at home except the privacy of his own house. If he could not quite have that, he wished to have something as near it as might be. Hence the original character of the English club was somewhat solitary and unsocial. Another difference between English and American clubs was originally this: The men who founded the great English clubs were either without occupation or at most half employed. The club was, therefore, with them a place to live in and to spend a large part of the day. The American clubs, on the contrary, were originally founded by men fully employed, for purposes of social relaxation. Their early equipment, as a rule, was two or three rooms, where business men could meet outside of business hours and talk. From such a nucleus as this have grown up in our cities the great houses with library, restaurant, billiard rooms, baths, and other appliances of luxurious living.

The present tendency, however, seems to be for English and American clubs to assimilate in character. In England the clubs have extended through all classes of the community, so that in many of them membership consists fully as much of business men as it does in the United States. In the United States, on the other hand, the number of unemployed or half-employed men is growing, so that the men who use clubs as places to live in have greatly increased in number. It is said, by those who are in a position to know, that the sociability which has characterized American clubs has extended to these societies in England and is on the increase among them.

Regarded from a legal point of view, a club may be incorporated or unincorporated; but it is essential to its character as a club that it shall not be instituted for trading purposes and shall not carry on any occupation having gain for its object. Social clubs, as we know them, are of English origin and have usually been unincorporated, the earliest—such as White's, Brooks's, The Beefsteak, and other celebrated resorts in London—being of the proprietary kind, one person furnishing the club premises and all accessories, in consideration of an entrance fee and fixed annual subscriptions, the members being mere licensees and not co-proprietors. This type of club still survives in England and has of late become quite common in convivial and sporting circles in New York, Chicago, San Francisco, and other large cities of the United States. Gaming clubs are usually conducted on this principle.

The more usual and familiar type of club at the present time, however, is the "members' club," in which the persons constituting the association are, by virtue of their membership, coöwners of the property of the club and equally entitled to share in its privileges. The legal relation between the members is that of mutual contracting parties, the terms of the agreement creating their mutual rights and obligations being contained in the articles of association and in the rules and regulations adopted thereunder. These articles and rules also fix the powers and determine the authority of the governing board and other officers and committees of the club, each member being bound to submit to such authority by his express or implied assent to the rules and regular proceedings of the club. Every new member becomes a party to the contract of association, whether he formally subscribes to its articles or not, though it is usual to make such subscription.

The proceedings of social clubs have not often come before the courts for review, and when they have, it has usually been in connection with the exercise of the right of expulsion of an obnoxious or offending member. This is generally provided for and regulated by the rules of the club, and, in general, it may be said that any member who brings himself by his conduct within the condemnation of the rules may be expelled in the manner provided by them, or, in the absence of any express provision, by the vote of a majority of its members. But the courts are not blind to the serious consequences of an expulsion, especially in the forfeiture of the property rights which it involves, and will see that the offending member has fair play. He is entitled to a hearing and to reasonable notice, whether the rules of the club provide for it or not. The governing committee is a quasi-judicial tribunal and must act as such. But if the proceedings have been regular and fairly conducted, the courts will usually make no further inquiry. They will not, under ordinary circumstances, undertake to control the discretion of the association or its committee, or to determine what is and what is not proper conduct on the part of a member. Doubtless, however, if it appeared to the court that a member against whom proceedings have been taken was the victim of unreasonable prejudice or of a conspiracy, it might order his reinstatement.

Generally speaking, the individual members of unincorporated clubs are not liable for the debts of the concern, unless they have authorized the transactions out of which such debts arose—a voluntary club not being a partnership and no agency being presumed; but the assent necessary to bind the members individually may be given by resolution under the rules. Of course, where no agency or ratification can be shown, the steward or house committee or other officer making or directing a purchase becomes personally liable upon the

obligation incurred, the club, as such, having no legal status. An incorporated club, however, like any other corporation, may sue and be sued in its corporate capacity; and its officers and members, so long as they have complied with the law, are equally free from individual liability for its debts. For this and other reasons it has become a common practice to incorporate clubs of this character. But incorporation does not involve the existence of a capital stock, in the ordinary sense of that term, nor of corporate shares, nor has a club member usually a transferable interest. (For a remarkable exception to this rule, see STOCK EXCHANGE.) For the dissolution of an incorporated club, legal proceedings are necessary; but a voluntary, unincorporated association may be dissolved informally by mutual agreement of its members, and thereupon the property of the club is distributed equally among them.

Although a club is not a place of public entertainment, i.e., neither a tavern nor a hotel, within the meaning of excise legislation, it may nevertheless be brought by statute under public regulation. Of course, the proprietor of a "proprietary club" is subject to the same laws as any other persons buying and selling intoxicating liquors. It has been held, however, that the furnishing of wine, beer, etc., to a member of a "members' club" is not "giving or selling" liquors within the excise laws. A club may also be a common gambling house under the law if its members in considerable numbers habitually congregate there for purposes of gaming. See CORPORATION; JOINT-STOCK ASSOCIATION; VOLUNTARY ASSOCIATION; and the authorities there referred to. See also BOYS' CLUBS; WOMEN'S CLUBS; WORKINGMEN'S CLUBS; WORKING WOMEN'S CLUBS. Consult also Wertheimer, *Law Relating to Clubs* (2d ed., London, 1889).

CLUBFOOT (in Lat., *talipes*). A deformity of the foot, due to a distortion of one or more of the joints, and characterized by extreme extension, flexion, adduction, abduction, or rotation. Surgeons recognize several varieties: a turning in of the foot (*talipes varus*), a turning out (*talipes valgus*), an elevation of the heel so that the weight is borne on the ball of the foot and the toes (*talipes equinus*), and a depression of the heel with the front of the foot raised from the ground (*talipes calcaneus*). Two of these forms are frequently combined (*equinovarus*). We may also mention here the deformities flat foot (*pes planus*), where the arch of the foot is lost, and its opposite (*pes cavus*), where this arch is unduly exaggerated.

Clubfoot is either congenital or acquired. When acquired, the deformity is usually due to infantile paralysis (anterior poliomyelitis). The changes involve the muscles, tendons, bones, and ligaments. The treatment is manual, mechanical, or operative. Considerable improvement can be obtained in congenital cases by the first method, but those of long standing require splints or special apparatus, or surgical interference with sections of the tendons and frequently removal of parts of the bones. The first operation for clubfoot was done in 1731, by Stromeyer. Consult Gould and Pyle, article "Talipes," in *Cyclopedia of Medicine and Surgery* (Philadelphia, 1912).

CLUBHAND. A rare congenital deformity, in which the hand is closed or bent backward or to one side. Defective development of the bones of the wrist coexists, and other malnutrition is apparent in the child, who rarely survives.

CLUB MOSS, or GROUND PINE. Species of *Lycopodium* and *Selaginella*, resembling coarse mosses, and frequently bearing clublike cones (strobili) of spore-bearing leaves. See LYCOPODIALES; PTERIDOPHYTES.

CLUBROOT, or ANBURY. A disease to which turnips, cabbages, cauliflowers, rutabagas, and allied plants are liable, and which often proves of serious importance to farmers, destroying the crop of entire fields. It is called clubroot because of the knobs or tubercular excrescences which form upon the root. The root often becomes divided into a number of parts, each in some small degree swelling separately by itself; whence the popular name, "finger-and-toe disease." The disease is caused by *Plasmodiophora brassicæ*, a fungus of low order, which multiplies with great rapidity in the cells of the host. This acts as a stimulus, causing the roots to assume their strange appearance. The fungus can remain in the soil for a number of years. On this account, care should be taken to rotate crops, so that no cruciferous plants shall be grown on the infested land for several years. The seed bed is often a source from which the disease is spread, and it should receive attention. The application of lime every few years at the rate of 75 bushels per acre, has given promising results. It is also advisable to remove all infected plants as much as possible and rotate crops at frequent intervals.

CLUB-RUSH. See SCIRPUS.

CLUEN'TIUS HAB'ITUS, AULUS. A Roman central figure in a celebrated and complicated poison case, which involved two trials at Rome, in 74 and 66 B.C. On the latter occasion Cicero delivered the speech *Pro Cluentio*, still extant, which is rated highly. The speech was edited by Fausset (1887). Consult Nettleship, *Lectures and Essays on Subjects Connected with Latin Literature and Scholarship* (Oxford, 1885).

CLUGNY. See CLUNY.

CLUMBER SPANIEL. See SPANIEL; and Plate of TERRIERS, SPANIELS, ETC., under DOG.

CLUMSY, SIR TUNBELLY. A boorish country squire in Vanbrugh's play *The Relapse*. He also appears in Sheridan's *Trip to Scarborough*.

CLUNCH. Old Madge's husband in Peele's *Old Wives' Tale*.

CLU'NIACS, or CONGREGATION OF CLUNY. A branch of the Benedictine Order, founded at Cluny or Clugny in France about 910, by William, Duke of Aquitaine. He placed at its head Berno, who had made a great reputation by his conduct as abbot of the monasteries of Gigny and Baume. The order was noted for its rigorous discipline and its influence for reform. It spread rapidly, and in the fifteenth century had 825 houses (the 2000 sometimes assigned is probably exaggerated), spread from Scotland to Palestine, all connected with the house at Cluny. In England the first Cluniac house was founded in 1077. At the time of the suppression of the monasteries there were 32 houses. The Congregation in France was dissolved in 1790 by the Constituent Assembly; the town of Cluny purchased the magnificent abbey church for 100,000 francs and pulled it down. When, a few years later, the citizens invited Napoleon to visit them, he dismissed them contemptuously, calling them vandals. In Paris the present Hôtel de Cluny was begun in the fifteenth

century (on the site of the old palace of the early Frankish kings) by the Congregation of Cluny, but is now a rich museum owned by the city of Paris. The Congregation was reformed by Peter the Venerable (q.v.), and in 1131 Innocent II dedicated the great church of Cluny, which was one of the wonders of the world. Among the great men whom the Congregation has produced are Popes Gregory VII, Urban II, and Paschal II. Consult Sachur, *Die Cluniacenser* (Halle, 1891–94); Duckett, *Charters and Records of Cluni* (Lewes, 1890).

CLUNY, klṳ'nē', or **CLUGNY** (Lat. *Cluniacum*, probably connected with OIr. *chain*, Ir. *clon*, meadow, Gk. *κλέπος*, *klepos*, moisture, Lith. *szlápias*, wet). A town in the Department of Saône-et-Loire, France, 12 miles northwest of Macon (Map: France, N., K 6). It has an excellent industrial college, and manufactures pottery, paper, leather, and yarn. Pop., 1901, 4108; 1911, 4150. Its architectural attractions include, besides the celebrated Benedictine abbey of the ninth century, the church of Notre Dame, dating from the thirteenth century; the church of Saint-Marcel, with a beautiful Romanesque steeple of the twelfth century; the ruins of Saint-Mayeul; the abbot's palace; portions of the ancient fortifications; and picturesque houses, dating from the twelfth century and later, all classed among the historical monuments of France. Before the erection of St. Peter's at Rome, the abbey church at Cluny, which was begun in 1089, was the largest building of its kind in Europe, being 650 feet long by 130 wide. It is now in ruins, having been destroyed by order of the town, to which it was sold after the convent was suppressed by the Constituent Assembly in 1790. (See CLUNIACS.) A model of it is preserved in the town museum, which was once a part of the abbot's palace. It is the birthplace of the noted painter Prud'hon. Consult: Bernard, *Les chartes de l'abbaye de Cluny* (Paris, 1876–94); Duckett, *The Archives of the Ancient Abbey of Cluny* (n. p., 1886); Penjon, *Cluny, la ville et l'abbaye* (Cluny, 1872).

CLUNY, klṳ'nē', HÔTEL DE. A fine Gothic edifice in Paris, built during the fifteenth and sixteenth centuries by the abbots of the Benedictine abbey of Cluny, on the site of an ancient Roman palace. In 1515 it was occupied by Mary, the widow of Louis XII, and in 1537 James V of Scotland was married in it. It passed into the hands of the nation after the Revolution, was acquired in 1833 by the antiquarian Du Sommerard, and in 1842 was purchased with its collections by the State. The museum established in it is important for its antiquities, particularly of France.

CLUPE'IDÆ (Neo-Lat. nom. pl., from Lat. *clupea*, small river fish + Gk. *εἶδος*, *eidos*, shape, form). An important family of soft-rayed fishes, including the herring, shad, sardines, alewives, etc. (qq.v.). The body is usually elongated and compressed; the head naked; the body covered with rather large scales, usually easily lost. The lateral line is wanting. There is only one dorsal fin, and the tail is forked. There are about 30 genera and 150 species found in all seas, and usually in immense shoals. Many species are anadromous, while some remain in fresh water permanently. See FISHERIES and FISH CULTURE, and Colored Plate of AMERICAN FOOD FISHES, under FISH AS FOOD, and Plate of HERRING AND SHAD.

CLUSERET, klṳ'z'-râ', GUSTAVE PAUL (1823–1900). A French soldier and Communist, born in Paris. He was educated at Saint-Cyr, distinguished himself during the insurrection of 1848 in Paris, served in the Crimean War and in Africa against the Kabyles, and became a captain in 1855. In 1858 he resigned his commission, and in 1860, as commander of the French volunteers, joined Garibaldi in the expedition to Sicily and Naples. At the outbreak of the American Civil War in 1861 he came to the United States, entered the Union army, served on the staffs of McClellan and Frémont, and was brevetted brigadier general in 1862. In 1864 he was editor of the *New Nation* in New York, advocating the nomination of Frémont for the presidency. In 1867 he took part in the Fenian revolt and went back to France, where he wrote for several radical papers, but was condemned for certain publications and compelled to take refuge in England. On the proclamation of the Republic in September, 1870, he took part in the insurrectionary attempts at Lyons and Marseilles, whence he fled to Geneva. In 1871, after the establishment of the Commune, he was appointed delegate of the War Department, and endeavored to improve the military organization of the Communist troops, but soon gave offense to the Central Committee, was accused of treachery, and was imprisoned at Mazas. When the government troops entered Paris, he escaped to England, thence to Mexico, and finally to Switzerland. In 1872, during his absence, he was formally sentenced to death; he returned to France in 1881, having spent several years in Turkey, and was elected to the Chamber of Deputies in 1888, 1889, and 1893. He published *Mémoires du général Cluseret* (1887–88).

CLUSTER CUP. See ÆCIDIUM; UREDINALES.

CLUSTERED PIER, or CLUSTERED COLUMN, or COMPOUND PIER. A form of architectural support characteristic of the Middle Ages, though not absolutely unknown to the ancient East, as is shown by the Babylonian cluster of four columns found at Tello. It was not used in the classic, early Christian, or Byzantine style, nor until the development of the vaulted Romanesque in the eleventh century. It probably originated in the attempt to vary the plain square pier which was then being used in place of the classic column, and to connect it with moldings of the arcades and the ribs of the vaulting. These Romanesque piers had a square or rectangular core, to each face of which a semicolumn or engaged shaft was attached; this simplest form was varied by the addition of minor shafts and reëntrant angles. Very rich effects were thus obtained, especially in central France and England during the twelfth century. The developed Gothic style of the thirteenth century adopted the clustered pier as its regular support in interior architecture. The Gothic pier differed from the Romanesque in being usually more slender and more varied in plan, and in a majority of cases based on a circular or polygonal instead of a square core. The larger shafts were sometimes—especially in England—separated from the core, to which they were fastened only at the base and at the capital and by intermediary molded bands. But this form was found unsatisfactory and was abandoned except in England for the solid pier, which was a better support. Its simplest form with circular core is shown in the nave of Amiens Cathedral, but its variations are infi-

nite, being determined largely by the number, form, the grouping of the vaulting ribs and moldings above, by connecting with which the effective sweep of architectural lines is continued from floor to vaulting ridge. The neoclassicism of the Renaissance put an end to the clustered pier almost entirely except in its simplest rectangular forms.

CLUTCH. A mechanical device whereby it is possible to transmit the rotary motion of a shaft by means of connecting two elements which normally are independent. This connection may be established by means of teeth, by the friction of two surfaces, by pins and studs, by cams, or in other ways. The clutch finds extensive application for the transmission of power in various mechanical devices, and perhaps the most important types are the friction clutches, where two surfaces rub on each other when the clutch is thrown into gear, the pressure of contact being sufficient so that the friction is increased to a degree that the surfaces, which may have special coatings as of wood or cork, bind and one surface is enabled to drive the other. These surfaces may take the form of disks placed at right angles to the shaft, of blocks sliding on its outer or inner surface, of a surface or band on the rim of a pulley on the shaft, of two conical surfaces, internal and external, or of a band and ribbon around a pulley, or some one of numerous other devices. There are also magnetic clutches where the two parts are brought together by the action of powerful electromagnets. The advantage of the clutch is that shafts may be put into motion gradually without shock, and for this object they find extensive application in motor vehicles (q.v.).

For detailed consideration of friction clutches, consult Souther, in *Transactions American Society of Mechanical Engineers for 1908.*

CLUTE, Willard Nelson (1869–). An American botanist, born at Painted Post, N. Y. Between 1897 and 1911 he was assistant curator of the botanical department of Columbia University, curator of the New York Botanical Garden, instructor in biology in the Joliet (Ill.) High School, and instructor in botany in the Curtis High School, Chicago. In 1911 he became head of the biology department in the Girls' Technical High School, Chicago. He was at one time publisher of the *Plant World* and later became both editor and publisher of the *Fern Bulletin* and the *American Botanist.* He founded the American Fern Society in 1893. His publications include: *A Flora of the Upper Susquehanna Valley* (1898); *Our Ferns in their Haunts* (1901); *The Fern Collector's Guide* (1902); *The Fern Allies of North America* (1905); *Laboratory Botany for the High School* (1909); *Agronomy for High Schools* (1912; 2d ed., 1913); *Laboratory Manual and Note Book in Botany* (1913).

CLUT'TERBUCK, Captain Cuthbert. A retired officer, the fictitious editor of Scott's *The Abbot, The Monastery,* and *The Fortunes of Nigel.*

CLUVER, klōō'vĕr, or **CLÜVER,** klü'vĕr, Philipp (1580–1622). A German antiquarian and geographer, born in Danzig. He first studied law in Leyden, but soon forsook it for archæology and geography, whereupon his father withdrew all support and he was obliged to take service in the Austrian army. From 1607 to 1613 he traveled through Norway, England, Scotland, France, Germany, Switzerland, and Italy, and in 1615 he settled in Leyden, where he was made "Geographus Academicus." In 1617–18 he roamed once more through Italy and Sicily, on foot and under great hardship. He was the founder of historical geography and author of *De Tribus Rheni Alveis atque Ostiis* (1611); *Germania Antiqua* (1616); *Sicilia Antiqua* (1619); *Italia Antiqua* (1624), his principal work; and *Introductio in Universam Geographiam* (1624).

CLYDE (called *Glotta* by Tacitus, connected with OIr. *Cluad,* name of a river, Gk. *κλύζειν, klyzein,* to wash out, Lat. *cluere,* to purify, Goth. *hlūtrs,* AS. *hlūttor,* Ger. *lauter,* pure). The third in size, commercially the most important river in Scotland, widely celebrated for the romantic beauty of its scenery (Map: Scotland, D 4). It is formed by the Daer Water, the Potrail Water, and several small streams of the semicircular range of the Hart, Queensberry, and Lowther hills, and drains the counties of Lanark, Renfrew, and Dumbarton, flowing past Lanark, Hamilton, Glasgow, Renfrew, Bothwell, Crawford, Lamington, Blantyre, Uddingston, and Dumbarton, near which town it opens into the Firth of Clyde. In this course it receives the Medwin, Carnwath, Mouse, Calder, North Calder, Kelvin, and Leven rivers. It flows through a fertile, wooded valley, often extending into level plains, and often having bold, wooded banks. From 2 miles above to 4 miles below Lanark are the celebrated falls of Clyde—a series of four cascades and rapids, the largest in Scotland; the total descent in the course of 6 miles being 230 feet, amid very picturesque scenery. Corra Linn, the grandest fall, forms three distinct leaps—in all 84 feet high. Below Glasgow the Clyde expands into an estuary, navigable by the largest vessels, and at Greenock it attains a breadth of about 4 miles. Opposite this point the Gareloch empties into it, and a short distance below, Loch Long on the north. Turning, it expands into the Firth of Clyde, which extends between Argyll on the west, and Renfrew and Ayr on the east, to the North Channel at the island of Ailsa Craig, where its breadth is about 30 miles. In the Firth of Clyde are the islands Arran, Bute, Great Cumbrae, and Little Cumbrae. In the north a narrow arm, called Loch Fyne, extends far into Argyll. The Clyde from its source to Glasgow is, by its windings, 75 miles long, and from Glasgow to the south end of the peninsula of Cantyre the distance is about 90 miles. The basin of the Clyde occupies 1500 square miles. Floods sometimes raise its waters 20 feet. Clydesdale, or the valley of the Clyde, is noted for its coal and iron mines, orchards, and horses. The falls of Clyde furnish power for many mills, especially cotton. Bell, in 1812, launched on the Clyde the first steamboat, and to this day in Europe the Clyde forms the centre of the shipbuilding industry in Scotland. Consult Millar, *The Clyde from its Source to the Sea* (London, 1888).

CLYDE. A village in Wayne Co., N. Y., 38 miles west of Syracuse, on the New York Central and the West Shore railroads, and on the Barge Canal (Map: New York, D 4). It contains glassworks, steam-engine and boiler factory, cannery, and harness works. Pop., 1900, 2507; 1910, 2695.

CLYDE. A village in Sandusky Co., Ohio, 75 miles west by south of Cleveland, on the Cleveland, Cincinnati, Chicago, and St. Louis, the Lake Shore and Michigan Southern, the Wheeling and Lake Erie, and the Lake Shore Electric

railroads (Map: Ohio, E 3). The village contains a Carnegie library and a monument to Gen. James B. McPherson, who was born and buried here. There are manufactories of cutlery, kraut, automobiles, barrels, and screens, and granite works. The water works and lighting plants are publicly owned. Pop., 1900, 2515; 1910, 2815.

CLYDE, JOHN CUNNINGHAM (1841–1915). An American clergyman, born at White Deer Valley, Lycoming Co., Pa. After serving in the Civil War he was educated at Lafayette College and Princeton Theological Seminary. In 1869 he was ordained to the Presbyterian ministry. He was pastor at Frazer, Pa. (1872–79), and at Bloomsbury, N. J. (1879–1901). His publications include: *Rosbrugh, a Tale of the Revolution* (1880); *Life of James H. Coffin* (1881); *History of the First Presbyterian Church of Bloomsbury, New Jersey* (1884).

CLYDE, LORD. See CAMPBELL, SIR COLIN.

CLYDE'BANK. A town in Dumbartonshire, Scotland, on the Clyde, 7 miles northwest of Glasgow (Map: Scotland, D 4). It has extensive yards for building iron and steel ships, engineering works, and distilleries. Pop., 1901, 18,670; 1911, 16,202.

CLYDES'DALE, or **PAISLEY TERRIER.** See TERRIER.

CLYMENE, klīm'ê-nê. 1. The daughter of Oceanus and Tethys, and mother, by Iapetus, of Atlas, Prometheus, and Epimetheus. 2. The mother of Phaëthon (q.v.).

CLYME'NIA (Neo-Lat. nom. pl., from Lat. *Clymene*, Gk. Κλυμένη, *Klymenē*, name of a nymph, originally p.p. of *κλύειν, klyein*, to hear). A genus of goniatitoid cephalopods, found in the Upper Devonian rocks of Europe and North America, and distinguished from the other goniatites by the dorsal position of its siphuncle. The shell of this genus is a flattened spiral, the whorls of which are closely coiled so that each whorl clasps the outer half of that next inside it. The suture lines are simply curved or lobed. In some beds of the European Upper Devonian the shells of this genus are so abundant as to give the name "Clymenienkalk" to the limestone containing them. Consult Foord and Crick, *Catalogue of the Fossil Cephalopoda in the British Museum of Natural History*, part iii, pp. 14–32 (London, 1897). See also GONIATITES; CEPHALOPODA; DEVONIAN SYSTEM.

CLYMER, klī'mēr, GEORGE (1739–1813). An American patriot, one of the signers of the Declaration of Independence and a prominent member of the Constitutional Convention of 1787. He was born in Philadelphia, was orphaned when only one year old, was educated at the College of Philadelphia (now the University of Pennsylvania), and became a merchant in his native city. In 1772 he was appointed by Governor Penn to the position of "Justice of the Court of General Quarter Sessions of the Peace, and of the County Court of Common Pleas of Philadelphia." On the approach of the Revolutionary War he became an active member of the patriot party, and was chosen successively a member of the Committee of Correspondence (1774) and of the Provincial Congress of Pennsylvania (1775). From July, 1775, to August, 1776, he served as one of the two treasurers of the Continental Congress; from October, 1775, to July, 1776, he was a leading member of the Pennsylvania Committee of Safety; and in July, 1776, he was one of the five men who were appointed by the Pennsylvania Legislature in place of the Pennsylvania delegates who had opposed the Declaration of Independence, which document he signed on August 2. He was a prominent member of the Constitutional Conventions of Pennsylvania in 1776 and 1779; served as captain under Cadwalader at the battle of Princeton; was a member of the Pennsylvania Assembly in 1777 and 1778; was reëlected to the Continental Congress in March of 1778; was sent to Valley Forge by Congress as a special commissioner to inquire into the alleged maladministration of the Commissary Department; and in 1778 was one of the special commissioners sent by Congress to treat with the Indians at Fort Pitt (Pittsburgh). In May, 1780, he cooperated with Robert Morris and others in founding the Bank of Pennsylvania to facilitate the furnishing of supplies to the army, and in both 1780 and 1781 he was reëlected to the Continental Congress, by which in 1782 he, with Edward Rutledge, was sent as special commissioner to the Southern States, to secure the payment of funds due to the national treasury. From 1782 to 1785 he lived at Princeton, N. J., but returned to Philadelphia in the latter year, and from then until 1789 was an influential member of the Pennsylvania Assembly. He took a prominent part in the Constitutional Convention of 1787; was a member of Congress from 1789 to 1791; was appointed by Washington in 1789 Supervisor of the Internal Revenue for Pennsylvania, in which capacity he was charged with the collection of the tax on spirits which brought on the Whisky Insurrection (q.v.); and in 1796 was one of the special commissioners appointed by Washington to treat with the Creeks and Cherokees in Georgia. Subsequently, though taking no further part in public life, he took an active interest in public enterprises of various kinds, devoted much of his time to reading and study, and was president of the Philadelphia Bank and of the Academy of Fine Arts. He was one of the foremost leaders during the Revolutionary period and had a wide reputation for ability, learning, and patriotism. Consult Dickenson, in the *Magazine of American History*, vol. v (New York, 1880).

CLYSTER, klis'tēr (Lat., from Gk. *κλυστήρ, klystēr*, a syringe, from *κλύζειν, klyzein*, to purify). An old term for a medicine administered in the liquid form by the rectum, or lower end of the intestines. See ENEMA.

CLY'TEMNES'TRA (Lat., from Gk. Κλυταιμνήστρα, *Klytaimnēstra*). In Greek legend, the daughter of King Tyndareus and Leda, and the twin sister of Helen. She became the wife of Agamemnon (q.v.), and bore him a son, Orestes, and three daughters, Iphigenia, Electra, and Chrysothemis. While Agamemnon was at Troy, she formed an adulterous connection with Ægisthus (q.v.), murdered her husband on his return, and reigned for seven years with Ægisthus, till she was murdered by Orestes (q.v.).

CLYTIE, klī'tê (Lat., from Gk. Κλυτίη, *Klytiē*). A Greek maiden beloved by Helios (the sun). When he deserted her for Leucothea, she betrayed the latter to her father, who put her to death. As her lover did not return, Clytie gazed ever after him, until in pity the gods changed her to a flower, called by the Greeks *ἡλιοτρόπιον, hēliotropion*, of the same family as our heliotrope. The so-called Clytie of the British Museum is only the portrait of a Roman maiden.

CNIDUS, nī'dŭs, or GNIDOS (Lat., from Gk. Κνίδος, *Knidos*). An ancient city on the western extremity of the promontory of Triopion (now Cape Krio), in Caria, Asia Minor, founded as a colony from the east coast of the Peloponnesus, and hence said to be both Laconian and Argolic; it was one of the six cities of the Dorian League. Cnidus (according to Strabo) had two ports, one of which was a closed harbor for war vessels. The original settlement was on an island, but the city later spread to the mainland, and a mole was built to unite the two parts. The southern port was formed by two moles carried into the sea to the depth of nearly 100 feet, one of which is nearly perfect at the present day. The city was famous for its worship of Aphrodite, and in one of its temples was the famous nude statue of the goddess by Praxiteles. The Cnidians valued this work so highly that they are said to have refused the offer of Nicomedes of Bithynia to pay their large public debt in exchange for this statue. Off Cnidus, the Athenian admiral Conon defeated the Spartan fleet in 394 B.C., and thus broke the power of Sparta in Asia Minor. The site is still covered with ruins. In 1857–58 Sir Charles T. Newton excavated the sacred precinct of Demeter, discovering the fine seated statue of the goddess now in the British Museum. Famous citizens of Cnidus were Eudoxus (q.v.), Ctesias (q.v.), and Sostratus, who built the Pharos (q.v.) at Alexandria. Consult Newton, *Discoveries at Halicarnassus, Cnidus, and Branchidæ* (London, 1862–63), and *Travels and Discoveries in the Levant* (London, 1865).

CNOSUS, nō'sŭs, GNOSUS, or KNOSUS (Lat., from Gk. Κνωσός, *Knōsos*, or less correctly Κνωσσός, *Knōssos*). An ancient city of Crete, on the north side of the island, 3 miles from the coast, near the modern Candia (q.v.), famous in legend as the home of King Minos (q.v.). The Dictæan cave in the neighborhood was a legendary birthplace of Zeus, though in later times somewhat supplanted as a seat of worship by the Idæan cave on Mount Ida. Here also legend placed the famous labyrinth (q.v.), in which the Minotaur was confined. In historical times Cnosus was inhabited by Dorians, and shared with Gortyna the chief power in the island. It finally became a Roman colony. The site has become highly important in the study of the civilization known as Ægean or Minoan from the excavations made by Sir A. J. Evans since 1899–1900. These have shown that the site of the early town was abandoned near the end of the Mycenæan period, never to be reinhabited. A city of the Mycenæan period has been discovered, and also a palace of far greater size and splendor than any previously known, bearing witness to the great power of the rulers of Cnosus in the heroic age. The decorations include wall paintings on stucco, and reliefs of an artistic merit hitherto unsuspected for so remote a period (about 2000–1200 B.C.) outside of Egypt. The art, however, is not Egyptian, but must be attributed to the pre-Dorian civilization of Greece. In the palace were also found a great number of clay tablets bearing inscriptions in two varieties of writing, neither of which can be read, though it seems clear that some of the tablets contain inventories of chariots, shields, and other stores. Consult Sir A. J. Evans, *An Atlas of Knossian Antiquities* (London, 1914). See ARCHÆOLOGY, *Mycenæan Period;* CRETE.

CNUT. See CANUTE.

COACH (Fr. *coche*, Ger. *Kutsche*, probably from Hung. *kocsi*, coach, named after a little place called Kocs (pronounced Koch) in western Hungary). A heavy inclosed four-wheeled carriage for the conveyance of passengers. The construction of the coach differs from that of other inclosed vehicles in the following particulars: 1. The roof forms a part of the framing of the body, and in this respect the construction is different from other covered carriages in which the roof is simply a canopy supported by iron rods or wooden pillars. 2. Coaches from the earliest times were suspended on springs. The coach sent by Ladislas, King of Hungary, to Charles VII of France is described as a carriage the body of which "trembled." 3. A coach is always designed with more than one seat for passengers.

According to Thrupp (see *Bibliography* below), coaches were first made in the town of Kocs, Hungary, and were so called from the name of the town, just as landaus and berlins are named from the towns which produced them. The same author traces their development from the huge agricultural wagons used on the Continent in the twelfth and thirteenth centuries, which were so constructed that, by different adjustment, they could carry a long timber, a cask of wine, a load of hay, or a family. The coaches of the Middle Ages were very elaborate affairs, used only by royalty and nobility, and for purposes of state. As late as 1550 there were only three coaches in Paris; one of these belonged to the Queen, another to Diana of Poitiers, and a third to a nobleman who was too corpulent to ride a horse. In 1631 a "glass coach," that is, a coach with glass windows, was built for the Infanta of Spain.

The first coach ever seen in England was made in 1555 by Walter Rippon for the Earl of Rutland; in 1564 the same builder made a showy vehicle for Queen Elizabeth. Later in her reign the royal coaches were constructed with sliding panels, so that the Queen could show herself to her subjects whenever she desired.

Stagecoaches. The Romans during the Empire had a system of public vehicles for hire which traveled over definite routes and probably at stated times. During the Middle Ages no such system of public conveyance prevailed. Towards the end of the sixteenth century wagons began to travel regularly between the principal towns of England to carry goods and people. These wagons were called stages. They were soon superseded by coaches. In 1662 we find a writer condemning this innovation because "these coaches make country gentlemen come to London on small occasion, which otherwise they would not do but on urgent necessity; nay, the conveniency of the passage makes their wives often come up, who, rather than make such long journeys on horseback, would stay at home. Here, when they come to town, they must be in the fashion, get fine clothes, and by this means get such a habit of idleness and love of pleasure that they are uneasy ever after." In spite of such protests coaches became more and more popular, and by 1750 an elaborate system of routes had been established. In 1784 these coaches began to carry the mail. The flourishing period of the stagecoach was at the opening of the nineteenth century. About this time an extensive good-roads movement had been inspired by the systems of Macadam and Telford. The stagecoach acquired a speed of 10 miles

an hour on the most important English routes. In America stage routes, although established between some of the principal cities, were never developed to the extent to which they were in England—a condition of affairs to be explained by the poor roads and the more sparsely settled territory. The introduction of transportation by steam proved a speedy and successful rival. This form of carriage—the railway car—has been given the name of coach, and, indeed, the early passenger cars were modeled in shape after the coaches. For further history, see COACHING.

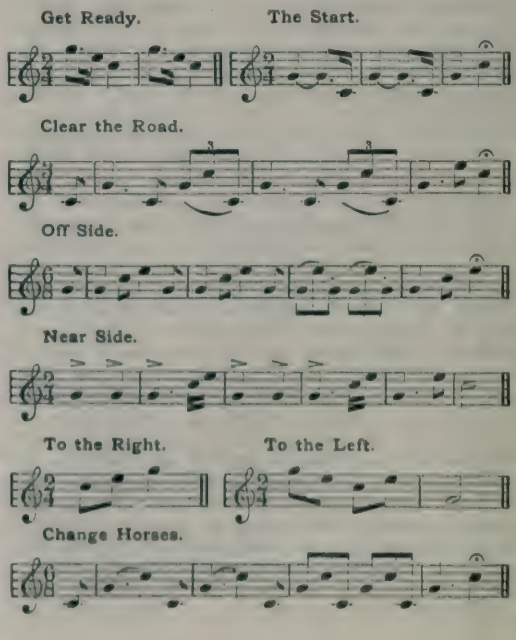
At the beginning of the twentieth century coaches are built both for public and private use, though the advent of the motor car has detracted from their use. In design they are closely akin to those in use in England during prerailroad days. They may be described as consisting of two parts—the *carriage* and the *body*. The former comprises the axles, perch (or reach), futchels, and transom (or bed), and many minor component parts, which together with the wheels form a complete vehicle or carriage upon which the body part is supported by the springs. The latter are secured to the bed and body by clips, and are always made of several stiff plates, because of their greater elasticity as compared with one plate of steel of the same length. The pole fits between the inside futchels and completes the carriage part. In the best-made carriages the dimensions of a pole are 3½ inches wide and 4¼ deep, measured at a point 2 feet from the splinter bar. For horses averaging between 15 and 16 hands, the length of the pole is usually 9 feet from the front of the splinter bar to the crosshead or the polehead; for smaller horses, cobs, etc., about 3 inches shorter. The *body* is practically the same in all coaches and is usually 4 feet 10 inches in length, 4 feet wide, and 4 feet 2 inches high. It is built as lightly as possible, so as not to detract from the centre of gravity of the coach. The roof is almost flat, in order that seats may be built on it, or for baggage, and the sides have a "cant" in a horizontal direction and the "turn under" in a vertical direction. There are two *boots*, the one in front being a few inches higher on the body than the hind boot, which latter is about 2 feet long (the front one 3 feet) and 2 feet deep. Both these boots are a little narrower than the body. The *box* and *driving seat* are placed on the front part of the front boot and are supported by solid ends or risers. The shape of the seat is made by the cushion, and not by the seat itself, which is always flat. All modern coaches have brakes, but a good driver rarely has recourse to them, except in emergencies. (See DRIVING.) A complete set of tools is carried in case of accidents to horses or vehicle. The weight of a road coach varies from 2200 to 2600 pounds. Builders generally contrive to throw more of the whole weight into the carriage part, in order to keep the centre of gravity low, and because it has to withstand the bulk of the strains.

The typical American coach is the Concord coach, so called from Concord, N. H., where many of them were built. Its principal constructive features are three parallel straight perches connecting the hind axle with the front transom bed, which steady a very rigid, rectangular frame. At each of the four corners of this frame are placed stiff iron standards carrying at their upper ends square iron shackles. Connecting with these shackles are strong leather straps, upon which rests the body of the coach, a mode of suspension common to European carriages before the use of springs. These latter are entirely absent in the Concord coach. The so-called *hackney coach* is a smaller four-wheeled vehicle for hire.

Bibliography. Consult: Adams, *English Pleasure Carriages* (London, 1837); Thrupp, *History of the Art of Coach-Building* (London, 1877); Gilbey, *Early Carriages and Roads* (London, 1903); Straus, *Carriages and Coaches: Their History and their Evolution* (London, 1912). See CARRIAGE; COACHING.

COACH DOG, or DALMATIAN CARRIAGE DOG. A dog of medium size, related to the hounds (q.v.), and having the form and smooth coat of a pointer, which properly is used only to follow a carriage, as an ornamental part of the equipage, and as a watchdog about the stable. This dog should, therefore, be capable of endurance on foot, trim of form, well groomed, and "stylish" in appearance. The coat must be pure white, evenly spotted with small, round, *distinct* spots, from half an inch to an inch in diameter, either perfectly black or pure brown. The head should be long, fine, and like that of a pointer, but not so deep. This dog is commonly said to have been first bred in Dalmatia, but the same breed seems to have been common in Spain as early, at least, as the sixteenth century. It is often used in Denmark to draw carts. See DOG.

COACH HORN. A straight tapering horn made of brass or copper, and used to sound certain simple calls. There are no keys and the range is limited to the six open notes (c^1-g^1-c^2-e^2-g^2-c^3), of which the high c is exceedingly difficult. The coach horn varies considerably in length, a short (42-inch) horn giving more brilliant notes, and a long (56-inch) horn giving a softer, richer tone. The various calls sounded with the coach horn have a well-recognized place in coaching; and in addition to those used universally, as in the case of examples noted below, there are others employed by particular coaches and routes. A few of the best-known calls are as follows:



COACHING. Driving or being driven in a coach (q.v.) drawn by four or more horses. The driving of a coach requires great skill, coolness, judgment, and a knowledge of horses on the part of the driver; and, where indulged in as a sport or pastime, may be said to derive its greatest attraction from that fact alone. The history of coaching is naturally part of the history of the coach, for which see article COACH. The first stage in England was put on the road in 1659 and traveled between London and Coventry. At the beginning of the eighteenth century there were many coaches employed throughout the country; but the slowness of travel was such that it took a week to go from London to York, and proportionately for all lesser distances. The royal mail, which had been carried by a system of postboys under a contract speed of five miles an hour, was, in 1784, undertaken by Palmer's mail-coach service, which carried mail as well as passengers, and grew to such a success that the average speed rate of mail coaches was brought up to 10 miles an hour. This, however, was due almost entirely to the improvements in road construction instituted by Macadam and Telford.

In 1836 coaching had become so important an institution that 54 coaches were employed in England, 30 in Ireland, and 10 in Scotland. The British government exercised a rigid supervision and discipline over the stagecoach service, because of its connection with the post-office system, and exacted a military punctuality and regularity in its running and general management. The landed and country gentry, generally, maintained a zealous watchfulness over the condition of the roads, and consequently much competition was indulged in by the people of the countryside, to attract coaches to some particular route, and among the coaches themselves, to establish the best records. The drivers were frequently gentlemen, and often members of the aristocracy. The "Brighton Age," in its palmy days, numbered among its professional drivers Charles Jones, Sir St. Vincent Cotton, Dick Brackenbury, and many others; while such distinguished men as the Duke of Beaufort, Lord Chesterfield, and Prince Henry Batthyányi were among the amateur drivers of that and similar coaches. Professional drivers would frequently receive as much as $3000 and $4000 per year for their services; an immense salary for those days, and the best indication of the importance attached to the position. After 1840 coaching as a public necessity ceased to be; and with diminishing business, decay set in rapidly.

In America, even in Colonial times, four-horse stage wagons were in regular employment throughout the country, the most important (1760) plying between Philadelphia and New York. Owing to the absence of regular roads, the saddle horse was the favorite means of transport. Coaching as a recreation or amusement began in England about 1868—a revival which spread to America as well as throughout continental Europe. In England it had as its leading supporters men who remembered the pre-railroad coaching days, and desired to save the institution from the oblivion which threatened it. A more or less successful effort had been made to keep alive the old spirit of coaching on one or two of the older routes; but at the time of the so-called revival the Four-in-Hand Club, established in 1856, and Sir Henry Peyton, were the only interested ones. The results were not very permanent so far as England was concerned; for in 1880 there were only four coaches running—a state of things, however, which has since considerably improved.

In 1877 the "Old Times" was again put on the road between London and St. Albans; the Four-in-Hand and the Coaching clubs afterward became permanent organizations, and their "meets" have come to be regarded as among the social events of the London season. The first English coaching club was the B. D. C., or Bensington Driving Club, limited originally to 16 members, and first organized in 1807. In 1823 the annual club meets were abandoned, and in 1856 the club ceased to exist. The Four-Horse Club, frequently but inaccurately referred to as the Four-in-Hand Club, was formed in 1808, and, after a varied career, disbanded in 1830. Amateur coaching in the United States may be said to have antedated the English revival by two or three years, August Belmont putting the first coach on the road in 1864. Leonard Jerome is credited with the distinction of driving the first American-built coach, and he, together with a number of other gentlemen, founded in 1875 the New York Coaching Club. Since then coaching has been a regular feature of fashionable New York and Newport life, the number and equipment of the coaches employed comparing most favorably with those of either London or Paris. Indeed, modern coaching in both England and France has received no little impetus from American lovers of the pastime.

At the present day coaching is confined almost exclusively to such great centres and cities of the world as are most frequented by the wealthy and leisure classes, as London, New York, Paris, Berlin, Vienna, etc., and is generally employed in connection with racing and trips to summer resorts. The first amateur road-coach service in the United States was established in 1876 between the Brunswick Hotel, New York City, and Pelham Bridge (15½ miles). The following is a list of the principal road coaches of New York, London, and Paris, past and present, together with their routes and time taken. *New York:* Holland House to Ardsley Casino, 25.8 miles in 2½ hours. *London:* Northumberland Avenue to Box Hill, 25 miles in 3 hours; Northumberland Avenue to Virginia Water, 26.5 miles in 3¼ hours; Northumberland Avenue to Windsor, 30 miles in 4 hours. *Paris:* New York Herald Office to Cernay-la-Ville, 29 miles in 3 hours; New York Herald Office to Pontoise, 26.3 miles in 2¾ hours; New York Herald Office to Maisons-Lafitte, 19.4 miles in 2 hours; New York Herald Office to Versailles, 14.5 miles in 1¾ hours. Of the "two-days" trips, or routes which require an entire day each way, the most important in the United States is that from the Holland House, New York, to Philadelphia and return, about 90 miles each way, taken annually by the New York Coaching Club members. In England, the journey from the White Horse Cellar, Piccadilly, to Brighton (54 miles) is accomplished in 6 hours; while in France the distance from the New York Herald Office, Paris, to Fontainebleau (60 miles) is accomplished in 7 hours. *Stages:* Under the best conditions a change of horses would be made every seven miles, but ordinarily it has to be done to suit the available stabling accommodations of the route. The best authorities agree that a fast coach running out and in is best served by having a horse to each mile of the road. Thus

30 horses would be necessary to run a coach out and in once a day, between points 30 miles apart. An illustration of the distance between stages under normal conditions, over a route 28 miles long, would be as follows: First stage 7, second stage 8, third stage 7, fourth stage 6 miles, each team serving one stage each way. On hilly roads longer stages are frequently made, but at a greatly reduced rate of progress. It is common experience that "pace" rather than "pull" is responsible for the disablement of the average coach horse. The bibliography of coaching is somewhat limited, but the following works are both interesting and comprehensive: Nimrod (C. J. Apperley), *Essays on the Road* (London, 1876); Rogers, *A Manual of Coaching* (Philadelphia, 1900); Ware, *Driving* (New York, 1903); Tristram, *Coaching Days and Coaching Ways* (New York, 1903).

COACHWHIP SNAKE. See WHIP SNAKE.

COAG'ULA'TION (Lat. *coagulatio*, from *coagulare*, to curdle, from *coagulum*, rennet, from *co-*, together + *agere*, to drive). The amorphous solidification of a liquid, or part of a liquid, as when the casein of milk is solidified by rennet in making cheese (q.v.), or the white of an egg by boiling. The process varies in various substances. Albumen, or the white of an egg, is said to coagulate at a temperature of about 71° C. (160° F.), although coagulation would undoubtedly take place also at lower temperatures, only more slowly. Milk is coagulated or curdled by the action of the rennet or by acids. The fibrin in the blood, chyle, and lymph of animals coagulates after the separation of these fluids from the living body.

COAHUILA. See KAWIA.

COAHUILA, kō'ä-wē'lä (named from the Mexican tribe *Coahuiltecs*). A northern state of Mexico, separated from Texas on the north and east by the Rio Grande, and covering an area of 63,745 square miles (Map: Mexico, H 4). With the exception of the eastern part, which is somewhat mountainous, the surface forms an elevated plateau, with a general incline towards the Rio Grande. The western part is taken up by the Bolson de Mapimi, a semidesert region, only partially explored, with many lagoons and vast mineral resources. The climate is moderate and healthful. Mining is an important industry of the state. Silver, lead, and zinc are the chief metals extracted. It is the only Mexican state in which coal is mined. The chief occupation is cattle raising, although the soil is well adapted for the growing of cereals and European vegetables, to which more and more attention is being paid. In the southwest some vines and cotton are cultivated. The state is traversed from north to south by the Mexican International Railway. Its southern section is well provided with railroads. Pop., 1910, 367,652; capital, Saltillo (q.v.).

COAITA, kō-ī'tä. See SPIDER MONKEY.

COAL (AS. *col*, OHG. *kolo*, Ger. *Kohle;* ultimately connected with Skt. *jval*, to blaze, and probably with Ir., Gael. *gual*, coal). A mineral fuel of solid character, found and used in many countries. The name is a word common to all the languages of the Gothic stock, and seems allied to the Latin *calere*, to be hot; as also "to glow," and "kiln." The word "coal" has often prefixed to it some qualifying word, to distinguish different kinds of coal; such as cannel coal, stone coal, pea coal, etc.

ORIGIN. Coal is one of the most important economic minerals, and is of vegetable origin. When vegetable matter accumulates under water it undergoes a slow process of decomposition, gradually giving off its nitrogen, hydrogen, oxygen, and some carbon, the result of which if carried far enough is the formation of a mass of carbon. Peat (q.v.), the material so often found underlying swampy tracts in north temperate zones, but occurring also even in warmer climates, represents the first stage in the coal-forming process, and the further stages are obtained by the burial of these vegetable deposits under great loads of sediment, where they become subjected to pressure, and at times to heat also. This effects a series of changes, especially consolidation and loss of oxygen, and gives a series of products, whose nature depends on the degree to which the original vegetable matter has been changed. The products are known as *lignite, subbituminous coal, bituminous coal, semibituminous coal,* and *anthracite coal;* these five types being connected by all degrees of intermediate stages. In Carboniferous times certain regions were covered by rank and luxuriant vegetation which grew upon swampy land slightly raised above the level of the sea. As the plants died, their remains fell into the water of the swamp, and slowly formed an accumulation of vegetable matter of increasing thickness. By slow subsidence this thick layer of vegetable matter sank below the water, and became gradually covered by sand, mud, or other mineral sediments, washed out from the shore. Successive elevations and depressions, with intervening accumulations, may thus have yielded successive beds. Subsequent elevation, folding of the earth's crust, and accompanying metamorphism, followed by erosion of the surface, has exposed to view the edges of the once deeply

buried beds of coal. In the United States and even in other countries conditions favorable for coal formation occurred also in the Triassic, Cretaceous, and Tertiary.

Composition. The composition of coal may be expressed in either the elementary or the proximate form, as shown in the preceding table, in which it will be noticed that the ash and sulphur are common to both. These analyses of the several members of the coal series indicate the general increase in carbon, and decrease in oxygen, hydrogen, and nitrogen in passing from the lower to the higher members of the series. Of the two methods for expressing the composition of the coals, the proximate is of greater commercial importance, and is sometimes also used as a basis for classification.

A proximate analysis like the above is of practical value, since it gives us a better conception of the coal worth. Thus the freedom of burning increases with the amount of volatile matter, which may have a variable composition. The volatile matter of coals from the eastern United States and Canada is rich in hydrocarbons, while that of coals from Western States contains more carbon monoxide and carbon dioxide, as a result of which it gives less heat and less smoke in burning. The heating power depends chiefly on the amount of fixed carbon present. Sulphur is an injurious constituent when the coal is to be used in the manufacture of gas or for metallurgical purposes; while ash is undesirable, since it displaces so much carbon, and if it contains fusible impurities such as iron, lime, or alkalies, it causes clinkering. Moisture retards the heating power of the coal until it is driven off.

The heating power of coal, which can be expressed in calories or British thermal units (B. T. U.), is its most important property, and is often tested by means of an apparatus known as a "calorimeter" (see CALORIMETRY). The principle of the test depends on the determination of the weight of water which one pound of coal can convert into steam at 212° F. under atmospheric pressure. (See HEAT.)

Varieties of Coal. The several varieties of coal and their properties are as follows:

Anthracite often contains over 80 per cent of fixed carbon, and also little ash, sulphur, and moisture. It has great heating power, and burns with a smokeless flame. It is dense, has a shining lustre, and usually breaks with a smooth, conchoidal fracture. The largest supply of true anthracite is obtained from the great anthracite region of eastern Pennsylvania, where the quality of the coal is due to regional metamorphism. Several small fields occur in the West, and are partly the result of contact metamorphism. They include Crested Butte, Colorado; Routt County, northwestern Colorado; Cerillos, New Mexico; and a few others. A little is mined in western Canada.

Semianthracite is a variety between bituminous and anthracite, but more closely resembling the latter. It is but slightly developed in the United States, the main commercial supply coming from Sullivan Co., Pa., and being sold as anthracite. Some is found in the eastern part of the Arkansas field.

Semibituminous coal, also intermediate between anthracite and bituminous, more nearly resembles the latter. It is perhaps the best-known coal of the United States, and because of its ideal steaming qualities has a world-wide reputation. This type is produced in the fields known as Clearfield, Pennsylvania; George's Creek, Maryland; New River and Pocahontas of Virginia and West Virginia, and the Arkansas field. It is known in Colorado and some other Western States, but has not attained commercial importance.

Bituminous coal is a comparatively brittle coal, of deep-black color and often cubical fracture. It burns readily, with a smoky flame, and is much used for steaming purposes; indeed, the great bulk of merchantable coal of the United States belongs to this class. It includes most of the coal produced east of the Mississippi, as well as in Iowa, Kansas, Oklahoma, and Texas. Bituminous coal is also known in many parts of the Rocky Mountain province and the northern Pacific coast.

Cannel coal (q.v.) is a variety of coal very rich in volatile matter, and found sparingly in parts of Kentucky, Ohio, and Indiana. Its chief use is as a gas enricher, since it yields 8000 to 15,000 cubic feet of gas per ton. It is very compact in texture, and may even have an oily look.

Subbituminous coal or *black lignite* is a grade intermediate between bituminous and lignite, and sometimes difficult to distinguish from one or the other. It differs from the latter usually in having a black streak; from the former in that it cracks irregularly in drying or splits parallel to the bedding on weathering, while bituminous shows a columnar cleavage or jointing. Subbituminous coal is black, and often has a fair lustre. It is a common type in many of the Western coal fields.

Lignite or *brown coal* is the lowest grade of true coal. It often shows a woody structure, brown color and streak, and high moisture content. On drying out it usually cracks badly, and hence should be used near the point of production unless it is formed into briquettes or utilized in a gas producer.

Coking coal (see COKE). Some bituminous coals form a hard, more or less porous coke or cake when heated in the presence of little air. *Natural coke* or *carbonite* is sometimes formed when an igneous rock penetrates a coal seam, but such deposits are limited in extent and of no commercial value.

Structural Features. Coal beds are liable to thicken or thin out when traced from point to point. Others divide or split, perhaps only to reunite farther on. In regions of disturbance they may show folding and faulting. Several beds may occur one above the other, separated by varying intervals of barren rocks. The rocks associated with coal are usually shale and sandstone, but clays, conglomerates, and limestones are also known.

History and Use. The value of coal does not seem to have been known to the ancients, nor is it well known at what time it began to be used for fuel. Some say that it was used by the ancient Britons; at all events, it was an article of household consumption to some extent during the Anglo-Saxon period as early as 852 A.D. There seems to be reason for thinking that England was the first European country in which coal was used in any considerable quantities. In America the deposits near Richmond, Va., were discovered in 1701, and mining was begun in 1750, while anthracite was first produced in 1793. Extended coal mining in the United States did not really begin, however, until about 1820. Since that time up to the present the

increase has been very rapid. In 1822 the amount of coal mined in Virginia was about 48,000 long tons. Latterly the production for the United States has reached over 500,000,000 short tons, greater than that of any other country of the world.

Coal is used largely for domestic purposes, either as fuel or, in the form of gas, for illumination and fuel. Its use for the latter purposes is, however, not so widespread as formerly, water gas having superseded it to a considerable extent. In the production of steam for motive power it also finds important applications. It is furthermore widely employed in the metallurgical industry in the form of either coal or coke, and in this connection may serve both as a fuel and as a reducing agent. Coke is made only from bituminous coal. Lignite seldom has much value as a fuel, owing to the large percentage of moisture that it contains. Because of this moisture it tends to crack in drying, and must therefore be used soon after mining, and in localities where it does not require long transportation from mine to market. This is true, for instance, of some of the lignite deposits in Colorado which are near the Denver market, and therefore possess commercial value. Lignite has sometimes been successfully used in the manufacture of producer gas, and peat has been found adaptable for this purpose. It has been suggested that much lignite could be used in the form of briquettes.

Coal Areas. The leading coal-producing countries of the present day are the United States, Great Britain, Germany, Austria-Hungary, France, Russia, and Belgium. The Russian coal fields are probably the most extensive in Europe. In the Far East coal is known in India, the Malay Archipelago, Japan, and China. The coal fields of China are very large and may become a source of European supply. Up to the present time they have not been developed in a systematic manner. Italy, Spain, Sweden, Australia, New Zealand, Borneo, the Philippine Islands, and some countries in Africa also produce coal; while in America, outside of the United States, deposits are worked in Canada, Mexico, Chile, and Argentina, and are known to occur in Colombia and Peru.

United States. The coal fields of the United States are especially extensive, the total area of the known fields exceeding 300,000 square miles, as shown by the accompanying table.

The American coal fields are separable into several provinces, the divisions being geographical and not geological. The geological ages of the coals in 1 and 2 are all Carboniferous, except small Triassic areas in Virginia and North Carolina. Those of 3, 4, and 5 are Cretaceous and Tertiary.

By far the most important of these regions is the Appalachian, which takes in portions of Pennsylvania, Ohio, West Virginia, Virginia, Maryland, eastern Kentucky, eastern Tennessee, Georgia, North Carolina, and Alabama. It is about 750 miles long and 70 to 80 miles wide. The coals are all bituminous or semibituminous with the exception of those at the northeastern end, in Pennsylvania, where close folding of the rocks has changed the bituminous into anthracite coal. In general, the rocks at the upper or northern end of the Appalachian belt are folded, while those of the lower end, as in Alabama, are often faulted in addition, so that the coal miner frequently finds the coal seam suddenly broken off. The Carboniferous section of this region has been described in the article CARBONIFEROUS SYSTEM, from which it may be seen that the coal beds occupy more or less well-marked stratigraphic positions.

COAL FIELDS OF UNITED STATES

* Bituminous and subbituminous areas of northern and eastern Montana.
† Bituminous and subbituminous areas of northeastern Wyoming.
‡ Coal fields in the mountainous districts of Montana.
‖ Coal fields in the mountainous districts of Wyoming.

Appalachian Field. The coal measures of the Appalachian field consist of a great thickness of overlapping lenses of conglomerate, limestone, shale, fire clay, and coal. A fairly uniform succession of beds is identifiable in Pennsylvania, Ohio, Maryland, and West Virginia, but the section is less uniform in the Southern States. Coking coal is found throughout the field, but most of it is made from coals on the eastern border, for the coking qualities seem to disappear towards the western margin. Coking coals of high quality are found in the Connellsville district in Fayette and Westmoreland counties of southwestern Pennsylvania. Excellent steaming coals are mined in Clearfield, Allegheny, and Washington counties of Pennsylvania; in the Hocking district of Ohio; in northern West Virginia, and in the Pocahontas district of south-

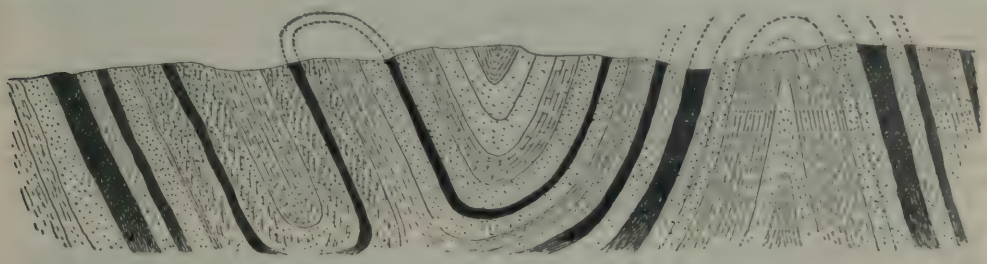
1. INCLINED PLANE FROM MINE TO BREAKER.

2. VIEW OF TYPICAL BREAKER.

west Virginia, the latter being known as smokeless, as well as coking. Other well-known grades are the Youghiogheny gas coals of southwestern Pennsylvania, the Cumberland smithing coal of Maryland, the Kanawha splint and gas coals, the Massillon domestic coal of Ohio, etc. The anthracite district of Pennsylvania occupies an area of about 470 square miles. The strata between Pottsville and Wyoming, which belong to the lowest portion of the coal measures, are probably about 3000 feet thick; but it is difficult to make an exact estimate, because of the numerous folds and contortions. There are from 10 to 12 seams, each over three feet in thickness. The principal one, known as the Mammoth or Baltimore vein, is 29 feet thick at Wilkes-Barre, and in some places exceeds even 60 feet.

Michigan Field. The Michigan area is a small one in the lower peninsula of Michigan. It forms a circular basin with a diameter of about 50 miles. The coals are bituminous, mostly noncoking, and are mined chiefly for local use. The seams range from a few inches to 3 feet in thickness.

Canada. The Acadian field includes deposits in Nova Scotia and New Brunswick, the former being quite important. The coals are bituminous, sometimes of coking character and of good quality. Extensive deposits of lignite and subbituminous coal are found in the Great Plains area of Saskatchewan and Alberta. In the mountain ranges of Alberta and British Columbia extensive coal seams have been discovered, and they are now under development. Semianthracite is mined near Banff, Alberta. A good quality of coke is made from the coal of Crow's Nest Pass, which finds a market at the British Columbian



CROSS SECTION OF ANTHRACITE COAL MEASURES (PENNSYLVANIA).

The Eastern Interior region of the central province includes parts of western Kentucky, Indiana, and Illinois, and lies chiefly within the latter State. These coals are all bituminous, of Carboniferous age, and are used chiefly for steaming. Many are coking, but do not yield a sufficiently high-grade coke to compete with the eastern product. The thickness of the Carboniferous system varies from 1200 to 1400 feet in southern Illinois, to about 600 feet in Indiana, and the workable coal seams vary in number from 7 to 12 in Illinois, and their thickness from 3 to 8 feet. The "block coal" of Indiana, so called because of its peculiar jointing, is very pure, dry, and noncoking. The western central region includes Iowa, Missouri, Arkansas, Oklahoma, Kansas, and part of Texas. Here again there is an abundance of bituminous coal. That of Iowa is mostly low grade, noncoking, but has fairly good steaming qualities. Some of the Kansas coal is coking, and Arkansas produces both bituminous and semianthracite.

The Cordilleran Region comprises the coal regions of Colorado, New Mexico, Utah, Wyoming, North Dakota, Montana, California, Oregon, Washington, and Alaska. In these fields are found many varieties grading between lignite and anthracite. They are all of either Tertiary or Cretaceous age excepting some in Alaska. Colorado is perhaps the most important producer, having a number of good bituminous seams. Those in the vicinity of Crested Butte have been changed locally to anthracite by the metamorphic action of igneous intrusions. Excellent coking coals are found near Trinidad. The New Mexican coals are in part an extension of the Colorado areas, and bear a good reputation, as do also many of the Wyoming coals. California has little fuel of good quality, and has for many years drawn on Australia for its coal supply, but in recent years the coals of Oregon, Washington, and British Columbia have become a source of supply.

The rocks of the small Rhode Island area have been so highly metamorphosed that the coal has been altered to graphitic anthracite. It is sold on the market as amorphous graphite, and has little value as a fuel.

smelters. Bituminous coals are worked near Nanaimo on Vancouver Island as well as at other points.

Europe. Commercially valuable deposits of coal are found in practically all the independent political divisions of Europe, but in some, as Switzerland, the reserve is nearly exhausted. Indeed in Europe as a whole the duration of the coal supply, considered in the light of the present output, is a matter of serious consideration. The principal anthracite fields are those of the Donetz basin in Russia and the Welsh fields of Great Britain, both being of Carboniferous age. The Belgium-German basins contain the largest reserves of bituminous coal, also of Carboniferous age, but they are not as easily exploited as the British fields, from which consequently a larger percentage of reserves can be extracted. A large proportion of the brown coal of Europe is of Tertiary age, the principal fields being those of Germany, Austria, and southern Russia.

South America. The fields supplying the best quality of coal are those along the Pacific coast and the Gulf of Mexico, the deposits being usually of Tertiary age. These latter occur in the coastal belt of southern Argentine, Chile, and in the mountain districts of Peru, Ecuador, Colombia, and northern Venezuela. Permo-Carboniferous coals are known east of the Andes, outcropping in southern and eastern Brazil, and underlying part of Uruguay as well as possibly a large part of Argentina.

Other Countries. The coal reserves of Asia are large, though not to be definitely estimated, as the Siberian and Chinese coal fields are in-

sufficiently explored. Those of China and India are probably Permo-Carboniferous, those of Japan, Tertiary, and those of Siberia, Lower Carboniferous to recent. In Africa the coal reserves are practically confined to the southern part of the continent. Coal deposits, especially those of Tertiary age, are widely distributed in the islands of Oceania, but New South Wales is the only producer of importance.

Coal Reserves. The accompanying table, compiled under the direction of the International Geological Congress in 1913 gives a careful estimate of the actual coal reserves of the world based on observations and calculations of the geologists in the different countries.

ESTIMATE OF COAL RESERVES OF THE WORLD IN MILLION TONS

CONTINENT	Anthracitic coals, including some dry coals	Bituminous coals	Subbituminous, Brown coals, Lignites	Totals
Oceania	659	133,481	36,270	170,410
Asia	407,637	760,098	111,851	1,279,586
Africa	11,662	45,123	1,054	57,839
America	22,542	2,271,080	2,811,906	5,105,528
Europe	54,346	693,162	36,682	784,190
	496,846	3,902,944	2,997,763	7,397,553

Output. The world's annual production normally is about 1,300,000,000 short tons; but naturally the World War disturbed production in Europe and temporarily stimulated it in the United States. The output of the more important countries as estimated by the statisticians of the U. S. Geological Survey as follows:

ESTIMATE OF WORLD'S COAL PRODUCTION IN CALENDAR YEARS 1919, 1920, AND 1921

(In metric tons of 2204,622 lbs.)

Other Countries	46,553,865	49,068,527	(a)
Totals	1,170,400,000	1,305,000,000	1,100,000,000

(a) Estimates included in total.
(b) Includes Saar and Upper Silesia.
(c) Estimated from 11 months production.

In 1868 Great Britain produced 3.6 times as much coal as the United States, while Germany's product that year was 15 per cent greater than that of the United States. In 1871 the United States exceeded Germany's output by about 10 per cent, but afterward fell back to third place until in 1877 she once more sprang forward, and gained on both Germany and Great Britain. In 1899 the United States led the world, and in 1913 supplied 38.5 per cent of its production. By 1918 this proportion had increased to 46.2 per cent, but in 1921 it had fallen to 40.9, a larger amount than before the war but the smallest since 1916.

Coal Production of the United States. In 1921 the total production of Anthracite in the United States was 78,917,000 short tons which with a colliery consumption of 8,800,000 tons gave a commercial production of 70,117,000 tons. In 1920 the production of Anthracite was about 89,000,000 tons. In 1920 the bituminous coal produced in the United States totalled 556,500,000 tons valued at $2,225,000,000, which was the record production except for 1918 when it amounted to 579,000,000 tons. In 1920 the coal exported from the United States amounted to 39,215,030 short tons while the imports were 2,281,542 tons. Briquettes to the amount of 567,192 tons valued at $4,250,000 were made during the year. The distribution of the consumption of soft coal in the United States is indicated in the accompanying tabulation.

Soft Coal Consumed in the United States and Exported in a Year of Active Business (a)

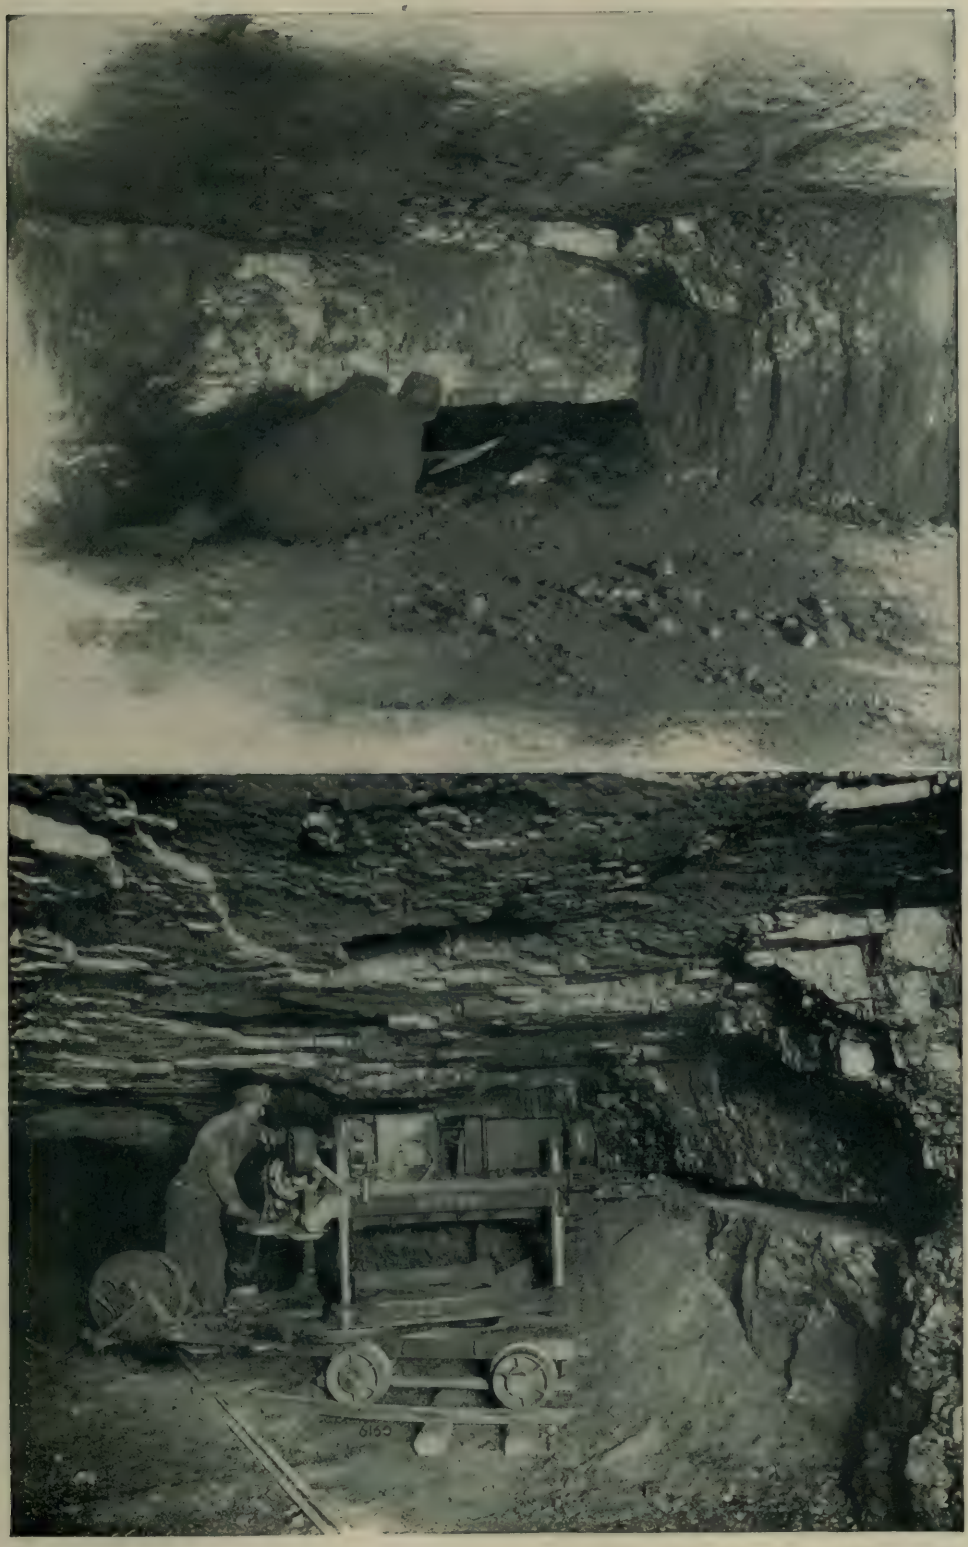
	NET TONS	PER CENT
Railroads	153,700,000	27.7
Industrials, other than steel and coke	139,100,000	25.1
Steel plants	35,500,000	6.4
Coke, Beehive	36,000,000	6.5
By-product	47,740,000	8.7
Public Utilities	31,700,000	5.7
Electric	4,960,000	0.9
Coal Gas(b)	57,100,000	10.3
Domestic Consumers	12,100,000	2.2
Coal mine fuel —		
Exports:		
Canada and Mexico	16,500,000	3.0
Seaborne	9,500,000	1.7
Bunkers		
Foreign trade	6,700,000	1.2
Coastwise and Lake trade	3,600,000	0.6
Totals	554,200,000	100.0

(a) The figures are for the year 1917 except that the Exports are the preliminary figures for 1921 and that the proportions between beehive and by-product coke are those which obtained in 1920.
(b) Excludes coal consumed in by-product coke ovens supplying gas for city use, which is included under by-product coke.

A corresponding Summary for Anthracite would be as follows, the figures being for the coal year ended March 31, 1917.

ANTHRACITE CONSUMPTION	QUANTITY SHORT TONS	PER CENT
Domestic consumers (Domestic Sizes)	49,400,000	55.1
Artificial gas plants	1,650,000	1.8
Steam trade (industries, power plants and heating large buildings)	18,450,000	20.5
Railroad fuel	6,400,000	7.1
Power and heat at mines (estimated)	9,350,000	10.4
Exports	4,640,000	5.1
Totals	89,850,000	100.0

Mining of Coal. The presence of coal in paying quantities having been determined by prospecting and geological surveys, the next consideration is to extract this coal from seams. Speaking broadly, all methods of mining come under the head of either open working or closed working. Open working is employed when the deposits have no overburden of barren rock or earth, or where this overburden is of such small depth that it can be easily and cheaply removed, leaving the coal deposit exposed. The mining of such exposed seams of coal is really a process of excavation or quarrying, and the machines used in making open-pit excavations and in quarrying are applicable to the work. Closed working is adopted when the depth of the overburden is so great that the mining must be conducted underground. The first task in opening up underground coal seams is to secure access to the seam by means of shafts, slopes, or tunnels.



1. THE OLD WAY—Miner working with hand pick.
2. THE MODERN WAY—The machine cutter. The Jeffrey motor turret coal cutter cutting a break-through in a shale band.

1 SULLIVAN ELECTRIC CHAIN MACHINE, Making "light" or corner cut

2. SULLIVAN ELECTRIC CHAIN MACHINE, Cutting across face of room.

Shafts are vertical openings from the ground surface to the coal seams. In the United States shafts are usually made square or rectangular in form. This practice is largely due to the fact that timber is used for lining shafts. In Europe round or oval shafts are frequently employed with linings of brick, iron, or masonry.

Generally the shafts are divided into two or more compartments, one of which contains a ladder, compressed-air pipes, etc., while in each of the remaining is installed an elevator for hoisting the coal cars to the surface. Where the seams are comparatively near the surface, it is usually cheaper to sink a number of two or three compartment shafts than it is to haul all the ore to one large shaft; while, when the shafts are very deep, it is preferable to sink a smaller number of four or six compartment shafts and extend the underground haulage to a single shaft over a great area of the workings. In shallow mines separate shafts are often employed for hoisting and for pumping, ventilation, and ladder ways. One of the largest coal-mine shafts in America is situated at Wilkes-Barre, Pa.; it is 1039 feet deep, 12×52 feet in size, and has five compartments. Slopes are openings begun at the outcrop of an inclined seam, which they follow down into the earth. Slopes are usually made with three compartments side by side, two of which are used as hoistways and the third for the traveling way, piping, etc. When the dip of the slope is under 40 degrees the slope is made about 7 feet high, but when the dip exceeds 40 degrees cages have to be used and a great height is necessary. Slopes are usually lined with timber. Tunnels are nearly horizontal passageways beginning on the side of a hill or mountain and extending into the earth until they meet the coal seam; they are built for both haulage and drainage purposes, and are constructed like railway tunnels, except that the cross section is usually much smaller, and that it is lined with timber instead of with permanent masonry. The forms of timbering used in coal mining are various, and are of interest chiefly to the practical miner. In a general way, it may be said that timber used for underground support in mines should be of a light and elastic variety of wood. Oak, beech, and similar woods are heavy and have great strength, but when they do break it is suddenly and without warning, thus bringing disaster to the miners who might escape if a tough wood were employed which gives warning of rupture by bending and cracking. Steel frames as means of support have several advantages and have met with considerable favor.

The systems of working the coal seams after access is attained to them by the means described are two, known as the room-and-pillar and the long-wall systems. The room-and-pillar method—also known as the pillar-and-chamber or board-and-pillar method, which may include the pillar-and-stall system—is the oldest of the systems, and the one very generally used in the United States. By this system coal is first mined from a number of comparatively small places, called rooms, chambers, stalls, boards, etc., which are driven either square from or at an angle to the haulageway. Pillars are left to support the roof. In the long-wall method the whole face of the coal seam is taken out, leaving no coal behind, and the roof is allowed to settle behind as the excavation progresses, care being taken to preserve haulageways through the falling material. The coal is cut from the seam by hand or by some form of coal-cutting machine. In America machine cutting is used extensively and is employed increasingly in Great Britain. There are four general types of machines in general use: Pick machines, chain-cutter machines, cutter-bar machines, and long-wall machines; the machines most used in America are pick machines and chain-cutter machines. Both compressed air and electricity are used for operating coal-cutting machines. Pick machines are very similar to a rock drill; chain-cutter machines consist of a low metal bed frame upon which is mounted a motor that rotates a chain to which suitable cutting teeth are attached. The ventilation of the working is a very important feature of coal mining, owing to the presence of gases peculiar to coal formations. One of the most common of these is marsh gas, CH_4, which is very explosive if mixed with the right proportions of air. This mixture is what the coal miner calls "fire damp." Other gases found in coal mines and dangerous in one way or another are carbonic-acid gas, CO_2 (called "black damp" or "choke damp"), sulphureted hydrogen, H_2S ("stink damp"), and carbon monoxide, CO ("white damp"). "After damp" is a gas present after an explosion of gas in the mine and is very dangerous. Great care is taken to lay out the workings so as to facilitate ventilation, and mechanical ventilation by means of fans and blowers is usually employed.

Hoisting in mines is accomplished by means of cages, as the elevators are called, running up and down the shafts, and operated by large hoisting engines on the surface. There are two general systems of hoisting in use—hoisting without attempt to balance the load, in which the cage and its load are hoisted by the engine and lowered by gravity, and hoisting in balance, in which the descending cage or a special counterbalance assists the engine to hoist the loaded ascending cage. Haulage in mines is accomplished by animal power or by steam-hoisting engines operating a system of rope haulage or by mine locomotives operated by steam, electricity, compressed air, or gasoline.

The preparation of mined coal for the market consists in screening the coal over bars and through revolving or over shaking screens together with breaking it with rolls to produce the required market size. The large lumps of slate or other impurities are separated by hand, while the smaller portions are picked out by automatic pickers or by hand by boys or old men seated along the chutes leading to the shipping pockets or bins. When coal contains much sulphur, this is frequently removed by washing it with water in special washing plants.

COAL APPLES. The name given to some curious specimens of spheroidal anthracite coal found in the Mammoth seam of Pennsylvania. They vary from one-fourth inch to 10 inches in diameter, but are usually about the size of a hen's egg. They are thought to be due to jointing.

COAL BREAKER. A structure containing machinery for the purpose of crushing, sorting, and cleaning anthracite coal. The breaker is often as much as 150 feet high and rarely less than 80 feet. The coal, as it is hoisted out of the mine, is carried up to the top of the breaker and discharged into a hopper, whence it passes downward over bars, through screens and crushers, and is finally discharged into bins at the bottom. The admixed slate is separated partly by special screens, and the slaty coal (bone coal) is picked out by boys as it slides down the chutes. In the more modern breakers water jigs are used very successfully to separate the slate and coal. The sizes produced are described in the article on ANTHRACITE. The capacity of a coal breaker is commonly about 1000 tons per day, but some exceed 2000 tons in output. Consult Chance, "Report on Coal Mining," *Report AC of the Second Geological Survey of Pennsylvania* (Harrisburg, 1883).

COAL CITY. A village in Grundy Co., Ill., 60 miles southwest of Chicago, on the Atchison, Topeka, and Santa Fe, the Chicago and Alton, and the Elgin, Joliet, and Eastern railroads (Map: Illinois, D 2). Coal is mined, and there are manufactories of brick and tile and clothing. Pop., 1900, 2607; 1910, 2667.

COALDALE. A borough in Schuylkill Co., Pa., 15 miles northwest of Pottsville, on the Lehigh and New England, and the Central of New Jersey railroads (Map: Pennsylvania, K 5). It contains the Panther Valley Mining Institute. The borough is in a productive coal-mining region. Pop., 1910, 5154.

COALFISH (so named from its color). 1. The pollack (q.v.). 2. A singular and interesting chirid fish (*Anoplopoma fimbria*) of the North Pacific, which is usually slaty-black above and white below, but variable with age and place. It is about 18 inches long, allied to the rock trout, and called in California beshow, candlefish, and skilfish.

COAL GAS. See GAS, ILLUMINATING.

COALGATE. A town and the county seat of Coal Co., Okla., 120 miles by rail southeast of Oklahoma City, on the Missouri, Kansas, and Texas and the Chicago, Rock Island, and Pacific railroads (Map: Oklahoma, E 4). The chief industries are coal mining and cotton raising. The water works are owned by the town. Pop., 1900, 2921; 1910, 3255.

COALINGA. A city in Fresno Co., Cal., 98 miles by rail west of Fresno, on the Southern Pacific Railroad (Map: California, E 6). It contains a Carnegie library and fine grammar and high school buildings. Coalinga is practically surrounded by oil wells. In 1912 the production of petroleum in the region was 18,803,292 barrels, and there are now 1327 producing wells in the entire field. The city has eight oil-field supply houses, a refinery, and several machine shops. One of the unique features of Coalinga is the direct supply, through pipe lines to the houses, of distilled water. Pop., 1900, 300; 1910, 4199.

COALING SHIP. One of the most important matters connected with modern naval war is the supply of fuel. In the United States navy this is usually provided by naval fuel ships, but in certain home ports, and occasionally elsewhere, both coal and fuel oil are brought alongside in barges carrying from 200 to 1000 tons. Notwithstanding all that can be done in the way of drill and improved appliances, the operation of coaling a large war vessel requires from 10 to 20 hours if the coal is taken from barges, and about half as long if supplied by one of the new-type fuel ships. From a collier of the older type the time required is considerably greater. Fuel oil, being pumped on board, requires little or no labor and much less time. The loss of time required to coal the vessels of a fleet, even if performed in the most expeditious manner, may seriously interfere with the operations of war. Under existing conditions coaling can be effected only in comparatively smooth water, either at sea or in a protected harbor or roadstead, and requires the vessels to remain at rest or to proceed at a very low rate of speed. Means for coaling at sea, while steaming at a moderate rate of speed on any desired course, have therefore been sought, but those so far designed have not proved very successful. The plan which has given the best results requires the battleship or collier to take the other in tow, the vessel in tow operating her engines to reduce the towing strain to a point which will just keep the lines taut. The coal, in large bags, is hoisted to a point high on the fuel ship's mast, where the bags are hooked to a trolley running on a large wire rope which extends to the other ship. While this method of supplying coal is not regarded with much favor, it is quite probable that oil could be pumped aboard from a ship in tow without great difficulty. See FUEL SHIP.

COALING STATION. See NAVAL STATION.

COAL-LAND FRAUDS. See ALASKA.

COAL MEASURES. See COAL; CARBONIFEROUS SYSTEM.

COAL OIL. See PETROLEUM.

COAL TAR, or GAS TAR. During the process of manufacturing illuminating gas from soft coal, a thick, oily, black liquid collects in the hydraulic main and condensers of the gas works. This is coal or gas tar. It is slightly heavier than water and has a strong, disagreeable odor. Coal tar is a complex mixture of substances, and the separation of its components constitutes one of the most important branches of manufacturing chemistry. It is the only source of innumerable compounds of the greatest value to science and the industries.

By fractional distillation the tar is first

broken up into groups of substances—principally hydrocarbons, phenols, and bases—which are further distilled or otherwise treated. The original fractions, or distillates, vary according to the composition of the tar or the market demand, but the following is an average separation:

1. *"First Runnings" or First Light Oil.* This fraction is collected up to 105° C., and contains water, ammonium salts, the more volatile oils, and a small amount of the heavier oils carried over mechanically. 2. *Light Oil.* The distillate between 105° C. and 210° C. is taken as light oil. It is again distilled and the fraction up to 170° C. forms crude naphtha; above 170° C. the running is put with the next main distillate, the carbolic oil. The crude naphtha is treated with alkali and acids to remove phenols, thiophene, unsaturated hydrocarbons, and pyridines. On further distillation the naphtha yields "90 per cent benzol" up to 110° C., "50 per cent benzol" from 110° C. to 140° C., and "solvent naphtha," or "benzine," from 140° C. to 170° C. The "90 per cent benzol" contains about 70 per cent pure benzene, 24 per cent toluene, and xylene. The 50 per cent benzol contains about 46 per cent benzene. Benzene is the basis for the manufacture of many compounds, notably aniline and its derivatives. It is also used as a solvent. The fraction known as "solvent naphtha," or "benzine," contains xylenes, cumenes, and other higher homologues of benzene. It is used as a solvent for rubber and resins and is also employed to enrich illuminating gas. It is a grease remover, but is not identical with petroleum benzine, also used for this purpose. 3. *Carbolic Oil* is collected between 210° C. and 240° C. It contains phenols and naphthalene. The phenols yield carbolic acid, of powerful antiseptic properties, and the source of many dyes, explosives, and medicines. Naphthalene separates from the carbolic oil as a crystalline mass. It is one of the most important constituents of coal tar and is used extensively as moth-ball camphor and in the preparation of dyes and medicines. 4. *Creosote Oil.* From 240° C. to 270° C. a small amount of distillate is received which contains some naphthalene, together with cresol, naphthol and liquid paraffin. After the removal of the naphthalene its principal use is for preserving timber and railroad ties and as a vermin destroyer. (See CREOSOTE.) 5. *Anthracene,* or *Green Oil,* is collected above 270° C. This fraction contains anthracene, the most valuable constituent of coal tar. It crystallizes out from the oil, is purified, and is extensively employed in the manufacture of the beautiful alizarin dyes, which were formerly made from madder root. See ALIZARIN.

The *Pitch* remaining in the stills after the above fractions have passed over is used in making asphalt, varnishes, tarred paper or roofing paper, and as a cement to bind together soft coal dust as "briquettes" for fuel.

Coal tar in its crude form finds some use as a protective paint, in the preservation of timber, and in making tarred paper. See COAL-TAR COLORS; GAS, ILLUMINATING; and see the articles on the various products mentioned above.

COAL-TAR COLORS. Coloring matters artificially prepared from coal tar, chiefly from the hydrocarbons extracted from it. (See COAL TAR.) The first observation of a colored compound of this class was made by Runge in 1834; but the real beginning of the great modern color industry dates from 1856, when W. H. Perkin obtained a violet dyestuff by oxidizing impure aniline with chromic acid, took out a patent for it, and commenced manufacturing it in England. Many other dyes were subsequently obtained from aniline and the substances related to it, by A. W. Hofmann, Gries, Girard, Lauth, and many others. But the most sensational step was the preparation by Graebe and Liebermann (1868) of a natural dyestuff, viz., the coloring principle of madder root, from the anthracene of coal tar. In 1880 indigo was first prepared, not from coal-tar products, but by a purely synthetic method, and other natural colors have since been prepared in a similar manner; so that natural dyestuffs reproduced by artificial means need not necessarily originate from coal tar. The artificial indigo and alizarin are not mere substitutes for the natural indigo and madder; they are chemically identical with them and surpass them in purity, and their adaptability to special methods in dyeing and printing makes them even more desirable. The color industry was first developed in England and France, but the more thorough technical instruction at the German universities produced a body of skilled manufacturers and investigators who soon took the lead. At present, in addition to the great factories near Berlin, Frankfurt, Elberfeld, and Mannheim, and a host of smaller ones in various parts of Germany, German capital controls many of the establishments in France, Russia, and other countries. The United States possesses few independent factories, and the list of their products is rather limited; indeed, American dyers appear to call for a smaller range of dyestuffs than those of other countries. A peculiar modern development has been the extension of the methods of the dye industry to the production of artificial drugs, such as antipyrin, antifebrin, etc., many of which are manufactured in the same establishments which control the dye patents.

Classification. Artificial colors were formerly classified merely according to the sources from which they were obtained. Thus, many of them, including magenta, "aniline blue," "aniline green," "aniline yellow," etc., were grouped together as *aniline colors.* At present somewhat different systems of classification are used by different authors, but all systems are based exclusively on the chemical constitution of the dyes.

Many attempts have been made to find a general answer to the question, What must be the chemical nature of a carbon compound in order that it may be a dye? An all-embracing answer to this question has not yet been found. But experience has shown that the true dyestuffs exhibit peculiar groupings of the constituent atoms. Such "chromophore" groupings produce, however, only a *tendency* towards color, but not necessarily colors; indeed, many compounds containing them are perfectly colorless, and the majority of true dyes become colorless if deprived of the small amount of oxygen they contain, although their chromophore groups may not be in the least affected. If, however, a chromophore group is combined with certain other atomic groups known as auxochromes, the result is a dye. For example, the so-called *azo group* (—N=N—) is chromophoric; the compound called azobenzene, $C_6H_5—N=N—C_6H_5$, although colored red and evidently containing the azo group, is not a dye; but it becomes one when the so-called amido group (NH_2) also is

introduced into its molecule, the compound $C_6H_5 - N = N - C_6H_4NH_2$, called amidoazobenzene, being a true dye. If, instead of the amido group, a hydroxyl group (OH) is introduced, the result is again a dye (an orange one). Further, the tints of dyes are produced by variation in the "substituting" groups which replace hydrogen in the primitive molecule. Thus, the introduction of the methyl group (CH_3) generally increases the violet tendency; the phenyl group (C_6H_5) produces bluish tints; the naphthyl group ($C_{10}H_7$) a tendency towards brown-red; etc. The relative position of the groups likewise plays a large part in the determination of color. But, as we have already observed, a definite and all-embracing rule does not exist. Frequently compounds must enter into combination with a base or an acid before they will fix themselves upon the fibre, and then the tints are frequently affected by the different bases or acids to a varying degree. For example, alizarin dyes red with the hydroxide of aluminum, and black with the hydroxide of iron.

For the purpose of the present sketch the coal-tar colors may be grouped in five classes: viz., the azo colors; triphenylcarbinol derivatives; quinone derivatives; diphenylamine derivatives; and indigo dyes.

Azo Colors. The characteristic compound of this class is azobenzene, $C_6H_5N = NC_6H_5$, already mentioned above. We have seen that the introduction of either NH_2 or OH in place of a hydrogen atom produces a coloring matter—yellow in the former, orange in the latter instance. Replacing either or both of the phenyl groups (C_6H_5) by more complex hydrocarbon groups deepens the tone (with a tendency towards the redder tints), increases the affinity for fibres, and diminishes the liability to fade. The earlier dyes of this class, such as "aniline yellow," "Bismarck brown," chrysoidin, etc., were singularly brilliant, but were not fast; whereas the browns and the many reds, ranging from scarlet to purple, which are now produced under the names of ponceaux or bordeaux, congos, quinoline red, etc., are exceedingly permanent. In manufacturing this class of dyes nitrous acid is allowed to act upon an ice-cold solution of the salt of any primary base (like aniline), and the "diazo salt" formed is allowed to act on another base or a phenol; an endless variety of combinations is thus possible.

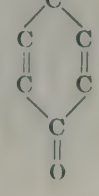
Triphenylcarbinol Derivatives. These represent the first discoveries in the aniline dyes, and some of them are still produced on the largest possible scale. The fundamental compound of the class is triphenylcarbinol $(C_6H_5)_3COH$, and its derivatives are properly subdivided into *rosanilines*, *rosolic acids*, and *phthaleïns*.

In the rosaniline group two or three amido groups (NH_2) are introduced in place of hydrogen atoms of the phenyls (C_6H_5). The *di*amido compounds are green; the *tri*amido compounds are red, violet, or blue. Strictly speaking, the compounds thus obtained are not themselves dyes, but are bases which must first be combined with suitable acids and thus brought into a soluble form. Their salts are beautifully crystalline bodies in the solid condition, showing colors quite different from those of the solutions and having peculiar lustres like those of beetles' wings. The solutions have very intense colorations and stain animal fibres readily and permanently, although they do not fix themselves easily upon cotton or linen. They are the most brilliant and lively dyes, but are strongly affected by sunlight and are consequently less useful than some dyes of other classes. They are generally manufactured by oxidizing processes at a comparatively high temperature, whereby two or three simpler compounds are welded, as it were, into compounds of complex molecular structure. Thus, in the manufacture of the well-known magenta dye (a triamido compound) approximately equal quantities of aniline, orthotoluidine, and paratoluidine are heated from 8 to 10 hours with arsenic oxide to 190° C. in large iron kettles. A very thick mass results, which can be extracted with hot water, and the compound thus obtained is found to be made up of molecular quantities of aniline, orthotoluidine, and paratoluidine, chemically combined.

Rosolic acid and its derivatives are made by the condensation of various phenols, three phenols being condensed into one compound of the rosolic acid group, just as three bases are condensed into one compound of the rosaniline group. The comparatively few dyes of this group give various shades of red. The hydroxyl groups, and hence the acid character of the phenols, remain unchanged in the products of condensation; the latter therefore combine with bases and then they readily go into solution.

The phthaleïns differ from the rosolic acids in so far as one of the three phenyls of the triphenylcarbinol is connected in them with a carboxyl group (COOH), the other two phenyls having one or more hydroxyls apiece, as in the rosolic acids. The phthaleïns were discovered by Adolph Baeyer and are chiefly remarkable for the fluorescence of their alkali salts in solution. They are prepared by heating phenols with phthalic anhydride and a little sulphuric acid; when resorcin is taken as the phenol a very well-known compound is obtained, which has been called *fluoresceïn*, while its sodium salt is known as *uranin*. Solutions of the latter are yellow, with a green fluorescence. This fluorescence is so intense that it is distinctly noticeable in extremely dilute solutions; so that this salt has been used to trace subterranean watercourses supposed to connect two neighboring bodies of water, the dye being thrown into one of these and fluorescence being subsequently noticed in the other. The potassium salt of a brominated fluoresceïn is *eosin*, $C_{20}H_6O_5Br_4K_2$, with a magnificent red and yellow fluorescence. The phenomenon of fluorescence is due to the action of light falling upon the solution. Some of the light rays, being reflected from the surface, carry one color to the eye; some are absorbed; some are emitted in the form of light waves with either a longer or shorter period than those which are absorbed, and thus produce a different color. Fluoresceïn and eosin emit shortened light waves.

The Quinone Derivatives. These contain the characteristic nucleus—



and are almost invariably colored, although they become suitable for dyes only when they also contain several hydroxyl groups. By far the most important substance of this class is alizarin (q.v.), which was already mentioned as identical with the active principle of madder. Anthracene (q.v.), a coal-tar hydrocarbon, is converted into anthraquinone by heating with potassium bichromate and sulphuric acid; the anthraquinone is acted upon by fuming sulphuric acid, and the resulting compound is melted with caustic soda, yielding a sodium salt of alizarin. This is soluble in water with a fine red color, but does not fasten upon any kind of fibre. If, however, cotton is previously impregnated with salts of aluminum, iron, or chromium, the alizarin will form insoluble salts ("lakes") with these metals; and as the precipitation occurs within the pores of the fibre, subsequent washing cannot remove it. Colors of this class of dyes are not suitable for silk and wool, but are very intense and permanent when properly applied to cotton.

The Diphenylamine Derivatives. These include many varieties of dyes, such as the indulins, indophenols, thiazins, etc. Their chemistry is too involved to be disposed of in a few words. It may, however, be mentioned that their characteristic groups are similar to anthraquinone, excepting that the oxygen of the latter is replaced by sulphur, imido groups, etc. The more important dyes of this class include "methylene blue" and "aniline black."

Indigo Dyes. By far the most important of these is indigo itself, a vegetable dye obtained from a tropical plant cultivated in India since the earliest times. The sap of this plant, when fermented under conditions excluding oxygen, yields *indigo white*, a soluble material having the formula $C_{16}H_{12}N_2O_2$; if the fermentation proceeds in the open air, *indigo blue*, $C_{16}H_{10}N_2O_2$, is produced. This substance is a derivative of the base called indol, C_8H_7N, which occurs ready formed, in small quantities, in many animal and vegetable secretions. It can be prepared artificially from aniline and chloraldehyde. When indigo was found to consist of two indol molecules joined together and oxidized, the clue for the production of artificial indigo was at hand. It has since been found that any benzene derivative having a nitrogenous group and a two-carbon group in the "ortho" position may give rise to the formation of indigo. The first practical method, devised by Baeyer in 1880, involved the action of potassium hydroxide on orthonitropropiolic acid; but many other methods have been devised since then, such as the action of melted potassium hydroxide on bromacetanilid, the action of halogenated acetone on aniline, etc. Indigo is one of the most reliable dyestuffs, both as to brilliancy and permanency in either its natural or its artificial form. The latter, however, gives a brighter shade than the average vegetable dye, being of uniform composition and free from the impurities of the natural indigo. Until recently, the finished compound could, however, only be applied after reduction to the soluble indigo white, and this made its use in dyeing and printing somewhat cumbersome. It was necessary to set up a fermentation vat in which the reducing action was allowed to continue for several days before the solution was in a form suitable for dyeing. At present rapid reduction is brought about by the use of sodium hydrosulphite in an alkaline bath, or the indigo may be purchased already reduced and ready for immediate dyeing in an alkaline solution. Indigo is still called a vat color, and many new dyes of great permanency have been placed on the market recently, which, like indigo, are applied in the modern alkaline hydrosulphite vat and are grouped in this class. See INDIGO.

List of Colors. The following are some of the best-known commercial coal-tar colors, their molecular formulas, and the principal methods employed in their manufacture.

Aldehyde Green. See Aniline Green below.

Alizarin, $C_{14}H_8O_4$, made artificially by successive treatments of anthracene with chromic acid and fuming sulphuric acid, and melting the product with potassium hydroxide. Among the dyes allied to alizarin are: *Alizarin Black*, $C_{16}H_8O_4.NaHSO_3$; *Alizarin Blue*, $C_{17}H_9NO_4$; *Alizarin Orange*, $C_{14}H_7NO_6$; and *Alizarin Violet*, or Galleïn, $C_{20}H_{10}O_7$.

Aniline Black, $C_{50}H_{25}N_5$, made by the oxidation of aniline with mineral salts.

Aniline Blue (triphenylrosaniline hydrochloride), $C_{38}H_{35}N_3Cl$, made by heating rosaniline, benzoic acid, and aniline, and subsequently adding hydrochloric acid.

Aniline Brown, Bismarck Brown, or Phenylene Brown (triamidoazobenzene), $C_{12}H_{13}N_5$, made by the action of nitrous acid on metaphenylenediamine.

Aniline Green, or Aldehyde Green, $C_{22}H_{27}N_3S_2O$, made by the action of ordinary aldehyde on an acid solution of rosaniline sulphate and the subsequent addition of sodium hyposulphite.

Aniline Orange. This name is applied to various compounds made by the action of amidosulphonic acids on phenols. The name is often applied to the so-called Victoria Orange, $C_7H_6N_2O_5$.

Aniline Red. See Fuchsin below.

Aniline Scarlet, $C_{18}H_{15}N_2O_4SNa$, made by the action of diazoxylene on naphthosulphonic acid.

Aniline Violet. See Mauveïn below.

Aniline Yellow (hydrochloride), $C_{12}H_{12}N_2Cl$, made by the action of nitrous acid on an excess of aniline.

Auramin (hydrochloride), $C_{17}H_{24}N_3OCl$, made by the successive action of phosgene gas (carbon oxychloride) and ammonia upon dimethylaniline.

Aurantia (ammonium salt of hexanitrodiphenylamine), $C_{12}H_8N_7O_{12}.NH_4$, made by the action of nitric acid on methyldiphenylamine.

Aurin, $C_{19}H_{14}O_3$, made by the action of oxalic and sulphuric acids on phenol.

Benzaldehyde Green. See Malachite Green below.

Benzidine Red. See Congo Red below.

Benzopurpurins, dyes of various scarlet shades. They are chemically allied to Congo Red (which see below) and are made by treating salts of toluidine (which is made from nitrotoluene, and is analogous to benzidine) with nitrous acid, and combining the resulting salts with α- and β-naphthylamine sulphonic acids.

Bismarck Brown. See Aniline Brown above.

Blackley Blue. See Indulin below.

Bordeaux. See Ponceaux below.

Chrysoïdin (hydrochloride), $C_{12}H_{13}N_4Cl$, made by the action of diazobenzene chloride on metaphenylene diamine in aqueous solution.

Congo Red, or Benzidine Red, $C_{32}H_{22}N_6S_2O_6Na_2$, made by the action of nitrous acid and then of sodium naphthionate on benzidine hydrochloride.

Eosin, $C_{20}H_6O_5Br_4K_2$, or $C_{20}H_6O_5Br_4Na_2$, made by the action of bromine on fluoresceïn.

Erythrosin, $C_{20}H_8O_5I_4Na_2$, made by the action of iodine on fluoresceïn.

Fluoresceïn, $C_{20}H_{12}O_5$, made by the action of phthalic acid anhydride on resorcin.

Fuchsin, Rosaniline Hydrochloride, Magenta, or Aniline Red, $C_{20}H_{20}N_3Cl$, made by the oxidation of toluidine and aniline in the presence of acids.

Gallein. See Alizarin above.

Helianthin. See Methyl Orange below.

Indigo. See text of the article above.

Indulin, or Blackley Blue, $C_{18}H_{15}N_3$, made by heating aniline salts with amidoazobenzene.

Magenta. See Fuchsin above.

Malachite Green, Benzaldehyde Green, or Victoria Green, $3C_{23}H_{25}N_2Cl.2ZnCl_2 + H_2O$, made by the condensation of benzaldehyde with dimethylaniline, and the subsequent addition of hydrochloric acid and zinc chloride.

Martius' Yellow, $C_{10}H_5N_2O_5SNa$, made by the action of nitric acid on α-naphthol-monosulphonic acid.

Mauveïn (hydrochloride), or Aniline Violet, $C_{27}H_{25}N_4Cl$, made by the action of chromic acid on aniline containing some toluidine.

Methyl Orange, $C_{14}H_{12}N_3SO_3Na$, made by the successive action of nitrous acid and methylaniline upon paraämidobenzene-sulphonic acid; it is the sodium salt of helianthin.

Methyl Violet, $C_{24}H_{28}N_3Cl$, made by oxidizing dimethylaniline with metallic salts.

Methylene Blue, $C_{16}H_{18}N_3SCl$, made by heating amidodimethylaniline with sulphide of iron.

Naphthol Yellow, $C_{10}H_5N_2O_8SK$, made by the action of nitric acid on α-naphthol-trisulphonic acid.

Night Blue, $C_{28}H_{24}N_2O$ (the hydrochloride of this is the commercial dye), made by heating pararosaniline with aniline and benzoic acid.

Nigrosin, $C_{18}H_{18}N_2$, made by heating aniline salts with nitrobenzene.

Pararosaniline (chloride), $C_{19}H_{18}N_3Cl$, made by oxidizing a mixture of paratoluidine and aniline with arsenic acid, or nitrobenzene.

Phenylene Brown. See Aniline Brown above.

Ponceaux, or Bordeaux. Various derivatives of azonaphthalene. "Ponceau 3R," $C_{18}H_{16}N_2O_7S_2Na_2$, is made by combining diazocumene chloride with β-naphthol-disulphonic acid.

Primulin, $C_{14}H_{12}N_2S$ (?), made by the action of sulphuric acid on thiotoluidine.

Resorcin Yellow, or Tropæolin, O, $C_{12}H_{10}N_2O_5S$, made by the action of diazobenzene-sulphonic acid on resorcin.

Rhodamine (hydrochloride), $C_{28}H_{31}N_2O_3Cl$, made by the action of phosphorous trichloride on fluoresceïn, and treatment of the product with diethylamine.

Roccellin, $C_{26}H_{15}N_2O_6SNa$, made by the action of β-naphthol on the diazo compound of naphthionic acid.

Rosaniline. See Fuchsin above.

Rose Bengale, $C_{20}H_4Cl_2I_2O_5K_2$, made by the successive action of chlorine and iodine upon fluoresceïn.

Rosolic Acid, $C_{20}H_{16}O_3$, closely allied to aurin; neither aurin nor rosolic acid is specially valuable.

Safranin, $C_{21}H_{21}N_4Cl$, made by the oxidation of a mixture of toluylene-diamine and aniline or toluidine.

Tropæolin. This name is applied to various compounds made by the successive action of nitrous acid and phenols upon amidobenzene sulphonic acids. See Resorcin Yellow above.

Uranin, $C_{20}H_{10}O_5Na_2$, the sodium salt of fluoresceïn (which see above).

Victoria Green. See Malachite Green above.

Victoria Orange. See Aniline Orange above.

Leffman (Philadelphia, 1912); Hesse, *Coal-Tar Colors Used in Food Products*, government publication (Washington, 1912). A journal devoted to the progress of the coal-tar industry has, since 1877, been published in Berlin by Friedländer, under the title *Fortschritte der Theerfarben-Industrie und verwandter Industriezweige*. The most important dyestuffs will be found described in some detail under their special names. See also Dyeing; Textile Printing.

COAL'VILLE. A town of Leicestershire, England, 16 miles northwest of Leicester, in the midst of a coal district. It has mines, foundries, car works, and brick kilns. Pop., 1901, 15,281; 1911, 18,548.

COALVILLE. A city and the county seat of Summit Co., Utah, 40 miles southeast of Ogden, on the Union Pacific Railroad, and on Weber River (Map: Utah, C 2). It is in a coal-mining region and has stock-raising and agricultural interests. The water works and electric light plant are owned by the city. Pop., 1890, 1166; 1900, 808; 1910, 976.

COAMO. A town of Porto Rico, on the Coamo River, 18 miles east-northeast of Ponce, in a municipality of the same name (Map: Porto Rico, D 3). It is a favorite resort on account of mineral waters known as the Baños de Coamo. Pop., 1899, 3244; 1910, 3869. Pop. of municipality, 1899, 8249; 1910, 11,170.

COAN, kō'an, Titus (1801–82). An American missionary, born in Killingsworth, Conn. He was ordained as a Congregational minister in 1833 and in that year explored Patagonia, where his attempt to establish a mission was unsuccessful. Immediately afterward (1835) he went to the Hawaiian Islands, and for the remainder of his life, except a visit to the United States in 1870, was a missionary at Hilo, where he received more than 12,000 into a church and organized missions from Hawaii to the Marquesas and Gilbert Islands. He published many valuable papers on the volcanoes of Hawaii and two books entitled *Adventures in Patagonia* (1880) and *Life in Hawaii* (1881), the latter a classic of missionary literature. See the *Memorial* (Chicago, 1885) by his wife.

COAN, Titus Munson (1836–1921). An

American author, son of Titus Coan, born at Hilo, Hawaiian Islands. He was educated at Williams College and at the College of Physicians and Surgeons of Columbia University. From 1861 to 1863 he served as an interne at Bellevue Hospital and in army hospitals and from 1863 to 1865 was assistant surgeon in Admiral Farragut's squadron. In 1880 he founded, and thereafter was director of, the New York Bureau of Revision, and founded *Topics of the Time*. His writings include: *Ounces of Prevention* (1885); *Hawaiian Ethnography* (1899); *The Natives of Hawaii: A Study of Polynesian Charm* (1901); *Climate of Hawaii* (1901).

COAN GARMENTS. See Cos.

COANZA, kō-än'zȧ. See KUANZA.

COASTAL PLAIN. In physiography, the name given to a portion of the North American continent bordering the Atlantic Ocean and the Gulf of Mexico. From New York to Georgia the Coastal Plain includes the strip of low-lying lands that is limited on the east by the Atlantic and on the west by the first foothills of the Appalachian Mountain system. In northern Alabama the Coastal Plain passes around the southern limit of the Appalachians, after which it widens out and reaches northward as far as the Ohio River. West of the Mississippi River it extends with decreasing width southwestward into Mexico. The peculiar features of the Coastal Plain are its low elevation and the predominance of stratified rock formations of recent geological age. On the outer border the surface is flat and raised but little above sea level; towards the interior there is an increasing diversity of relief owing to the higher elevation and the extensive erosion by streams. The western limit of the plain, where the horizontal strata give way to the upturned and eroded rocks of the Appalachians, is marked by a sharp slope and by numerous cataracts. Geologically the Coastal Plain consists of Cretaceous, Tertiary, and Quaternary beds, which still retain the relative positions they acquired during deposition, although they have since been elevated above sea level. Consult Mill, *The International Geography* (New York, 1900). See AMERICA; UNITED STATES.

COAST AND GE'ODET'IC SUR'VEY, UNITED STATES. A bureau of the Department of Commerce, which has for its object the survey of the coasts of the United States and all coasts under the jurisdiction thereof, and the publication of charts covering those coasts. This includes the investigation of the character of the sea bottom, the location of reefs, shoals, etc., the rise and fall of tides, the direction and strength of currents, the character and amount of magnetic disturbances, and the position and elevation of points in the interior, for the benefit of commerce. An Act of Congress, approved Feb. 10, 1807, authorized a survey of the coast of the United States and appropriated $50,000 to pay for beginning the work. On March 25, 1807, a circular letter from the Secretary of the Treasury requested plans for the execution of the work. Nothing was immediately done beyond the consideration of these plans, and no further action was taken until April 16, 1811, when it was decided to send F. R. Hassler, whose plans had been approved by President Jefferson, to Europe to procure the necessary instruments. Mr. Hassler's proposed plan, briefly stated, was to determine the positions of certain prominent points of the coast by astronomical observations and to connect these points by trigonometrical lines from which to make a geodetic survey. Mr. Hassler sailed for Europe on Aug. 29, 1811, and, owing largely to the war between England and the United States which intervened, he spent four years in England and on the Continent, returning to the United States with his outfit complete on Oct. 16, 1815. Field work was actually begun on Aug. 6, 1816, under the direction of Mr. Hassler as superintendent. From this time until April 14, 1818, operations were continued in the vicinity of New York City. A base line was measured in the valley of English Creek, May 7, 1817, and one of verification, twice measured, was completed on December 6 of the same year. The triangulation connecting these measured lines represents the nucleus of the work of the Coast Survey and embodies its first tangible results. The trigonometric network now covers a large part of the continental portion of the United States, and will ultimately be extended north and south by Canada and Mexico. By agreement a common reference datum for all geographical positions in these countries has been adopted and designated "The North American Datum." On April 14, 1818, it was enacted by Congress that so much of the law relating to the survey of the coast as authorized the employment of other persons than those belonging to the army and navy be repealed. Between 1818 and 1832 little work was done. The instruments, records, and funds were transferred to the War Department, and the Coast Survey may therefore be considered as in army service during this period.

In 1823, 1824, and 1825 efforts were made by the Navy Department to establish a hydrographic corps, but public sentiment favored a return to the ideas of Jefferson. Bills were introduced in Congress in 1828 and in 1831, and one was finally passed, on July 10, 1832, carrying into effect the original law of 1807. On August 9 of the same year Mr. Hassler was again appointed superintendent. Field work was resumed in April, 1833. Less than a year later, March 12, 1834, the administration of the Survey was transferred from the Treasury Department to the Navy Department, Mr. Hassler, however, remaining in charge. These conditions held for two years, when a transfer was effected on March 26, 1836, and the Treasury Department again assumed control. Operations continued without interruption until March 30, 1843, when a Board of Reorganization was convened with Mr. Hassler as chairman. The plan submitted by this board practically continued in force the plans which had been formulated and acted upon in former years by Mr. Hassler. The scientific organization of the Survey may be properly said to date from 1832. Mr. Hassler died in 1843, having held the office of superintendent twice, from Aug. 3, 1816, to April 14, 1818, and from Aug. 9, 1832, to Nov. 20, 1843. During his incumbency of office the original triangulation in the vicinity of New York City was extended eastward to Point Judith, R. I., and southward to Cape Henlopen, Del. The area included in this triangulation amounted to 9000 square miles and determined the positions of about 1200 stations to be used in the delineation of about 1600 miles of shore line. Prof. A. D. Bache became superintendent in 1843. He extended the triangulation along the South Atlantic coast and among the Florida

Keys, instituted regular and systematic observations of the tides and the Gulf Stream, and investigated magnetic forces and directions.

The Civil War practically stopped the Survey, although many of its officers were assigned to service on Federal war vessels, where their knowledge of the coast waters proved of great service in the various naval operations which were conducted by the Northern fleets. In 1867 Professor Bache died and was succeeded by Prof. Benjamin Peirce, of Harvard University, who served until Feb. 17, 1874. Since then the successive heads of the Survey have been: Carlile P. Patterson, who served until his death in 1881; Prof. Julius E. Hilgard, who resigned in 1885; Frank M. Thorn, who resigned in 1889; Prof. T. C. Mendenhall, who resigned in 1894 to become president of Worcester Polytechnic Institute; Gen. W. W. Duffield, who resigned in 1897; Prof. Henry S. Pritchett, who resigned in 1900 to become president of Massachusetts Institute of Technology, and O. H. Tittmann, who was appointed superintendent in 1900.

The original and the principal purpose of the organization is a survey of the coasts of the United States primarily for the benefit of commerce. It is charged with the duty of publishing all results of such a survey that may be useful to the public. There has been added to its original duty, by legislation, that of determining the magnetic elements, exact elevations, and geographic positions in the interior. In 1878 the name of the organization was changed by Congress from Coast Survey to Coast and Geodetic Survey, in recognition of the extension of its functions to include triangulations in the interior.

The Coast and Geodetic Survey is a bureau of the Department of Commerce, and the head of the bureau, known as the superintendent, reports to the Secretary of the Department. The superintendent is charged with full responsibility in every respect for all the work of the bureau. He is aided in such of his duties as cannot be delegated to officers of lower rank by an assistant superintendent, who acts as superintendent in his absence. Eight officers or groups of officers report directly to the superintendent and assistant superintendent, viz., (1) the assistant in charge of the office; (2) the inspector of hydrography and topography; (3) the inspector of geodetic work; (4) the inspector of magnetic work; (5) the disbursing officer; (6) the editor; (7) the chiefs of field parties; (8) the heads of suboffices. The first four of these officers have a general supervision over all the operations of the Survey both in the field and office, each acting as an advisory officer to the superintendent in regard to specified portions of the work. The functions of the fifth and sixth officers are stated fully further on. The officers in groups seven and eight have direct charge of all operations in the field. Each field party is a temporary organization which is created for a specific operation by an order of the superintendent, which makes one of the officers of the field force the chief of party, and, if necessary, assigns to him as subordinates one or more other officers from the same force. The party is disbanded when the work assigned to it has been completed. If the party is for duty on land the remainder of the organization of the party, the hiring of laborers, drivers, etc., is left to the chief of party. If the party is for duty on a vessel, the assignment of an officer of the field force to command the vessel carries with it, necessarily, the command of the whole force on board the vessel, including watch and deck officers as well as crew. There was in 1913 a field force of 64 assistants, 29 aids, 12 magnetic observers, 4 nautical experts, 12 tide observers, 55 watch officers, engineers, surgeons, deck officers, etc., and 343 enlisted men, together with others found necessary to secure effective work, while the office force, consisting of 165, is divided as follows: disbursing agent, chiefs of division, clerks, computers, draftsmen, engravers, instrument makers, printers, etc. Field officers are subject to office duty. The Survey has a fleet of 10 steamers, 1 schooner, and small craft. There are suboffices at San Francisco, Cal., and Manila, P. I. The survey of the Philippine Islands has been undertaken in coöperation with the insular government, which furnished four steamers for the work and pays a large portion of the expense, and in 1914 was rapidly nearing completion. About 63 per cent of the coast line of the islands had been surveyed in the interval between 1900 and 1914.

The inspector of hydrography and topography, reporting directly to the superintendent, has a general supervision over the classes of field work indicated in his title, places before the superintendent plans for such work, makes the necessary inspection in the field to insure that the superintendent's orders are carried out economically and effectively, and is especially charged with the supervision of all matters relating to the ships and their *personnel*. *The Coast Pilot*, a publication giving full description of the coast from the mariner's point of view, sailing directions, warnings as to dangers to navigation, and other information of special value to navigators, is prepared under his direction. The inspector of geodetic work, reporting to the superintendent, is charged with the duty of preparing plans for the field operations of triangulation, astronomic determinations, and precise leveling, and of making inspections of parties in the field, and of records and correspondence received at the office from field parties, with a view of insuring that the field operations are in accordance with the superintendent's orders, are of the desired degree of accuracy, and are efficient and economical.

The inspector of magnetic work, reporting to the superintendent, is charged with similar duties in regard to the magnetic work of the Survey. The assistant in charge of the office, reporting to the superintendent, has charge of the office at Washington, is responsible for the safety and arrangement of archives and property, and receives all money paid to the Survey for charts and other publications. As the official head of the office, the chiefs of the following divisions of the office force report to him: computing division, magnetic division, tidal division, drawing and engraving division, chart division, library and archives division, and instrument division. Each of these divisions, under the direction of the assistant in charge of the office, prepares replies for the superintendent's signature to such parts of the correspondence as fall within its particular field and also furnishes such information and equipment to field parties as it is within their power to furnish. In the computing division all computations in connection with triangulation, astronomic determinations, and precise leveling are made, appropriate regis-

ters of results are kept, and the results prepared for publication as rapidly as possible. The magnetic division and the tidal division deal similarly with the computations and publication of magnetic and tidal results, respectively.

The chart-construction division is divided into five sections: (1) the photographing section, engaged in reducing, enlarging, and reproducing drawings for various purposes; (2) the drawing section, engaged in making from the original topographic and hydrographic field sheets, the office drawings, which are the originals in completing unfinished hydrographic sheets sent in from the field, corrections of charts especially with reference to aid to navigation (lights, buoys, etc.), preparation of data for the weekly *Notices to Mariners* published by the Bureau of Lighthouses in coöperation with the Survey, and the inspection of charts in their various stages of preparation, from which charts are produced, either by engraving on copper or by photolithography; (3) the engraving section, engaged in copperplate engraving; (4) the electrotype section, engaged in producing, from the original engraved copperplates by electrotype process, the copper plates actually used in printing the charts; (5) the printing section, engaged in printing charts from the copperplates and by photolithography. The chart division is engaged in applying such hand corrections to charts, before issuing, as have become necessary on account of changes, principally in the aids to navigation, as have taken place after the chart was printed; and with the clerical work connected with the issue and sale of charts, coast pilots, and tide tables. The library and archives division has charge of the library of the Survey and the archives in which all hydrographic and topographic sheets and all the original records and computations are stored.

The instrument division has charge of all the instruments and general property. Instruments needed for work of primary importance are designed and made in the division, and it is continually engaged in the repairing and remodeling necessary to keep the instrumental outfit at a high standard of efficiency. The accounting division, at the head of which is the disbursing officer, is not a division of the office in the sense of reporting to the assistant in charge of the office. This disbursing officer makes all disbursements on account of the Survey, with the approval of the superintendent, renders a quarterly account of all such disbursements to the auditor for the State and other departments, renders a statement of expenditures and balances to the superintendent whenever required to do so, suspends returns for correction or disallows all items of expenditure irregular in form or in contravention of law or regulations, and refers to the Comptroller of the Treasury, for decision, all apparently excessive or unnecessary charges. The editor, reporting to the superintendent, compiles the administrative part of the annual report and acts as editor in connection with all other publications of the Survey except the charts.

COAST ARTILLERY. This term means both the guns used in harbor defense and the troops that man these guns. In most countries there is no special body of men exclusively assigned to harbor defense. That duty is taken to fall naturally to the foot, or unmounted, artillery. In the United States, however, the Coast Artillery constitutes a special corps. (See COAST ARTILLERY CORPS.) If we keep in mind the great length of our coast line, and the fact that some of our most important harbors are immediately on that line itself, it is logical to assign their defense to a special body of men. In England the duties of harbor defense fall to the Royal Garrison Artillery, one of the great subdivisions of the Royal Regiment of Artillery.

For general administrative purposes the coast of the United States is divided into three districts: the North Atlantic, from Maine to Delaware; the South Atlantic, from Delaware to Texas; and the Pacific, from Washington to the southern boundary of California. Two of these are under the command of general officers coming from the corps. The general districts are themselves further subdivided into artillery districts proper, commanded by colonels and lieutenant colonels. Of these artillery districts proper, there are 9 in the North Atlantic, 12 in the South Atlantic (including the Gulf States), and 4 in the Pacific Coast district, respectively. To these must be added 2 districts in the Philippines, Manila Bay and Subic Bay, and 1 in the Hawaiian Islands.

The following table exhibits the guns served by the Coast Artillery (only calibres greater than 3 inches are included); the powder used is a nitrocellulose.

GUN	Weight of projectile	Range, yards corresponding to maximum elevation
3-inch	15 uncapped	8,500
4 "	33 "	8,500
4.72	45 "	11,000
5	58–59 long cap	10,000
6 (1908)	108 " "	11,000
8, M I and M II	323 " "	11,000
10	617 " "	12,000
12 (Mod. 1900)	1070 " "	11,000
14 (1910)	1660 " "	18,000
16	2400 " "	18,000
12-inch mortar (1912)	700 " "	20,000

A strong family likeness exists among all guns used for harbor defense; all fall substantially under three classes, (*a*) high power, of large calibre, 8 inches and upward, for the attack of side and turret armor; (*b*) high power, of smaller calibre, 3 to 6 inches, for unarmored vessels, torpedo boats, and to sweep mine fields; (*c*) mortars for deck attack, of which the chief development is to be found in the United States. The English place their principal reliance on a 9.2 piece for ship attack. In other countries, until lately, the highest calibre was 12 inches, but there is to-day a distinct tendency to go beyond this limit. For details, see ORDNANCE.

COAST ARTILLERY CORPS, kōr. That portion of the army of the United States charged, by the Act of Congress approved Jan. 25, 1907, with the care and use of the fixed and movable elements of land and coast fortifications, including the submarine and torpedo defense. Its *personnel* consists of a chief with the rank of brigadier general, 14 colonels, 14 lieutenant colonels, 42 majors, 210 captains, 210 first lieutenants, 210 second lieutenants, 48 "additional" officers, 63 sergeants major, 26 master electricians, 74 electrician serjeants, 1st class, 74 electrician serjeants, 2d class, 42 master gunners, 60 engineers, 60 firemen, 170 companies, and 14 bands—a total of 749 officers and not exceeding 18,931 enlisted men. Officers and certain classes of noncommissioned officers and men receive their

technical instruction at the Coast Artillery School at Fort Monroe, Va. The regimental organization of the United States artillery was abolished by the Law of Feb. 2, 1901, and the entire arm was designated as the "Artillery Corps," which was charged with the care and use of both field and coast artillery. By the Act of Jan. 25, 1907, these two branches were made separate and distinct, 6 regiments of field artillery were created, and the "Coast Artillery Corps" was organized as outlined above. See ARMY ORGANIZATION; COAST ARTILLERY; COAST DEFENSE; UNITED STATES, *Army*.

COAST DEFENSE. A sharp distinction should be drawn between coast defense and coast defenses. Coast defense involves the protection of the coast at all points, whether fortified or not, against any enemy whatever. It thus involves all arms of the service, even cavalry, for it is conceivable that the enemy, wishing to possess himself of New York, e.g., and deterred by the difficulties of a purely naval attack, may endeavor to land an army at some unprotected point and attack the city in the rear. Or a fleet may attack any unfortified region of the coast in order to support the operations of an army already ashore. To guard against such a possibility is a function of coast defense, even though not a single shore gun had fired a shot. Coast defenses, on the other hand, are the various works and batteries with all their auxiliaries, prepared in time of peace for the defense of the principal ports and waterways against purely naval attack. But even in such an attack land troops, chiefly infantry, as distinguished from artillery troops proper, may be called to play a part and should always be available.

In any war carried on over sea by a strong naval power, the acquisition of a hostile port is a matter of prime importance. Hence works are erected the world over in order to make such an acquisition, if not impossible, at least extremely difficult. In the modern defense of harbors two great classes of elements are employed: (1) guns or mortars for the direct attack of ships; (2) obstructions to delay the advance of a fleet. These obstructions themselves are either (*a*) passive, such as booms, sunken barges, etc., or (*b*) active, i.e., submarine mines, and dirigible torpedos operated from the shore. The chief reliance to-day, however, rests on submarine mines. To these two great classes of elements must be added warships proper, if any should be available. A moment's reflection will show the relation existing between the two classes of elements just mentioned. Without obstructions a fleet may run past the works, e.g., by night, or in thick weather, or even in broad daylight. Without guns and mortars the removal of obstructions is merely a question of time, involving practically no risk. But by the combination of these two elements a fleet is stopped under the effective range of the shore guns, since obstructions are placed where they can be easily swept by the batteries.

Whether coast defense in its narrower sense of harbor defense should be intrusted to the army or to the navy has been a much-debated question. The solutions reached vary according to the necessities of the countries interested. To-day, in the United States and in England, harbor defense is left to the army; in Germany, chiefly to the navy. It should be recollected, however, that Germany has only two ports—military ports—whose defense gives her any particular concern. The French have apparently never been able to come to any rational decision of the matter: the army and the navy are both responsible, so that in case of war confusion and inefficiency would probably result. It is clear that where harbor defense is intrusted to the army, the navy is free to discharge its principal function, viz., to seek out and destroy the enemy's fleets. This principle may safely be ignored only when, as in the case of Germany, harbor defense is relatively unimportant. It should be recollected, further, that even if the navy should be charged with the defense in question, it must employ the same means as the army, when it is responsible.

The defense of a seacoast involves the principles of both strategy and tactics. In considering the principles of strategy applicable to coast fortification it is essential to take into account the navy as our first line of defense. Every nation possessing a coast line has commercial interests, the protection of which requires a navy. Her fleet, whatever its strength, will require points of support on the home coast, to serve as a basis of operation in attack or defense. These points of support contain all the material necessary for building or equipping ships; they furnish all the needed men and supplies to the navy and must offer for a beaten fleet, or one which on the outbreak of war has not yet completed its equipment, a safe harbor to repair damages or complete equipment. Naval material is very expensive; it is difficult or impossible to secure it after war has begun; consequently, the greater part must be prepared in time of peace and collected at the points of support, for which purpose extensive depots, magazines, and other constructions must be erected. To prevent their destruction at one blow and to guard the fleet, while still taking in supplies or completing its equipment, against surprise, these points of support must be protected by suitable means, and this is the purpose of fortifications.

The only points of a coast that fulfill the conditions imposed by these considerations are the larger harbors (always bays and mouths of rivers), and they must be fortified not only against attack by sea, but also against land attack, for the war between Japan and Russia showed conclusively that important naval ports (Port Arthur, e.g.) may be taken by forces landed on the coast without risking an attack on them by sea.

In applying the principles of land tactics to the selection of sites for, and the construction of, seacoast forts, some modifications must be introduced, due to the fact that the enemy in the latter case is confined to the navigable channels, so that all his possible flanking attempts can be foreseen and provided against. The principles of tactics which find application here are: 1. To obstruct the enemy's advance, while leaving free that of the forces of the defense for offensive movements; in other words, so to obstruct the water approaches against the enemy as to leave free entrance and exit for the defending fleet. 2. To be superior to the enemy at the point of attack, i.e., to bring to bear on the channels of approach a heavier fire of high-power guns and howitzers and mortars than any fleet able to operate there can bring to bear on the defenses. 3. To place the isolated units for most effective action so as to be mutually

COAST DEFENSE GUNS—U. S. ARMY

1. TWELVE-INCH GUN MOUNTED ON BARBETTE CARRIAGE, WITH FIRING DETAIL.
Weight of Gun, 52 tons. Weight of Projectile, 1046 pounds. Weight of Powder Charge, 279 pounds. Projectile carries bursting charge of 58½ pounds

2. THREE-INCH FIFTEEN POUNDER RAPID FIRE GUN ON BARBETTE CARRIAGE.
Weight of Gun, 2690 pounds. Weight of Projectile, 15 pounds. Weight of Powder Charge, 5½ pounds. Projectile carries bursting charge of 4.2 ounces. This type of gun is for coast defense in repelling light-armored vessels of the torpedo class

supporting; this is accomplished by scattering the forts to prevent the enemy from concentrating his fire, at the same time arranging them so that fire can be concentrated on him. 4. To protect well the flanks of the position and compel the enemy, if he attacks at all, to make a direct frontal attack. This is done by closing all unnecessary channels, by protecting the obstructions by means of rapid-firing guns and the operators by means of bombproofs, and at night by illuminating the obstructed field with search lights. 5. To provide means for offensive returns against countermining operations, either by means of a swarm of torpedo boats, or by batteries for operating movable torpedoes from the shore. To these must be added an accurate and rapid range-finding and communication service.

There are two systems of guns in use in coast artillery: the flat trajectory, high-power guns, designed to pierce the side armor of battleships, and the high-angle pieces (howitzers or mortars) whose projectiles are designed to fall on the decks. Both are necessary, and each has its proper sphere of action, the former having by far the greater accuracy, and the latter attacking the battleship at its weakest point. In Europe howitzers are generally preferred; but the recent development of mortar fire in the United States service has proved the greater value of the latter. The calibre of the fort guns must be at least equal to that which the depth of water in the channel will enable the enemy to bring against the defenses and sufficient to pierce his armor at the outer mine field. The greatest thickness of Krupp armor used in the latest battleships is about 15 inches at the belt, and to penetrate this at the required range will require a 12-inch gun. The average thickness of deck armor at present is about 3 inches of hardened nickel steel, and to penetrate this a high-angle gun (howitzer or mortar) 12 inches in calibre will be required. These are the maximum calibres required against battleships, but to prevent distant bombardment of cities, etc., there are larger rifles and for close ranges also an 8-inch rifle. Armored cruisers have from 5 to 6 inches of hardened nickel-steel armor, and to penetrate their armor within the mine field (where they first come seriously into play) will require a 5-inch or 6-inch rapid-fire gun. The smaller vessels have but little armor protection, but as they come into action at the outer mine field (about 3600 yards) the smaller calibre guns to fight them must have the necessary penetration at that range, consequently must be about 2.5 to 3 inches in calibre.

The number of guns of each calibre essential to the defense of a harbor depends primarily on its importance; a weighty factor of this importance is the depth of water approach.

From the depth and length of the approach, taken in connection with the importance of the place, political or commercial, can be determined the number and nature of ships that might attack, and hence roughly, the number of guns to be provided by the defense. These should be, preferably, as many as the enemy can bring to bear, never less than half as many. If the enemy's armament is not known, then in deep channels from 30 to 60 guns of 6-inch calibre and over must be allowed to the mile. (Abbott.) The outer mine line is derived by the intersection of the curves representing the limit of armor-piercing ranges of the guns on either side of the entrance, so that these torpedoes are under the effective fire of all the guns in the harbor; the inner line is usually at the narrowest part of the entrance.

The battle tactics of coast defense comprise defense against blockade, bombardment, and attack by sea.

DEFENSE AGAINST BLOCKADE

The object of a blockade is the isolation of the port concerned in order to close all commercial communication by way of the sea, and presupposes the defeat of the enemy's fleet, which may also be shut up in the port. The observation of the movements of a daring enemy thus shut in is one of the most difficult problems which fleets have to encounter, and history shows that it is almost impossible. "For example, in 1759, the French fleet succeeded in breaking through the blockade of Dunkirk without being observed by the English fleet consisting of 66 ships." "In 1805 Nelson was in continuous observation of the harbor of Toulon. In spite of this fact the French fleet succeeded in running out, returning again because of injuries at sea, again leaving the harbor and joining the Spanish fleet, the combined fleets then sailing for the West Indies. Only after their return was Nelson enabled to seize them." The defender will naturally resist the blockade as long as possible and try to fit his fleet for active service again as promptly as he can. His first duty, then, is to keep the blockading fleet as far out as possible, and this duty will fall to the coast artillery, which must be constantly prepared, the guns ready for immediate action, the stations and range finders continually manned, and the searchlights constantly at work. The plentiful use of electric light as a fighting agent is a passive factor, but one of very high value. His next duty is to inflict as much damage as possible on the blockading fleet, and this duty falls to the fleet stationed in the harbor, which must at all times be ready for action, and single torpedo boats should be sent out, under cover of darkness, to attempt the destruction of the enemy's ships. When the defeated fleet is ready for sea again, the coast artillery will open a heavy fire on the enemy's ships, and, aided by their own artillery fire, the home fleet will endeavor to break through. This will naturally lead to a purely naval engagement, which need not be further considered here.

DEFENSE AGAINST BOMBARDMENT

Bombardments aim chiefly at the destruction of the naval establishments of a port, such as the arsenals, docks, magazines, and ships of the fleet lying in the harbor, but also secondarily at the destruction of cities and establishments other than those purely naval, in order to produce a moral effect on the people. Bombardments are applicable only under special circumstances and not against every harbor; indeed, the latter must be a true roadstead. But even then the fortifications and armament must be either weak or obsolete. From this fact, and because of the limited supply of ammunition carried by ships, a bombardment will but rarely be justified. If it is attempted, however, the attacking fleet will set aside a small portion of its artillery to attack the coast artillery, re-

serving the greater part to attack the establishments lying within the harbor.

The defender will attempt to hold the open sea as long as possible with his fleet, but when driven in he will assemble his ships in rear of the outer obstructions, or at least attempt to hold that line with his torpedo boats. The coast artillery will endeavor to keep the enemy as far as possible from the harbor. The object being to prevent, if possible, a bombardment of the harbor or city, all guns should take part, and when the enemy's fleet approaches the proper range, high-angle fire, with deck-piercing shell, will be used. The gunboats and coast defenders or monitors of the home fleet can materially assist the coast artillery by the fire of their guns, but they must be protected from the enemy's torpedo boats by a number of destroyers. As in case of blockade, the guns must be kept constantly manned and ready for action, and at night the searchlights must be constantly at work. Should the enemy be forced to retire, the home fleet must advance to the attack. See BOMBARDMENT.

DEFENSE AGAINST ATTACK BY SEA

In attacking a hostile coast a fleet may either direct its efforts against a fortified harbor or attempt to take possession of unfortified coast regions. The problem for the defense, therefore, naturally resolves itself into the defense of fortified places and the defense of unfortified coast regions. The phases of the attack by sea in the first case are, in order, the removal of the outer obstructions, the reconnaissance, the artillery duel, the removal of the inner obstructions, the forcing of the entrance, and, finally, landings to obtain full possession of the forts. The phases of the defense will correspond.

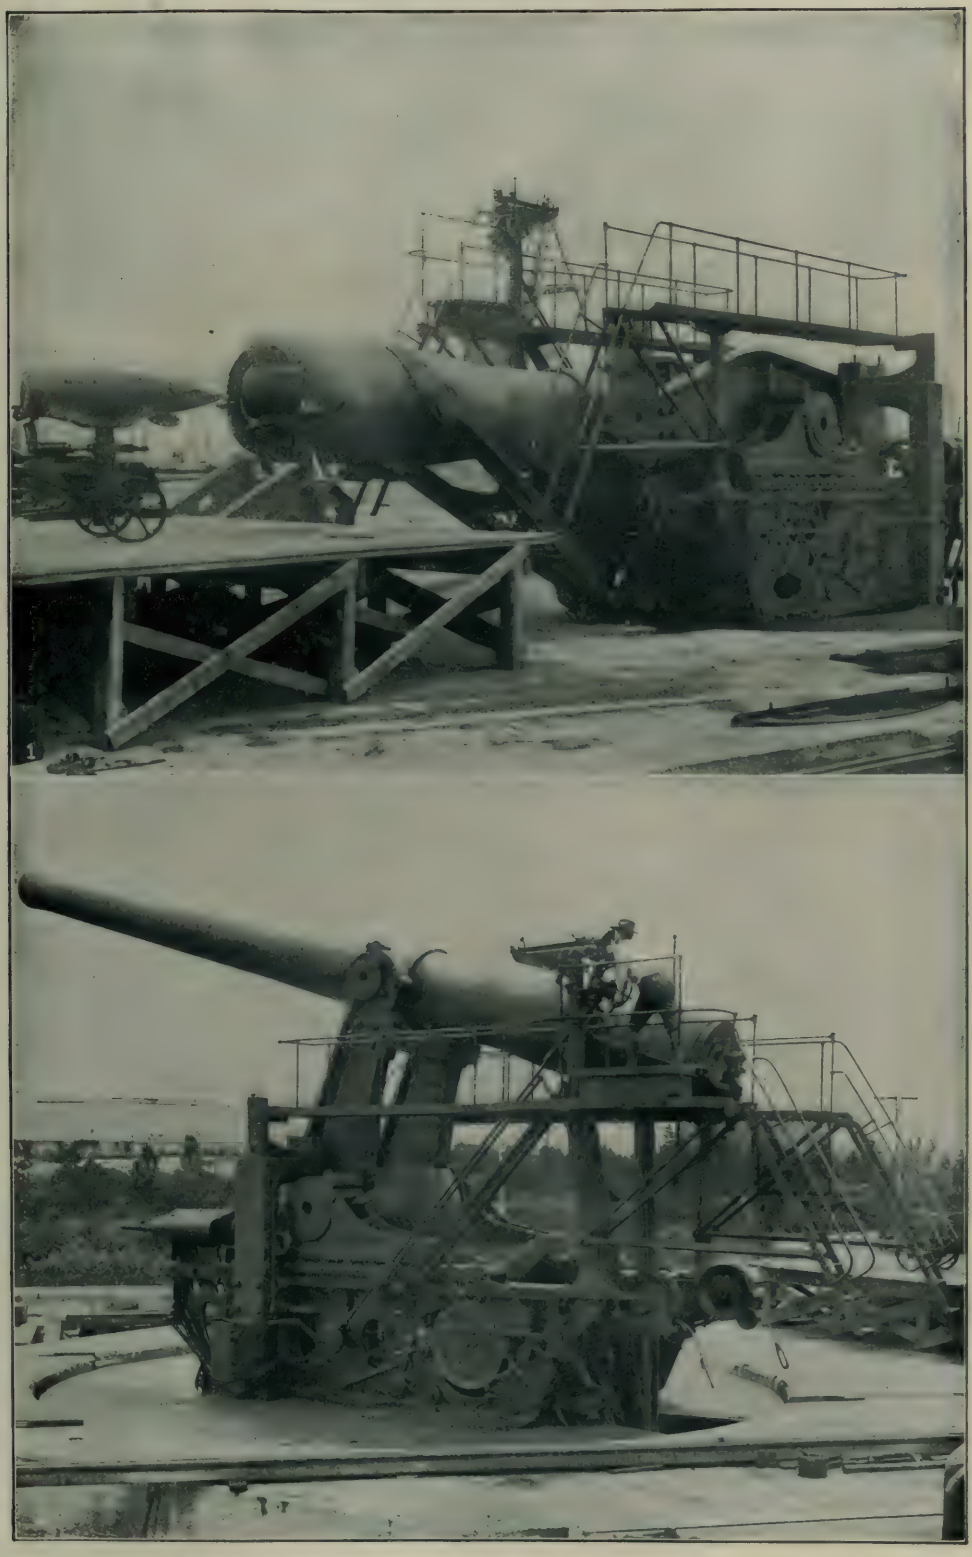
Before endeavoring to ascertain the position of the guns of the defender, the attacking fleet will seek to destroy outer obstructions, in order to get possession of the outer bay, and, if the opportunity should offer, to force the passage. The outer mine field is so important that there will be a serious struggle over it, for, once the attacking fleet passes over it, its further work is greatly simplified.

The defender, therefore, must be constantly on the alert, especially at night, when the searchlights are continually in use lighting up the foreground beyond the mines. All approaching ships are fired upon by the artillery, and since the enemy will probably not attempt to remove the mines with any but his smaller vessels, such as torpedo boats (since the outer mine field is placed intentionally in the field of the greatest effect of the guns on shore, both vertical and horizontal), rapid-fire guns should be used, because these small vessels move rapidly, offer but a small target, and their work, by the time their purpose is known on shore, can be done promptly. Moreover, since the attack may be directed on several points of the mine field at the same time, it is best to assign the rapid-fire batteries to particular sectors of the mine field to insure prompt action on all the enemy's vessels. The torpedo boats of the defense remain close up to the mine fields in order to fight the enemy's torpedo boats while they are endeavoring to remove the mines. The counterattacking torpedo flotilla must be followed by one or two mine-laying ships, for repairing the damaged mine lines.

The attacker's object in reconnaissance is to obtain full and accurate knowledge of the location and power of the defender's guns of all calibres and kinds, the position of the torpedo batteries and mine observation stations, and finally to find out what new gun positions have been erected for the war. The defense, therefore, endeavors to veil all his batteries that cannot be readily seen from the sea, and still further to deceive the enemy he erects a number of small batteries. Batteries with disappearing carriages and mortar batteries have here a great tactical advantage, because they can be readily concealed. While the fleet is reconnoitring, therefore, beyond the outer mines, only such guns of the defense open fire as cannot be concealed, but as the ships come near the mines and take up the formation in column, the other batteries open fire with armor-piercing projectiles. Each battery is assigned to a different ship, on which it concentrates its fire, and which it follows until it is sunk or gets beyond armor-piercing range. The coast artillery is assisted in this work by the guns of the ships that may be in the harbor, these vessels moving inside the mine field on lines perpendicular to the enemy's line of advance, making the greatest possible use of their artillery, the torpedo boats making counterattacks when possible. The infantry garrison of the fortified place is posted on outpost along the shore, and prevents the enemy from landing reconnoitring parties, or fires on torpedo boats sent along the shore to reconnoitre. In case the mine obstruction was removed by the enemy before his reconnaissance, the defender's larger vessels cannot take so advanced a position close up to the mine field, and as soon as the attacker approaches the latter the defender must bring all his guns into action.

The object of the artillery attack is to silence all coast forts and batteries commanding the harbor entrance, to put out of action all guns mounted in them, and to destroy all positions flanking the obstructions. It is the preparation for the final assault. The main strength of the defense in this phase of the action will be the coast artillery, and since the enemy, because of his limited supply of ammunition, will probably endeavor to gain the upper hand as rapidly as possible, this artillery will require an energetic, decisive, and rapid service, and should be assisted by the artillery fire of the ships of the defense that may be in the harbor. The targets to be attacked are mainly the large, heavy battleships, whose vitals are protected by powerful armor. To reach the vitals is the business of the heavy calibres, but a ship may be put out of action before its vitals are seriously affected. The coast-artillery defense proper must be thoroughly organized in advance, and hence the command of a fortified place is given to a fortress commander, under whom are the district commanders, and these again control the group of battery commanders and the searchlight stations. The heavier armor of a battleship is on her belt, extending above and below the water line, while the deck is but slightly protected. The large calibre, flat-trajectory guns are used for piercing the heavy side armor, and with the United States explosive D, and the delay-action fuse of the Ordnance Department, the destructive effect is expected to be enormous. Howitzer or mortar shells are used for piercing deck armor; rapid-fire guns for firing on unprotected parts and clearing decks and tops.

The naval battle of Santiago clearly illus-



UNITED STATES ARMY 14-INCH GUN MOUNTED ON DISAPPEARING CARRIAGE

No. 1. LOADING POSITION. No. 2. FIRING POSITION.

Weight of gun, 51 tons. Weight of projectile, 1660 lbs. Weight of powder charge, 349 lbs. Range, 19,000 yards. Projectile carries bursting charge of 88½ lbs.

NOTE. — This Carriage is a type of the latest model of disappearing carriage for 6-inch, 8-inch, 10-inch and 14-inch guns

COAST DEFENSE MORTAR

U. S. ARMY 12-INCH MORTAR MOUNTED ON 1912 CARRIAGE

1. LOADING POSITION. Weight of Mortar, 15.1 tons. Weight of projectiles, 700, 824, and 1046 pounds. Weight of powder charge varies according to zone: maximum about 89 pounds. Projectiles carry bursting charges varying from 24.16 pounds to 98.4 pounds. Maximum range, 19 000 yards

2. FIRING POSITION, 45° elevation.

trated the value of a good artillery, and if such a magnificent action is possible from aboard ship, a far more favorable effect is to be expected from the land. But this battle also shows how dangerous it is to neglect all preparations on the part of the coast artillery, and the Spanish coast artillery must bear a large portion of the blame for the sacrifice of Cervera's fleet. Special attention must be paid to the equipment of the observation stations of the district artillery commanders. Good telescopes and photographs and plans of the enemy's ships must be available for immediate use, in order to facilitate the ready recognition of hostile ships, and in the group and battery commanders' stations there must be more detailed plans of the ships to determine the projectiles to be used at various ranges. Works are now published giving, in silhouette, the appearance (to the naked eye, at a particular distance) of every important warship.

The inner obstructions consist of lines of mines, sea barricades, and occasionally also of a submarine dike. The decisive engagement for the possession of the harbor will be fought at this barrier, for which reason it is protected by numerous rapid-fire and torpedo batteries. The reconnaissance of the inner obstructions, and even their partial removal, may be attempted by the enemy during the artillery duel; hence the defender must make constant use of his searchlights to detect such a move. The assailant will first attempt to destroy the inner obstructions by means of torpedo boats, then he will try to break them up by artillery fire, and finally he may attempt to land detachments at night to blow them up, or send a drifting mine destroyer against them. The inner mines are usually within the effective armor-piercing range of the heavy guns, as well as under the fire of the rapid-fire batteries; the former act against the armored ships, the latter against the small and fast torpedo boats or unarmored vessels.

The forcing of the entrance is the closing act of the assailant's undertaking, and its object is the final occupation of the disputed harbor. At the head of the final assault are torpedo boats which, acting as a patrol, make a final attempt to break through the obstructions. These, as well as the torpedo flotilla following them, should be greeted with a hail of projectiles from the rapid-fire guns of the shore batteries. All other coast guns and howitzers should be directed against the battleships of the attacking fleet and should fire especially at the leading ship. As the attacking vessels enter the harbor, the fire of the coast guns is concentrated more and more against the vessels following. This artillery battle is continued until each fort in succession is taken by the enemy. The home fleet inclosed in the harbor should now attempt to break through the lines at all hazards, and this can best be done at night.

Military history proves that it is by no means easy to capture a well-defended harbor by the means at the disposal of a fleet. The success of Farragut in the Civil War appears to contradict this statement, but it must be remembered that the condition of the navy on the one hand, and that of the coast artillery on the other, were at that time more favorable for forcing a harbor than they are to-day. Nevertheless, on many occasions, Farragut himself, while attacking a seacoast, called for assistance from the artillery on the land side. Wars are so short nowadays, and decisive battles are sought so quickly in the interest of the countries concerned, that the cooperation of a strong land army is now deemed essential to support the naval attack; indeed, the land attack will generally be the principal one. This was shown to be the case in the Chino-Japanese War, the Spanish-American War, and especially in the Russo-Japanese War. The best protection of a seacoast is a powerful navy, but should the latter meet with misfortune the coast must be protected to prevent landings. The defense of the unfortified portions of the coast will be intrusted to a special coast-guard corps, strong enough to oppose the enemy at all points with superior forces. To determine what this strength should be, the landing of the Japanese for the purpose of attacking Wei-hai-wei furnishes some useful data. The army of 27,000 men was landed in 36 hours; consequently, with the better means available to-day, about 20,000 men can be landed in 24 hours, hence a coast-defense corps of equal strength should be able to appear at the landing place in that time, and, considering the necessary detachments to be left at various points, it will take about 30,000 men to guard the coast between two fortified forts not over a day's cruise apart.

It may be remarked, in conclusion, that the issue of future ship attacks on adequate coast defenses is highly problematical. The function of the modern warship is chiefly the attack of other ships; the attack of seacoast forts is secondary. In the next place, the fire of shore guns well handled is to-day so rapid and accurate that no fleet will expose itself to its effects save under emergency. Coast defenses will have answered their purpose as fully by dissuading a naval enemy from attacking as by repelling his attack if he should attempt it.

Consult: Abbot, *Defense of the Seacoast of the United States* (New York, 1888); Wisser, *Tactics of Coast Defense* (Kansas City, 1902); Clarke, *Fortification* (New York, 1907); and the works of Mielichhofer, of the Austrian artillery. For a description of the ordnance used in modern coast defense, see ORDNANCE, the historical side of the subject being treated under ARTILLERY. The article on FORTIFICATION discusses the history and construction of coast defenses, together with the scheme adopted for the defense of the coast of the United States, and should be read in this connection.

COAST DISTRICTS. See KÜSTENLAND.

COAST GUARD. The coast-guard service of Great Britain was originally established as a means of revenue protection, but was reorganized and transferred to the Admiralty in 1856. It now partakes of the character of a naval reserve, life-saving, and signal service in addition to its duties in connection with the customs. It is under the control of the admiral superintendent of naval reserves, who has a captain in the navy as his assistant. The coasts of the United Kingdom are divided into six districts—Eastern, Southern, Western, Scottish, North of Ireland, and South of Ireland—each presided over by the captain of the coast-guard station ship of the district, which vessels are usually old-type armorclads. In addition there were (in 1914) six cruisers of 278 to 805 tons, besides several tenders. The districts were subdivided into 44 divisions in charge of inspecting officers consisting at the date mentioned of 30 commanders, 37 lieutenants, and the remainder of subordinate

coast-guard officers. The divisions are divided into stations, each in charge of a chief officer who is about equal in rank to a warrant officer. The coast between stations is patrolled at all times, day and night, and means of signaling to vessels is kept ready for instant service. The regulations of entry vary from time to time, but the men are all good-conduct men who have completed a long term of service in the navy and are not above a certain age. According to the budget of 1913–14, the number of commissioned officers attached to the coast-guard service was 102, exclusive of officers regularly serving on board the vessels of the navy acting as station ships and gunboats. There were also 198 chief officers of stations and 2830 petty officers and seamen, making a total of 3130 persons. Many of the men composing the coast guard were old men-of-war's men who retired from active service on completion of their regular service. The pay is comparatively high, and in many cases free houses are provided.

In 1913 the Secretary of the Treasury of the United States proposed that the United States Life Saving Service and Revenue Cutter Service be consolidated for administrative purposes under the title of Coast Guard.

COASTING. An outdoor winter game, supposedly of Russian origin. The sport consists of sliding down a slippery bank or other inclined grade of snow or ice, by means of a sled, or two sleds attached by a board, the rear one rigidly, the front one on a pivot so that it may be moved for steering. These contrivances have various local names, such as "bobsled," "double-ripper" and "double-runner." The connecting board may be long enough to seat from 8 to 12 coasters. Consult Steele, "Coasting," in *Outing Magazine*, vol. xli (New York, 1903). See TOBOGGANING.

COASTING TRADE. The commerce carried on by sea between the different ports of the same country. In Great Britain "coastwise" is defined to mean "from any one part of the United Kingdom to any other part thereof." Vessels engaged in this commerce are subject to different rates and regulations from oversea traders, and the masters must keep their books showing that their cargoes come strictly within the definition of coasting trade. Formerly no goods or passengers were allowed to be carried from one port of the United Kingdom to another except in British vessels; but this restriction was repealed in 1854, and the coasting trade in Great Britain is now open to all the world, though the share of foreign nations is inconsiderable. Most other countries, however, reserve the coasting trade to their nationals, as does the United States, which restricts the trade to ships built and owned in the United States, as well as officered and chiefly manned by Americans. The term "coasting trade" usually includes also the trade between the mother country and its colonies. This interpretation of the term is followed by the United States.

Owing to the length of coast, this trade in the United States is far more extensive than in any other country. Of the 49 States and Territories (exclusive of Alaska), 18 border on the Atlantic Ocean and the Gulf of Mexico, and three border on the Pacific Ocean, to which may be added the enormous coast line of Alaska, Hawaii, and Porto Rico. The extensive commerce of the Great Lakes is also included in the coasting trade. In the time of the early settlements such trading was done in small shallops, sloops, and schooners, and there was very little of it. With the growth of the country in population the trade has grown until the tonnage engaged in it exceeds by 40 per cent the total tonnage of the German Empire. At the present time many hundreds of steamers and many more hundreds of sailing craft are constantly plying from Maine to Texas, transferring the cotton, sugar, rice, and lumber of the South to Northern, and the grain and manufactured goods of the North to Southern markets. In summer these coasting steamers do a large share of the passenger as well as trade traffic. The thoroughness of the coast survey, and the introduction of the weather service, whereby mariners are duly forewarned of danger, have done much to prevent the disasters which were common not long ago, and even the dreaded Cape Hatteras has lost much of its terror. There are no records of the volume of business which is done in the coasting trade, but the fact that the licensed tonnage in the coasting trade and fisheries grew from 3,160,917 tons in 1860 to 6,782,082 in 1912, coupled with the fact that the tonnage of steam vessels increased from 770,641 tons in 1860 to 4,543,276 in 1912, attests its growth. Consult *Annual Reports* of the Commissioner of Navigation.

COAST LINE. See SHORE.

COAST PILOT. A pilot licensed to conduct vessels from one part of the coast to another. He is expected to be familiar with all buoys, beacons, lighthouses, and other aids to navigation along the part of the coast for which he pilots, and to have such a knowledge of the soundings, currents, weather, etc., as to enable him to conduct safely a vessel in thick or bad weather or at night. Upon reaching the entrance to a port the local pilots take charge of the vessel. The term *Coast Pilot* is also applied to a series of volumes published by the United States Coast and Geodetic Survey which give information in regard to the coast of the United States in great detail. See COAST AND GEODETIC SURVEY, U. S.

COAST RANGE. The system of uplifts which extends along the Pacific coast with interruptions from southern California to the Strait of Juan de Fuca in Washington (Map: United States, A 2). The name is also given to the range of mountains that defines the coast line of British Columbia and which is flanked by the Island Range on the west and merges into the Cascades towards the east. The Coast Range of the United States has its beginning where it meets the Sierra Nevada Range in the San Rafael Mountains, near Santa Barbara, southern California. Thence the line of elevation is continued in a general north-northwesterly direction by the Mount Diablo Range, the San Benito Range, and the one known locally as the "Coast Range" rising abruptly from the shore line. At San Francisco Bay a great rift is made, all ranges sloping down to the rocky hills through which this body of water has broken. The highest points in these ranges are San Carlos (5470 feet) and Mount Hamilton, on which is situated Lick Observatory (4450 feet).

Throughout northern California the Coast Range is continued through the Trinity Mountains, thence turning eastward through the Scott Mountains, throwing off branches to the south and west, but continues north again in the Siskiyous. Groups near the Oregon boundary

diverge to the east and connect with the Cascade Range. Farther north, the Coast Range in Oregon and Washington has less marked uplifts, the elevations averaging only from 1000 to 3000 feet. The Olympic Mountains, however, near the Strait of Juan de Fuca in Washington, include several peaks of considerable elevation, the highest being Mount Olympus, with an altitude of 8150 feet. The mountains of southern California below the San Rafael Mountains are sometimes called part of the Coast Range, but may more properly be considered a continuation of the Sierra Nevada. Their peaks are higher than in the north, numbering among them San Bernardino Mountain, 10,630 feet; San Jacinto Mountain, 10,805; Tehachapi Peak, 9214, and Pinos Mountain, 9214. The Coast Range presents no marked barrier to the drainage of the coastal region. This is due both to the interrupted character of the range and to its low altitude. The principal rivers crossing it are the Chehalis, Columbia, Umpqua, Rogue, Klamath, Eel, Sacramento, Santa Maria, and Siuslaw. The Salinas River occupies the valley between the parallel ranges of southern California and flows into the Bay of Monterey. See CALIFORNIA; OREGON; WASHINGTON; BRITISH COLUMBIA.

COAST-RANGE TROUT. A local name in California for the rainbow trout (q.v.).

COATBRIDGE, kōt'brĭj. A prominent and prosperous town of Lanarkshire, Scotland, 9 miles east of Glasgow (Map: Scotland, D 4). The town is in the centre of a mineral district, coal being the most important product. Its products include malleable iron, fire brick, tiles, tin plate, wire, tubes, and boilers. Owing to the great increase in the iron trade, Coatbridge has grown rapidly in size and prosperity since 1825, when James Baird put up furnaces. Educational institutions include a technical school, a mining college, and the Baird Institute. Pop., 1841, 1599; 1901, 36,981; 1911, 43,286.

COATES'VILLE. A borough in Chester Co., Pa., 39 miles (direct) west of Philadelphia, on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, K 8). It contains a fine Y. M. C. A. building, a hospital, and is noted as an industrial centre, the establishments including iron and steel works, steel-plate mills, boiler works, brass and iron foundries, machine shops, a tube mill, silk mills, and factories of tobacco, phosphate, and automobiles. Settled about 1800, Coatesville was incorporated in 1867. The government is vested in a burgess, elected every three years, and a borough council chosen on a general ticket. There are municipal water works. Pop., 1900, 5721; 1910, 11,084; 1920, 14,515.

COATI, kō-ä'tē, or COATI-MONDI. The native Brazilian name of certain tropical raccoons of the genus *Nasua* and the family Procyonidæ. They are not unlike the typical raccoons in many of their characteristics, but the body is more elongated. They are from 2 to 3 feet long and are chiefly remarkable for the elongation of the snout, which is a sort of flexible proboscis and is used in search of food and in rooting up the earth to obtain worms and insects. They are often domesticated in South America and are very affectionate, active, troublesome, and amusing. They are arboreal in their habits and, besides insects, eat birds and their eggs. The colors are extremely variable, but as a rule only two species are recognized, the Mexican coati (*Nasua nasica*, or *narica*) and the Brazilian red coati (*Nasua rufa*). The former is brownish gray and is found from Panama northward to southern Mexico. The other is reddish brown and occurs throughout South America east of the Andes. In the Pleistocene these animals were abundant, judging from their fossil remains, and at least one species was much larger than any living one. Consult: *Pop. Science Monthly*, vol. ii (New York, 1872); *American Naturalist*, vol. x (Boston, 1877); *Proc. U. S. National Museum* (Washington, 1889). See Plate of AMERICAN MINOR CARNIVORES under CARNIVORA.

COATICOOK, kō-ăt'ĭ-kụk. A town and port of entry in Stanstead Co., Quebec, Canada, on the Coaticook River and the Grand Trunk Railway 120 miles (direct) south by west of Quebec (Map: Quebec, G 5). It is a manufacturing and industrial centre and has a United States consulate. The manufactured products include fabrics, butter and cheese, chemicals, woolens, cream, sashes, doors, chairs, flour, shingles, lifting jacks, patent medicines, bricks, and knit goods. Pop., 1901, 2880; 1911, 3165.

COAT OF ARMS. In heraldry, "a complete armorial composition, to be charged upon a shield or banner." It is a relic of the armorial insignia which were embroidered upon a cloth worn over the armor, to render a knight conspicuous in battle. See HERALDRY.

COAT OF ARMS, NATIONAL. The coats of arms officially sanctioned by modern national governments represent, in most cases, the family heraldic insignia of their sovereigns. See HERALDRY.

COAT OF MAIL. Body armor composed of interlaced steel links. These links averaged about three-eighths of an inch in diameter, and there were two main styles. In the first, one end of the slender steel rod was flattened and pierced, the other brought to a point and turned up; the rod was then curved, the point thrust through the hole in the flat end and riveted; in the second form both ends of the rod were flattened and pierced, it was bent in a circle and the superimposed ends joined with a rivet. At the time of the Norman Conquest coats of mail were loose, shirtlike garments extending from the neck to the knees, with sleeves to the elbows; the skirts were split front and back for ease in the saddle. In the days of Richard Cœur de Lion the vogue of mail was at its height. The legs and feet were protected by leggings of this material, apparently laced behind, and a coif or hood attached to the coat covered the head and protected the throat and the face to the lips. By the end of the fourteenth century mail had practically passed out of use.

COATZACOALCOS, kō-ät'sä-kō-äl'kōs, better known as PUERTO MEXICO. A port in the State of Vera Cruz, Mexico, on the Gulf of Campeche, at the mouth of the Coatzacoalcos River, 170 miles northeast of Oaxaca (Map: Mexico, M 8). It is the Atlantic terminus of the Tehuantepec National Railway and one of the busiest shipping centres in Mexico. The natural harbor has been deepened for heavy-draft steamers. Its port works are of the most modern construction. It has a United States consular agent. The exports consist chiefly of rubber and timber. Pop., 1910, 4200.

COATZACOALCOS, or SNAKE RIVER. A river of Mexico rising on the north slope of the Tuxtla volcano, in the Sierra Madre, flowing

most of the distance across the Isthmus of Tehuantepec, and emptying into the Gulf of Mexico (Map: Mexico, M 9). It has a length of about 220 miles and is navigable for 25 miles from its mouth.

COB, OLIVER. A character in Ben Jonson's *Every Man in His Humour.*

CO'BALT (Ger. *Kobalt;* possibly same as *Kobold,* goblin). Symbol, Co; atomic weight, 59.0; specific gravity, 8.5 to 8.9; melting point, 1467 C.

A metallic element discovered by Brandt in 1735. The word "cobalt" is found in the works of Paracelsus and other early writers and was used to designate minerals that suggested the appearance of metallic ores, but when smelted failed to yield any metal; hence the name "cobalt," signifying "sprite," was given to such minerals on account of the illusive character of their metallic constituents. It was also applied to certain blue pigments containing cobalt as far back as the times of the Greeks, but it was not until Brandt investigated the blue coloring of smalt that the elementary character of the metal was established.

The color of cobalt is steel gray with a reddish tinge. It possesses considerable lustre and will take a high polish, is ductile at red heat, and at ordinary temperature is hard and brittle. The metal by itself has practically no uses at the present time, but is admirably suited for cutting tools when alloyed with chromium, molybdenum, and tungsten. This alloy, known as "stellite," is the result of the investigations of Elwood Haynes of Kokomo, Ind., U. S. A. Cobalt is very magnetic, burns in oxygen with a red light, decomposes water at a red heat, dissolves slowly in hydrochloric and sulphuric and readily in dilute nitric acids, forming cobaltous salts. It absorbs carbon when heated in it; combines with sulphur, the halogens and phosphorus, arsenic, antimony, and bismuth; is easily precipitated from its solutions, and in other respects resembles nickel in its properties. When prepared by reduction by hydrogen, it is pyrophoric.

The element has been found free only in meteorites and has been detected in the solar atmosphere. The minerals of cobalt have been found in Saxony, Prussia, Bohemia, Hungary, France, Sweden, England, Spain, and in the Timiskaming district of Ontario, Canada, the last-named region being the greatest source of supply at the present time. The minerals occurring in sufficient quantities to be classed as ores are: linnæite, $(Co. Ni. Fe)_3 S_4$, a cobalt-nickel-iron sulphide; smaltite, $CoAs_3$, a cobalt arsenide; cobaltite, (Co.Fe) AsS, a cobalt-iron sulpharsenide; wad, or earthy cobalt, (Co.Mn) O. $2MnO_2.4H_2O$, composed of oxides of cobalt and manganese; and cobalt bloom, or erythrine, $Co_3As_2O_8 + 8H_2O$, an arsenate of cobalt. Cobalt is nearly always present in nickel ores.

Cobalt combines with oxygen to form a monoxide or cobaltous oxide, CoO; a sesquioxide or cobaltic oxide, Co_2O_3; and a cobalto-cobaltic oxide, $CoCo_2O_4$, which is rather unstable and is generally considered as a mixture of the monoxide and the sesquioxide; they are all black and are reduced to metallic cobalt by carbon or hydrogen at a high temperature. Cobaltic oxide combines with water to form a dark-brown powder, $Co(OH)_3$, which when heated loses oxygen until the cobaltous-oxide stage is reached, at which point it remains stable. Of these oxides the most important is the cobalto-cobaltic oxide. In the commercial extraction of cobalt from its ores direct-fire methods are impracticable owing to the impurities present. The ore, matte, speiss (which may be the result of the separation from nickel), or slag containing the cobalt, is treated by wet methods and aims at the recovery of the cobalt as cobalto-cobaltic oxides. Smalt, other compounds, and metallic cobalt may then be prepared from the oxide. Zaffre is an impure oxide obtained by roasting cobalt ore and mixing with sand. By far the greatest quantity of the oxides is converted into smalt, also called *bleu d'azur* and *bleu de saxe,* which consists essentially of cobalt silicate and potash and is employed as a pigment for coloring glass by enamelers and potters for the production of the finest blue glaze on porcelain.

The silicate of cobalt itself is an exceedingly strong coloring agent, surpassed only by gold, one-tenth of 1 per cent imparting a deep-blue color to glass. Other pigments which are produced in smaller quantities are the phosphate; arsenate (known as red oxide of cobalt); cob bronze, a double phosphate of cobalt and ammonium; cobalt blue, also known as cobalt ultramarine and Thenard's blue, which is produced by heating an intimate mixture of alumina and the oxides; Rinman's green, or cobalt green, a mixture of the oxides and zinc oxide, which is also subjected to heat in its preparation. The principal salts of cobalt are those derived from the cobaltous oxide, viz., cobaltous sulphide, CoS; cobaltous sulphate, $CoSO_4 + 7H_2O$, which forms double salts with ammonium sulphate, $(NH_4)_2SO_4$, and serves, like nickel, for the electric deposition of the metal; cobaltous chloride $CoCl_2$, which is used as the basis of sympathetic inks; cobaltamines, so called, which are composed of cobaltic chloride, Co_2Cl_6, and varying amounts of ammonia, and are formed by the oxidation of ammoniacal solutions of cobaltous chloride, and when heated are converted into pure cobalt.

The world's estimated consumption of cobalt oxide during 1912 was 350 tons, valued at $560,000. Consult Schnabel, *Handbook of Metallurgy,* and *Metallurgical and Chemical Engineering,* vol. xii, No. 3, p. 184 (March, 1914).

COBALT. A town on Cobalt Lake, in the Timiskaming district, in the northern part of Ontario, Canada, 330 miles north of Toronto, and 103 miles north of North Bay, on the Timiskaming and Northern Ontario Railway. Rich deposits containing silver, nickel, bismuth, cobalt, copper, lead, and zinc were discovered in 1903. Claims were first worked in 1904. The yield of silver was remarkably rich. The ores were found to carry up to 3000 and 4000 ounces of silver to the ton of 2000 pounds. In 1904 the shipments of ore amounted to 158 tons, valued at $136,217. A rush to the locality set in in 1906. At the end of that year there were 20 large mines in operation, and in 1912 the output amounted to 30,322,805 ounces, valued at $17,455,080. On June 6, 1912, a large part of the town was destroyed by fire, but it was soon rebuilt. Being the centre of the richest of existing silver-mining districts, Cobalt has some of the characteristics of a mining camp. The manufacturing industries include a sampling plant, a machine shop and foundry, and 13 concentrators. An electric railway runs to Haileybury, 5 miles, and to New Liskeard, 10 miles. Pop., 1911, 5638.

CO'BALTITE. A mineral cobalt sulpharsenide, whose composition is CoAsS. It crystallizes in the isometric crystals which resemble those of pyrite (q.v.), has a metallic lustre, and is silver white, tending to red, in color. Cobaltite occurs in association with other metallic sulphides, especially those of lead and silver, and is found in Sweden, where excellent crystals are known; also in Norway, and at various localities in Silesia, but not in the United States to any extent. When present in sufficient quantities, it is a valuable ore of cobalt.

COBÁN, kō-bän'. The capital of the Department of Alta Vera Paz, Guatemala, on the Rio Cojabón, about 90 miles north of the city of Guatemala (Map: Central America, B 3). It is picturesquely situated on the slopes of a hill and is irregularly built. Its modern buildings are of some merit. The town has minor manufactures and is the centre of a fertile district producing coffee, cacao, vanilla, and sugar cane. Pop., 1900, 24,475; 1904, 30,770.

COBB, Henry Ives (1859–). An American architect. He was born in Brookline, Mass., and was educated at the Massachusetts Institute of Technology and at Harvard, where he graduated in 1880. He was architect of the Opera House, the Newberry Library, the University of Chicago, and the church of the Atonement in Chicago, and of the Pennsylvania State Capitol. In 1893 he was one of the National Board of Architects for the World's Columbian Exposition, for which he designed the Horticultural Hall, and was retained as special architect by the United States government from 1893 to 1903. Among others of his more recent works the most important are the city hall and courthouse building in Chicago, and in 1913 the Booth Memorial Theatre in New York.

COBB, Howell (1815–68). An American politician. He was born in Jefferson Co., Ga., graduated at Franklin College in 1834, and was admitted to the bar in 1836. From 1837 to 1840 he was Solicitor-General of his State, and from 1843 to 1851 was a member of Congress. In 1849 he was elected Speaker of the House. He was one of the leaders of the Southern party in Congress and favored the extension of slavery into the territory acquired from Mexico. He was chosen Governor of Georgia in 1851 and was again sent to Congress in 1855. He was Secretary of the Treasury in Buchanan's cabinet, but resigned in 1860 to join the South in the approaching war. He was the president of the congress that drafted and adopted the Confederate constitution, but antagonism to Jefferson Davis compelled his retirement from the Secession administration. He was appointed major general in the Southern army, but did not take part in any considerable military operations. In defense of slavery he published *A Scriptural Examination of the Institution of Slavery* (1856).

COBB, Nathan Augustus (1859–). An American agriculturalist, born at Spencer, Mass., and educated at Worcester Polytechnic Institute and the University of Jena. He was professor of chemistry and natural science at Williston Seminary, Mass. (1881–87), between 1891 and 1904 served as pathologist in the Department of Agriculture in New South Wales, for three years directed the division of physiology and pathology of the Hawaiian Sugar Planters' Experiment Station at Honolulu, and became agricultural technologist of the United States Department of Agriculture (1907), and also acting assistant chief of the Bureau of Plant Industry (1911). He discovered and described a large number of new species of plants and animals and patented several photographic devices. He published: *Elements of Chemistry* (1885); *Seed Wheat* (1903); *Universal Nomenclature of Wheat* (1905); *Methods of Using the Microscope, Camera-Lucida, and Solar Projector for Purposes of Examination and the Production of Illustrations* (1905); *Fungus Maladies of the Sugar Cane* (3d ed., 1909).

COBB, Sylvanus (1799–1866). An American Universalist minister, born at Norway, Me. He edited the *Christian Freeman* of Boston, for 20 years, and published *The New Testament, with Explanatory Notes* (1864), *A Compend of Divinity*, and *Discussions*. He was prominent in antislavery and temperance movements. His son Sylvanus (1823–87) was a prolific and very popular writer of tales and sketches of adventure, especially for the New York *Ledger*. He published a *Memoir* accompanying his father's *Autobiography* (Boston, 1867).

COBB, Thomas Reed Rootes (1823–62). An American lawyer and author. He was born at Cherry Hill, Ga., graduated in 1841 at the University of Georgia, and from 1849 to 1857 was a reporter of the State Supreme Court. During the Civil War he served in the Confederate Congress, where for a time he was chairman of the Committee on Military Affairs. He afterward became a brigadier general in the Confederate army and fell at Fredericksburg. He published: *Digest of the Statute Laws of Georgia* (1851); *Inquiry into the Law of Negro Slavery in the United States* (1858); *Historical Sketch of Slavery, from the Earliest Periods* (1859); *The Colonel* (1897).

COBB, William Henry (1846–). An American librarian, born at Rochester, Mass. He was educated at Amherst College. In 1872 he was ordained to the Congregational ministry. He was pastor at Plymouth, Mass. (1872–76), and at Uxbridge, Mass. (1878–87). In 1887 he became librarian of the Congregational Library and assistant treasurer of the American Congregational Association at Boston, and in 1889 he was also coeditor of the *Journal of Biblical Literature*. He is author of *A Criticism of Systems of Hebrew Metre* (1905).

COBBE, kōb, Frances Power (1822–1904). An English philanthropist and author. She was born in Dublin and was the great-granddaughter of Charles Cobbe, Archbishop of Dublin. Though brought up in an atmosphere of evangelical piety and sent to a fashionable boarding school, which proved to be torture to her vigorous, independent spirit, yet her early study of theological, ethical, and religious subjects finally brought her to the acceptance of the doctrines of theism. In 1857, after a year of travel in Italy, she joined Mary Carpenter at Bristol in conducting schools and reformatories for girls. She contributed articles to *Macmillan's* and other magazines and weeklies and, beginning in 1867, was for seven years an editorial writer for the *Echo*, a London daily. Later she wrote for the *Standard*. During this period her special subjects were the suffrage and property rights for women, and vivisection. She was long one of the foremost opponents of vivisection in England, and, when the columns of the newspapers were closed to her for the discussion of this subject, she established a monthly periodical for that purpose. Her published works make a long list. They

are all characterized by a remarkably fluent and forcible style. Among them are: *Intuitive Morals* (1855); *Religious Duty* (1857); *Pursuits of Women* (1863); *Broken Lights* (1864); *Darwinism in Morals* (1872); *Hopes of the Human Race* (1874); *Duties of Women* (1880; 9th ed., 1905); *The Scientific Spirit of the Age* (1888); *The Modern Rack: Papers on Vivisection* (1889); *Vivisection in America* (4th ed., 1890); and a charming *Autobiography* (2 vols., London, 1894; new ed., 1904).

COB'BETT, WILLIAM (1762–1835). An English political writer. He was born March 9, 1762, at Farnham, Surrey, where his father, a peasant farmer, trained him in habits of industry and self-dependence. He took a dislike to rural occupations and at 16 years of age went to London, where he was employed as a copying clerk; but, this becoming distasteful, he enlisted in the Fifty-fourth Regiment of Infantry, which shortly afterward went to Nova Scotia. He remained in the regiment eight years and by good conduct, activity, and intelligence became sergeant major. During this period he devoted his leisure to self-education. On his return to England in 1791 he obtained his discharge through the kind offices of Lord Edward Fitzgerald, married, and later went to France, where he learned the language. In the following year he went to America and, failing in an attempt to obtain a government position, supported himself for a time at Wilmington, Del., teaching English to French immigrants, Talleyrand being one of his pupils. He settled in Philadelphia and became a political writer. Under the signature of "Peter Porcupine" he was as keen a Tory as in later life he was a Radical, and, being stung by disparaging criticism of his mother country, he lashed American democracy and French republicanism with coarse, bitter, and personal scorn. Twice prosecuted for libel, he left America in June, 1800, and returned to England, where, in January, 1802, he started his famous *Weekly Political Register*, which continued uninterruptedly until his death. At first Tory, the *Register* gradually changed its politics and became the determined opponent of the government and the uncompromising champion of Radicalism. Having previously been found guilty twice of libel on certain members of the government, he was in 1810 fined £1000 and sentenced to two years' imprisonment in Newgate for his severe comments in the *Register* upon the flogging of five militiamen by Hessian mercenaries. In sore financial straits, and again in danger of imprisonment for free speech, Cobbett returned to America in 1817, and for two years farmed on Long Island, transmitting his articles for the *Register* with unfailing regularity. On his return to England in 1820 his strange whim of transporting the bones and relics of Thomas Paine, whom he had formerly reviled and now fulsomely eulogized, met with contempt and ridicule. He established a seed farm at Kensington and for some years engaged in agriculture. In 1829–30 he traversed England and Scotland on horseback, delivering political lectures in the principal towns, and he was received everywhere with enthusiasm as the most powerful advocate of the people's rights. In 1832 he was returned to the first Reform Parliament as member for Oldham. His first speeches did not add to his reputation, but caused amusement, Peel blandly informing him that they would receive the attention due to any "respectable member," but he eventually gained a respectful hearing. He was engaged in a debate on the malt tax just before his death at Normandy Farm, near Guildford, June 18, 1835. Cobbett is one of the great newspaper men of all time. His earlier tracts, such as *A Bone to Gnaw for the Democrats*, were widely circulated, but the success of his *Political Register* as a newspaper medium has never yet been surpassed. This came about partly because of his style,—his sentences short, terse, in the vernacular, his broad humor, picturesque caricature, and striking epigrams; and partly also because of the fearless and long-protracted onslaught on intrenched privileges which characterized Cobbett through the first third of the nineteenth century. Cobbett was also greatly interested in agriculture, about which he knew much, and in banking and currency, about which he knew little. He was the compiler of the *Parliamentary History* (London, 1806), which after 1812 was published as Hansard's *Debates*, and originated Howell's *State Trials* (ib., 1809–28). Among his best-known works are his *Grammar of the English Language* (1819), *Rural Rides* (1830), *Cottage Economy* (1822), and *Advice to Young Men and Women* (1829). His *History of the Protestant Reformation* (2 parts, 1824–27) attacks the Reformers, defends Roman Catholicism, and, often translated, has been extensively circulated in France and Italy. His sons published an annotated abridgment of his political works (9 vols., 1848). While not a man of the first order of intellect, and excluded from the higher refinements of thought, in matters of common sense Cobbett exhibited vigor far surpassing that of any other writer of his day. Despite crotchets, he rendered lasting service to the cause of the people. Consult: his autobiographical *Life and Adventures of Peter Porcupine* (Philadelphia, 1798); E. Smith, *Life of Cobbett* (2 vols., London, 1878); Huish, *Life of Cobbett* (ib., 1836); Waters, *Cobbett and his Grammar* (New York, 1883); Watson, *Biographies of Wilkes and Cobbett* (London, 1870); Carlyle, *William Cobbett* (ib., 1904); "Lewis Melville," *The Life and Letters of William Cobbett in England and America* (ib., 1913).

COB'BLER, or **COBBLER FISH.** 1. See KILLIFISH. 2. See THREADFISH.

COBBLER OF PRESTON, THE. A musical burlesque by Charles Johnson, produced in 1716 and altered a century later. Its plot was suggested by the adventures of Christopher Sly in Shakespeare's *Taming of the Shrew*.

COB'BOLD, THOMAS SPENCER (1828–86). An English scientist, born at Ipswich. He studied anatomy under Crosse and later took the regular medical course at the University of Edinburgh. In 1857 he went to London, and from 1857 to 1861 he lectured on botany at St. Mary's Hospital. In 1861 he began his lectures at the Middlesex Hospital, and subsequently, while practicing medicine, also lectured on geology at the British Museum. In 1873 he was made professor of botany and later acted as professor of helminthology at the Royal Veterinary College. Although he was a scientist in the broadest sense of the term, his investigations were chiefly in the field of helminthology, the science of parasitic worms; and his published works deal chiefly with subjects of this science. His writings include: *Entozoa: An Introduction to the Study of Helminthology, with Reference More Particularly to the Internal Parasites of*

Man (1864, and supplement, 1869); *Tapeworms* (1866); *Worms* (1872); *Parasites* (1879); *The Parasites of Elephants* (1882); *Human Parasites* (1882); *Parasites of Meat and Prepared Flesh Foods* (1884); also a large number of memoirs published in scientific periodicals.

COB'DEN, RICHARD (1804–65). An English statesman and economist known as the Apostle of Free Trade. He was born in the hamlet of Heyshott, near Midhurst, in Sussex, on June 3, 1804, of a family which for centuries had been settled in the place. His father was a sweet-natured, incapable man, who proved unequal to the task of supporting his family. In 1814 the farm was sold, and young Cobden was sent off to be educated at a Yorkshire school, where he learned nothing and suffered much for five unhappy years. In 1819 he entered his uncle's warehouse in Old Change, London, and devoted himself with great energy to his new business, finding time, nevertheless, at nights, for study and reading. At 21 he was a commercial traveler for his uncle's house and loved the business for the opportunities it gave him of studying men and things. In 1828 he set up as the commission agent of a large manufacturing house in Manchester on a capital consisting mainly of energy, ability, and his good name. In 1831 he and his partners had prospered sufficiently to start in business for themselves as calico printers at Sabden, near Clitheroe, and in the following year branches were established in London and Manchester. The "Cobden prints," tasteful and original in design, became famous, and the partners were speedily on the way to the accumulation of a large fortune. In 1832 Cobden settled in Manchester, and from that time his private affairs became secondary to the interest which he displayed in the broad practical principles of economics and public education. From 1832 to 1835 he must have been busy educating himself, for this was the only time during his early life when he could have found the leisure to acquire the profound knowledge of political history and economics for which he was distinguished. Reading and foreign travel continued to the last to be a great passion of his life.

In 1835 Cobden published a pamphlet entitled *England, Ireland, and America*, "by a Manchester Manufacturer," and this was followed in 1836 by another pamphlet on *Russia*. These two pamphlets were epoch making, in that they boldly challenged the prevalent ideas of foreign policy and foreign trade in England. It would seem that the sober-minded Cobden, an enthusiast in his way, had become convinced that commerce was the great torchbearer of civilization and the great foundation of national prosperity. Anything, therefore, which interfered with the free exchange of commodities between nation and nation was harmful, and for this reason protection, which dammed the current of trade, and war, which sought entirely to destroy it, were pernicious. He attacked the historical English policy of intervention in European affairs, on the ground that it bred interminable wars in Europe, while it crushed the English taxpayer with the burden of an enormous debt. The balance of power, the political ideal for which so many sanguinary contests had been fought, Cobden ridiculed as an impossible adjustment which, in spite of centuries of bloodshed and diplomacy, still left statesmen facing an obstinate, unstable equilibrium. He strongly deprecated, too, the prevailing spirit of hatred for Russia, the great bugbear of English statesmen. Summed up, his plea was for the principles of peace, nonintervention, and a policy of retrenchment and free trade as a means of husbanding the national resources for the great economic struggle that was fast approaching with the entrance of the United States into the markets of the world. In 1835 he made a brief tour in the United States and Canada. In the winter and spring of 1836–37 Cobden traveled in Spain, Turkey, and Egypt. On his return he entered into Manchester municipal politics, being one of those who secured the incorporation of that city in 1838. Popular education was a subject of great interest to him, and he discussed it in many public speeches. In 1837 he was a candidate for Parliament at Stockport, but was defeated.

The history of Cobden's connection with the Anti-Corn-Law agitation began in October, 1838, when an Anti-Corn-Law association was founded in Manchester. (See CORN LAWS.) Cobden was one of its earliest members and soon became its guiding spirit. He converted the Manchester Chamber of Commerce to his views and made it a powerful instrument of agitation. Anti-Corn Law associations were founded in many towns of the north, and in London, in March, 1839, the delegates of the various associations united to form the Anti-Corn-Law League, of which Cobden and six others constituted the council. From the first he was the soul of the movement, and to the people at large he seemed to be the embodiment of the cause. With magnificent talents for organization, with an unequaled gift for popular oratory, and, above all, with his kindling enthusiasm and tremendous capacity for work, he was what would be called in modern parlance campaign manager, press bureau, and stump speaker all in one. The history of the Anti-Corn-Law agitation belongs properly elsewhere, but Cobden's activity is so identified with the work of the League that the two can hardly be separated. Wonderful instances are quoted of the sudden conversion of hostile audiences in country and town, as they listened to Cobden's simple, sincere, and irrefutable arguments; and his success in his "campaign of education" was all the more rapid in that his teachings confined themselves to driving home the elemental truth that food is a desirable thing for people who starve. In 1841 he entered Parliament from Stockport. His reception in the House was not friendly; but his evident sincerity and his straightforward, unanswerable arguments always gained him a hearing. At the beginning of the session Mr. Charles Villiers's annual motion to consider the repeal of the Corn Laws was rejected by a vote of 393 to 90, yet within five years after he had entered Parliament, Cobden had converted Sir Robert Peel and his party to free trade. In 1843 considerable odium was heaped upon his name as the result of an attack on the government, which Peel unjustly took to be an exhortation to personal violence against himself. Cobden, however, was undaunted, and continued to plead, in Parliament and out, against the "system of legislative murder" which "starved people to death." On March 13, 1845, he delivered an especially powerful speech in the House, at the end of which Peel is said to have muttered, "Those may answer him who can, I cannot do it." The famine in Ireland came to the aid of the Anti-Corn-Law League. On

Dec. 5, 1845, the Prime Minister pronounced for the total repeal of the Corn Laws, and in 1846 the battle had been won. Speaking in Parliament in that year, Peel declared that to Cobden was due the honor for the great reform which had just been enacted. That the intense earnestness which animated Cobden throughout the struggle was something more than enthusiasm for a principle in economics is shown in the following words of John Bright, his lifelong friend and supporter, spoken at the unveiling of Cobden's monument at Bradford in 1877. It was in September, 1841, and Bright was mourning over the dead body of his young wife when Cobden came to him, saying: "There are thousands of houses in England at this moment where wives, mothers, and children are dying of hunger. Now, when the first paroxysm of your grief has passed, I would advise you to come with me, and we will never rest until the Corn Law is repealed." The struggle and the triumph are thus described by Mr. Bright: "We were joined, not by scores, but by hundreds, and afterward by thousands, and afterward by countless multitudes; and afterward, famine itself, against which we had warred, joined in. A great minister was converted, and minorities became majorities, and finally the barrier was entirely thrown down, and since then, though there has been suffering, and much suffering, in many homes in England, no wife, and no mother, and no little child has been starved to death as a result of famine made by law."

During the agitation for the repeal of the Corn Laws, Cobden had neglected his own affairs entirely, and at the end he was a poor man. A popular subscription of more than £75,000 was made up for him and he went abroad for rest. His nature, however, was opposed to rest, and during his long travels in France, Spain, Italy, Germany, and Russia, he did not cease to advocate in public speeches and interviews with sovereigns and statesmen the great principles of free trade, peace, and nonintervention. During his absence he was elected to Parliament from the West Riding of Yorkshire (1847), and on his return to England he affiliated himself with numerous peace societies and subsequently attended a number of international peace congresses in Paris, Frankfort, and London. In 1849 he moved in Parliament that action be taken towards the establishment of international arbitration, and in 1851 he proposed a general reduction of armaments. He was active in combating the periodic outbursts of anti-Gallic and anti-Russian fever such as that which spread over the country in 1853, and lost thereby that immense popularity which he had acquired in the struggle against the Corn Laws. He bitterly assailed Palmerston's policy of active intervention in European affairs, and with John Bright opposed the war against Russia in 1854, for which he was virulently assailed by the unanimous voice of a war-mad nation. Far from considering the preservation of Turkey as desirable, Cobden maintained that the downfall of the Ottoman Empire in Europe would redound to the welfare of the Christian peoples of the Balkans and to the cause of civilization. In 1857, as the result of an attack by Cobden on the Chinese policy of the cabinet, the Palmerston ministry was outvoted and forced to appeal to the country. Cobden stood for Huddersfield, but his unpopularity on account of his attitude towards the war recently ended was still great and he was defeated. In 1859 he came to the United States, this being his second visit after a lapse of 24 years. On his return the post of President of the Board of Trade was offered him by Palmerston, with a place in the cabinet. Against the urgent advice of his friends, Cobden declined the offer, refusing frankly to take sides with a man from whom he differed *toto cælo* on matters of foreign policy. At the suggestion of M. Chevalier, the eminent champion of free trade, Cobden went to France in 1859 to attempt the negotiation of a commercial treaty between that country and England. He possessed the support of none of the English ministers save Gladstone, but his reputation was such that in his unofficial capacity he succeeded in converting the French Emperor and his ministers to his views. In January, 1860, Cobden was clothed with official authority and in the same month the treaty was concluded. He remained in Paris until November, accomplishing the tremendous labor necessary in the minute adjustment of a new tariff schedule. On returning to England he declined the offer of a baronetcy and resumed his activity in Parliament. With John Bright he earnestly supported the cause of the North in the Civil War, and in Parliament severely criticized the course of the government in permitting the equipment of Confederate cruisers for the purpose of preying on American commerce. His last speech in Parliament was delivered in July, 1864. He contracted serious bronchial trouble as the result of exposure in traveling on a public mission to London, and died there, July 2, 1865. His death was acknowledged as a national loss by men of such widely differing opinions as Palmerston, Disraeli, and John Bright, and was received with sorrow in France and other countries of the Continent.

Cobden's *Speeches on Questions of Public Policy* were published by his friends John Bright and Thorold Rogers in 1870. The best biography is that by John Morley, *Richard Cobden's Life* (London, 1881; New York, 1908). Consult also Garnier, *Richard Cobden, les ligueurs et la ligue* (Paris, 1846); Bastiat, *Cobden, et la ligue ou l'agitation pour la liberté du commerce* (Paris, 1848); Walpole, *Studies in Biography* (New York, 1907); MacCunn, *Six Radical Thinkers* (ib., 1910).

COBDEN CLUB. An association of leading free traders instituted in London in 1866, in honor of Richard Cobden (q.v.), with the object of diffusing in all parts of the world those principles with which his name is connected. For this purpose it has published tracts, pamphlets, and books for free circulation, especially in Great Britain, the United States, and the British colonies.

COBEGO, kō-bā'gō, or **KAGUAN,** kä'gwän. The native name of a singular group of East Indian flying insectivores, constituting the family Galeopithecidæ and genus *Galeopithecus*, having one species (*Galeopithecus volans*) and perhaps one or two others. They are known in the Malayan region as cobegos, colugos, kaguans, kubongs, etc., and in many books as flying lemurs, this aberrant and puzzling group having at first been considered lemuroids. But the scientific name, meaning "weasel monkey," is no more appropriate than lemur, for this creature is neither the one nor the other, but rather a distant cousin of moles and shrews. Even here we have the anomaly of an animal classed with the insectivores which, in diet, is wholly a vege-

tarian. They are slender, long-limbed, large-clawed, long-tailed, fox-headed animals, about 18 inches in length, clothed in exquisitely soft, short and protectively mottled fur, and provided with a folded extension of the skin which extends from the neck nearly to the tip of the tail and includes the feet, which are fully webbed. This parachute thus equals that of the best-furnished bats in extent, but it is furry both above and below. In flight the cobego does not equal bats, but it can sail longer distances, and come nearer to guiding its course, than do any other "flying" mammals. It is wholly arboreal in its life; in fact, on a flat surface it is as helpless as a bat, and flops awkwardly towards the nearest tree, the mode of progression resembling that of a seal. It becomes active mainly in the evening and early morning, disliking the glare of day, and impeded by the darkness of midnight. It spends most of its time scrambling about the branches or sailing from one tree trunk to another, and seems to feed upon anything vegetable that lies in its way, but mostly upon leaves and fruit. It has been said that in sleep it hangs head downward, clinging with its hind feet, and by means of the prehensile free tips of its tail, when it is nearly invisible among the flickering lights of the leaves. Like many of the owls, the cobego has two color phases, rufous and gray, which are wholly independent of age, sex, or season. The rufous is much the rarer, only about one in a dozen being of this hue. It is probable that only a single young is born at a time and this in a very imperfect stage of development, reminding one of the marsupials. The young animal sleeps hanging by all four feet, its head and tail curled inward, forming almost a circle. Consult: Wallace, *Malay Archipelago* (London, 1869); Moseley, *Notes by a Naturalist on the "Challenger"* (London, 1879); Beebe, *New York Zoölogical Society Bulletin* (New York, 1913).

COBET, kō-bĕt′, Carel Gabriel (1813–89). A brilliant Dutch classical scholar. He was born in Paris and studied from 1831 to 1836 in Leyden. In a journey to Italy at government cost in 1840–45 he studied carefully most of the Greek manuscripts in Italian libraries, and became thus an expert in paleography (q.v.). He became a professor at Leyden in 1847. Cobet was one of the most sagacious and acute of modern scholars in the criticism and emendation of Greek texts. He published, besides other works of high merit: *Oratio de Arte Interpretandi Grammatices et Critices Fundamentis Innixa*, his inaugural address, famous for its Latinity (1847); *Variæ Lectiones* (1854); *Novæ Lectiones* (1858); *Miscellanea Critica* (1876); *Collectanea Critica* (1878); works on Dionysius of Halicarnassus, and Xenophon; and editions of Diogenes Laërtius, Xenophon's *Anabasis* and *Hellenica*, Lysias, and Cornelius Nepos. From 1856 he was one of the editors of *Mnemosyne*, an important periodical devoted to the classics. Consult Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908). See Textual Criticism.

COB′HAM, Lord. See Oldcastle, Sir John.

CO′BIA, or **Crab Eater.** See Sergeant Fish.

COBIJA, kō-bē′hȧ. A seaport in the Province of Antofagasta, Chile, about 70 miles north of Antofagasta (Map: Chile, C 8). It was formerly a considerable town, but has lost its commerce and now contains a population of but 500. Cobija, once known as Puerto la Mar, was part of Bolivia and its only seaport until ceded to Chile in 1883. It suffered from an earthquake and tidal wave in 1877.

COBLENZ, or **KOBLENZ,** kō′blĕnts (corrupted from the Latin name *Confluentia*, or *Confluentes*, from *confluere*, to flow together, from *con-*, together + *fluere*, to flow). The capital of the Prussian Rhine Province, about 57 miles southeast of Cologne, beautifully situated at the junction of the Rhine and the Moselle (Map: Prussia, B 3). It consists of the old town, along the Moselle, and the new town, farther up the Rhine. Among the principal buildings are the church of St. Castor, founded early in the ninth century by the son of Charlemagne, containing the tomb of Archbishop Kuno of Falkenstein; the Liebfrauen Kirche ('Church of Our Lady') of the thirteenth century; the so-called Kaufhaus, built in 1477 as a town hall; the ancient Burg, erected by the Archbishop of Treves in 1276, restored by the town; and the large electoral palace, now a royal palace, completed in 1786. In 1905 the government completed a magnificent new building in which to centre the activities of the province. At the extreme point of the city, at the junction of the rivers, stands the splendid equestrian statue of Emperor William I, erected by the province. Coblenz has numerous and excellent educational institutions, including a royal gymnasium, a teachers' seminary, and a conservatory of music. Its chief industry is the production of the sparkling Moselle wine. There are also manufactures of ships, hats, machinery, pianos, and lacquered wares. A system of four forts, including Ehrenbreitstein on the opposite bank of the Rhine, makes it very formidable. Prince Metternich, the Austrian statesman, was born here in 1773. Pop., 1900, 45,146; 1905, 53,902; 1910, 56,487. Coblenz was known to the Romans as Confluentes. In 1018 it was conferred by Henry II upon the archbishops of Treves. After 1789 it was the headquarters of the French Emigrés, and in 1794 it passed to France. In 1815 it was ceded to Prussia. Consult: Daniel, *Deutschland* (Leipzig, 1895); W. A. Gunther, *Geschichte der Stadt Koblenz* (Coblenz, 1815); Bär, *Urkunden und Akten zur Geschichte der Verfassung und Verwaltung der Stadt Koblenz bis zum Jahre 1500* (Bonn, 1898).

COBNUT. See Hazelnut.

COBOURG, kō′bĕrg. The capital of Northumberland Co., Ontario, Canada, on Lake Ontario and the Grand Trunk Railway, 69 miles east-northeast of Toronto (Map: Ontario, F 6). It is a port of entry, with a commodious harbor and regular steamship connections with Rochester, N. Y., Toronto, Montreal, and other American and Canadian ports. The town is well laid out and has notably fine public buildings. The manufacturing establishments include extensive car works, woolen and matting factories, steel works, woodworking, wire-fence, and canning factories. Cobourg is a well-known and popular summer resort. For many years Cobourg was the seat of Victoria University (Methodist), now federated with Toronto University. Electric power is generated for manufacturing purposes. Pop., 1901, 4239; 1911, 5074.

CO′BRA, or **COBRA DE CAPELLO,** kō′brȧ dā kȧ-pĕl′ō (Portug., hooded snake). One of a group of Oriental venomous snakes constituting the proteroglyphic genus *Naja*. There are six or seven species dwelling in Asia and Africa. Of the African species the best known is the

asp (*Naja haie*). (See ASP.) The Asiatic cobras are not large, except the "giant" cobra (*Naja bungarus*), which is sometimes 13 feet long. (See HAMADRYAD.) Several species belong mainly to the Malayan region and are comparatively small and harmless. None is American, the "cobras" of Brazil being something else, usually harmless.

The cobra de capello (*Naja tripudians*) is the most interesting one, as it is exceedingly numerous throughout India and Ceylon, thence westward to the Caspian, and eastward throughout the Malay Peninsula and into southern China; and is justly regarded as the most deadly of venomous serpents—certainly the most harmful considered in the aggregate, the annual mortality from its bite in India alone being many thousand human beings, besides a great quantity of live stock. Little can be done to prevent this, because of the religious veneration with which the "black snake" (the native name) is regarded by the larger part of the population. This species rarely exceeds 6 feet in length and is a rather slender, brownish snake (bluish beneath) with lighter crossbars; but the markings are variable. The head is small, without the triangular and separated appearance of the vipers; but when the snake is angry or excited and about to strike, it lifts from the ground a third of its length and spreads the nuchal ribs until the neck expands into a broad, shell-like hood of terrifying appearance; and the back of this hood displays a yellow mark, more or less of the shape of a pair of spectacles.

These cobras wander even up to elevations of 8000 feet in the Himalayas, but are most common in the lowland jungles, where they are able to climb trees, although they seldom do so; and as they can swim well they often enter the water after frogs, fish, etc. They are attracted to villages, enter gardens and houses in search of mice and other small mammals, or of eggs and young poultry, and are likely, especially during the rainy season, to take up their residence in old houses, broken walls, fodder stacks, and rubbish heaps, and remain there. It is about such places, especially at night, that they are most often trodden upon, and fatal bites are received. They are sluggish and strike rarely except when provoked or endangered, and they may be killed by a slight blow. Their bite, when well delivered by a vigorous snake, is almost surely fatal; men have been known to perish within half an hour, and in such cases all so-called remedies are useless. The immunity this snake receives among the Hindus is due to a belief that it once spread its hood as a shade over Buddha while he slept, and was blessed by the saint, who placed the spectacle mark upon its back as a warning to the kite not to molest it. Little headway can be made against this superstition in efforts towards extermination of this deadly reptile, which occasionally penetrates even the gardens and parks of large towns. Its natural enemies are few, chiefly the kite, the mungoos (q.v.), and cattle (by tramping).

Bibliography. For these and other poisonous snakes of the Old World, consult authorities referred to under SNAKE; also Fayrer, *Thanatophidia of India* (London, 1874); Ewart, *Poisonous Snakes of India* (ib., 1878); and especially Wall, *Journal Bombay Natural History Society*, vol. xxii (Bombay, 1913). See PROTEROGLYPHA; and Colored Plate of FOREIGN VENOMOUS SERPENTS with the article SNAKE.

COBRE, or EL COBRE, kō'brā. A small town in the Province of Santiago, Cuba, about 9 miles from Santiago de Cuba (Map: Cuba, K 6). It is the centre of a copper-mining district, and derives its name from that metal. Cobre dates from the sixteenth century, the mines having been exploited first in 1558. Pop., 1899, 1028; 1907, 1781.

COBURG, kō'bo͝orĸ (Lat. *Melocabus*). The capital of the Duchy of Coburg and, alternately with Gotha, the residence of the Duke of Saxe-Coburg-Gotha, picturesquely situated on the left bank of the Itz, a tributary of the Main, about 26 miles north-northeast of Bamberg (Map: Germany, D 3). Its principal public buildings are chiefly found on the Marktplatz and Schlossplatz. The former, adorned with a statue of Prince Albert, contains the old Rathaus, from the early seventeenth century, the handsome government buildings, the arsenal, with the Ducal Library of 100,000 volumes, and the town museum. The Schlossplatz contains the large palace erected in 1549 and restored in 1693, two smaller ducal palaces, and the theatre. The church of St. Moritz, a handsome Gothic structure, dating from the fifteenth century, contains some fine monuments and brasses. On a hill about 500 feet above the town stands the ancient castle of the dukes of Coburg, dating from the sixteenth century. It has been restored and is fitted up as a museum. The rooms which Luther occupied, when in concealment here in 1530, remain, as well as the pulpit from which he preached in the chapel of the castle. It has a gymnasium founded in 1604 by Duke John Casimir, commercial, agricultural, and other schools. There are flourishing industries of beer brewing, the weaving of woolen and linen fabrics, and the manufacture of porcelain and basket ware, machinery, colors, ironwork, and lumber. Pop., 1890, 17,106; 1900, 20,459; 1910, 23,794. The town of Coburg grew up around the castle and is mentioned for the first time in 1207. In 1485 it passed to the Ernestine line of Saxon dukes and became in 1735 the capital of Saxe-Coburg.

COBURG FAMILY. An old German ducal family, dating from the fifteenth century, which has contracted various alliances with the English and continental royal houses. Queen Victoria's mother was a sister of Duke Ernst I of Coburg. The first wife of Ernst's brother, Leopold I, King of Belgium, was a daughter of George IV, of England, and his second wife was a daughter of Louis Philippe. Albert (q.v.), the son of Ernst I, was the husband of Victoria.

COBURG PENINSULA. A peninsula on the north coast of Australia, bounded by the Van Diemen Gulf and the Arafura Sea. It extends in a northwesterly direction towards Melville Island, from which it is divided by Dundas Strait (Map: Australasia, F 4). On its northeast side is the bay known as Port Essington, at the head of which was established, in 1839, the settlement of Victoria—abandoned six years later because the red-clay soil could not be cultivated. The district abounds with swamp buffaloes which were originally imported from Java.

COBURN, FOSTER DWIGHT (1846–). An American agriculturist, born in Jefferson Co., Wis. He had a common-school education, served in the Civil War in Illinois regiments, and in 1867 settled in Kansas. The agriculture of Kansas owes much to his expert knowledge and enthusiasm. He became in 1882 and again in 1894 Secretary of the State Department of

Agriculture and was chief of the department of live stock at the St. Louis Exposition (1904). He was repeatedly a member of the board of regents of the State Agricultural College and president of the State Temperance Union. In 1906 he refused an appointment as United States Senator. He wrote many State reports and *Swine Husbandry* (1904); *Alfalfa* (1901); *The Book of Alfalfa* (1906); *Swine in America* (1909).

COBWEB. One of the four fairies that appear in Act iii, Scene 1, and Act iv, Scene 1, of Shakespeare's *Midsummer Night's Dream.*

CO'CA (So. Amer. name), *Erythroxylum coca.* A shrub of the family Linaceæ, the leaves of which are much used by the inhabitants of Peru and Bolivia as a narcotic and stimulant. (For illustration, see Plate of CORNFLOWER.) The dried leaves are chewed with a little finely powdered unslaked lime or with the alkaline ashes of the quinoa (q.v.), or certain other plants. The principal constituents of coca are cocaine and several derivatives, hygrine, cocatannic acid, etc. As a local anæsthetic the alkaloid cocaine is unexcelled. The common forms of administering are in the wine of coca, a fluid extract, and the alkaloid cocaine. The properties and effects of coca resemble those of opium, although it is less narcotic, while it possesses the property of dilating the pupil of the eye, which opium does not possess. It also lessens the desire for ordinary food, and for some time, at least, enables the person who uses it to endure greater and more protracted exertion than he otherwise could, and with less food. The leaves are sometimes mixed with forage for mules, when especially long trips are taken. It is especially remarkable for its property of preventing the difficulty of respiration, so common in the ascent of long and steep slopes at great elevations. But when used habitually and in excess, it weakens the digestion, produces biliary and other disorders, and finally induces a miserable ruin both of body and mind. It has been in use from a very remote period among the Indians of South America and was extensively cultivated before the Spanish conquest. Many of the Indians of the Peruvian Andes are to this day excessively addicted to it, and its use prevails also to a considerable extent among the other inhabitants of the same regions. Its culture and use have extended into Brazil. The shrub is extensively cultivated in various parts of South America and in Ceylon, India, and Java. It could probably be grown in parts of Florida and California. The shrub is 3 to 6 feet high, with rusty branches and leaves somewhat like tea leaves, which are borne on the ends of the branches, the small yellow flowers some distance below. The annual production of leaves in South American trade is estimated at 30,000,000 to 40,000,000 pounds. There are about 100 species of *Erythroxylum.* The name is from the red wood of some species.

COCADRILLE, kŏk'ȧ-drĭl. A monster described by Sir John Mandeville as living on the island of Silha and corresponding to the crocodile, of which the word is an early form.

COCAINE, kō'kȧ-ĭn, $C_{17}H_{21}NO_4$. An alkaloid derived from the leaves of a shrub, *Erythroxylum coca* (see COCA). The hydrochlorate, $C_{17}H_{21}NO_4$·HCl, produces temporary insensibility when applied to the conjunctiva, mucous membranes, or denuded surfaces, or when injected beneath the skin. It is not absorbed by the unbroken skin, however, unless by cataphoresis (q.v.). It also causes a temporary contraction of the blood vessels of the region anæsthetized, but this is followed by congestion. Applied to the conjunctiva, it causes anæsthesia, dilatation of the pupil, diminution of intraocular tension, and some interference with accommodation. For dilating the pupil it is sometimes employed in combination with homatropine (q.v.). As a local anæsthetic for regions covered by skin it is injected in solution, by a hypodermic needle, into the tissue which is to be anæsthetized. The toxic dose varies greatly, some persons being unfavorably affected by a small amount. The only result may be restlessness and excitement, or there may be headache, rapid respiration, delirium, coma, or convulsions, with wide dilatation of the pupils. Persons addicted to the cocaine habit use the drug internally or by subcutaneous injection. Its prolonged use causes digestive disturbance, muscular twitching, insomnia, mental, moral, and physical deterioration, and often death.

Within recent years cocaine has been successfully employed as an anæsthetic in major surgical operations; if injected into the spinal canal, cocaine has the remarkable effect of producing complete insensibility to pain in the entire part of the body below the point where it is injected, but no effect at all above that point. See ALKALOIDS.

COCAMA, kō-kä'mȧ. A tribe of Tupian stock, known also as the *Ucayales,* situated on the banks of the lower Ucayalí River, in northeastern Peru, particularly in the neighborhood of the great Cocama Lagune; also in the vicinity of Nauta, on the left bank of the Amazon, opposite the mouth of the Ucayalí. On the lower Huallagá are some Cocamas, who are known as *Cocamillas.* They are closely related to the Omaguas, or Campevas, another Tupian people of the higher Amazon. Besides the older notices in De Castelnau and Marcoy, consult the article of Dr. P. Rivet, "Les langues guaranies du Haut-Amazone," in the *Journal de la Société des Américanistes de Paris* for 1908.

COCANADA, kō'kȧ-nä'dȧ (corrupted from Telugu *kakinadi*). The capital of the Godavari District, Madras, India, 315 miles north-northeast of Madras, and after that city the principal port on the Coromandel coast (Map: India, D 5). Navigable canals connect it with the Godavari River at Dowlaishwaram. The commercial establishments and docks of the town are on the banks of one of these canals, which leads to the protected roadstead in Coringa Bay. In spite of a decline in its trade due to silting of the harbor, large quantities of cotton are exported, and there are exports also of rice, sugar, oil seeds, ghee, pulse, and tobacco. The principal industries are the manufacture of salt, ironwork, and cheroots. Pop., 1901, 48,096; 1911, 54,110.

COCCAI, MERLIN. See MERLIN COCCAI.

COCCEIANS, kŏk-sē'yanz. The name given to the adherents of Johannes Cocceius, the seventeenth-century theologian (q.v.), who held that the future history of Christianity was to be found foreshadowed in the Old Testament.

COCCE'IUS, NERVA, or NERVA MARCUS (?–33). The grandfather of the Emperor Nerva, elected consul 22 A.D. His legal learning is extolled by Tacitus, and he is frequently mentioned in the *Digest.* He had charge of public works under Tiberius, to whom he was

a constant companion. Notwithstanding the Emperor's entreaties, he starved himself to death, 33 A.D., because of continual ill health.

COCCEIUS, kŏk-tsā'yo͝os, or KOCH, JOHANNES (1603–69). A German Protestant theologian. He was born in Bremen and made his first studies there. In 1625 he went to Hamburg and acquired a thorough knowledge of Oriental languages under the guidance of a learned Jew. Returning to Bremen in 1630, he taught Hebrew there and was appointed professor of theology in Franeker in 1643 and in Leyden in 1650. Cocceius' chief work is the *Lexicon et Commentarius Sermonis Hebraici et Chaldaici Veteris Testamenti* (Leyden, 1669), the first tolerably complete dictionary of the Hebrew language. By a fanciful typology he found New Testament ideas in the Old Testament. The representation of a covenant between God and man he made the centre of his theology. This idea of two covenants—one of works, or that before the Fall, and one of grace, that after it—was first broached by William Ames (died 1633); but Cocceius elaborated it and so became the virtual founder of the federal theology (q.v.), which is found in the Westminster standards and was long accepted by the Reformed churches. The most complete exposition of his views is in his *Summa Doctrinæ de Fœdere et Testamento Dei* (1648). His collected works were issued in Amsterdam (1675), with a life by his son.

COCCEJI, kŏk-tsā'yē, HEINRICH VON, BARON (1644–1719). A German jurist. He was born at Bremen and studied jurisprudence and philosophy in Leyden and afterward in Paris and Oxford. He was made professor in Heidelberg in 1672 and in Utrecht in 1688, and two years later was appointed to a similar office in Frankfort-on-the-Oder. In 1712 he was created a baron of the realm. His work on German civil law, *Juris Publici Prudentia* (1695), was almost universally used as a textbook.

COCCEJI, SAMUEL VON, BARON (1679–1755). A German jurist, born in Heidelberg, son of the preceding. He became Prussian Minister of State and of War (1727), director of ecclesiastical affairs and curator general of the universities of the kingdom (1730), president of the High Court of Appeals (1731), chief of the Prussian judiciary (1738), and Chancellor (1747). He exerted the greatest influence upon the development of Prussian law. The legal codes prepared by him, and respectively entitled *Projekt des Corporis Juris Fridericiani Pomeranici* (1747) and *Projekt des Corporis Juris Fridericiani Marchici* (1748), remained in operation until 1780. Consult Trendelenburg, *Friedrich der Grosse und sein Grosskanzler Samuel von Cocceji* (Berlin, 1863).

COC'CIDÆ (Neo-Lat. nom. pl., from Lat. *coccum*, Gk. *κόκκος, kokkos*, berry). A family of bugs, including the scale bugs or bark lice, the mealy bugs, and others without popular names. This family not only departs the most widely from the Hemiptera, but in it the most anomalous forms among insects are found; and the most extraordinary diversities occur, even in the two sexes of the same species. The habit of secreting a shell or covering of some sort is common to all the Coccidæ, most frequently in the form of a scale made up of cast skins and excreted matter. Sometimes, as in the case of the mealy bugs, the covering is white and powdery; and in the "ground pearls" it is glassy or shell-like and may entirely incase the insect. A few gall-forming species occur in Australia. The young mitelike females at first have the power of locomotion. The perfect male has only one pair of wings, like flies. Sexual reproduction is the normal method, while parthenogenesis and viviparous reproduction, so common in the aphids, is a rare method among the Coccidæ. Almost complete histolysis may occur in the female, lasting for several years. The young of both sexes sink the rostrum into plants, suck the sap, and secrete a waxy coating or shield of some sort, under which they undergo subsequent development. Coccidæ occur on bark, leaves, and fruits of various trees, and as they are sap suckers they may greatly impoverish or kill the plant. The black or brown scalelike spots on oranges and lemons are really scale insects, and by the transportation of the fruit gain world-wide distribution. Honeydew is secreted by the Coccidæ, but usually not so plentifully as by the Aphidæ. The "man" still used by the Arabs for food is probably the manna of Exodus and is secreted by a coccus. White wax is secreted by a species in India, and another produces in China the wax commercially known as China wax. The shelly resinous scale produced by another form is the lac or shellac of commerce, while the body of the lac-producing insect affords the red dye known as lake. Other Asiatic and European species furnish dyes. The tropical American *Coccus cacti* yields cochineal (q.v.). Axin and axinic acid are produced by another Mexican coccus. Consult Newstead, *Monograph of the Coccidæ of the British Isles* (London, 1900), and the references to subdivisions of this group in Banks, "List of Works on North American Entomology," *Department of Agriculture, Bulletin 81* (Washington, 1910). See LAC INSECT; SCALE INSECT.

COCCID'IO'SIS. See DIARRHŒA, WHITE, OF CHICKENS.

COCCID'IUM. A protozoön of the order Sporozoa, occurring as a cell parasite in most animals. *Coccidium oviforme* has been found in human liver and intestines. Within a mosquito inoculated with malaria are found coccidia, which, rupturing, set free threadlike bodies eventually found in the secretion that lubricates the mosquito's lancet.

COCCIUS, kŏk'tsē-o͝os, ERNST ADOLF (1825–90). A German oculist, born near Leipzig. He studied medicine at the universities of Leipzig and Prague and practiced several years in Leipzig, where he became connected with the university in 1851. He was made full professor of medicine there in 1867. Coccius made contributions of great value to the diagnosis of the diseases of the eye. His published works include: *Ueber die Ernährungsweise der Hornhaut und die Serum führenden Gefasse des menschlichen Körpers* (1852); *Ueber die Anwendung des Augenspiegels nebst Angabe eines neuen Instruments* (Leipzig, 1853); *Ueber die Neubildung von Glashäuten im Auge* (1857); *Der Mechanismus der Akkommodation des menschlichen Auges nach Beobachtungen im Leben* (1867); *Ueber Augenverletzungen und ihre Behandlung* (1871); *Ophthalmometrie und Spannungsmessung am kranken Auge* (1872); *Ueber die Diagnose des Sehpurpurs im Leben* (1877).

COC'CO (West Indian name). EDDOES, YANTIA, or TANIERS, names given in the West Indies to species of *Xanthosoma*, of which there are about 30, all American. *Xanthosoma* is a genus belonging to the Araceæ, or aroids, and

only about three species are of economic importance, viz., *Xanthosoma sagittifolium*, *X. violaceum*, and *X. atrovirens*. Until quite recently these plants have been confused with the elephant ears, or taro (*Colocasia antiquorum*), and allied species of the Pacific islands. They resemble the taro, but may be distinguished by their leaves never being in the least peltate and by their producing numerous tubers. These tuberous offshoots often contain as much as 30 per cent starch and are used similarly to white or Irish potatoes. The leaves are often served as a potherb, resembling spinach. The culture of the plant is quite simple, and the yields are large, and it may prove adapted to the frostless portions of the United States. The taro is recognized by its slightly peltate leaves and its large fleshy rootstock. In Hawaii, and the South Sea Islands generally, taro is one of the staple sources of food for the natives. The rootstock is roasted, after which it is pounded in wooden trays with water into a thick dough. This is allowed to ferment and may be eaten in that state or prepared in a number of ways. Its native name in Hawaii is poi. In Japan, Porto Rico, etc., the rootstocks are utilized as we use potatoes.

COCCOSTEUS, kŏk-kŏs'tē-ŭs (Neo-Lat., from Gk. *κόκκος*, *kokkos*, berry + *ὀστέον*, *osteon*, bone). A genus of heavily armored fishes, of the order Arthrodira, fossil remains of which are found in the Devonian rocks of Europe and North America. The head and the forward part of the trunk were covered with strong bony plates, and the plates of these two regions articulated by a hinge joint that admitted of free movement of the head upon the trunk. The skull had large orbits, placed well forward, and in the middle of the frontal surface was a pit that indicated the position of the pineal body. The jaws were strong, and the mandibles or lower jaws were furnished with conical teeth. The trunk of *Coccosteus* was sharklike in form, and was provided with a single dorsal fin, an anal fin, and perhaps a pair of rudimentary pelvic fins. It was probably covered by a soft skin that readily decomposed after the death of the animal and that hence escaped fossilization. The vertebral column shows an interesting progressive stage in the evolution from the cartilaginous backbone of the earlier fish to the completely calcified skeleton of the later genera. The neural arches and the spiny processes of the vertebræ have alone become calcified, so that in well-preserved specimens they appear as two rows of bony processes, with an intervening empty canal that represents the cartilaginous centra, or "bodies," of the vertebral elements. All the species of the *Coccosteus* are small, none of them having been found with a length greater than 20 inches. The best-known species and the type of the genus is *Coccosteus decipiens*, which is common in the Old Red Sandstone of the Scottish Devonian. A few specimens, though none so perfect as the Scottish, have been found in the North American Devonian. See FISH; DIPNOI; LUNG FISH.

COC'CULUS IN'DICUS (Neo-Lat. *cocculus*, dim. of Lat. *coccum*, berry, and Lat. *indicus*, Indian). The name given to a very poisonous seed brought from the East Indies, which is used for various medicinal purposes, and illegally, it is said, for imparting a bitter flavor to malt liquors. It possesses acrid and intoxicating qualities. It is used in India for stupefying fish, that they may be taken by the hand. When the seeds, known as "fish berries," are thrown into a stream, any fish in the neighborhood are quickly stupefied. It contains a most poisonous principle, called "picrotoxin," while the pericarp contains another called "menispermin," equally poisonous. It is the seed of the *Anamirta paniculata*, a beautiful climbing plant, of the natural order Menispermaceæ. The action of picrotoxin, when taken internally in poisonous doses, resembles that of strychnine (see NUX VOMICA); the most noticeable symptoms being uneasiness, restlessness, and tetanic convulsions. The drug is used to destroy lice and the parasite of ringworm. It has been employed internally, in small doses, to check the night sweats of phthisis. Poisoning occasionally occurs from drinking the drug, as it is sometimes prepared as a domestic parasiticide—the bottle being filled with equal volumes of the berries and rum, and allowed to stand after shaking. Absorption through broken skin also causes poisoning at times. The genus *Anamirta* is closely allied to the genus *Cocculus* (see CALUMBA), in which it was formerly included. The fruit of several allied species possesses properties analogous to those of the *Anamirta paniculata*.

COCCYX, kŏk'sĭks. See SPINAL COLUMN.

COCHABAMBA, kō'chä-bäm'bȧ (*Cocha*, lake + *bamba*, plain). The capital of the Department of Cochabamba, Bolivia, situated on the Río de la Rocha, in a fertile valley, about 8000 feet above the sea level (Map: Brazil). It is laid out with wide and regular streets and contains several pretentious structures, notably the theatre, government building, and the hospitals of Viedma and San Salvador. Cochabamba has a university, two colleges, and secondary schools. The city manufactures cotton and woolen goods, leather, soap, and earthenware, and besides carries on considerable trade, especially in grain. Pop., 1900, 21,881; 1910 (est.), 24,512. Cochabamba was founded in 1563 and was called Oropesa. In 1847 it was created an episcopal see.

COCHEM, kō'kĕm. The capital of a district in the Rhine Province, Prussia, at the confluence of the Moselle and Endert, 24 miles southwest of Coblenz (Map: Germany, B 3). It is noted for its picturesque situation, near the entrance to the Emperor William Railway Tunnel, 2⅔ miles in length, the longest in Germany. Cochem has a beautiful riverside park, in which is a war monument by Schies, and a former cloister of the Capuchins. The ancient episcopal castle of the archbishops of Treves, destroyed by the French in 1689 and restored since 1868, crowns a hill to the south of the town. Near by are the ruins of the castle of Winneburg. Its chief industries are milling, forestry, and the making and handling of wine. Pop., 1900, 3586; 1910, 3758.

COCHERY, kôsh'rē', GEORGES (CHARLES PAUL) (1855–). A French public official, son of Louis Adolphe Cochery, born in Paris. He was educated at the Lycée Condorcet and the Ecole Polytechnique. He was a director in the Department of Posts and Telegraphs, Minister of the Interior, President of the General Council of Loiret, and in 1895–98 and 1909–10 was Minister of Finance. He was made a chevalier in the Legion of Honor.

COCHERY, kôsh'rē', LOUIS ADOLPHE (1819–1900). A French statesman. He was born in

Paris, where he practiced law, and occupied the post of Chief of Cabinet in the Ministry of Justice during the revolution of 1848. He was subsequently editor of the *Avenir National*, and in 1868 established the journal entitled *L'Indépendant de Montargis*. As a member of the Left Centre in the Legislative Assembly, he opposed war with Germany, and after Sept. 4, 1870, acted as General Commissioner of the National Defense in the Department of Loiret. Under Dufaure he became Undersecretary of the Finances, and from 1878 to 1885 he was Minister of the Postal and Telegraphic service. He was elected to the Senate in 1888.

COCHIMI, kō-chē'mē. A name formerly applied to tribes of Yuman stock, occupying the northern and central portions of the peninsula of Lower California, Mexico. According to the account of the Jesuit Baegert, who labored among them for some years in the middle of the eighteenth century, they, like the Guaicuru and Pericu, who occupied the southern part of the peninsula, were in the lowest grade of culture, naked, without agriculture of any kind, and with no permanent shelters, depending entirely upon fishing, hunting, and wild fruits for subsistence. The dead were first buried, and after a certain time the remains were dug up, the bones cleaned and painted red, and preserved in ossuaries.

COCHIN, kō-chēn' (Tamil *Kocchi-bandar*, 'Little Harbor'). The chief port of Malabar and the third in importance in the Madras Presidency, British India (Map: India, C 7). It is situated within the limits of the native State of Cochin in lat. 9° 58′ N. and long. 76° 14′ E. The town is about a mile long and half a mile broad, being at the northern end of a strip of land about 12 miles in length; it stands at one of the entrances of the Cochin backwater (see following article), which forms an excellent natural harbor of several square miles and provides communication by boat with a large area of rich country. The climate is very moist and hot; elephantiasis is common. Cochin is the only western port south of Bombay in which shipbuilding is carried on. It has a large trade, the main exports being coconut oil and coir; considerable tea from Travancore is exported. Of the import trade, more than half is rice. The Portuguese, under Cabral, arrived in 1500, and they soon got control of the town. Vasco da Gama founded a factory in 1502, and in 1503 Albuquerque built the Cochin fort, the first European fort built in India. Almeyda, arriving as Viceroy in 1505, enlarged the fort, and Cochin became the chief Portuguese settlement till the capture of Goa. St. Francis Xavier came in 1530 and made many converts; in 1577 the Society of Jesus published at Cochin the first book printed in India in native characters. An English settlement was made in 1634, when the East India Company by treaty acquired access to Portuguese ports. In 1663 the Dutch captured the fort and town, and the English retired to Ponnani. The town prospered under the Dutch, who remodeled it; in 1778 Van Moens rebuilt the fort. In 1795 the English besieged the town and captured it from the Dutch; the latter were allowed to retain their administration, but the cathedral (consecrated by the Portuguese in 1557), the fort, and many Dutch houses were blown up by the English in 1806, and in 1814 the town was definitely ceded to the East India Company. The population of Cochin in 1901 was 19,274; 1911, 20,023. More than half of the inhabitants were Christians, including a large Eurasian community.

COCHIN, kō-chēn'. A small native state of India in political relations with the government of Madras (Map: India, C 7). It consists of two disconnected parts, the larger of which is bounded on the north by the Malabar District of Madras, on the east by Malabar and Travancore State, on the south by Travancore, and on the west by Malabar and the Arabian Sea. The smaller part, called Chittur, lies to the northeast and is surrounded by the Madras districts of Malabar and Coimbatore. There are also a few small isolated tracts within Travancore. The total area is 1362 square miles. The eastern portion of the state, comprising nearly half the total area, is covered by a section of the Western Ghats, which reaches an altitude of about 5000 feet. It abounds in forests of teak and other valuable trees. To the west are forest-clad uplands, succeeded by plains reaching to a line of coastal backwaters. These backwaters or lagoons, which are separated from the sea by a long narrow stretch of sand densely grown with coconut palms, are very irregular in form, varying from a few dozen yards to four miles in breadth; they receive the numerous streams descending from the Ghats, communicate with the sea at three points, and are navigable for flat-bottomed boats. The climate is damp and enervating; the average annual rainfall is reported at 136 inches at Trichur, 108 at Ernakulam, and 66 at Tattamangalam; the temperature is fairly uniform, ranging from about 69° in December to about 96° in April, the mean being 82°. In the forests are found all the larger animals of southern India, and otters and crocodiles in the rivers and backwaters. Rice is the staple product, and coconuts second in importance; other crops are cereals and pulses, plantains and vegetables, betel leaf and areca nut, sugar cane, tapioca, ginger, pepper, and coffee. The forests, which cover nearly half the country, were formerly recklessly exploited, but now are conserved. The most important factory industry is the extraction of coconut oil. Coconut products constitute the principal exports. A branch line of railway, 65 miles long, was opened in 1902, connecting Ernakulam with Shoranur, on the southwest line of the Madras Railway. The backwaters form a line of communication from Trichur to the southern end of the state, 60 miles, and the canals branching therefrom aggregate about 60 miles. The capital is Ernakulam. The town of Cochin, which was formerly the capital and from which the state takes its name, has been British territory since 1814. The state is administered under a rajah, with the approval of the government of Madras. Pop., 1891, 722,906; 1901, 812,025 (increase 12.3 per cent); 1911, 918,110 (increase 13.1 per cent). Cochin leads all the districts and states of southern India in the literacy of its population, of whom over 13 per cent are able to read and write. Malayalam is the language of about 88 per cent of the people, and Tamil of about 7 per cent; in the Chittur taluk (285 square miles) over a third of the people speak Tamil. At the 1911 census Hindus numbered 615,710, Christians 233,092, Mohammedans 63,822, Animists 4177, Jews 1175, Jains 129, and Parsis 5. Of the Christians, 132,944 were Syrian and 97,987 Roman Catholic.

The Roman Catholic and the Syrian churches have a long history in Cochin, where there were probably Christians as early as the thirteenth century.

COCHIN, kō'chĭn (from *Cochin*-China). A breed of large domestic fowls, highly esteemed as producers of flesh and large eggs. They are known in black, buff, partridge (variegated), and white varieties, have yellow-feathered legs (except in the black variety) and single erect combs. See Fowl, and Colored Plate of Domestic Fowls in article Poultry.

COCHIN, kō'shăn', Charles Nicolas (1715–90). A French engraver and art critic, born in Paris. He was the most celebrated of a prominent family of engravers and painters and was the son and pupil of Charles Nicolas Cochin (1688–1754) and Louise Madeleine Hortemels, who was an etcher of note. He was named engraver to the King in 1739 and in this capacity designed a series of court subjects, such as "The Marriage of the Dauphin" (1745), in which his father assisted him. His drawings include vignettes, frontispieces, ornamental letters, and a number of portraits, including those of Garrick, Van Loo, Vernet, and Chardin. His works were catalogued by Jombert in 1770. Among them are etchings for his own pamphlets on Herculaneum and illustrations for the works of La Fontaine, Rousseau, Boccaccio, Ariosto, and Tasso. His criticisms on art were printed under the title *Œuvres diverses* (1757), and he also wrote *Voyage d'Italie* (1758), and *Mémoires inédites du Comte de Caylus*, published in 1880. He occupied many positions of distinction, and was ennobled in 1757. Consult Rocheblave, *Les Cochins* (Paris, 1893).

COCHIN, Henry Denys Benoit Marie (1854–1922). A French writer and legislator, born in Paris. He was educated at the Lycée Louis-le-Grand, Paris. In 1870–71 he served in the Franco-Prussian War, in 1877 he was an attaché of the Ministry of the Interior, and after 1893 he served continuously as a deputy. He was elected to the Academy in 1911. His publications include: *Giulietta et Romeo* (1878); *Le manuscrit de M. Larsonnier* (1880); *Boccace* (1890); *Un ami de Pétrarque* (1892); *Chronologie du Canzonière de Pétrarque* (1898); *Le frère de Pétrarque* (1903); *La vita nuova de Dante traduite et commentée* (1908); *Tableaux flamands* (1909); *Jubilis d'Italie* (1910); *Lamartine et la Flandre* (1912); *Ozanam: livre du centenaire* (1913); *Descartes* (1913).

CO'CHIN-CHI'NA, kō'chĭn-chī'nȧ. A possession of France, in the extreme south of the peninsula of Indo-China, lying between Cambodia and Annam on the north and the China Sea (Map: Asia, K 7). Its area is estimated at 21,980 square miles. It is traversed by the Mekong, which forms an extensive delta. The country is mainly a low plain, of alluvial origin. There is a region of granitic highlands in the northeast, representing the last spurs of the Annam chain, and reaching a height of 2300 feet. The Mekong, which has its source in Tibet, separates into three arms in Cochin-China, and together with many smaller rivers forms a network of waterways. The province in which Saigon, the capital, is located, is watered by the rivers Saigon, Donnai, and the two Vaicos. The delta land, almost wholly covered with rice fields and gardens, is frequently inundated, and the peninsula of Camau is like a great deserted swamp. Canals have been constructed for the joint purpose of commerce, irrigation, and drainage, vast areas thus being reclaimed for agriculture.

Cochin-China lies in the region of the monsoons. Typhoons frequently work great destruction. The healthfulness of the climate varies inversely with the frequency of the rains, and at its best is humid and warm. The severest heat is from April to June, and in the wet season there is almost a daily rainfall. Places near the seacoast are most favorable to Europeans. The flora is like that of Indo-China in general. The gamboge tree abounds, but palms are few. The vast forests are rich in the finest kinds of timber. There is game of every sort, from the elephant, rhinoceros, tiger, panther, leopard, deer, and wild boar, to the smallest rodents. Several species of venomous reptiles are found. Among the birds are the peacock, partridge, crane, duck, teal, snipe, woodcock, and pheasant. The rivers are plentifully supplied with fish of many species; alligators are numerous in the region of the Mekong. There is little mineral wealth, except phosphate of lime and salt. Most of the inhabitants are agriculturists and fishermen. About one-fourth of the area is cultivated, and the chief product is rice, which is planted throughout the country except in the north. Coffee culture is rapidly growing. Sugar cane, mulberry leaves, pepper, betel nuts, cotton, tobacco, maize, beans, sweet potatoes, oranges, bananas, and various valuable grasses, seeds, gums, and drugs are also produced. There are over 200,000 water buffaloes and 150,000 zebus employed in labor. Other farm animals are 11,200 horses, 109,000 cattle, 700,000 pigs, and 3000 sheep and goats. There are no native industries worthy of mention except the manufacture of salt, coarse silk stuffs, and sugar.

There are few good roads; but the innumerable little streams and canals give easy access to all parts of the country. The oldest railway in Cochin-China is that from Saigon to Mytho, now being extended from Mytho to Cantho, 60 miles. Other lines have been opened or are under construction and form part of the railway system of French Indo-China. In 1903 there were 2670 miles of telegraph. The chief article of commerce is rice. The minor exports consist of fish, cotton, copra, isinglass, silk, hides, and pepper. The articles imported are textiles, metals and metal implements, liquors, opium, paper, arms, and powder. In 1908, 756 vessels of 1,549,962 metric tons entered the ports of the colony. Commerce is mostly in the hands of Europeans and Chinese, but about 22,000 Annamites are small traders. There are over 73,500 fishing boats on the rivers and 3000 on the coast.

The colony is represented by a deputy in the French Parliament. It is divided into seven large provinces, Giadink, Vinh-long, Bassac, Bienhoa, Mytho, Chaudoc, and Hatien, which in turn are subdivided into 21 districts or inspectorates. The Lieutenant Governor, who is under the authority of the Governor-General of Indo-China, is assisted by a colonial council of 16 members, six of whom are French, and which has advisory functions, discusses and votes the budget, determines the taxes and the tariff. The Privy Council is a deliberative body of departmental heads as official members, together with two natives. Each province has its own administrative system, consisting of a provincial council and an administrator of native affairs. The provincial council is composed of natives and

discusses ways and means and questions of public works. The commune is the basis of the native social system, and the municipal councils are a sort of oligarchy of the prominent citizens. The cities of Saigon and Cholon are ruled by municipal councils part French and part native. Each important town has a citadel and garrison, and the collection of revenue and the suppression of robbery are secured by military posts in the interior.

The population in 1911 was placed at 3,050,785, of which 11,251 were Europeans, exclusive of the military. Saigon, the capital, had 64,845 inhabitants in the same year, of which 2939 were whites. Cholon had a population of 191,655. There were in 1911 about 380 schools, 800 teachers, and 19,000 pupils. Saigon presents a fine appearance, with its broad roads, good sanitation, and splendid government and public buildings, several of which cost over 2,000,000 francs. It has one of the finest docks in the world. A submarine cable connects it with Singapore and Hongkong.

For the administration of justice in Cochin-China there are native tribunals throughout the country, from which there is an appeal to the court at Saigon. In this appeal court European judges are assisted by Annamite mandarins in matters affecting the natives. In 1905 the penal system was reformed and punishment by torture abolished.

Cochin-China before the second half of the nineteenth century constituted a part of China, Cambodia, and Annam successively. In 1861 the French took Saigon and by treaty in the following year acquired the provinces of Saigon, Bienhoa, and Mitho. Hostilities continued until 1879. In 1888 the colony became a part of the Governor-Generalship of Indo-China. The name "Cochin-China" was formerly applied to the whole eastern division of the Indo-Chinese peninsula, including Tongking, Annam proper, and Lower Cochin-China. Consult: Lemire, *La Cochinchine française* (Paris, 1887); De Lanessan, *L'Indo-chine française* (ib., 1888); Norman, *Peoples and Politics of the Far East* (London, 1895); Baurac, *La Cochinchine et ses habitants* (Saigon, 1896–99).

COCHINEAL, kŏch'ĭ-nēl (from Sp. *cochinilla*, cochineal, wood louse, from Lat. *coccineus*, scarlet, from *coccum*, berry, or from Sp. *cochina*, sow; so called either from the color, or, if the second derivation be preferred, from the shape). A scale insect used as a dyestuff for scarlet and crimson and in the preparation of carmine and lakes. Cochineal consists of the bodies of the females of a coccid (see COCCIDÆ) called *Coccus cacti*, because it feeds upon plants of the cactus family, particularly on one known in Mexico as the nopal (*Opuntia cochinillifera*), nearly allied to the prickly pear. (See CACTUS.) These insects are minute, 70,000, it is said, being required to weigh a pound in a dried state—when not adulterated by red lead or other heavy dust. The male is of a deep-red color and has white wings. The female, which is wingless, is deep brown, covered with a white powder; flat beneath, convex above. Branches of nopal covered with insects are cut off before the rainy season sets in and carefully sheltered in a covered building. From these supplies the plantations are stocked at the close of the wet season, about the middle of October. When warmed by the sun, the females soon begin to lay eggs, each female producing more than 1000 young, which soon spread themselves over the plants. The males are very few—not more than 1 to 100 or 200 females—and are of no value as a dye. The first crop of females is picked off about the middle of December, and until May successive generations are gathered from time to time. The females, full of young, lose about two-thirds of their weight in drying. The process of gathering the insects is extremely tedious, a day's picking amounting only to about two ounces of cochineal. The killing is done in three ways: (1) by placing on a hot iron; (2) by placing in a hot oven; and (3) by dipping in a basket into boiling water, which is considered the best method. When killed and dried, they may be kept for any length of time without injury. The name "cochineal" is limited to that species first cultivated in Mexico, but long transplanted successfully to the Canary Islands, Java, and other warm parts of the Old World. Other species were known to the ancient Hebrews and Egyptians and were largely cultivated on a species of oak. Among the Arabs this insect is known as *kermes*, "red dye," and it is largely cultivated in Algeria (*Knowledge*, London, 1901). Cochineal was formerly much used for coloring wool or silk a scarlet or crimson; but, owing to the cost of its production and to the fact that the colors, although brilliant, are not very enduring, this dye has been greatly replaced by cheaper coal-tar products; and for this reason the cochineal industry has been rapidly declining. See CARMINE.

COCHITI. See Colored Plate of INDIANS (KERESAN STOCK).

COCHITUATE (cō-chĭt'ū-āt) **LAKE** (Massachusetts Indian: very deep water). A lake in Middlesex Co., Mass., 17 miles west of Boston. It is very narrow and irregular, with a length of about 4 miles, and has an area of little more than 1 square mile. From this lake and the connecting ponds, the city of Boston draws part of its supply of water (Map: Massachusetts, E 3).

COCHLEA, kŏk'lē-ȧ. See EAR.

COCHLEARIA, kŏk'lē-ā'rĭ-ȧ. See SCURVY GRASS.

COCHRAN, kŏk'ran, JOHN (1813–98). An American soldier and lawyer. He was born in Palatine, N. Y., graduated at Hamilton College in 1831, served as surveyor of the port of New York from 1853 to 1857, and from 1857 to 1861 was a Democratic member of Congress, where he took a prominent part in the debates on land reform, revenue, and other public questions. At the outbreak of the Civil War he became colonel of the First United States Chasseurs, which he commanded in the Peninsular campaign. In July, 1862, he was appointed brigadier general of volunteers, but resigned his commission in June, 1863, on account of failing health. He was Attorney-General of New York State in 1863–65. In 1864 he was nominated for the vice presidency on the ticket with John C. Frémont. As leader of the New York delegation to the Cincinnati Convention in 1872, he was instrumental in securing the nomination of Horace Greeley (q.v.) for the presidency. At the time of the Tweed-Ring disclosures in 1872 he became acting mayor of New York.

COCHRANE. A town in Timiskaming district, Ontario, Canada, situated on the National Transcontinental Railway and the Timis-

kaming and Northern Ontario Railway (of which it is the northern terminus), 500 miles north of Toronto, 550 miles west of Quebec, and 750 miles southeast of Winnipeg. It contains a customhouse and is the commercial centre for the newly opened northern Ontario and northern Quebec, especially the outfitting point for miners and prospectors, and for fishing and hunting parties. Machine shops and roundhouses of both the above-mentioned railways are located here. The town possesses electric-light and power, water works and sewage system. Pop., 1911, 1715.

COCHRANE, Francis (1852–1919). A Canadian merchant and statesman. He was born at Clarenceville, Province of Quebec, and was educated at the Clarenceville Academy. A few years afterward he removed to Sudbury, Ontario, and engaged in mining and lumbering. Entering municipal politics, he became mayor of Sudbury for several terms, and in 1902 was an unsuccessful candidate for the Ontario Legislature in the Conservative interest. He was elected in 1905, and again in 1908, when he was appointed Minister of Lands and Mines in the cabinet of Sir James P. Whitney (q.v.). In 1909–12 he was a member of the Royal Conservation Commission. Upon the accession to power of the Dominion ministry of Robert Laird Borden, Cochrane was appointed Minister of Railways and Canals.

COCHRANE, kŏk'ran, Thomas, tenth Earl of Dundonald (1775–1860). A British admiral, familiarly known as Lord Cochrane. The son of the ninth Earl of Dundonald, he was born at Annsfield, Lanarkshire, Dec. 14, 1775. His father, a scientist, ruined himself by experimental invention, and the boy received a desultory education volunteered by the village minister and schoolmaster. He was destined for the army, but in his seventeenth year joined his uncle's ship, on which he had been enrolled five years previously, and, in consequence of this priority, received rapid promotion. After serving in the Norway fiords and on the North American station, he won recognition in 1801 by a successful series of daring exploits in the Mediterranean, the most brilliant being the capture of a Spanish frigate of 600 tons and 319 men, which had been sent in quest of his small brig of 158 tons and 54 men. Shortly afterward his vessels were captured by three French line-of-battle ships, after several hours' resistance, but he was himself immediately released on parole. In 1802 he took advantage of the peace to repair his defective early education by a six months' assiduous course at Edinburgh University. He had imprudently offended Lord St. Vincent by a comparison, and at the renewal of hostilities in 1803 he was maliciously appointed to the stagnant Orkney station to protect nonexistent fisheries. But with a change of admiralty in 1804 he received a new ship, and within ten days captured several prizes. By a daring ruse he cleverly evaded a squadron of French battleships and sailed his prizes into Plymouth harbor, three golden candlesticks, each 5 feet high, decorating his masthead as specimens of spoil. In 1807 he was elected to Parliament for Westminster, but his indiscriminate exposure of naval abuses led to his being immediately ordered off to the Mediterranean. During four years he added to his reputation by a sequence of minor naval exploits and in 1809 was selected to burn out the French fleet which Lord Gambier had blockaded in Aix Roads, near Rochefort. He drove almost the whole squadron ashore and destroyed four ships; but, as he was unsupported by his superior, Gambier, who deliberately ignored his signals, the victory was incomplete. Cochrane received the knighthood of the Bath, but he emphatically expressed his disgust at the incompetency of Gambier, who demanded a court-martial. Through influence and a friendly court Gambier was exonerated, while Cochrane, discredited, was forced to retire on half pay. In Parliament, Cochrane continued his unsparing criticism of naval corruption, and thereby he made enemies who tried to implicate him in an attempt to influence the stock market by spreading the rumor of Napoleon's death. His uncle and another were found guilty and punished; and Cochrane, although innocent, was fined £1000, struck off the navy list, expelled from Parliament, degraded from his knighthood, sentenced to a year's imprisonment and to stand for an hour in the pillory. Owing to popular indignation, the pillory punishment was omitted. His Westminster constituents remained his friends and reëlected him. He escaped from jail in 1815, took his seat in the House, but was expelled by force, imprisoned for the rest of his term, and fined anew £100. Disgusted with vain attempts at justification, he accepted an invitation to organize the Chilean navy, and in 1818 proceeded to Valparaiso. He put the wretched Chilean vessels into the best possible condition and gained a series of remarkable successes over the Spanish fleet. In 1820 he took Valdivia and carried San Martin's army to Peru, having previously destroyed Spanish commerce on the Pacific coast and performed a brilliant exploit in cutting out the Spanish frigate *Esmeralda* from under the enemy's guns at the castle of Callao. Nonfulfillment of contracts and the refusal of arrears of pay caused him to resign, and soon afterward he became admiral in the Brazilian navy. During this appointment (1823–25) he compelled the Portuguese to evacuate Bahia, reduced Maranhão, and for his services received the marquisate of Maranhão; but the same causes as in the Chilean service led to his resignation from the Brazilian. His next appointment was the command of the Greek navy (1827–28); but an insufficiency of ships and men prevented the accomplishment of anything of importance. In 1831 he succeeded to the Dundonald peerage; in the following year William IV satisfied a general wish by granting him a free pardon for the offense of which he had been convicted, and in 1847 Queen Victoria reinstated him in the Order of the Bath and to his naval rank. In 1877 his heirs received compensation for his unjust condemnation in a restoration of 18 years' loss of pay and allowances as a naval officer. From 1848 to 1851 he was commander in chief of the North American and West Indian stations and became rear admiral of the United Kingdom in 1854. To an advanced age he busied himself with scientific inventions for the navy and early recognized the advantage of steam power and of the application of the screw propeller to war ships. He published: *Notes on the Mineralogy, Government, and Condition of the British West India Islands* (1851); *Narrative of Services in the Liberation of Chile, Peru, and Brazil*

(1859); and an *Autobiography* (2 vols., 2d ed., 1860); the same completed by the eleventh Earl and H. R. Fox Bourne (2 vols., London, 1869). He died at Kensington and was buried in Westminster Abbey. Consult: Fortescue, *Dundonald* (London, 1895); Atlay, *Trial of Lord Cochrane before Lord Ellenborough* (London, 1897); Miranda, *Memorias de Lord Cochrane* (Santiago de Chile, 1905).

COCINERO, kō'sē-nā'rō (Sp., cook). The name of various species of West Indian crévalle (q.v.).

COCK, The. A primitive tavern or alehouse on Fleet Street, near Temple Bar, London, with decorations of the period of James I. It is a famous resort and is well known through Tennyson's "Will Waterproof's Lyrical Monologue." The same name was borne by several other London taverns, of which one on Threadneedle Street was especially renowned.

COCKADE' (Fr. *cocarde* or *coquarde*, from *coq*, cock). A word first found in the works of Rabelais, "*bonnet à la coquarde*," and in the early part of the seventeenth century used to designate a cocked hat or cap set jauntily on the head. Later on, however, it acquired a more restricted meaning and was applied to the clasp or knot of ribbon which decorated the loop or cock of the hat. The word is now employed to designate a rosette or knot of ribbon, leather, or other material worn on the hat as a badge or ornament. Cockades have always been used as party badges and insignia since the War of the Spanish Succession, when the red and white cockade was adopted by the French. In England the Stuart cockade was white, the Hanoverian was black, and frequent references to the rival colors are to be met with in the literature of the time. As early as 1767 a regulation in France provided that every French soldier should "mount the cockade," the color being white; and a later decree, in 1782, restricted the wearing of cockades to the military. From this period till the outbreak of the French Revolution the cockade was an exclusively military emblem, and "to mount the cockade" was synonymous with becoming a soldier, both in France and England. After the meeting of the States-General of France in 1789, cockades of green were worn by the advanced party, but these soon gave way to the more popular red, white, and blue—the tricolor of the Revolution. See Tricolor.

Every nation of Europe has its own cockade. In Germany, black, yellow, and white, and black, red, and gold have been used; in Austria, black and yellow; in Russia, green and white. In England the cockades worn are always black—the old Hanoverian color; but being used, generally, as part of the livery of coachmen and footmen, they have lost all special significance. Consult Carter, "Cockades: Their History and Significance," in *Genealogical Magazine*, vol. iii (London, 1899), and Racinet, *Le costume historique* (6 vols., Paris, 1888).

COCKAIGNE, kŏk-ān'. A name given to an imaginary land of good things—of idleness, luxury, and perfect happiness. The word appears in a variety of spellings in English and French, and means the "land of abundance." In it the rivers flowed with wine, the houses were built of dainties, and cooked fowls offered themselves for eating. Its English synonym is "lubberland." It is the subject of a popular satirical poem of the thirteenth century, *The Land of Cockaigne*, and is a burlesque term applied to London and to Paris.

COCK AND THE FOX, The. A modernized version of Chaucer's *Nun's Priest's Tale*, made by John Dryden and published, with other translations, under the title of *Fables*, in 1699, shortly before his death.

COCK'ATEEL (from Dutch *kakatielje*, from Portug. *cacatilho*, *cacatelho*, cockatoo). A small, long-tailed Australian parrot of the genus *Calopsitta*, and the sole representative of the subfamily Calopsittacinæ. It is sometimes called "cockatoo parrakeet," or "ground parrakeet," its technical name being *Calopsittacus novæ-hollandiæ*. This pretty species is found wild over nearly the whole of Australia, where it goes about in flocks, sometimes of many hundreds, and nests in hollow trees. It is about 12 inches long, half of which belongs to the tail, which ends in two prolonged and sharply pointed feathers. The male is dark gray, with the face, cheeks, and crest bright yellow, and the ear coverts of a brick red. The wings have a wide band of white. The female is paler, and the face is only tinged with yellow. It is a favorite cage bird and thrives with but little care. If given a cage about 3 feet square and a hollow log, they are easily induced to nest, rearing 4 or 5 young at a time. A pair has been known to rear 16 young between March and September. The best food is a mixture of hemp, oats, and canary seed, with green food and fresh water. When young are in the nest, stale bread soaked in water should be provided. Consult Gould, *Birds of Australia* (London, 1865), and Seth-Smith, *Parrakeets* (London, 1903). See Cockatoo, and Plate of Parrots and Parrakeets.

COCK'ATOO' (Hind. *kākātūa*, Malay *kakatūa*, onomatopoetic from its cry). A bird of the family Cacatuidæ, of the order Psittaci (q.v.). They are closely related to the true parrots, and by some ornithologists are regarded as merely a subdivision of that family. The bill is high and curved from the base, and the tail is long, broad, and rounded. The head is also large, and in the true cockatoos is surmounted by a crest of long and pointed feathers, with their tips directed forward, which can be erected and expanded like a fan or depressed at the pleasure of the bird. The true cockatoos (*Cacatua*) are generally whitish in color, often finely tinged with red, orange, or other colors. The name "cockatoo," however, is also commonly extended to nearly allied genera, as *Calyptorhynchus* and *Microglossus*, in both of which the plumage is generally dark, and to which belong the black cockatoos of Australia and of the Indian Archipelago. The genus *Microglossus*, one of which is the great black cockatoo, or ara, of New Guinea (*Microglossus aterrimus*), the largest of all the Psittaci, is remarkable for the structure of its tongue, which is cylindrical, tubular, capable of being greatly protruded from the mouth, and terminates in a cloven, horny tip. All the cockatoos are natives of the Philippines, New Guinea, and adjacent islands, and especially of Australia and Tasmania, where they formerly abounded, and were hunted for food by the natives. They live on fruits and seeds, insect larvæ, etc. Some of them are frequently to be seen in confinement in Europe, particularly the lesser sulphur-crested cockatoo (*Cacatua galerita*), which, although of comparatively tame plumage, is a general favorite on account of its docility. None of the cockatoos learn to speak

COCKATOOS AND MACAWS

1. ROSEATE COCKATOO (Cacatuas roseicapillus).
2. WESTERN BLACK COCKATOO (Calyptorhynchus stellatus).
3. BILL OF No. 2—front view.
4. GREAT BLACK COCKATOO (Microglossus aterrimus).
5. BLUE-FRONTED MACAW (Ara nobilis).
6. GREEN-WINGED MACAW (Ara chloroptera).
7. SLENDER-BILLED COCKATOO (Licmetis nasica).

many words. Their name is derived from their cry. Compare PARROT and Colored Plate of PARROTS.

COCKBURN, kō'bûrn, SIR ALEXANDER JAMES EDMUND (1802–80), BARONET, Lord Chief Justice of England. Born Dec. 24, 1802, the son of Alexander Cockburn, who was at one time British Minister to Colombia, he was brought up on the Continent, and in 1822 entered at Trinity Hall, Cambridge, and was called to the bar in 1829. He was very successful as a practitioner and in 1841 was made a Queen's counsel. His early practice was largely in connection with election petitions, in which he won a wide reputation. In 1847 he was elected to Parliament as a Liberal from Southampton, and distinguished himself by the ardor and eloquence with which he supported the vigorous foreign policy of Palmerston. From this time on his promotion was rapid. In 1850 he was appointed Solicitor-General, and in the next year was promoted to the attorney-generalship. In 1854 he was made recorder of Bristol; in 1856 he was appointed Chief Justice of the Court of Common Pleas, and in June, 1859, he became Lord Chief Justice of England. In 1858 he succeeded to the baronetcy of his uncle, the dean of York. It fell to his lot, as a judge of the Queen's Bench, to conduct the trial of the celebrated Tichborne case (q.v.). His distinguished position as the head of the British bench was emphasized by his appointment in 1871 to represent Great Britain in the international court of arbitration convened for the settlement of the long-standing controversy between that country and the United States over the Alabama Claims (q.v.). For a sketch of his life, consult the *Law Magazine* for 1851, p. 193, and 4th series, vol. vi, p. 191; also *Law Times*, vol. xx, pp. 68–88.

COCKBURN, ALICIA, or ALISON RUTHERFORD (1713–94). A Scotch ballad writer. In 1731 she was married to Patrick Cockburn, of Ormiston, an advocate, and subsequently became acquainted with Burns, Hume, Lord Monboddo, and other celebrities of the day. Her lyric, "I've Seen the Smiling of Fortune Beguiling" (to the air of "The Flowers of the Forest"), has long been famous. She was one of the belles of Edinburgh, a graceful dancer, and an indefatigable letter writer. A relative of Walter Scott's mother, she all of her life sustained friendly relations with the poet and novelist. Consult her *Letters and Memorials*, with notes by T. C. Brown (London, 1900).

COCKBURN, CATHERINE (*née* TROTTER) (1679–1749). An English dramatist and philosophical writer. She wrote several plays, among which may be mentioned: *Agnes de Castro* (1696); *Fatal Friendship* (1698); *The Unhappy Penitent* (1701); *Love at a Loss* (1701). She is also known for her defense of the philosophy of Locke, and later for championing the views of Dr. Samuel Clarke. A collection of her prose works was published with a *Memoir* by Birch (London, 1751).

COCKBURN, SIR GEORGE (1772–1853). An English naval officer. His operations against Martinique brought about the surrender of that island in 1809. He was active in the war with the United States in 1812–15, planning and executing with General Ross the expeditions along the shores of Chesapeake Bay, and burning the public buildings in Washington. In the *Northumberland* he took Napoleon to St. Helena, where he remained in 1815–16 as Governor and commandant. He rose to the rank of admiral in 1837, was returned to Parliament in 1818, 1820, 1826, and 1841, and was one of the Lords of the Admiralty. William IV, when Prince of Wales and Lord High Admiral, quarreled with Cockburn over precedence, but was unsuccessful. Cockburn succeeded to the baronetcy in 1852.

COCKBURN, GEORGE RALPH RICHARDSON (1834–1912). A Canadian educator and member of Parliament. He was born in Edinburgh, Scotland, graduated at the university there in 1857, studied for several months in Germany and France, and in 1858 went to Canada, where in 1861 he became principal of Upper Canada College, which office he held for 20 years. From 1887 to 1896 he was a member of the Canadian Parliament. He was a stanch advocate of British Imperial federation. In 1893 he was chief commissioner from Canada to the World's Fair at Chicago.

COCKBURN, HENRY THOMAS, LORD (1779–1854). A Scottish advocate and judge. He was born in Edinburgh in 1779 and was educated at the high school of Edinburgh and afterward at Edinburgh University. He was called to the Scottish bar in 1800 and seven years later was appointed one of the advocates whose duty it was to assist the Lord Advocate in the prosecution of criminal offenders, but was dismissed after holding office four years. Not till the introduction of jury trial in civil causes into Scotland, in 1816, did Cockburn find opportunity for remunerative professional employment. His powers were better adapted for success with a popular than with a professional tribunal. Under the Grey ministry of 1830 he was appointed Solicitor-General for Scotland, and four years later he was made one of the judges of the Scottish supreme civil and criminal courts under the title of Lord Cockburn. He died April 26, 1854, at his residence of Bonaly, near Edinburgh.

Lord Cockburn contributed to the *Edinburgh Review* a series of articles on the reform of Scotch legal procedure, which had considerable influence. Late in life he undertook the task of writing the biography of Francis Jeffrey, the celebrated Scottish essayist and judge. This was published in 1852. Cockburn will be best remembered by the *Memorials of his Time*, which appeared posthumously in 1856. The work is an autobiography, into which have been interwoven anecdotes illustrating old Scottish life, and numerous sketches of the men who composed the brilliant circle of Edinburgh society at the beginning of the nineteenth century. For details of his life, consult also Chambers's *Biographical Dictionary of Eminent Scotsmen.*

COCKCHAFER. See CHAFER.

COCKER. A small dog. See SPANIEL.

COCK'ER, EDWARD (c.1631–75). An English engraver and teacher. He was born probably in Northamptonshire and died in London. The first edition of his famous arithmetic was published posthumously in 1678, by John Hawkins. At one time it was thought (following De Morgan's belief) that Hawkins wrote this work, but the evidence is against this view. Its popularity lasted nearly a century, and its sale probably exceeded 100 editions. The expression "according to Cocker" became proverbial through its frequent use on the title-pages of arithmetical treatises following his method. Cocker's chief works are: *Tutor to Arithmetic* (1664); *Compleat Arithmetician* (before 1669); *Arithmetic,*

edited by Hawkins (1678); and numerous contributions to methods of calligraphy.

COCKERELL, kŏk'ĕr-el, CHARLES ROBERT (1788–1863). An English architect, born in London. In 1810–17 he visited Greece, Italy, and Asia Minor to study ancient architectural remains, made excavations at Ægina and other places, and enriched the British Museum with many rare and valuable fragments, notably from the temples of Zeus Panhellenius (once so called, really of Aphaia) at Ægina and of Apollo Epicurius, near Phigaleia. He became surveyor of St. Paul's Cathedral in 1819, chief architect of the Bank of England in 1833, and a member of the Royal Academy in 1836. From 1840 to 1857 he was professor of architecture in the Royal Academy. He was the designer of many public buildings, such as the Hanover Chapel in London, and the Taylor Buildings at Oxford. His works include: *The Temple of Jupiter Olympius at Agrigentum* (1830); *Ancient Sculptures in Lincoln Cathedral* (1848); *Iconography of the West Front of Wells Cathedral* (1851); and *Travels in Southern Europe and the Levant* (1903), edited by his son.

COCKERELL, THEODORE DRU ALISON (1866–). An American zoölogist, born at Norwood, England. He was educated at the Middlesex Hospital Medical School, and studied botany in the field in Colorado in 1887–90. Between 1891 and 1901 he was curator of the public museum of Kingston, Jamaica, professor of entomology at the New Mexico Agricultural College, and entomologist of the New Mexico Agricultural Experiment Station. In 1900–03 he was an instructor in biology at the New Mexico Normal University; in 1903–04, curator of the Colorado College Museum; and in 1904 he became lecturer on entomology, and in 1906 professor of systematic zoölogy, at the University of Colorado. Cockerell is author of more than 2200 articles in scientific publications, especially on the Coccidæ, Hymenoptera, and Mollusca, and on paleontology and various phases of evolution. His later writings include: *Some Bees of the Genus Augochlora from West Indies* (1910); *The Scales of the Mormyrid Fishes* (1910); *Observations on Fish Scales* (1913); *Some Fossil Insects from Florissant, Colorado* (1913).

COCKERILL, kŏk'ĕr-ĭl, JOHN (1790–1840). An English manufacturer, born at Haslingden. With his brother, Charles, he established in Berlin a successful woolen factory, and subsequently at Seraing, near Liége, Belgium, an iron foundry and machine shop, which became the largest on the Continent. King William I of the Netherlands was for a time a partner in this business.

COCK'ERMOUTH, -mŭth. A town of Cumberland, England, at the confluence of the Cocker and Derwent, 25 miles southwest of Carlisle (Map: England, C 2). It is situated in an agricultural district, and in the vicinity are extensive coal mines. On the left bank of the Cocker are the ruins of a castle built in the eleventh century and destroyed by the Parliamentarians in 1648. Near by is a tumulus, with a Roman camp and fort, where many ancient relics have been found. The town was the birthplace of the poet Wordsworth. It has woolen and flax mills and manufactures hats, paper, hosiery, leather, and machinery. Pop., 1901, 5355; 1911, 5203.

COCKFIGHTING. This is a sport of great antiquity, and to-day is the great pastime of millions, in the place of its origin, the Far Orient, as well as a favorite sport in many Western nations, including practically all Latin America. It is noted in the earliest records of China, it was a common pastime of the Persians long before the Greek invasion, it existed in ancient Rome, and Fitzstephen vouches for it in England in the twelfth century. Cockpits existed in the metropolis of England (as they did in New York) well into the nineteenth century.

The origin of the breed of gamecocks is lost in an obscurity as dim as that of the origin of the sport. The jungle cock of India may have been its progenitor; he has the constitutional instinct of fighting highly developed. The gamecock needs neither education nor experience to teach him to fight, and his capacity for giving and taking punishment till dead has passed into a proverb. During the latter half of the nineteenth century the sport of cockfighting was made illegal throughout Great Britain. In America it is similarly prohibited in nearly all the States of the Union, either expressly or by laws for the prevention of cruelty to animals. In a few Southern States, where it is not forbidden by the statutes of the State, it is in some instances made illegal by local laws. Generally it is considered a brutal and brutalizing performance.

For early history, consult: Markham, *The Pleasures of Princes, or Goodmen's Recreations* (London, 1614); Fairfax, *Complete Sportsman* (ib., 1764); Blain, *Rural Sports* (ib., 1853).

COCK LANE GHOST, THE. A supposed ghost, whose manifestations occurred in 1762 in Cock Lane, London, in connection with a young girl named Parsons and her parents. Investigation disclosed a conspiracy against a former resident, Mr. Kent, whose wife had died, and who was supposed to be accused by her ghost of murder. Parsons and his wife were punished. Among the investigators was Dr. Johnson, who described the mysterious occurrences in the *Gentleman's Magazine*, and who, because of his connection with the matter, was made the object of attack in Churchill's poem, "The Ghost." Consult Lang, *Cock Lane and Common Sense* (London, 1894).

COCKLE, kŏk'l (Fr. *coquille*, shell, from Gk. κογχύλιον, *konchylion*, dim. of κογχύλη, *konchylē*, from κόνχη, *konchē*, shell, Lat. *concha*, Skt. *śankha*, shell), *Lychnis*. A genus of plants of the family Caryophyllaceæ. The common cockle or corn cockle (*Agrostemma githago*) is a frequent weed among crops of grain, a native of Europe or the west of Asia, but now to be found in almost all parts of the world. (For illustration, see Plate of CRANBERRY.) It is an annual plant, clothed with long, white, appressed hairs; 3 feet high, branched, with large, solitary, terminal reddish-purple flowers. The root, stem, leaves, and seed were formerly used in medicine; the seed, which are poisonous, are still sometimes sold in Germany under the name of "black cumin" (falscher Schwartz-kümmel). The corn cockle is a very troublesome weed in some parts of Great Britain and the United States. The seed can hardly be screened from wheat, and in some localities millers reduce the grade of grain on account of the presence of cockle. Sowing clean seed is about the only means of combating it, aside from pulling the plants from the field. See LYCHNIS.

COCKLE. A globose marine bivalved mollusk, especially of the family Cardiidæ, often called "heart cockle" because, viewed endwise, the outline of the shell is like that of the ace of

hearts. Cockles are usually gregarious, and vast numbers are found half buried on sandy and muddy banks. The common European cockle (*Cardium edule*) is a valuable shellfish, extensively sold in Great Britain; other species are less commonly eaten elsewhere. The number of known species is great; they are most numerous within the tropics, and particularly in the Indian Ocean, where some have shells very beautiful in sculpture and coloring. The shell upon which Venus is represented, in ancient art, as riding upon the sea is a cockle; and several other genera, such as *Venus*, *Cytherea*, *Selene*, etc., are named in reference to this myth. Consult Lovell, *Edible Mollusks of Great Britain, etc.* (London, 1884); and see Colored Plate of CLAMS AND EDIBLE MUSSELS.

COCK'LEBUR', or CLOTBUR. A name given to the species of *Xanthium*, a genus of Compositæ, of which there are but few species, but these are widely distributed. Several species are all too common in the United States—*Xanthium spinosum* (called spiny clotbur) and *Xanthium strumarium*, both of which were probably introduced from the Old World, and the native species, *Xanthium canadense*, *Xanthium commune*, *Xanthium speciosum*, and *Xanthium echinatum*. (For illustration, see Plate of CORNFLOWER.) They are coarse, annual, branching plants, 1 to 3 feet high, with alternate, rough, heart-shaped leaves. The stem is frequently spotted with brown or purple. The flowers are in separate groups, the female ones furnishing the well-known burs, which are about an inch long and covered with stout, hooked prickles. These are troublesome to animals, especially to sheep, the wool of which is often seriously depreciated by their presence. The seeds contain two cells with an ovule in each. These retain their vitality for a long time, and both do not germinate in the same season. Being an annual, this weed can be exterminated if it be prevented from seeding for a number of years. In the south of Africa stringent laws for its eradication were enacted on account of the injury to the wool industry.

COCK'LOFT', PINDAR. The nom de plume used by Washington Irving in *Salmagundi*.

COCK'NEY. A word of disputed origin, used as a general term for a Londoner, more specifically for one "born within the sound of Bow Bells." It has been connected with cocagne, or cockaigne, and with the Thames, which is said to have been called "the Cockney."

The earliest form of the word is *cockenay*, i.e., 'cock's eggs,' a name given the inhabitants of towns on account of their ignorance of country ways and objects. It was not till the seventeenth century that the word began to be confined to the inhabitants of London. For a full historical explanation of the various uses of the word, consult Sir James Murray's *New English Dictionary*.

COCKNEY SCHOOL OF POETRY. A nickname which John Gibson Lockhart tried to fasten upon a school of writers, including Leigh Hunt, Keats, and Hazlitt, whom he thought vulgar. Their productions were said "to consist of the most incongruous ideas in the most uncouth language." Consult the articles "On the Cockney School," in *Blackwood's Magazine* (Edinburgh, October and November, 1817), where the expression was first used; also the article on Keats's "Endymion," in *Quarterly Review* (London, April, 1818).

COCK OF THE PLAINS. See GROUSE.

COCK OF THE ROCK (so called from building its nest on rocks). A remarkable bird of northern South America, representing a subfamily (Rupicolinæ) of the cotingas, three forms of which are known. The most familiar is *Rupicola rupicola*, or *crocea*, inhabiting the lower Amazon valley; it is about the size of a large pigeon, almost purely orange in plumage, and has a remarkable flat-sided crest. Two other species are found higher up the Amazon and in Ecuador. In each case the female is dull olive brown and uncrested. They inhabit rocky water courses and bushy hillsides, where they remain close to the ground and build their nests, largely of mud, on some rock. They are among the birds which court the females by assembling for "dances" in certain cleared spaces, each displaying its showy plumage by queer antics until chosen by some observant hen.

Great numbers of these splendid birds are shot annually, as their skins not only command a high price for millinery purposes, but are much employed by the Indians in making a variety of beautiful decorations, and they are thus becoming rare. A large state mantle, formerly worn by the Emperor of Brazil, was entirely composed of their feathers; and in some districts of South America, it is said, the natives are, or were, compelled to bring a certain supply of skins as tribute. Their flesh is well flavored, but of a very peculiar color, being bright orange red. The cock of the rock is much valued by residents of the Amazon valley as a cage bird, but does not thrive for any length of time when taken to foreign countries. Consult Hudson, *A Naturalist in the La Plata* (London, 1892). See Plate of COTINGAS.

COCK OF THE WOODS. See CAPERCAILLIE.

COCKPIT. In old sailing men-of-war the apartment in which the wounded were placed during the engagement. It was ordinarily below the water line on the orlop deck and served, under ordinary circumstances, as a broad passageway to the storerooms on each side of it. At one time the warrant officers were quartered in the forward cockpit, and occasionally other officers, for whom there was no room on the decks above, were quartered in staterooms opening from the after one, where storerooms were ordinarily placed.

COCKPIT, THE. A London theatre of the seventeenth century, changed from a cockpit, on Cockpit Alley, the present Pitt Place. It was succeeded by the Phœnix Theatre, which in turn was replaced by the Drury Lane Theatre.

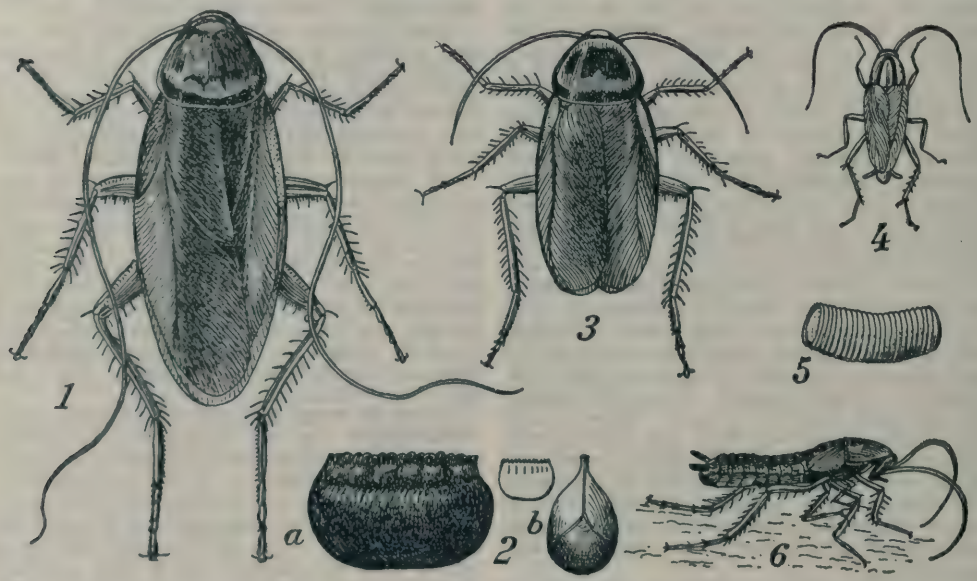
COCKRAN, kŏk'rən (WILLIAM), BOURKE (1854–). An American lawyer and politician. He was born in Ireland, was educated in that country and in France, shortly after his arrival in the United States, in 1871, was appointed teacher in a private academy, and subsequently became principal of a public school in Westchester Co., N. Y. He studied law at the same time and was admitted to the bar in 1876. He was elected to Congress in 1886 and again in 1890; opposed the nomination of Cleveland for the presidency in 1892; in 1896 supported McKinley; and in 1900 advocated the election of Bryan. He was again elected to Congress at a special election in February, 1904, to succeed George B. McClellan, and was re-elected in November of the same year for the term of 1905–07.

COCK'RELL, FRANCIS MARION (1834–1915).

An American lawyer and politician, born in Johnson Co., Mo. He graduated at Chapel Hill College in 1853 and practiced law at Warrensburg, Mo. During the Civil War he served in the Confederate army, rising to the rank of brigadier general. He was a Democratic Senator from Missouri from 1875 to 1905. From the latter year until 1910 he was a member of the Interstate Commerce Commission, and in 1911 he was United States Commissioner to reëstablish the boundary between Texas and New Mexico.

COCK'ROACH, or **ROACH.** An orthopterous insect of the family Blattidæ, several species of which are household pests throughout the civilized world. Those most common are: 1. The Croton bug (*Ectobia germanica*), so called from its becoming noticeable in New York when Croton water was introduced, but really of foreign origin and of cosmopolitan range, having followed civilized man to all parts of the globe; it is of medium size, brown or yellowish, with wings, in the adult, extending beyond the abdomen. 2. The Oriental or proper cockroach (*Periplaneta orientalis*) is also a widely distributed pest introduced from the East. Although it is not at all related to the beetles (*Coleoptera*), its British name "black beetle" well describes its dark, shining, robust appearance; its wings are characteristically shorter than the abdomen. 3. The American cockroach (*Periplaneta americana*) probably originated in tropical America, whence it long ago spread to most of the seaport cities of the world; it is large and reddish brown, with very long wings. 4. The Australian cockroach (*Periplaneta australasiæ*), much like the American but smaller. In addition to these, which frequent houses, bakeries, warehouses, and shipping, there are a large number of wood cockroaches but rarely seen.

Roaches as a group prefer warm, moist places. They go abroad mainly at night and thus often escape notice even where they are abundant; and their excessively flattened body permits them to creep into very narrow crevices—below baseboards, in table drawers, etc., where the eggs ("nits") are laid, surrounded by a peculiar "pod"; but they are often carried by the female until nearly ready to hatch. The new-born young have nearly the same shape as the adult, but are wingless and pale in color. They are practically omnivorous, injuring all kinds of provisions, eating parts of books, blackened boots, and even the nails and eyelashes of sleeping children. The loss caused to provisions by their appetite is far surpassed by the remaining food being rendered unfit for human use, on account of the nauseous "roachy" odor noticed wherever they congregate in large numbers. Their only claim to credit is that they serve as scavengers to a small degree and are the enemies of bedbugs.



COCKROACHES INFESTING HOUSES.

1. The American cockroach (*Periplaneta americana*). 2. Egg capsule or "pod" of the same (somewhat enlarged); *a*, side view; *b*, end view; the dotted figure shows the natural size. 3. Australian roach (*Periplaneta australasiæ*); natural size. 4. Croton bug, or German roach (*Ectobia germanica*); natural size. 5. Its egg capsule; double size. 6. Oriental cockroach, or "black beetle" (*Periplaneta orientalis*); natural size.

Consult: for extended illustrated accounts of species above mentioned, Marlatt, *Household Insects* (Department of Agriculture, Washington, 1896; revised reprint, 1902); for general account of the Blattidæ, De Saussure, *Mélanges Orthoptérologiques*, fascicule ii (Geneva, 1878); for structure, Carpenter, *Insects: Their Structure and Life* (London, 1899).

Fossil Forms. During the latter part of the Paleozoic era cockroaches seem to have been very abundant, and to have formed the dominant feature of the insect life of that time. Their remains are present, though much less abundantly, in the Triassic rocks also, and some have been found in the Tertiary. The total number of fossil species is about 225, of which number 193 species are Paleozoic, and of these 133 are American. The Paleozoic cockroaches are as a rule larger, and have broader bodies than do the modern species. Their wings are quite common in the shales of the Coal Measures and Permian

at several localities, such as Richmond, Ohio; Cassville, W. Va.; Mazon Creek, Ill.; and Commentry, France. At a few localities the larval forms (nymphs) have been found and described under the generic name *Dipeltis*. The cockroach wings of the Coal Measures are usually found in shales that are replete with the leaves of ferns. One of the commonest ferns is Neuropteris, and the insect's wings so closely resemble the leaflets of this fern that the likeness has been remarked upon and explained as a case of protective mimicry, adopted by the insect to enable it to elude its pursuers by hiding among the fallen fern leaves.

For a full history of these insects, with recommendations for their suppression as a pest, consult: Howard and Marlatt, "Principal Household Insects of the United States," in *United States Department of Agriculture, Division of Entomology, Bulletin 4*, N. S. (Washington, 1896); also Miall and Denny, *The Structure and Life History of the Cockroach* (London, 1887); Marlatt, *Cockroaches*, publication of United States Department of Agriculture (Washington, 1908).

COCKS, Richard. A grocer and merchant adventurer of Coventry, England. He was one of the charter members of the East India Company (1600), merchant at Bayonne, France (1603–08), and one of the seven Englishmen who accompanied Capt. John Saris to Japan, on the first voyage of Englishmen thither. He established the British factory on the island of Hirado in 1613, and began June 1, 1615, to keep a journal, which is now of the greatest value as a contribution to the history of Japan and the foreigners there during the first quarter of the century, and as a picture of manners and customs. The *Diary* ends March 24, 1622. The great hope of the English was to open commerce with China, but they could not successfully compete with the Dutch, who understood them, and in the end starved them out of the country. In April, 1623, the dissolution of the English factory was decided upon, and Cocks and the other Englishmen arrived at Batavia, Jan. 27, 1624. Cocks made many travels through Japan, even to Yedo, meeting Iyeyasu and many native notables and the Korean Embassy. He introduced white potatoes into Japan from Java, and "Java potato" is still the name applied to this tuber by the Japanese. The diary of Richard Cocks, carefully edited and annotated by Edward Maunde Thompson, with introduction and index, was published in two handsome volumes by the Hakluyt Society (London, 1883).

COCKS'COMB' (from its crest, resembling the comb of a cock), *Celosia cristata*. An annual plant of the natural order Amarantaceæ, a native of the tropics, and formerly much grown in greenhouses and gardens. It grows with an upright stem, which becomes flattened upward, divides, expands, and forms a sort of wavy crest, covered with pointed bracts, and bearing on its surface many very small flowers. There are both tall and dwarf forms, and a number of colors of each. The plant is of easy cultivation. See Amaranth.

COCK'SFOOT GRASS. See Orchard Grass.

COCKSPUR GRASS. See Bur Grass.

COCKSPUR THORN. See Cratægus.

COCKSWAIN. See Coxswain.

COCK'TON, Henry (1807–53). An English humorous novelist, born in London. His works, of which *Valentine Vox, the Ventriloquist* (1840), is the best, were very successful in their day. *Stanley Thorne* was illustrated by so distinguished a trio as George Cruickshank, Alfred Crowquill, and John Leech. He also wrote *Sylvester Sound* (1844); *The Sisters* (1844); *The Love Match* (1847).

COCLES, kō'klēz, Horatius, "the one-eyed." A hero of ancient Rome. Aided by Lartius and Herminius, he defended the Sublician Bridge, on the Etruscan side, against a great army under Lars Porsena (q.v.), keeping the enemy at bay until the Romans behind them destroyed the bridge. When the bridge was about to fall, Cocles sent his two companions back; when it had fallen, sheathing his sword and praying the river to favor him, he plunged in and swam safely to the Roman shore. He received for reward as much land as he could plow in a day, and a statue in the Comitium. Consult Macaulay, *Lays of Ancient Rome*.

COCOA, kō'kō. See Cacao.

COCOA, Brazilian. See Guarana.

COCOA BUTTER. A pure white solid fat, obtained from the seeds of *Theobroma cacao*, in the process of working them up into cacao, having a specific gravity of .96 to .97 at 15° C. It is used in cosmetics and other pharmaceutical preparations, and in the manufacture of confectionery. Substitutes for cocoa butter are made from the solid fats obtained from palm-nut or coconut oils. See Cacao; Oils.

COCOANUT. See Coconut.

COCOA PLUM. An edible drupaceous fruit growing on a shrub (*Chrysobalanus icaco*) of the family Rosaceæ, in Florida and the West Indies. It is yellow, purple, or black, and is much like a large plum in appearance. The skin is thin, and the sweet white pulp adheres firmly to the stone.

COCOA ROOT. See Cocco.

COCOA-TREE CLUB, The. A London club, developed about the middle of the eighteenth century from the Tory Cocoa-Tree Chocolate House, which flourished during the reign of Queen Anne. It was a gathering place of Jacobites, and was frequented by many leading men of the day.

COCONU'CAN. A linguistic stock of South American Indians (its chief tribes are the Coconucos, Totoros, Moguex, and Guanacos), living on the west side of the central Cordillera, south of the Paniquitan, in the region of Popayan, in southern Columbia. Rivet attaches the Coconucan to the Chibchan stock. Several Coconucan tribes seemed to have participated before the Conquest in the more or less rude civilization of this part of South America. Consult Beaucleat and Rivet's *Affin. des langues du Sud de la Colombie, etc.* (Louvain, 1910).

CO'CONUT', or **CO'COANUT'** (Fr. *coco*, Gk. κοῦκι, *kouki*, cocoa tree, from anc. Egypt. *kuku*, cocoa tree). The well-known fruit of a species of palm (*Cocos nucifera*), perhaps originally a native of the Indian coasts and South Sea islands, although there is evidence of its prehistoric occurrence on the west coast of Central and South America. (For illustration, see Plate of Palms.) It is now diffused over all tropical regions. The coconut palm belongs to a genus having pinnate leaves, and staminate and pistillate flowers on the same tree, the latter flowers at the base of each spadix. There are about 35 known species, nearly all of which are natives of South America. Many of the species prefer dry and somewhat elevated districts. The

coconut palm, on the contrary, is seldom found at any considerable distance from the seacoast, except where it has been introduced by man, and generally succeeds best in sandy soil near the sea. It is always one of the first of the larger plants to establish itself in the low islands of the Pacific Ocean, as soon as there is soil enough. It has a cylindrical stem, about a foot in diameter, and from 60 to 100 feet high, with many rings marking the place of former leaves, and bearing at its summit a crown of from 16 to 20 leaves, which generally curve downward, and are from 12 to 20 feet in length, with numerous leaflets, 2 to 3 feet long. The flowers proceed from within a large pointed spathe; the fruit grows in short racemes, which bear, in favorable situations, from 5 to 15 nuts; and 10 or 12 of these racemes in different stages may be seen at once on a tree, about 80 or 100 nuts being its ordinary annual yield. The tree bears fruit in from 4 to 8 years from the time of planting, and continues productive for 70 or 80 years. Of the three round, black scars at one end of the shell, the largest one through which an opening is commonly made to get out the *milk* is the destined outlet of the germinating embryo, which is situated there, the kernel consisting generally of the endosperm destined for its nourishment. The thick husk is remarkably adapted to the preservation of the seed, while the nut is tossed about by the waves, until it reaches some shore far distant from that on which it grew.

The coconut affords to the inhabitants of many tropical coasts and islands a great part of their food; it is not only eaten as it comes from the tree, both ripe and unripe, being filled in a young state with a pleasant, milky fluid, but is also prepared in a variety of ways, as in curries, etc.

The kernel of the coconut contains more than 70 per cent of a fixed oil, called coconut oil, or coconut butter. The oil is itself an important article of commerce, being much employed for the manufacture of "stearin candles," and also of a "marine soap" which forms a lather with sea water. It is also employed as an article of food, so long as it remains free from rancidity—to which, however, it is very liable. It is obtained by pressure of the bruised kernel, or by boiling over a slow fire, and skimming off the oil as it floats on the surface. A quart, it is said, may be obtained from seven or eight coconuts. It is liquid at the ordinary temperature of tropical countries, but in colder climates becomes a white, solid, butter-like oil. It becomes liquid about 74° F. It can be separated by compression into a liquid portion called "olein," and a more solid part termed "stearin," or "cocosin," which is of complex constitution. The cake resulting from the pressure of the endosperm for its oil is an important cattle food. The dried kernel, known as copra, forms an important article of export from the South Sea islands, etc.

The root of the coconut palm possesses narcotic properties, and is sometimes chewed instead of the areca nut. When the stem is young, its central part is sweet and edible; but when old, this is a mass of hard fibre. The terminal bud (palm cabbage) is esteemed a delicacy, and trees are often cut down for the sake of it. The saccharine sap of the flower spathes before they open is a source of toddy and palm wine, and by distillation the liquor arrack. In the East Indies the juice is often boiled down to yield sugar (jaggery).

The dried leaves of the coconut palm are much used for thatch, and for many other purposes, as the making of mats, screens, baskets, etc., by plaiting the leaflets. The midribs of the leaves supply the natives of tropical coasts with oars. The wood of the lower part of the stem is very hard, takes a beautiful polish, and is employed for a great variety of purposes under the name of porcupine wood. The fibrous centre of old stems is made into cordage. By far the most important fibrous product of the coconut tree is coir (q.v.), the fibre of the husk of the somewhat immature nut. If the nuts are allowed to ripen, the coir is coarser and more brittle. The husk of the ripe nut is used for fuel, and also, when cut across, for polishing furniture, scrubbing floors, etc. The shell of the coconut is made into cups, goblets, ladles, etc., and is often finely polished and elaborately ornamented by carving.

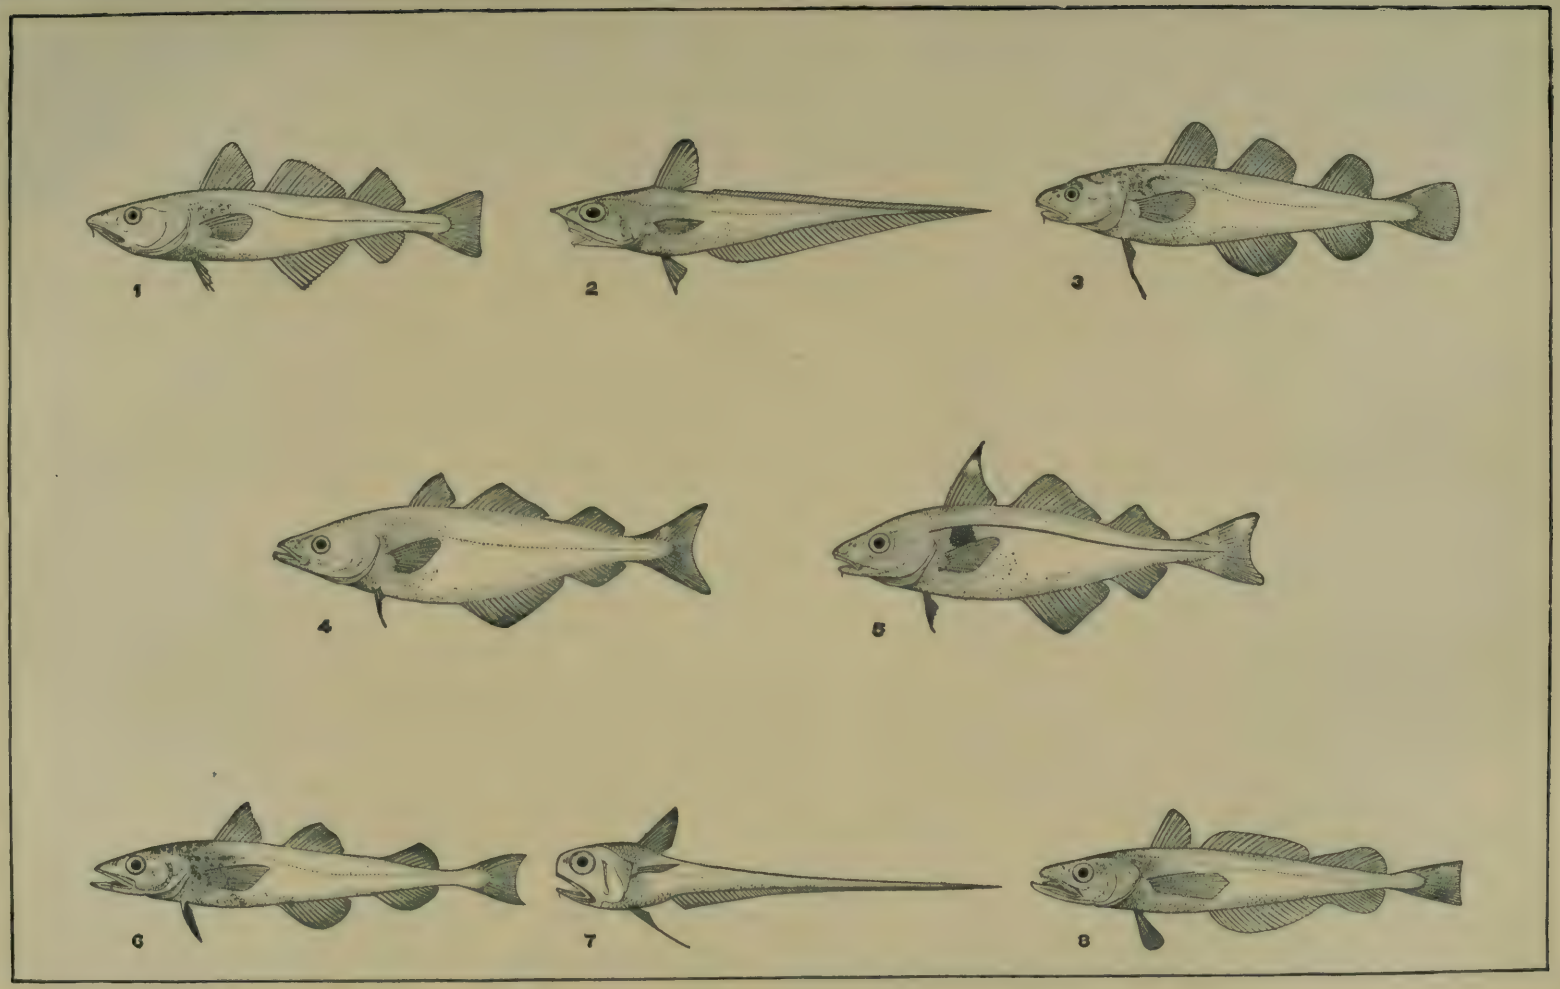
Cocos butyracea, one of the South American species of this genus, is a very large tree, and its nut abounds in an oil and butter of similar quality to that obtained from the coconut. The double coconut of the Seychelles Islands is the fruit of a palm of a different genus (*Lodoicea callipyge*). *Cocos weddelliana* is the species most commonly cultivated in greenhouses and in the open as an ornamental. For illustration, see PALM.

COCONUT, or ROBBER, CRAB. A large terrestrial macrurous crab (*Birgus latro*), of the East Indies, which feeds on coconuts. Although allied to the hermit, it has the abdomen symmetrical and covered above, with a series of horny plates, so that it requires no borrowed shell or other artificial protection. It is found in the islands of the Indian and South Pacific oceans, and may reach a size larger than that of any other land crab, enabling it to handle the largest nuts; and Forbes says that "one of its pincer claws is developed into an organ of extraordinary power, capable, when the creature is enraged, of breaking a man's arm." Its flesh is edible. It digs and inhabits burrows and long tunnels, lined with fibres stripped from coconuts. In these it lurks during the day, going abroad, as a rule, only at night. It feeds mainly upon fallen coconuts, not gathering them from the trees, as has been asserted, although it often climbs into the palms. "To get at the contents of the nut, the crab first tears away the fibre overlying the three 'eyes,' and then hammers away with its claws at the latter until a hole is made, when it extracts the kernel by means of its smaller pincers." This crab has its gills so modified as to function as lungs. It occasionally visits the water, and periodically resorts to the sea to spawn, where the young pass through their developmental stages in the water like other crabs. Several species are known. Consult Darwin, *A Naturalist's Voyage* (London, 1860), and Forbes, *A Naturalist's Wanderings in the Eastern Archipelago* (New York, 1885). See Plate of CRABS.

COCOON' (from Fr. *cocon*, dim. of *coque*, shell, from Lat. *concha*, shell). The pupa case of an insect. See INSECT; BUTTERFLIES AND MOTHS; ANT.

COCO'PA. An agricultural tribe, of Yuman stock, formerly holding the country about the mouth of the Colorado River and the head of the Gulf of California, in Mexico, and sometimes

CODFISH AND ALLIES



1. CODFISH (Gadus callarias).
2. A PELAGIC GADOID (Cœlorhynchus carminatus).
3. TOMCOD (Microgadus tomcod).
4. POLLOCK (Pollachius carbonarius).
5. HADDOCK (Melanogrammus æglifinus).
6. ALASKAN POLLOCK (Theragra chalcogramma).
7. A MACRURID (Hymenocephalus cavernosus).
8. SILVER HAKE (Merluccius productus).

ranging northward into Arizona. They still number about 245, but are rapidly wasting away from contact with civilization. They are now confined to a reservation near the mouth of the Colorado.

CO'CO RIVER. See SEGOVIA.

COCOS ISLANDS. See KEELING ISLANDS.

COCX, GONZALES. See COQUES, GONZALES.

COCY'TUS (Lat., from Gk. Κωκυτός, *Kōkytos*, river of wailing, from κωκύειν, *kōkyein*, to wail). A tributary of the Acheron in Epirus, now called Βωβός, *Bōbos* (Vuvo). Cocytus was also the name of a river of the infernal regions.

COD (origin obscure; possibly from *cod*, shell, husk, or from Flem. *kodde*, club, from the rounded shape of the fish). A fish (*Gadus callarias*) of the family Gadidæ, which almost rivals the herring in its importance to mankind. The body is elongate, slightly compressed, and tapers towards the tail, so that with the rather large head it appears heavy anteriorly. The body is covered with small scales. There are three dorsal and two anal fins. From the end of the lower jaw hangs a well-developed barbel. The general color varies greatly, being greenish, brownish, or even yellowish and reddish. The back and sides have numerous round, reddish-brown spots. The fins are dark. It will attain a weight of four to five pounds in about three years, and may ultimately reach a weight of 150 to 200 pounds, but the usual weight of large specimens is from 15 to 30 pounds.

The home of this fish is in the shallower parts of northern seas. "The southern limit of the species," on the American side of the Atlantic, according to Goode, "may safely be considered to be Cape Hatteras, in lat. 35° 10′. Along the coast of the Middle States, New England, and British North America, and upon all the offshore banks of this region, cod are usually found in great abundance during part of the year at least, . . . and it is more than probable that they occur in the waters of the Arctic Sea to the north of the American continent." It no doubt extends around the northern shore of the continent to Bering Strait, and thence into the North Pacific, for the cod of the coastal waters and shallows off Alaska, Siberia, and thence down to Vancouver Island and Japan are the same in appearance and habits, and probably specifically identical. On the European side of the Atlantic it frequents the Scandinavian and Spitzbergen coasts, the North Sea, and the waters about Great Britain and Iceland. Its favorite haunts are the ocean banks, down to about 120 fathoms, but it frequently approaches close to the coast, enters bays, and ascends the estuaries of large rivers. It is a powerful swimmer, predatory, having strong teeth upon the vomer, and is one of the most voracious denizens of the sea. It eats anything and everything it can, capturing other fishes, squids, etc., in large numbers, and devouring great quantities of deep-sea clams, which it swallows whole. The stomachs of cods have supplied to conchologists great numbers of rare shells, and before the days of deep dredging many conchological specimens were obtainable only in this way.

These fish are very prolific, 9,000,000 eggs having been taken from a single female weighing 75 pounds. The spawning season lasts from October to April, but the eggs of any given female do not all ripen at once. "Impelled by the spawning instinct, the cods seek the shoal waters of the coast or banks in shoals consisting of both sexes." Here the eggs are extruded, float to the surface, and toss about until they hatch, and the fry escape to become the prey of innumerable foes. It appears, however, that many (some say most) cod void their eggs in deep water, whence they rise and drift towards the shore. The destruction of eggs and young through various agencies must be very large; since, in spite of the enormous numbers produced, comparatively few reach maturity, so that the number of cod is limited, and liable to be materially reduced by persistent fishing. This diminution began to be felt, in fact, long ago, the cod almost disappearing from easily accessible inshore resorts, so that the fishermen have been obliged to go to the more distant oceanic banks. To compensate for this loss, the species has long been extensively propagated, both in Europe and America, more than 100,000,000 fry having been hatched and planted during the year 1897 alone by the United States Fish Commission. For the methods and results of these efforts, see FISH CULTURE; for the methods, extent, and value of the products of cod fishing, see FISHERIES; and for portraits of imported species, see Plate of CODFISH AND ALLIES.

Several other species, important as food, belong to this family, such as tomcod, haddock, ling, etc., which are elsewhere described. The "codfish" of the San Francisco markets, however, is an entirely different fish, a chirid (*Ophiodon elongatus*), for which see CULTUS COD.

For the most complete history of the cod family, consult G. Browne Goode, in *Fisheries and Fishery Industries of the United States*, Tenth Census (Washington, 1884), in which other books are mentioned; also Kendall, *Notes on the Food of Four Species of the Cod Family*, United States Fisheries Bureau (Washington, 1897); Smith, *Notes on the Tagging of Four Thousand Cod* (Washington, 1902); Bowers, *Artificial Propagation of Marine Species* (Washington, 1904); Bitting, *Preparation of the Cod and Other Salt Fish for the Market*, Government Publication (Washington, 1911). See COD-LIVER OIL.

COD, Cape. See CAPE COD.

CO'DA (It., tail, end). The concluding passage of a musical composition. Originally a single phrase for ending a canon, it was used by the classical masters for the purpose of securing an effective close. Beethoven was the first to recognize the unlimited possibilities of the coda for the purpose of building up tremendous climaxes, thus raising it to the place of an essential factor in his architectonic scheme —a place which it has subsequently maintained in the works of later masters.

CODAZZI, kô-dät'sê, AGOSTINO (1792–1859). An Italian traveler, engineer, and geographer, born at Lugo, near Ferrara. He entered the army as a volunteer, and afterward set up as a merchant at Constantinople, whence he made extensive journeys through Europe. In 1817 he went to the United States. He served in the Venezuelan Revolutionary army, and later entered the Colombian service, in which he rose in 1826 to be a lieutenant colonel. From 1831 to 1838 he prepared maps of the State of Venezuela, being compelled, for the purpose of topographical surveys, to explore the deserts of Guiana, and to penetrate nearly to the sources of the Orinoco. The results of this undertaking

he published in Paris in 1841, under the title *Resumen de la geografía de Venezuela* (with an atlas). He subsequently made surveys of the Isthmus of Panama, with reference to the possibility of an interoceanic ship canal.

CODDE, kôd'de, Pieter (c.1598–1678). A Dutch genre painter, born in Amsterdam. He is reputed to have been a pupil of Frans Hals, and was chosen to complete the latter's picture of the "Marksmen's Guild" in Amsterdam. He painted a few historical compositions, but most of his subjects are guardroom scenes, like those at The Hague and Dresden, or groups of people drinking, singing, and dancing, as "The Ball" (1633, Vienna), "The Dinner Party" (Emden), and others in Brussels, Berlin, Dresden, and Schwerin. His execution is spirited, his color finely shaded and of a silvery or golden-brown tone, and his treatment of costume is especially good. It is only recently that his works have been clearly identified and their value understood.

COD'DINGTON, William (1601–78). One of the founders, and the first Governor, of the Colony of Rhode Island. He was born in Boston, Lincolnshire, England; came to Plymouth Colony in 1630 with a commission as magistrate, landed at Salem, and was for some time a trader in Boston. He undertook the defense of Anne Hutchinson, and opposed similar persecution in other cases, but without success. In 1638, with 18 others, he removed to the island of Aquidneck (later Rhode Island), and founded a colony which was to be "judged and guided by the laws of Christ." Coddington was elected Governor in 1640, and held the office until the Colony was incorporated in the charter with Providence Plantations in 1647. He went to England in 1649, and two years later obtained a commission to govern Aquidneck and Conanicut for life. His opponents in the Colony, through Roger Williams and John Clark, succeeded in having this revoked (1652); but Coddington did not finally submit until 1655. He became a Quaker in 1666, and from 1674 until his death was again in office as Governor. He left a work entitled *Demonstration of True Love unto the Rulers of Massachusetts* (1674). Consult "William Coddington in Rhode Island Colonial Affairs," No. 4 of the *Rhode Island Historical Tracts* (Providence, 1878).

CODE (from Lat. *caudex* or *codex*, trunk of a tree, tablet for writing). The word *code* is often loosely employed to describe: 1. A set of rules of any sort, as when we speak of the moral code or of the code of honor. 2. Any compilation of legal rules, from a collection of early customs like the Twelve Tables of Ancient Rome down to the building laws of a modern municipality.

As a modern legal term, the word *code* (Fr. *code*, It. *codice*, Sp. *código*, Ger. *Gesetzbuch*) may be defined as an orderly presentation, in statutory form, of some distinct branch or fairly extensive portion of the law. On the continent of Europe and in Latin America there are regularly in each State (1) a civil code, setting forth the law of persons, domestic relations, property, obligations, and succession; (2) a commercial code; (3) a penal, or criminal, code; (4) a code of civil procedure; and (5) a code of criminal procedure. Systematic arrangements of other and less extensive portions of the law, resembling the English Consolidation Acts, are sometimes termed codes, but more commonly laws. For European and Latin-American civil codes, see paragraph VIII of the subtitle *History*, in the article Civil Law.

In Great Britain, the statutes of the realm have been revised by eliminating obsolete and repealed enactments (Revised Statutes, 1870, 1885); and statutes relating to certain subjects have been brought together in consolidation acts, of which, perhaps, the most important are the statute law revision and civil procedure acts of 1881 and 1883; but the only important acts in which the statutory and common-law rules relating to a given subject have been combined, and which are therefore true codes, are: the Bills of Exchange Act (1882), the Partnership Act (1890), and the Sale of Goods Act (1893). In British India codification has been carried much further. Not only have the general and provincial statutes been revised, but there are codes of civil and criminal procedure (1859 and 1861, new codes 1882 and 1898), a penal code (1860), and acts nearly equivalent to codes governing contracts (1872), and transfers of property, easements, and trusts (1882). Ceylon and the Straits Settlements have adopted or adapted some of the Indian codes. Canada, New South Wales, Victoria, New Zealand, and Queensland have criminal codes.

In the United States the general or public statutes of the Federal government, and those of a great majority of the States, are periodically revised, and these revisions are sometimes called codes. When (as is usually the case) the revision is passed by the Legislature, it replaces the original acts. The Revised Statutes are grouped according to the subjects with which they deal, and the arrangement of subjects is sometimes systematic, but more often alphabetical. Under either arrangement these compilations ordinarily contain more or less complete codes of criminal law and procedure, and sometimes codes of civil procedure. Nearly one-fourth of the States have separate codes of procedure; a small number have separate penal codes. The Revised Statutes rarely include anything approaching a complete civil code, and only four States (California, Louisiana, North Dakota, and South Dakota) have separate codes of this character; for in most of the States the substantive private law, especially the law of personal property and of contracts, is still in the main common law, i.e., to be sought for in the reports of judicial decisions. In Louisiana, where the common law has never obtained, there has been a civil code since 1808; but no State has yet passed a civil code which completely supersedes the common law. The first attempt to combine common and statutory law in a civil code was made in Georgia in 1860, in connection with a general revision of the law; but this code was not meant to be a complete enactment of the common law. Iowa, Ohio, and Texas have gone further than most of the other States in embodying common-law rules in statute form, but not so far as Georgia. The nearest approach to a complete enactment of the common law is found in a civil code which was drafted in New York, but which was not adopted in that State. It was, however, substantially adopted in the Territory of Dakota, 1865, and in California, 1872; and many of its provisions have passed into the laws of Montana, Utah, and

Wyoming. This code, although frequently revised and extended in the States of its adoption, has not completely superseded the common law. Consult *Estate of Apple*, 66 Cal. 432.

The question of codification, in England and in the United States, is practically a question of the advisability of transforming common or judge-made law into statutory law. The conditions are different from those which have prevailed on the continent of Europe. There the earlier modern codifications were provincial; and they were made partly to protect existing customs against the Romanizing tendencies of the courts, and partly to substitute for the Roman laws civil and canon laws written in the vernacular. The great codes now in force in France, Italy, and Germany were constructed to replace the earlier local provincial and State codes and to establish uniform national law. The codification movement in Switzerland has substituted a general federal law for the local cantonal laws. (See CIVIL LAW, *History*, VIII.) In England the existing common law is national, and codification by act of Parliament will simply change its form and the mode of its future development. In the United States, the common law is both national and local, i.e., bounded by State lines. As each State has its own system of jurisprudence free from national control, the United States Congress cannot codify the common law for the States, and codification is therefore possible only in the form of State codes; and even if the State codes were uniform at the outset subsequent amendment and varying judicial interpretation would speedily diversify them. Codification in the United States accordingly means the creation of a diversity of laws similar to that which has made national codification necessary in Europe. An important movement towards uniformity of law in the United States is represented by the Negotiable Instruments Act, the Sale of Goods Act, and the Bills of Lading Act, drafted by comissioners from the several States and already enacted in a considerable number of States and Territories.

J. Stimson and Munroe Smith, "Statute and Common Law," in *Political Science Quarterly*, vols. ii and iii (ib., 1888–89); Ilbert, *Legislative Methods and Forms* (London, 1901).

CODE'INE (from Gk. *κώδεια, kōdeia*, a poppy-head), $C_{18}H_{21}NO_3$. One of the alkaloids found in opium, in which it exists in relatively small quantities. In chemical constitution it is closely allied to morphine, being a *morphine-methyl-ether*. Pure codeine may be obtained from opium by extracting the latter with water, adding a little marble to the aqueous solution, concentrating and then precipitating it with calcium chloride solution; the filtrate now obtained yields, on concentration, a mixture of morphine and codeine hydrochlorides, and when these are decomposed with ammonia, practically pure codeine hydrochloride remains in solution; the solution is evaporated, and the codeine hydrochloride that separates out is decomposed with caustic potash; finally, the free codeine produced is recrystallized from aqueous ether containing no alcohol. Its physiological action is similar to that of morphine, and it is used in medicine to diminish sensibility to pain; it is also sometimes prescribed in diabetes. Codeine is a white crystalline substance, sparingly soluble in water, freely soluble in alcohol, ether, chloroform, and other organic liquids. It may be readily identified by dissolving a small quantity in strong sulphuric acid and adding a trace of ferric chloride solution, which produces a blue coloration. The medicinal dose of codeine is from one-quarter to two grains.

CODE NAPOLÉON. Properly, the entire body of French law as contained in the so-called Five Codes promulgated between 1804 and 1810. In general usage, however, the term is restricted to the first of these, the code of civil or private law enacted in 1804 and still in force. The relation of this code to the general development of European law is indicated in CIVIL LAW, *History*, VIII. At the outbreak of the Revolution (1789) there was great diversity in the laws by which different parts of France were governed, and the establishment of a general or national code was one of the reforms urgently demanded. Such a code was promised in the constitution of 1791, and the Convention caused a code to be drafted in 1793; but this draft was rejected because it contained "no new and grand ideas, suitable to the regenerated France." It was not until the revolutionary storm had spent its force and Napoleon, as First Consul, had established a strong government that the work could be pushed through. In July, 1800, the task was intrusted to a commission consisting of the most eminent jurists in France, chief among them being Bigot-Préameneu, Malleville, Portalis, and Tronchet. These men completed their work in four months. After the proposed code had been approved by the principal courts of justice, it was discussed in the Council of State, where Napoleon displayed great interest in the work and made many shrewd suggestions, and it was then submitted, title by title, to the legislative body. Here it encountered opposition, because it was considered too conservative; and it was not passed until the legislature had been reformed into docility. The entire code was promulgated, March 21, 1804, as *Code civil des Français*. In 1807 the title was changed to Code Napoléon. These two designations have since prevailed alternately, according to the form of government. After the completion of the civil code, other codes were adopted, dealing with civil procedure, penal law, criminal procedure, and commerce.

The Code Napoléon introduced little new law. It was a compromise between the customary law of the northern provinces, which was substantially German, and the law of eastern and southern France, which was mainly Roman. It consists of three "books." The first deals with persons, including family relations. The second deals with rights in things, but does not include the law of pledge and mortgage. The third, entitled "Various modes of acquiring ownership," includes succession, by testament

and ab intestato; matrimonial property law; the law of liens and mortgages; and the rules regarding proscription.

The great merits of the code are simplicity (sometimes secured by superficiality) and clearness of statement. In spite of these merits, the code has aroused the usual amount of controversies, some of which are still unsettled, and has required no little judicial interpretation. To contemporary jurists it seemed fairly complete; but experience has revealed many "open places" which have been filled, in part by judicial decisions and in part by supplementary legislation. There has been also considerable legislative amendment.

The Code Napoléon, as a result of French conquests, was introduced before 1814 into many parts of central and southern Europe. In most instances independent national codes have since been substituted; but the Code Napoléon is still in force in Belgium, in Holland, in several Swiss cantons, and in Italy the newer codes are largely based upon the French. The same is true of the code of Louisiana, of that of Quebec, Canada, of most of the Central American and South American codes, and of the Spanish Code of 1889. The Code Napoléon is contained in Roger and Sorel, *Codes et lois usuelles* (15th ed., Paris, 1883). There are commentaries by Marcade and Pont, *Explication théorique et pratique du code civil* (Paris, 1874–94); Mourlon, *Répétitions écrites sur le Code Napoléon* (12th ed., Paris, 1885).

CO'DEX (Lat., trunk of a tree, tablet). The name "codex" seems to have been applied first to books that were made by laying sheets one on another, like tablets, in sets of three, four, or more. Each one of such sets, when folded and stitched together, constituted a book (*liber*) in the more technical sense. Any number of these "books" might be bound together in a large book or codex. In distinction from the codex, the volume or roll was made by pasting or stitching the separate sheets together edgewise, thus forming a long ribbon which had to be rolled in order to be easily handled.

The word is at present used almost exclusively for manuscript copies of the whole or parts of the Bible or of the Greek and Roman classics. Some of the most important of the former are noted in the article on the New Testament text. (See BIBLE.) About 200 A.D. the codex form began to supplant the roll form. The earlier codices appear to have been larger than the later ones. It was perhaps in imitation of the appearance of the open roll, with its several parallel columns of reading matter, that the early codices were written with three or even four columns on a page. Later it was more usual to write but two, and finally but one. Codices were of either paper or parchment—of various grades—the latter being always the more common. The oldest codices were written in uncial script—that is, in semi-capitals; the letters being, as a rule, separate from each other. They are without word divisions, punctuation, breathings, or accents. The separate books have only the simplest titles. In the fifth and sixth centuries the text was broken up into large sections beginning with large capital letters, accents and breathings were introduced, the titles enlarged, and more or less of introductory matter added. Some slight attempts at decoration were also indulged in. Late uncial codices, from the seventh to the tenth century, were frequently elaborately decorated with the parchment colored purple and the text written in gold or silver letters, e.g., the Codex Rossanensis. In the monasteries of the Middle Ages decorated or illuminated manuscripts were manufactured in large numbers. In the tenth century the uncial hand gave way to the cursive or running hand. Codices so written are called minuscules, in distinction from the majuscules or uncials. For other particulars, see BIBLE; BOOK; PALEOGRAPHY; TEXTUAL CRITICISM.

CODEX JUSTINIANEUS. See JUSTINIAN I.

CODEX THEODOSIANUS. See THEODOSIUS II.

CO'DIÆ'UM. See CROTON.

COD'ICIL (Lat. *codicillus*, little book or writing, dim. of *codex*, code). A supplement to a will, whereby anything omitted is added, or anything in the body of the will is revoked or explained or changed so as to provide for altered circumstances of the testator or beneficiaries. A codicil is authenticated or executed in the same manner as the will which it modifies and is considered a part thereof.

There may be as many codicils to a will as a testator cares to make, and where a provision in a codicil is inconsistent with a provision in a will, the provision in the codicil governs, as the purpose of making the codicil is to express the testator's latest wishes as to the disposition of his property after his death. By the Roman and early English law a codicil was an informal will, made without the appointment of executors, which was considered necessary in a valid will; but the term is no longer used in this sense. See WILL, and authorities there cited.

CODIFICATION. See CODE.

COD'LING. A squirrel hake (see HAKE), or some other species of the genus *Phycis*.

CODLING MOTH. A small tortricid moth (*Carpocapsa pomonella*), the most serious pest of the apple (q.v.). The females issue from their cocoons in the spring and lay their eggs in the early evening upon the upper sides of the leaves and occasionally upon the forming fruit. The eggs hatch in about 11 days, and the young larvæ penetrate the fruit usually by way of the calyx. In about 20 days they reach full growth, leave the fruit, crawl to a twig and thence down on the trunk of the tree, where they spin their cocoons and transform to pupæ. The moths issue in two weeks. The moth has a wing expanse of less than three-fourths of an inch. The general color is grayish brown with coppery metallic markings. It lays eggs for a second generation usually upon the fruit and hibernates in the cocoon. The best remedy consists in spraying with an arsenical mixture such as Paris green or arsenate of lead. Two sprayings in the early part of the season are advised—one a few days after the blossoms have fallen and the other two weeks later. If necessary, subsequent sprayings are made. The banding of the trees with bagging affords the larvæ convenient places for transforming. The bands are examined from time to time and the cocoons destroyed. Consult Simpson, "The Codling Moth," in *Bulletin United States*

Department of Agriculture, Division of Entomology, N. S. No. 4 (Washington, 1903).

COD-LIVER OIL (*Oleum morrhuæ*, or *Oleum jecoris aselli*). One of the most valuable therapeutic agents at the disposal of the medical practitioner. It is a pale yellow fixed oil, obtained from the livers of the cod (*Gadus callarias*) and of other related species of fish that are caught in the northern parts of the Atlantic Ocean. Cod-liver oil is a better food and is more readily absorbed than any other oil; its value as a food is due mainly to its being much more readily oxidized than other oils. The benefit derived from it in disease associated with loss of flesh cannot be overestimated. It is given in tuberculosis, in rickets, in tertiary syphilis, in chronic bronchitis, chronic eczema, in many nervous diseases, in general feebleness, etc. It should, however, be administered with some caution and in moderate quantities, larger doses being liable to cause sickness and diarrhœa. In those cases in which the oil is rejected by the stomach, it may be rubbed into the skin, through which it is readily and certainly absorbed; this treatment is, of course, disagreeable on account of the nauseating smell of the oil. The taste of the oil may be masked to some extent by taking it in coffee or in whisky, or by adding to a dose of the oil a few drops of ether and a drop of oil of peppermint. The taste is completely abolished by taking the oil in soft gelatin capsules now prepared by many manufacturing houses; after remaining in such capsules for some time, the oil turns rather dark, but does not seem to be thereby deteriorated. Cod-liver oil is often taken in the form of emulsions. An emulsion recommended by many medical men contains, besides cod-liver oil, the yolk of an egg, powdered tragacanth, elixir of saccharin, sodium bicarbonate, tincture of benzoin, oil of bitter almonds, chloroform, alcohol, and water. With malt extract, too, cod-liver oil makes an excellent emulsion. The common dose of the pure oil is from a dessertspoonful to a tablespoonful three times a day.

Manufacture. In preparing the oil for medicinal purposes, only perfectly healthy livers should be used, and the green-colored (or spotted), diseased livers rejected. In former times the oil was obtained as follows: The fishermen would stow away the livers in barrels, which were kept unopened till the end of the fishing season, i.e., from one to four months. During that time the livers would undergo putrefaction, their hepatic cells, containing the oil, would burst open, and the escaping brownish-yellow oil (called *pale oil*) would rise to the top of the barrels and be drawn off. The livers would then be allowed to undergo further putrefaction, and a quantity of dark-brown oil (called *light-brown oil*) would again be drawn off. Finally, by heating the disintegrated liver residues thus obtained above the boiling temperature of water, a last quantity of oil (called *brown oil*), though really black) would be obtained. This primitive method, a knowledge of the details of which would render the oil too repulsive to most patients to swallow, is still employed to some extent. By far the greater quantity of the oil, however, now reaching the market is prepared in a much cleaner way by the steam process first introduced by Möller in 1853. Instead of allowing the livers to undergo putrefactive decomposition, Möller obtained the oil by simply heating for about three hours the fresh livers, which were carefully selected, cleaned by washing with water, and separated from the gall bladders.

To avoid delay, the livers are often heated on board vessels, in wooden apparatus, steam being conducted directly into the mass of livers. Usually, however, the livers are heated in tinned sheet-iron vessels, either single or double walled. The single-walled apparatus is heated over large water baths; the double-walled by passing steam into the space inclosed between the interior and the exterior walls. In all these apparatus the temperature is about that of boiling water. An improvement recommended during recent years consists in heating the livers at a considerably lower temperature for a much shorter time, and as far as possible out of contact with the air; it is asserted that in this manner the oxidation of the oil may be almost completely prevented and that the oil would therefore not become rancid, nor acquire the disagreeable property of causing eructations.

Composition. Besides a large proportion of fats, cod-liver oil has been shown to contain (1) a peculiar principle called *gaduin* ($C_{36}H_{46}O_9$); (2) a crystalline substance called *morrhuol;* (3) traces of bromine and iodine; (4) biliary principles; and other substances. The brown oils contain also considerable quantities of ptomaines, which cannot but be injurious to health; bleaching brown oil by sunlight only masks the presence of such substances without destroying their injurious properties and should therefore not be resorted to. It is generally believed that the great benefit derived from cod-liver oil in tuberculosis is due to the specific action of some active principle that must be contained in the oil. It is probable, however, that the effect is due to nothing but the food value of the fatty constituents of the oil. These fats are commonly assumed to consist, like other natural fats, of the glycerides of oleic, palmitic, and stearic acids. Möller's chemist, P. M. Heyerdahl, states, on the contrary, that cod-liver oil contains a little palmitic, but no oleic or stearic acid; according to him it consists mainly of the glycerides of therapic and jecoleic acids ($C_{17}H_{28}O_2$ and $C_{19}H_{36}O_2$, respectively), two unsaturated organic acids which are not known to exist anywhere else in nature and to which the therapeutic action of cod-liver oil is due. The solid fat that is sometimes removed by freezing the oil is, according to Heyerdahl, also composed mainly of those glycerides; so that its removal appears to serve no purpose whatever. In view of the readiness with which the fats of cod-liver oil undergo oxidation, the oil should be kept out of contact with the air. Cod-liver oil is now prepared in Norway, the United States, Canada, Newfoundland, Great Britain, Iceland, and Russia. By far the greater proportion of the oil reaching the market comes from Lofoten and Romsdal in Norway.

CODMAN, Robert (1859–1915). An American Protestant Episcopal bishop. He graduated from Harvard (A.B., 1882; LL.B., 1885), practiced law in Boston until 1891, and then studied theology for three years. In 1893 he was ordained deacon and in 1894 priest; for five years he was rector of St. John's, Roxbury, Boston, at the end of that period (1900) being con-

secrated Bishop of Maine. He received the degree of D.D. from a Canadian college and that of S.T.D. from Trinity College, Hartford.

CODOGNO, kô-dô'nyô. A city in the Province of Milan, north Italy, 30 miles east of Pavia (Map: Italy, D 2). Its parochial church has a beautiful portal of the sixteenth century. It is the principal export market for Parmesan cheese and has tanneries and linen, silk, and majolica factories. Pop. (commune), 1881, 11,444; 1901, 11,594; 1911, 11,208.

COD'RINGTON, Sir Edward (1770–1851). A British admiral, born in Gloucestershire. He entered the navy in 1783 and at Trafalgar (Oct. 21, 1805) was captain of the *Orion*. He afterward served in the Mediterranean and in North America, notably in the Chesapeake and at New Orleans, and rose to the rank of vice admiral in 1821. He was appointed commander in chief of the Mediterranean squadron in 1826 and commanded the English, Russian, and French fleet at the battle of Navarino (q.v.), immediately after which he was recalled for having exceeded his orders. He had been made K.C.B. in 1815 and was promoted admiral in 1837. Consult the *Memoir of the Life of Sir Edward Codrington* by his daughter, Lady Bourchier, including autobiographic notes (London, 1873–75).

CODRINGTON, Sir William John (1804–84). An English general, son of Sir Edward Codrington. He entered the army in 1821. During the Crimean War he commanded a brigade as major general at the battle of the Alma (his first action) and at Inkerman, and in 1855 succeeded Sir James Simpson as commander in chief in the Crimea. He was elected to Parliament in 1857, was Governor of Gibraltar from 1859 to 1865, and in 1863 was appointed general.

CO'DRUS (Lat., from Gk. *Kódros*, *Kodros*). The reputed last King of Athens, the son of Melanthus (c.1060 B.C.). When the Dorians invaded the Attic territory, an oracle declared that Athens would be saved if its ruler should perish by the hand of the enemy. Codrus, disguised as a peasant, entered the Dorian camp and was struck down in a quarrel of his own making; the Dorians withdrew. His son Medon was the first archon (q.v.), chosen for life.

CODY, Henry John (1868–). A Canadian educator and clergyman. He was born at Embro, Ontario, and was educated at the Galt Collegiate Institute and at Toronto University, where he graduated with high honors in 1889. He was classical master in Ridley College, St. Catharines, in 1889–93. In 1894 he was ordained a priest of the Church of England in Canada, became curate of St. Paul's Church, Toronto, and was appointed professor of Old Testament exegesis and Church history in Wycliffe College (Toronto). He became professor of systematic theology at Wycliffe and acting rector of St. Paul's in 1899, and rector in 1907. In 1909 he was appointed Archdeacon of York; in 1904 he was elected Bishop of Nova Scotia, but declined the office; and in 1909 he was an unsuccessful candidate for the bishopric of Toronto. He was frequently a delegate to representative conferences and church conventions in Canada, the United States, and Great Britain. An able and eloquent preacher, his theological principles and outlook are largely those of the evangelical or Low Church school.

CO'DY, William Frederick (1846–1917). An American scout and showman, known as "Buffalo Bill." He was born in Scott Co., Iowa, and became one of the riders of the Pony Express (q.v.) at its establishment in 1860, and at the beginning of the Civil War was a government scout and guide. In 1863 he enlisted in the Seventh Kansas Cavalry, and at the close of the war contracted with the Kansas Pacific Railroad to furnish buffalo meat to its laborers building the line, in this way earning the name "Buffalo Bill." He was again with the army as scout from 1868 to 1872, when he was elected to the Nebraska Legislature. Later he became judge-advocate-general of the Wyoming National Guard. He served in the Fifth Cavalry in the Sioux War of 1876, and in the battle of Indian Creek killed in personal combat Chief Yellow Hand. In 1883 he organized his "Wild West Show," a representation of actual life on the plains, and in 1887 took the "show" to Europe for the first time. In 1901 he became president of the Cody Military College and International Academy of Rough Riders established on his lands in Wyoming. He is author of several books describing his life on the frontier, including: *The Life of Hon. William F. Cody* (1879); *Story of the Wild West and Camp-Fire Chats* (1888); *The Adventures of Buffalo Bill* (1904); *True Tales of the Plains* (1908). Cody is the last of the picturesque frontier scouts of American history.

COE, George Albert (1862–). An American educator and philosopher, born in Monroe Co., New York. He graduated at the University of Rochester in 1884; studied theology at Boston University and in Berlin; was professor of philosophy in Northwestern University from 1891 to 1909, and then was appointed to the chair of practical theology in Union Theological Seminary, New York. He was president of the Religious Education Association of America in 1909–10. He wrote: *The Spiritual Life: Studies in the Science of Religion* (1900); *The Religion of a Mature Mind* (1902); *Education in Religion and Morals* (1904).

COE, Wesley Roswell (1869–). An American biologist, born at Middlefield, Conn. He was educated at Connecticut Agricultural College and at Sheffield Scientific School (Yale University), and he studied abroad at the universities of Würtzburg and Naples. From 1892 to 1895 he was assistant in biology in Sheffield Scientific School; from 1896 to 1902 he was instructor, in 1902–08 assistant professor of comparative anatomy, and in 1909 he became professor of biology at Yale. He was a member of the Harriman expedition to Alaska in 1899. His writings include: *The Nemerteans* (1901); *The Nemerteans of Porto Rico* (1901); *The Nemerteans of the Hawaiian Islands* (1906); *Echinoderms of Connecticut* (1912).

COEDUCA'TION (Lat. *co-*, together + *educatio*, education, from *educare*, to bring up, to educate). The association of the sexes in the same classes for instruction is a system that prevails generally in the public elementary schools of the United States and quite extensively in Europe. Except in a few large Eastern cities, as New York and Boston, the free public elementary school in the United States is a mixed school. On the other hand, somewhat less than half the private elementary schools in this country are either for boys or for girls exclusively, and in 1910–11 about 10 per cent of the pupils receiving elementary instruction were

in such schools. The English elementary schools have since 1891 become free and coeducational, especially in the rural and small-town school systems. In France each commune having more than 500 inhabitants must establish a separate elementary school for girls, unless a mixed school is sanctioned by the departmental council. In Prussia the Volksschulen, or people's schools, were, according to the Law of 1871, advised to separate the sexes wherever possible, except when there were only two teachers in a school. Nevertheless, in 1911 there were nearly twice as many mixed as separate schools. In Switzerland the elementary schools are very largely mixed schools; but the course of study and the length of the course in some cantons vary for the sexes, while in Basel the boys' and girls' schools are separate. In Sweden practically all, and in Austria 85 per cent, of the public elementary schools are coeducational; while in Italy the reverse is true, only about one-fifth of the schools of this grade having such a character.

When, however, we turn to secondary education, we find that in Europe the sexes are almost universally separated. In Prussia the various classes of gymnasia and realschulen are, with the exception of a few girls' gymnasia, for boys exclusively. Elsewhere in Germany, where girls are given public secondary education, as in Bavaria, Saxony, and Baden, their schools are separated. The French public secondary-school system consists of state lycées and communal colleges for boys and girls separately. The secondary schools of Switzerland and for the most part those of Sweden keep the sexes apart. Since 1902 a large number of public secondary schools have sprung up in England; in 1910–11 of the 862 schools under the supervision of the Board of Education 302 were for girls only and 205 for boys and girls, but in many of the latter separate classes are conducted for the two sexes. The private secondary day schools for girls, of which there is a considerable number, admit young boys, but, as a rule, only up to the age of 9 or 10, when they can enter the secondary schools for boys. In the United States the contrast is striking. In 1911–12 there were 11,224 public high schools, of which 11,063 were coeducational, 26 for girls only, and 35 for boys. Of 2044 private secondary schools, 872 were coeducational, 749 for girls, and 423 for boys, exclusively. The public normal schools reporting to the United States Bureau of Education in 1911–12 numbered 222. Of these, two were distinctly for women; 41 had no men in attendance, though presumably coeducational; the rest contained both sexes. Of the 55 private normal schools 19 prepare kindergarten teachers and have no men in attendance, one is distinctly for women, while three others have no men, and two no women in attendance. The rest have a mixed attendance. The English training schools for teachers, the French primary and superior normal schools, and the Prussian normal schools separate the sexes.

An examination of the facts stated above will show that so far as Europe is concerned they bear out the general theory current there, that the sexes should be separated as far as possible in education. Wherever separate schools can be maintained, the French and Prussian systems require them, and they are plainly favored by the English. Since, however, elementary instruction has come to be regarded as necessary for both sexes, wherever financial considerations prevent separate schools, the elementary school is mixed. And it is this financial consideration that has most largely been the occasion of mixed schools in the United States. Through the efforts of Horace Mann, a system of town coeducational high schools was in 1826 initiated in Massachusetts, and from that time on such schools spread, at first slowly, then rapidly, throughout the Republic, until to-day they are almost within reach of all. The victory of public secondary education was in general the victory of coeducation.

Since the Civil War both elementary and secondary education have been given largely into the hands of women teachers. There accordingly followed a demand on their part for better opportunities for instruction. Oberlin Collegiate Institute in Ohio had, in 1833, admitted women. In 1855 Antioch College, also in Ohio, was founded—coeducational from the beginning, and having as its first president Horace Mann, the ardent advocate of this system. The following State universities were from the beginning coeducational: Utah, opened in 1850; Iowa, opened in 1856; Washington, opened in 1862; Kansas, opened in 1866; Minnesota, opened in 1868; and Nebraska, opened in 1871. The State universities of Indiana and Michigan admitted women in 1868 and 1870 respectively. To-day, of the 39 State universities, all except those of Virginia, Georgia, and Florida are coeducational. Of private colleges, Cornell, after an investigation and stimulated by a generous offer from Henry W. Sage, admitted women in 1872. Other private institutions were, however, somewhat slow to follow. Boston University, founded in 1873, admitted women from the first, and in 1883 the Massachusetts Institute of Technology became coeducational. In 1911–12, of the 596 colleges and universities reporting to the Bureau of Education, 108 were institutions for women only and 341 were coeducational. The principle of coeducation is almost universally accepted throughout the West, and the few remaining institutions of note which do not admit women to any of their courses are on the Atlantic seaboard. At the same time the tendency at present in the East is to strengthen the existing women's colleges, to which one or two notable additions have been made in recent years, bringing the number of first-class institutions up to 16. In addition, all the great university foundations, except Harvard and Princeton, admit women to graduate instruction. Women are also rapidly gaining ground in the professional colleges. In 1911–12, 66 out of 115 colleges of medicine, 46 out of 118 colleges of law, 35 out of 52 colleges of dentistry, and 52 out of 76 colleges of pharmacy in the United States were coeducational.

In Canada McGill University was opened to women in 1883. To-day all the Canadian universities admit women. The leading universities of Australia admit women not only as students, but as lecturers and professors. In 1878 the University of London opened all degrees, honors, and prizes to students of both sexes on equal terms. All the recently established universities, such as Manchester, Liverpool, Leeds, Birmingham, Sheffield, etc., and the University of Wales give similar privileges to women. The University of Durham excludes women only from the degree in theology. Cambridge admits women to nearly all university

and college lectures and grants a diploma to such as fulfill the regular conditions. This degree, however, does not admit them to the governing board of the university. At Oxford women are admitted to nearly all university and college lectures, except those in medicine. They may take the examinations, and the results are announced, but they do not receive a degree. The four universities of Scotland, Aberdeen, St. Andrews, Edinburgh, and Glasgow, admit women to all degrees except in law, and Aberdeen even to that. The Irish universities (Dublin, Belfast, and the constituent colleges of the National University of Ireland) grant equal privileges to both sexes. In France women are admitted to lectures on the same terms with men, professors, however, having a discretionary power of exclusion.

In Germany the struggle of women for admission to the universities has been especially stubborn, and women are now admitted to all the universities in all faculties. Heidelberg, Freiburg, and Göttingen were among the first to grant the degree of Ph.D. to women; but in 1898 Berlin, perhaps the most conservative of all in this respect, bestowed this degree on Fräulein Neumann. In 1909–10, 2324 women, including a number of foreigners, attended the German universities. In Austria, since 1878, women have been admitted to the eight universities as hearers, and since 1897 as matriculated students in the faculty of philosophy. During the winter of 1899–1900, 40 women were registered as regular students at Vienna, and in 1897 the degree of M.D. was granted to Fräulein Possauer. In 1912–13 there were 353 women in attendance. In 1895 the three Hungarian universities were thrown open to women, and graduates of the medical departments are allowed to practice. The Italian universities have, since 1876, all been open to women on the same terms with men, and the female attendance is large. The medical faculties of the Swedish universities were opened to women in 1870, and those of law and philosophy in 1873. In 1899 six women had taken the degree of licentiate in philosophy, and one that of doctor of laws. The latter, Fräulein Eschelsson, was made privatdocent (q.v.), to lecture on civil law. In Switzerland the universities are all open to women, and in most cases on the same terms as to men. At Zurich women were formally admitted in 1872, and they are even permitted to hold professorial chairs. There were, in 1911, 258 women in attendance, and a woman was lecturer on Roman law. Women have been admitted on the same terms as men to the University of Copenhagen since 1875. The Spanish universities and those of the Netherlands are equally open to both sexes. Russian higher education for women has had a stormy history. The medical schools were opened to them about 1860, then closed, and again in 1872 reopened on account of the Nihilism that sprang up among women who went abroad, and particularly to Switzerland, to study. A separate medical school for women was established at St. Petersburg in 1872, suppressed in 1882 on account of Nihilism, and in 1897 reopened. The universities are now closed to women, but there are higher courses given to them at St. Petersburg and Moscow under the Minister of Public Instruction, and in 1910 there were 10,576 attending these university courses of the medical institute for women.

Investigations made by the University of Wisconsin, and in 1893–94 by the University of Virginia, have shown that in coeducational institutions, according to testimony gathered in the United States and England, women equal or even surpass men in excellence of scholarship. Up to 1898, 54 per cent of the women taking examinations for matriculation at the University of London had passed, as against 53 per cent of men for the same period. Nor has the percentage of withdrawals from college on account of health been greater with women than with men. Investigations into the health, etc., of college women are given under COLLEGIATE EDUCATION FOR WOMEN. In the West, where coeducation is practically universal, no evil consequences have sprung from it, and there is but slight demand for separate schools. The main objection of both male and female students to coeducation is that it implies more restraint than exists where the sexes are apart. Of the many arguments for coeducation, doubtless that of economy has been most effective. It is noteworthy that in a report of the Massachusetts Society for the University Education of Women the fact that the University of California had a preponderance of women students was taken as a sign of the need for a separate college. Indeed, it may be said that having won in most cases their contention for admission to institutions for men, the advocates of higher education for women are turning their attention more and more towards separate schools, and that the privilege of separate education is, particularly in the East, coming to be sought and preferred by women rather than by men. Consult: Clarke, *Sex in Education* (Boston, 1873); *Reports of the United States Commissioner of Education*, 1898, 1891–92, 1894–95; *Circular of Information*, 1883, No. 2; Crawford, *The College Girl of America* (Boston, 1905); G. S. Hall, *Adolescence* (1902); Mills and Tyler, *Boy and Girl, should they be Educated Together* (Oxford, 1906); Shields, *The Education of our Girls* (New York, 1907); Thomas, *Sex and Society* (Chicago, 1906); Woods, *Coeducation* (London, 1903); Walker, *Woman's Unfitness for Higher Coeducation* (New York, 1903).

COEFFI'CIENT (Lat. *co-*, together + *efficere*, to work out, produce). In algebra, any factor of an expression is called the coefficient of the rest of the product. The word, however, is usually applied only to some factor whose numerical value is expressed or known, and which appears first in the product, e.g., in the expression $3ax$, 3 is the coefficient of ax, and $3a$ is the coefficient of x. Vieta seems to have introduced the use of the word in this sense (1591). Since $a = 1 \cdot a$, the coefficient 1 may be understood before any letter. The coefficients in any algebraic equation of the form

$$x^n + a_1x^{n-1} + a_2x^{n-2} + \ldots a_n = 0$$

are related to the roots; thus,

$$r_1 + r_2 + \ldots r_n \equiv \Sigma r_1 = a_1,\ r_1r_2 + r_1r_3 + \ldots$$
$$r_{n-1}\, r_n \equiv \Sigma\, r_1r_2 = -\,a_2, \ldots r_1r_2 \ldots r_n = \pm\, a_n.$$

See EQUATION; for differential coefficients, see CALCULUS; and for binomial coefficients, see BINOMINAL THEOREM.

Detached Coefficients. In many operations with algebraic functions, in which the letters are involved in ascending or descending powers, the

required calculation may be performed with coefficients only, e.g., to multiply

$$x^3 + 3x^2y + 3xy^2 + y^3 \text{ by } x^3 + 2xy + y^2$$

$$\begin{array}{c|l} 1 & 1+3+\ 3+\ 1 \\ 2 & \quad 2+\ 6+\ 6+2 \\ 1 & \quad\quad 1+\ 3+3+1 \\ \hline & 1+5+10+10+5+1 \end{array}$$

Hence $x^3 + 5x^4y + 10x^3y^2 + 5xy^4 + y^5$ is the product.

Indeterminate Coefficients. Many functions may be expanded to any desired number of terms by assuming arbitrary coefficients whose values are determined from resulting equations, e.g., to expand $\frac{1}{1-x}$ to four terms, assume

$$\frac{1}{1-x} = a + bx + cx^2 + dx^3 + \ldots$$

Then

$1 = a + (b-a)\,x + (c-b)\,x^2 + (d-c)\,x^3 + \ldots$

$1 \cdot a$, the coefficient 1 may be understood before

$b - a = 0,\ c - b = 0,\ d - c = 0 \ \ldots.$

that is to say, if $a = 1$, $b = a = 1$, $c = b = 1$, $d = c = 1$, etc. Substituting these values in our assumed equation, we find:

$$\frac{1}{1-x} = 1 + x + x^2 + x^3 + \ldots.$$

The method is as old as literal algebra.

In physics a constant expressing the measure of some property of a substance is often called a coefficient, e.g., the *coefficient of elasticity* is the quotient of the stress by the strain, or the quotient of the applied pressure by the voluminal compression produced. The *coefficient of simple rigidity* is the ratio of the shearing stress to the shearing strain. The *coefficient of refraction* (often called the index of refraction) is equal to the ratio of the speed of light in the first medium to its speed in the second. This ratio for air and water has the value 1.336, representing the refractive power of water. The *coefficient of friction* is the quotient of the resistance due to the sliding of one substance on another and the pressure producing the contact. The *coefficient of expansion* is the amount of expansion of a body of unit magnitude due to an increase of 1° in temperature.

COEFFICIENT OF EXPANSION. See Heat.

COEFFICIENT OF EXPANSION FOR GASES. See Gases, General Properties of.

COEFFICIENT OF FRICTION. See Friction.

COEFFICIENT OF SELF-INDUCTION, and Coefficient of Mutual Induction. See Electricity; Induction.

COEHOORN, or Coehorn, kō'hôrn. A small mortar, usually made of bronze and formerly used in boats and small vessels and on the gangways of larger ships. Mounted on a wooden block, supplied with handles, it was light enough to be carried by two men. It threw a shell of 12 to 14 pounds' weight. Its name is derived from that of its inventor, Coehoorn (q.v.).

COEHOORN, kōō'hôrn, **COEHORN,** or **CO'HORN,** Menno van (1641–1704). A Dutch military engineer. He was born near Leeuwarden, and, after studying at the University of Franeker, entered the Dutch service at the early age of 16, as captain in an infantry regiment. He distinguished himself at Maestricht, Graave, and Seneffe in 1673–74. It was at the siege of Graave that he used with effect a mortar of his own design, later called after him. After the Peace of Nimeguen (1679) he was employed to fortify the various Dutch strongholds. In 1685 he published his important work on fortification, *Nieuwe vestingbouw*, which was speedily translated into French and German. Coehoorn was actively employed during the wars of William of Orange against French aggression, and at Kaiserswerth, Bonn, Fleurus, and Namur he showed himself no mean opponent of the great Vauban. He was made a lieutenant general in 1695 and after the Peace of Ryswick (1697) was employed to refortify several of the Dutch towns. When the War of the Spanish Succession began, Coehoorn was at once dispatched to the front and by his brilliant and energetic generalship reduced six of the chief French strongholds. In 1704, while hastening to confer with Marlborough at The Hague, he was stricken down by apoplexy, March 17. Consult: De Peyster, *Life of Coehoorn* (New York, 1860); Bonomer, *Essai général de fortification* (Paris, 1814); Cosseran de Villenoisy, *Essai historique sur la fortification* (1869).

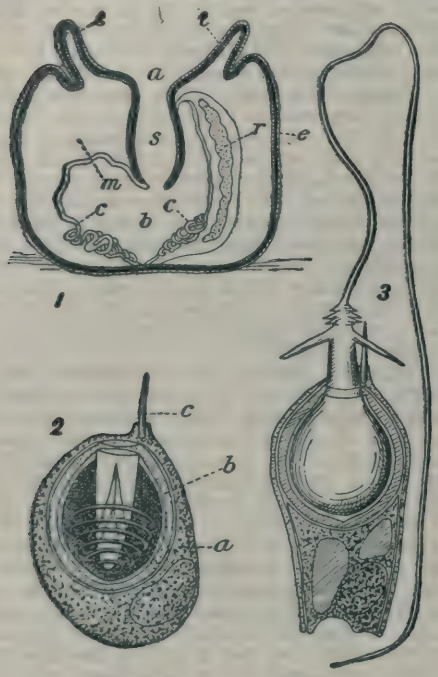
CŒLEBS (sē'lĕbz) **IN SEARCH OF A WIFE.** A novel by Hannah More (1809).

CŒLENTERATA, sē-lĕn'tē-rā'tà (Neo-Lat. nom. pl., from *cœlenteron*, from Gk. *κοῖλος, koilos*, hollow + *ἔντερον, enteron*, intestine). One of the phyla of the animal kingdom, usually ranked as next to the lowest of the types of Metazoa; the polyps and jellyfishes. It is characterized by the absence of a body cavity and a separate circulatory system, both of these being functionally replaced by the system of chambers or tubes into which the mouth opens. Owing to the fact that this system is not only digestive, but that it takes the place of the body cavity, it is sometimes called the *cœlenteron*. More commonly the cœlenteron is called the gastrovascular cavity, since it not only serves as a stomach for digestion, but, by means of its branches, as a vascular or circulatory system in conveying food (and perhaps oxygen) to all parts of the body. All of the Cœlenterata are more or less perfectly radially symmetrical and generally on the number 4 or 6; i.e., they can be divided in either four or six vertical planes, and the resulting halves will be approximately similar. The Cœlenterata may therefore be defined as radially symmetrical, unsegmented Metazoa, having a gastrovascular cavity. In most Cœlenterata there is no anus, waste matter from the digestive system being ejected through the mouth. Between the endodermal lining of the gastrovascular canals and the ectodermal covering of the body is a structureless layer, known as the supporting layer, or "mesoglœa." This may be very thin and firm, or it may be very thick and gelatinous. It contains scattered nerve and muscle cells, skeletal cells, and pigment cells.

The mouth is usually surrounded with a circle of tentacles, which function both as organs of touch and as capturing organs. The number of these oral tentacles varies from two to several hundred, and their size and shape vary quite as much. On these tentacles, and often on other parts of the body, there are batteries of remarkable stinging cells. (See Nematocyst.) These are wanting in only one class, the Ctenophores. The sense organs of the

Cœlenterata are very simple, as a rule, and many forms have no other sense than that of touch. Pigment eyes and positional organs of several kinds occur in the free-swimming forms.

The sexes are separate, and the eggs are set free and fertilized in the water. In their life history the Cœlenterata show some of the most interesting phenomena in the whole animal kingdom. To understand them we must remember that these animals not only reproduce by means of eggs, but even more frequently, like plants, by budding, and that oftentimes, as in plants, the buds do not become detached, but remain connected with the parent stock as long as they live. Moreover, in the type of Cœlenterata we have two very different sorts of individuals—those which are bell-shaped and free-swimming, known as medusæ (q.v.), and those which are more or less cylindrical, and are attached to some object, known as polyps (q.v.). Now, it so happens that the polyp form of a species may give rise to a medusa by budding, and that medusa breaks away and becomes free-swimming; it gives rise to eggs which in turn develop into attached polyps. This process is simple *alternation of generations* (q.v.), i.e., each generation is like its grandparents and not like its parents. The process may become simplified, until the medusa generation is entirely lost, by the medusa bud never getting free from the polyp and ultimately losing even the appearance of a medusa. Or the process may become very much complicated by additional generations produced by budding coming in between the others. The forms which produce the eggs are of course the *sexual* generations, while those that produce the buds are the *asexual*.



FEATURES OF CŒLENTERATA.

1. General anatomy; *a*, mouth; *s*, gullet; *b*, cavity of the body (enteron); *e*, integument, composed of ectoderm and endoderm, separated by a space; *c c*, convoluted cords (craspeda) containing thread cells (see 2), and forming the free edges of the mesentery (*m*); *t t*, tentacles; *r*, reproductive organ contained within the mesentery. 2. Thread cell or stinging cell (nematocyst) of a hydra, undischarged; *a*, formative matrix (enidoblast); *b*, coiled thread within the cell; *c*, trigger hair (cnidocil). 3. The same everted and discharged by rupture of the cell following a touch upon the cnidocil.

The interesting and important question as to whether the first Cœlenterata were medusoid or polypoid forms has been vigorously debated, but is by no means fully determined yet. Owing to the fact that the buds so often remain intimately connected with the parent, we find more or less complicated colonies or stocks very common. These may be free-swimming, as in the siphonophores (q.v.), having then arisen from medusæ; or they may be fixed as in all corals (q.v.), and in such cases have arisen from polyps. In most such colonies, owing to the division of labor that has taken place, we have differently appearing individuals in one colony, some being adapted to locomotion, some to capturing prey, some to digesting food, some for defensive purposes, and some simply for reproduction.

The Cœlenterata are a large group, of many hundred species, widely distributed in the oceans of all parts of the world. Only three or four species are known as occurring in fresh water. As individuals most of the species are small, though a few sea anemones and some medusæ reach a diameter of over a foot; in colonies, however, some of the reef-building corals cover an extraordinary area. As for color, the Cœlenterata are among the most gorgeous of animals; no shades are too exquisite or delicate. Nearly all are carnivorous, though perhaps some forms may use vegetable matter in part. The only species of any direct use to man are the precious and the lime-producing corals.

In classification the Cœlenterata present difficulties. The ctenophores are so different in some important ways from other cœlenterates that some zoölogists prefer to regard them as a separate type, especially since two genera are known that connect them directly with the flat worms (Platoda); but as they are radially symmetrical and have a gastrovascular system, they really come within the definition of cœlenterates. The type then may be divided into three great classes: (1) *Hydrozoa* (q.v.), which have no gastral filaments and have an endodermal œsophagus, if any; (2) *Scyphozoa* (q.v.), which have endodermal gastral filaments and give rise to medusæ; (3) *Actinozoa*, or *Anthozoa* (q.v.), which are polyp form, possess mesenteries and never give rise to medusæ; and (4) *Ctenophora* (q.v.), distinguished by having eight meridional rows of swimming plates.

Fossil Forms. The Cœlenterata comprise some of the oldest fossils found in the Lower Cambrian rocks (Archæocyathus and Ethmophyllum); they increased rapidly in variety, and attained already, early in the Silurian, great importance as rock builders in the reef-building corals (see CORAL ISLAND; LIMESTONE; DOLOMITE), which persisted through all formations to the present time, their remains often forming the greater part of whole mountain ranges, as in the southern Alps. Medusoid impressions, representing not only the Hydromedusæ, but also the Scyphomedusæ, occur as early as the Cambrian in Bohemia, Sweden, and North America, and are known

from later rocks. (See MEDUSA; JELLYFISH.) Those suborders of the Hydromedusæ, whose species possess either chitinous-calcareous or calcareous skeletons, viz., the Hydrocorallinæ and Tubulariæ, are also found in the fossil condition, though only sparingly and not until the Mesozoic and Tertiary formations. The most important representatives of the first suborder are the calcareous skeletons of Millepora, appearing in the Eocene, and of the second suborder, the masses of calcareous concentric lamellæ with supporting pillars, which have been described as Ellipsactinia from the Alpine Jurassic, and as Parkeria and Porosphæra from the Cretaceous. Similar calcareous concentrically lamellose forms, but without larger apertures on the surface, the Stromatoporoidea (see STROMATOPORA), are extremely common in the Silurian and Devonian systems, where they were reef builders and important rock-making organisms, being associated with the corals. Their real systematic position being unknown, they are provisionally allied with the Hydromedusæ.

A like relation to the Hydromedusæ is held by the graptolites (see GRAPTOLITA), which, forming chitinous hydroid-like colonies, swarmed, either as holoplanktonic or pseudoplanktonic organisms, in the Silurian seas. They differ in some important features, as the possession of a sicula and virgula, from the hydroids. On account of the world-wide distribution of their species and their short range, they are most important horizon markers or index fossils.

For bibliography of fossil forms, see the articles on CORAL; GRAPTOLITA; MEDUSÆ; STROMATOPORA; JELLYFISH; ETC.

CŒLE-SYRIA (Lat., from Gk. *κοίλη Συρία, Koilē Syria*, hollow Syria). A geographical term used by Greek writers in three different senses. 1. Originally, in the first century of the Seleucid era, Cœle-Syria was the name given to the region lying between the Lebanon and Anti-Lebanon mountains in Syria (so possibly referred to in 1 Esdras iv. 48; cf. Strabo, xvi, 2). "The Valley of Lebanon" (cf. Josh. xi. 17) denotes the same district. 2. Later, in the second century B.C., it was used to designate the whole of Syria, east and west of the Jordan, from the Taurus to Egypt, Phœnicia alone being excepted. Josephus once refers to it under these comprehensive limits (*Ant.* xiv, 4, 5). Such is its significance in most instances in 1 Esdras (ii. 17, 24, 27; vi. 29; vii. 1; xi. 67; cf. Strabo, xvi, 753) and in 1 and 2 Maccabees (1 Macc. x. 69; 2 Macc. iii. 5, 8; iv. 4; viii. 8; x. 11). 3. In Roman times, and even before, Cœle-Syria was again confined to the territory east of the Jordan, consisting of Perea, the Decapolis, and the provinces which constituted the tetrarchy of Philip. In 47 B.C. the Romans gave it into the military charge of Herod. Josephus puts into it the whole extent of eastern Palestine, including Moab and Ammon (*Ant.* xiii, 13, 3).

Later in the Roman period (Diocletian, 297 A.D.) the term receded to the region between the Taurus and Phœnicia; while to-day it denotes practically the valley between the Lebanons, under the Arabic name *El Bika'* ('the cleft').

Hölscher, in his brochure *Palästina in der persischen und hellenistischen Zeit* (1903), surmises that it originally described the entire Syrian country west of the Euphrates, the *'Abar-naharâ* (pp. 6–12).

Bibliography. Smith, *Historical Geography of the Holy Land* (11th ed., 1904); Leary, *Syria, the Land of Lebanon* (1913).

COELHO, kô-ā'lyô (Portug., rabbit), or CONEJOS. The rabbit fish (*Promethichthys prometheus*) of the middle Atlantic, so called in Madeira. See RABBIT FISH.

COELHO, GONÇALO. A Portuguese navigator, the commander of a ship on the coast of Senegambia about 1488. He is supposed to have been the leader of the expedition of 1501 to explore the Brazilian coast. Afterward he was placed in command of six ships sent out from Lisbon in 1503 to seek a passage to the East Indies around the southern part of Brazil, the extent of South America being at that time unknown. After suffering shipwreck and becoming separated from a part of his fleet, Coelho continued his journey of exploration in the remaining ships beyond the present site of Rio de Janeiro, returning to Lisbon in 1506.

COELHO DE ALBUQUERQUE, dâ ăl'bōō-kĕr'kâ, DUARTE (1537–c.1579). A Portuguese governor. He was born at Olinda, Pernambuco, and was the oldest son of Duarte Coelho Pereira, whom he succeeded as captain general of Pernambuco in 1554, which possession, after completing his education in Europe, he governed personally from 1560 to 1572. On his return to Portugal he accompanied Dom Sebastião to Africa, was captured by the Moors, Aug. 4, 1578, and died in captivity at Fez.

CŒLIA GENS. See CÆLIA GENS.

CŒ'LICA. A collection of short poems by Fulke Greville (1633).

CŒLIC'OLÆ (Lat., worshipers of heaven). A sect condemned in decrees issued by Theodosius II in 408 (*Cod. Theodos.*, 16, 5, 43) and in 409 (*Cod. Theodos.*, 16, 8, 19) as marked by a "new and unwonted audacity," and, as heretical, ordered to conform within a year or take the consequences. Augustine alludes to it in a letter (Ep. xliv, cap. vi, § 13) written in 398. Consequently the sect was extant in the fourth and the fifth centuries. It seemingly did not last much longer. Its exact nature is difficult to determine, but probably it presented a combination of Jewish and Christian doctrines and practices, among which the most prominent was the use of baptism along with circumcision.

CŒLIUS. See CÆLIA GENS.

COELLO, kô-ā'lyô, ALONSO SANCHEZ (c.1515–

90). A Spanish portrait and historical painter. He was born at Benifayro (Valencia) and apparently formed his style on Italian models. In 1541 he was in Madrid, and in 1552 he went to Lisbon with Antonio Moro and worked there until he succeeded that artist as court painter to Philip II of Spain. He became a great favorite with Philip and painted portraits of the King, his children, and the personages of the court. Many of these perished in the fire of the Prado and Alcazar; among those preserved are those of Don Carlos, the Infanta Isabella, Queen Isabel of the Peace, and Antonio Perez—all in the Prado,—Alexander Farnese (Hermitage, St. Petersburg), and Father Siguenza, the historian. His portraits are vital records of personality, graceful in design and good in color, but they suffer from overelaboration of detail. Among his less interesting religious pictures are five altarpieces with saints painted for the Escorial, "The Martyrdom of St. Sebastian," and "The Marriage of St. Catharine" (Prado).

COELLO, CLAUDIO (c.1630–1693). A Spanish painter, born in Madrid. He studied under Francesco Rizi and afterward under Carreño de Mirando, and probably learned fresco painting from his friend José Donoso. Coello is the last great painter of the Madrid school of the seventeenth century. He painted many large pictures for churches and decorations in fresco for various palaces. All of these works have disappeared, except the ceiling of the vestiary of the Toledo Cathedral. His designs for the triumphal arches raised to celebrate the marriage of Charles II with Marie Louise d'Orléans brought Coello to the notice of the King, and a few years later he became court painter. At this time he painted his greatest picture, the altarpiece of the "Sagrada forma" in the sacristy of the Escorial, which contains more than 50 characteristic portraits; it is baroque in style, carefully drawn, brilliant in color, and original in composition. Coello was now the foremost painter of his time, but the rise of Luca Giordano caused him to lose his prestige and is said to have hastened his death. Coello's mature style was based on that of Rubens and Titian, and his best work is of extraordinary power. His finest pictures are in the Prado (Madrid), in Apsley House and Grosvenor House, London, and in Munich, Budapest, Frankfort, and St. Petersburg galleries. Consult Beruete y Moret, *The School of Madrid* (London, 1909), and Schubert, *Geschichte des Barock in Spanien* (Esslingen, 1908).

CŒLORHYNCHUS, sē'lō-rĭŋ'kŭs (Neo-Lat., from Gk. *κοίλος, koilos,* hollow + *ῥύγχος, rhynchos,* nose). A genus of small deep-sea fishes of the family Macruridæ (q.v.), allied to the cods, which inhabit the deeper parts of various oceans and seas. There are many species, of which a common one is the silvery-gray *carminatus* of the West Indian region. Local names for these fish are grenadiers and rat-tails. See Plate of CODFISH AND ALLIES.

COEN, kōōn, JAN PIETERSZOON (1587–1629). The founder of the Dutch colonial power in the East Indies. He entered the service of the East India Company in 1607, and was Governor-General in 1618–23 and again in 1627–29. During his first term he fought successfully against the English and the native princes, and in 1619 destroyed the town of Jacatra, on the site of which he soon afterward founded Batavia. He forced the English to withdraw nearly all their factories from the archipelago and shut them out from the trade of the islands. He introduced the "colonial system" which aimed at a stable population of European stock.

CŒNO'BIA (Neo-Lat. nom. pl. of *cœnobium,* Gk. *κοινόβιον, koinobion,* life in a community, from *κοινός, koinos,* common + *βίος, bios,* life). A term applied to certain colonies of cells among the algæ, remarkable for their regularity of form. They are developed inside mother cells whose contents divide into the required number of daughter cells, which group themselves in the interior. In some forms (*Volvocales*) the individual cells are ciliated, so that the entire colony swims through the water. The colony of *Volvox* may have as many as 22,000 cells. Other colonies are motionless, and contain a small number of cells arranged with beautiful symmetry (*Pediastrum, Scenedesmus,* etc.). The water net (*Hydrodictyon*) is an immense cœnobium of 700 to 20,000 cells.

CŒN'OCYTE (Gk. *κοινός, koinos,* common + *κύτος, kytos,* cavity). The body of an unpartitioned plant, and also a segment of the body of an incompletely partitioned plant, found chiefly among certain algæ and fungi. It differs from a single cell, which has one nucleus, in that the contained protoplasm contains many nuclei. The protoplasm lies in a continuous cavity where portions of it containing the nuclei and other structures slowly circulate. Excellent illustrations are presented by the molds among the fungi and by the order Siphonales among the algæ. For details, see ALGÆ; FUNGI.

CŒNOGENESIS. See PALINGENESIS.

COER'CION (from Lat. *coercio,* from *coercere,* to restrain, from *co-,* together + *arcere,* to confine). In law, such a degree of physical force, or threatened personal violence, or intimidation, applied to a person as constrains or induces him to do some act which, but for such constraint, he would not have done. Under some circumstances coercion applied to a person's wife, husband, or near relative, or injury to his property, will be held to have the same effect as if it were applied to the person himself.

The consequences of an act done under coercion may generally be avoided by a person, on the ground that it is not the product of his free will and he is not considered responsible for it. In the United States, generally, where a person commits a crime under such coercion that he has a reasonable apprehension of instant death or serious bodily harm he is excused from the consequences. A less degree of coercion will render a civil act voidable. See DURESS.

COERCION ACTS. See IRELAND, *History.*

COERNE, LOUIS ADOLPHE (1870–1922). An American composer, born at Newark, N. J., and educated at Harvard University and the Royal Academy of Music, Munich. He was musical director at Buffalo, N. Y. (1894–97), Columbus, Ohio (1897–99), and Troy, N. Y. (1907–09), had charge of the music department of the Harvard summer session in 1903, and in 1903–04 was associate professor of music at Smith College. After a year as director of the Conservatory of Music at Olivet College he became, in 1910, director of the School of Music and professor of the history and science

of music at the University of Wisconsin. He is author of *Evolution of the Modern Orchestration* (1908). His compositions include: *Hiawatha*, a symphonic poem (Munich, 1893); *Jubilee March* (Chicago Exposition, 1893); *Beloved America; Mass in D Minor; Swedish Sonata; Sakuntala* (1904); and the grand operas, *A Woman of Marblehead* and *Zenobia* (Bremen, 1905–06). *Zenobia* was the first grand opera by a native American composer to be played before a European audience.

CŒUR, kēr, JACQUES (c.1395–1456). A celebrated French merchant and financier, born at Bourges. As early as 1432 he had begun to trade with the Levant and in that year made a journey to Damascus. He soon attracted the attention of the King and received many offices; in 1436 he was master of the mint in Paris; in 1444 he was one of the commissioners for the new Parliament in Languedoc; in 1448 he was an envoy to Pope Nicholas V. He had been ennobled in 1441 by the King, and now he was treated with marked distinction by the Pope, and received a special license to traffic with the infidels. His trade, which had been extensive before, increased rapidly and extended to England, Flanders, Spain, Italy, Turkey, Asia, and Africa. This enabled him to amass great wealth, and he was obliged to contribute largely to the King's purse, especially for the expenses incurred in driving the English out of Normandy. In spite of, or possibly because of, these contributions he became an object of envy, and his fall was rapid. In February, 1450, Agnes Sorel, the King's mistress, died; and Cœur, who was one of her executors, was accused of having poisoned her. There was no reasonable ground for such a charge; nevertheless, the needy and unscrupulous King, in July, 1451, who needed money for the war in Guienne, took advantage of the accusation to have Cœur arrested and his goods seized; Cœur was tried by men whose business it was to convict him without regard to the evidence or to justice; he was condemned to pay to the King an enormous sum and to remain a prisoner until the judgment was fully satisfied. All his property was confiscated, and he was exiled during the royal pleasure. In 1455 he managed to escape and, though pursued, succeeded in reaching Rome, where he was well received by the Pope. He died the following year at Chios. Consult Clément, *Jacques Cœur et Charles VII* (Paris, 1866).

CŒUR D'ALENE, kēr dȧ-lān'. A city and the county seat of Kootenai Co., Idaho, 33 miles by rail east of Spokane, Wash.; on the Cœur d'Alene and Pend d'Oreille, the Northern Pacific, the Cœur d'Alene and Spokane Electric, and the Chicago, Milwaukee and St. Paul railroads; on Cœur d'Alene Lake; and on the Cœur d'Alene, St. Joe, and Spokane rivers (Map: Idaho, B 2). Noteworthy features of the city are Cœur d'Alene College, a Catholic academy, Blackwell and City parks, and the Old Fort Sherman military grounds. There are manufactories of lumber, ties, shingles, and brick, and a trade is carried on in fruits and farm products. The city is in a picturesque region frequented by sportsmen for fishing and hunting. On the shores of Lake Cœur d'Alene Indians held great powwows. Pop., 1900, 508; 1910, 7291.

CŒUR D'ALENE. A lake in Kootenai Co., Idaho (Map: Idaho, A 2). It lies in a wild region on the west side of the mountains of the same name, and is about 30 miles long and from 2 to 4 miles wide. Its waters are cool and clear and afford excellent fishing. It is one of the headwaters of the Columbia, the Spokane River issuing from its northern end. It also receives the St. Joseph River from the east at its southern end.

CŒUR D'ALÊNE. A Salishan tribe formerly holding the territory about the lake and river of the same name in northern Idaho, and now settled upon a reservation in the same country. The name, signifying "awl-heart," is said to have been originally given to a chief of the tribe in derision of his stinginess. The natives call themselves Skitswish, the Skeetsomish of Lewis and Clark. They now number 293. See SALISHAN STOCK.

CŒUR DE LION, *de* lē'ŏn' (Fr., Lion-hearted). A title given to Richard I, King of England, for his exploits, mainly in the Crusades.

COF'FEE (Turk., Ar. *qahwe*, the coffee beverage). A beverage made of the roasted seeds of the coffee tree, *Coffea arabica* and other species, natives of Abyssinia, Arabia, and West Africa, now naturalized in many tropical countries. The genus *Coffea* comprises a number of species, but *Coffea arabica* is the species widest known which possesses valuable properties; although *Coffea liberica*, *Coffea stenophylla*, and *Coffea robusta* of West and Central Africa are being cultivated to some extent, the seeds of *Coffea mauritiana*, prepared in the same way, are bitter and slightly emetic. In the wild state *Coffea arabica* is a slender tree, 15 to 25 feet high, with few branches; in cultivation it is seldom allowed to become more than 6 to 10 feet high, and is made to assume a sort of pyramidal form, with horizontal branches almost from the ground. The leaves are evergreen and leathery; the flowers are small, fragrant, and snow-white; and the whole appearance of the tree is very pleasing. The fruit, when ripe, is cherry-like, of a dark-scarlet color, and usually contains two seeds inclosed with their flattened faces together in a tough membrane, called the parchment. Each seed is covered with a thin covering, the silver skin. The seeds are commonly termed coffee beans, a name derived not from any resemblance of the seeds to beans, but from the Arabic word *bunn*, which means 'coffee.' The seeds are also sometimes designated coffee berries. For illustration, see BEVERAGE PLANTS.

The earlier history of the coffee tree is not very clear. It was not known to the Greeks or Romans, but in Arabia it was certainly in use in the fifteenth century. Towards the end of the seventeenth century plants were carried from Mocha to Batavia by Wieser, a burgomaster of Amsterdam, and from the botanical gardens at Amsterdam the Paris Garden obtained a tree. A layer of this was carried out to Martinique in 1720, where it succeeded so well that in a few years all the West Indies could be supplied with young trees. The coffee tree succeeds where the temperature of the year ranges from 60° to 90° F. It does best in a sandy or gravelly soil, well drained, and on high lands or hill ranges from 1000 to 3000 feet above the sea. In Peru and Ecuador it is acclimatized at an elevation of 6000 feet, where, however, frost never occurs. The fruit ripens in hothouses in temperate zones. Coffee plantations

are laid out pretty much in the same way everywhere. Volunteer seedlings that come up under bearing trees or one-year-old trees 12 to 16 inches high are set from the nursery. They need shade at first and in some climates are shaded at all times. In Brazil little of any shade is used. They are pruned to the same height, and the ground between them is carefully kept clear of weeds. Where the climate is dry, abundant irrigation is necessary, but the supply of water is cut off as the fruit begins to ripen, in order to improve its quality. The tree yields its first crop in the third year, and the crop from a full-grown tree may amount to two pounds of coffee beans. The life of a tree is about 40 years. As the coffee tree continues flowering for eight months, its fruits are of very unequal ripeness; in the West Indies and Brazil three gatherings are made annually. The beans are placed on mats or large floors specially adapted for the purpose, where they are dried by the sun's rays, being meanwhile frequently turned. They are passed between rollers to remove the dried pulp of the bean, and the membrane which incloses the seeds themselves, and the coffee is afterward freed from impurities by winnowing, and conveyed in bags to the seaports. As equal care is not, however, bestowed upon the preparation of it in all places where it is cultivated, there are great differences in quality and price. The following sorts are particularly distinguished from one another in commerce: *Mocha coffee*, which comes from Arabia, and is known by its small gray beans inclining to greenish; *Java* or *East Indian coffee*, which has large yellow beans; *Jamaica coffee*, with beans somewhat smaller and greenish; *Surinam coffee*, which has the largest beans; *Bourbon coffee*, with beans pale yellow and almost whitish.

Liberian coffee, *Coffea liberica*, a native of West Africa, is being introduced into some countries, particularly in Ceylon. It is a much larger variety, and thus far it has withstood the ravages of the leaf disease that had nearly destroyed the coffee plantations of that country. This leaf disease, due to *Hemileia vastatrix*, has become very destructive in the East. The American disease, caused by *Stilbum flavidum*, is of importance in Central and South America.

The use of coffee as a beverage was introduced from Arabia, in the sixteenth century, into Egypt and Constantinople. Leonhard Rauwolf, a German physician, was probably the first to make coffee known in Europe, by the account of his travels printed in 1573. Soon after the first introduction of coffee, coffeehouses arose almost everywhere. The first in Europe was established at Constantinople in 1551. In London the first coffeehouse was opened in Newman's Court, Cornhill, in 1652, by a Greek named Pasqua. This Greek was the servant of an English merchant named Edwards, who brought some coffee with him from Smyrna, and whose house, when the fact became known, was so thronged with friends and visitors to taste the new beverage, that to relieve himself from annoyance, Edwards established his servant in a coffeehouse. The first coffeehouse in France was opened at Marseilles in 1671, and in 1672 there was one opened in Paris, which soon had several competitors. In the East coffee is not usually prepared as a beverage in the same way as in Europe, except by Europeans. A decoction of the unroasted seeds is there generally drunk; and for the "Sultan's coffee," the pericarp, with the dried pulp roasted, is employed.

The great demand for coffee has led to the employment of a number of cheaper substitutes, of which chicory (q.v.) root is the best known. Of others, dandelion root, carrot, the seeds of the common yellow iris, cereals, and sweet potatoes may be mentioned. They are prepared by roasting like coffee. The seeds of *Astragalus bœticus* are known on the continent of Europe as Swedish coffee and are said to be the best substitutes for coffee yet discovered. All the substitutes lack the most important constituent of true coffee, viz., caffeine (q.v.), and are therefore very different from it in their qualities. Coffee is subject to great adulteration, most of the articles specified as substitutes being employed for this purpose. The chief substance of mixture is chicory, the use of which is not injurious, however. The chief effect of adding chicory is to deepen the color. The leaves of the coffee trees are used in the western part of Sumatra instead of the seeds. They are prepared by quick drying in a manner similar to that in which tea leaves are prepared, and in this state contain even a larger proportion of caffeine than the coffee beans of our shops. It seems not improbable that the use of the coffee leaf may yet extend very much.

Unroasted coffee has, on an average, the following percentage composition: water, 11.2; protein, 12.1 (including caffeine, 1.2); fat, 12.3; nitrogen-free extract, 42.3; crude fibre, 18.2; ash, 3.9. Roasted coffee contains per cent: water, 1.1; protein, 14.0 (including caffeine, 1.2); fat, 14.5; nitrogen-free extract, 45.8; crude fibre, 19.9; ash, 4.7. Of the total material, some 25 per cent is soluble in water, half of this being nitrogen-free extract. When the beans are roasted till they assume a reddish-brown color, they lose 15 per cent by weight, and gain 30 per cent in bulk; when roasted till they become chestnut brown, they decrease 20 per cent by weight and increase 50 per cent in bulk; while if the roasting is continued till the beans become dark brown, they lose 25 per cent in weight and acquire 50 per cent in bulk. The beans should never be darker than a light brown color, which is quite sufficient to bring out the excellent aroma and other qualities of the coffee; when the roasting is carried further, more or less charring is the result and a disagreeable burned smell is produced, which tends to overcome the natural pleasant aroma. The improvement in flavor by roasting is probably due, in part at least, to the formation of caramel. Coffee does not retard the action of the bowels, as strong infusions of tea tend to do, partly because there is less of the astringent principle, and also owing to the presence of the aromatic oil which tends to move the bowels. The important offices which coffee fulfills are, to allay the sensation of hunger; to produce an exhilarating and refreshing effect; and possibly to diminish the amount of wear and tear, or waste of the animal frame, which occurs more or less at every minute. (See NUTRITION.) The grounds of coffee are nutritious, containing considerable protein, and some of the Eastern nations take advantage of this. The coffee is ground very fine and allowed to remain in infusion, being consumed with it. In most re-

spects coffee possesses properties similar to those of tea (q.v.).

An endless variety of apparatus has been contrived—some of them of great complexity—for preparing coffee for the table. The chief object aimed at by Western nations is to obtain the liquor free from all sediment. In France and elsewhere a very popular beverage is prepared known as *café au lait*. Coffee and milk are boiled separately and mixed in equal proportions immediately before serving. In the so-called French coffeepot boiling water is poured very slowly upon the freshly and finely ground coffee and then allowed to drip through two strainers into the bottom of the pot. This process makes excellent coffee, but is rather slow. Another and much quicker method, used by the Germans, is to infuse coffee like tea, and this has the advantage of bringing out the flavor. In using the Vienna coffeepot the water is poured through a pipe into a lower compartment of the pot. A drum with a strainer at the top is then fitted over the pipe, and in this drum the coffee is placed. A glass cover is adjusted over the pot, which is then placed over an alcohol flame. When the water boils, it rushes through the coffee and through the strainer and pours over the sides of the drum into the upper compartment of the pot, from which it is poured into the cups. The glass cover acts as a condenser of the steam and prevents the aroma from escaping. The nations of the Orient, generally, either follow the usage of the Turks, who drink their coffee thick with sediment; or the nomadic Arabs, who make it from the dried pulp, in much the same manner as tea is prepared in Occidental countries. A more curious method is that of the Somali, who boil the berries in oil and soak maize in the mixture.

The trade in coffee is of great importance. Brazil leads in its production, producing about two-thirds of the world's supply, which in 1910 was 1,996,000,000 pounds. Large exportations are also made from Mexico, Central America, Java, Sumatra, India, Ceylon, Arabia, Hawaii, and the West Indies. The exportation of coffee in 1909–10 was 1,424,000 tons. The coffee crop of the world for 1912–13 is estimated at 984,360 tons. The importation into the United States in 1912 was 885,201,247 pounds, valued at about $117,826,543. Deducting the amount exported, the average consumption per capita is over 9 pounds.

In order to prevent overproduction and maintain prices, Brazil adopted in 1906 a scheme known as the valorization plan, whereby the state through a syndicate held large quantities of coffee, selling only as the market required it. In addition a heavy tax was imposed on all new plantings so as to limit the extension of the area devoted to the crop. At the end of 1909 there were stored in New York and various European ports 901,687,265 pounds of Brazilian coffee subject to the control of the valorization committee. The plan, so far as storage in the United States is concerned, is said to have been abandoned in 1913.

Many sorts of cereal coffee are on the market. They are made of such materials as parched grains, peas, etc. On an average, they contain per cent: water, 6.2; protein, 13.3; fat, 3.4; total carbohydrates, 72.6; ash, 4.5. Only a portion of this material is soluble and enters into the infusion. The infusion of genuine coffee and cereal coffee each contains on the average 98 per cent water and 2 per cent nutritive material. Consult: Walsh, *Coffee: Its History* (Philadelphia, 1902); *Coffee*, pub. by Pan-American Union (Washington, 1909); Keable, *Coffee, from Grower to Consumer* (New York, 1910); McClelland, *Suggestions on Coffee Planting for Porto Rico* (Mayaguez, P. R., 1912). See ADULTERATION.

COFFEE BUG. Any of several sorts of scale insect which live on the coffee tree. The pest is encountered in all parts of the world, and spraying with insecticides or other means of eradication are often necessary to save the crop. It is stated that some years ago the experiment was tried in Ceylon of introducing into the plantations a red ant (*Formica smaragdina*), abundant in many of the gardens and jungles of the island, which feeds greedily on the coccids; but the fierce assaults of the ants on the naked skins of the laborers made them threaten to leave the estates, so that the ants were not further encouraged.

COFFEE-HOUSE POLITICIAN, THE. A play by Fielding (1730).

COFFEEHOUSES. Places of refreshment, first opened in the sixteenth century in Constantinople. In London they were, so to speak, clubhouses free to all who could buy a cup; and yet each was known for its special circle of visitors, literary, scientific, religious, or political. In the absence of newspapers they were a great means of spreading news and of discussing public questions. Nearly all of the middle and higher classes attended them daily, and they came to exert so powerful an influence in politics that in 1675 Charles II attempted to suppress them, but in vain. Consult Macaulay, *History of England*, vol. i (New York, 1858).

COFFEE TREE. See GINKGO.

COF'FERDAM'. A dam built to cut off a small body of water from the adjacent bay, river, etc. It consists of rows of piles, or piles and planking, the space between the rows filled in with clay, cement, or other material. Sheet steel interlocking piling is also extensively used in this form of construction. The term is also applied to iron or steel air-tight inclosures used in digging underwater tunnels or excavations. (See FOUNDATION.) On board modern ships the term is applied to inclosures designed to keep out water. In some cases they surround hatches, but their most important use is to form a continuous double wall at the sides of a ship. Above the protective deck the cofferdam is fitted as a continuous tank (with numerous bulkheads dividing it into sections), extending from that deck to several feet above the water line. It is packed with compressed corn-pith cellulose, or some similar material, which is designed to check the influx of water through a shot hole, which it does by swelling up, as soon as wetted, and closing the hole. If the hole made is not too large or the pressure of water too great, it operates very satisfactorily. Consult Fowler, *Ordinary Foundations, Including the Cofferdam Process for Piers* (New York, 1905).

COF'FEYVILLE. A city in Montgomery Co., Kans., 168 miles by rail south-southwest of Kansas City, on the Verdigris River, and on the Missouri Pacific, the Atchison, Topeka, and Santa Fe, the Missouri, Kansas, and Texas, and the St. Louis, Iron Mountain, and Southern railroads (Map: Kansas, G 8). It contains a

public library. The city carries on an extensive trade with Oklahoma and has strawboard, planing, and flour mills, railroad shops, oil refineries, a plow factory, glass factories, oil-well, packing plant, a large oxide smelter, foundry, vitrified brick works, and a roofing-tile factory. Coffeyville was incorporated in 1871 and adopted the commission form of government in 1909. The water works and the electric-light plant are owned and operated by the municipality. Pop., 1900, 4953; 1910, 12,687; 1920, 13,452.

COF'FIN. In ordinary sense, a burial case; usually a box or chest, in which the dead are inclosed for interment, or sometimes for cremation. In modern times the ordinary material of the case is wood, usually with metallic attachments; lead, copper, iron, glass, terra cotta, stone, etc., are sometimes employed. In earlier times the coffin was chiefly symbolic rather than merely utilitarian, and the material and form varied widely; and the early customs find parallels and interpretations among those of primitive peoples still surviving. Perhaps the simplest type of burial case is that of the Plains Indians, who wrapped the body tightly in a buffalo skin and then placed it upon a scaffold. Among some other tribes the corpse is merely enshrouded in all the habiliments of life, and then placed in a miniature "house of the dead" made in imitation of a dwelling; and this type grades among various peoples into cists of slabs, rock-hewn sepulchres, ornate tombs, and massive sarcophagi. Among riparian and maritime peoples of lowly culture the canoe or boat is the symbol of the home, and the body of a deceased owner may be placed in his vessel, which is portable, and may be borne to a chosen place of sepulture; and it is this type of burial case which can be traced through the customs of many peoples to the ordinary coffin of modern times. See BURIAL; MUMMY CASE; SARCOPHAGUS.

COF'FIN, CHARLES CARLETON (1823–96). An American war correspondent, novelist, and juvenile writer, born at Boscawen, N. H. Beginning as a farmer's boy, he tried civil engineering; then returned to farming, then became an expert telegrapher, and finally undertook journalism in Boston. He first attained distinction during the Civil War, as correspondent in the field for the Boston *Journal*. He served that newspaper also during the Austro-Prussian War of 1866. On his return he became popular as a lecturer and was a member of the Massachusetts Legislature (1884–85). Among his many books are: *The Great Commercial Prize* (1858), advocating a transcontinental railroad corresponding with the present Northern Pacific; *Days and Nights on the Battlefield* (1864); *Following the Flag* (1865); *Winning his Way* (1865); *Four Years of Fighting* (1866); *Our New Way Round the World* (1869); *The Seat of Empire* (1870); *Caleb Krinkle* (1875); *History of Boscawen* (1877); *Boys of '76* (1879); *Old Times in the Colonies* (1880); *Building the Nation* (1883); *The Drum-Beat of the Nation* (1887); *Marching to Victory* (1888); *Freedom Triumphant* (1891). He had a facile style and a vein of characteristically New England humor that secured for his books a wide popularity. Consult Griffis, *The Life of Charles Carleton Coffin* (Boston, 1894 and 1898).

COFFIN, SIR ISAAC (1759–1839). A British admiral, born in Boston, Mass., son of a customs official. He entered the British navy in 1773, served in the American Revolution, and rose through all grades to the rank of admiral (1814), though he was not in active sea service after 1794. He was twice court-martialed (1782 and 1788)—both famous cases in admiralty law. In 1818 he was elected to Parliament, where he remained until 1826. In 1827 he founded and endowed, on the island of Nantucket, a school which is still called by his name.

COFFIN, JAMES HENRY (1806–73). An American mathematician and meteorologist, born at Williamsburg, Mass. He graduated in 1828 at Amherst College and in 1829 opened at Greenfield, Mass., the Fellenburg Manual Labor Institution, the first school of the sort in New England and probably in the country. He was professor of mathematics and astronomy in Williams College in 1838–43, and from 1846 until his death he held the chair of mathematics and astronomy at Lafayette College. His scientific attainments were notable. He erected on Mount Greylock, at a height of about 4000 feet above sea level, an observatory, where careful observations were made by means of a self-registering anemometer of his own device. In 1846 he was appointed one of the first collaborators in the work of the Smithsonian Institution, under whose auspices he published *Winds of the Northern Hemisphere* (1853)—his chief volume, based on data collected from more than 600 stations on land and at sea; *Psychometrical Tables* (1856); and *The Orbit and Phenomena of a Meteoric Fire Ball* (1869). The theory of atmospheric circulation, known on the Continent as the Buys-Ballot (q.v.) law, was announced by him in 1853 at a meeting of the American Association for the Advancement of Science. His further works include *Solar and Lunar Eclipses* (1845) and *Elements of Conic Sections* (1849; 6th ed., 1881). Consult J. C. Clyde, *Life of J. H. Coffin* (Easton, 1882).

COFFIN, JOHN HUNTINGTON CRANE (1815–90). An American astronomer. He was born in Wiscasset, Me., graduated at Bowdoin College in 1834, and in 1836 was appointed professor of mathematics in the United States navy. In 1844 he was detailed to the Naval Observatory. He was professor of astronomy and navigation in the United States Naval Academy from 1853 to 1865, and from 1865 was in charge of the *American Ephemeris and Nautical Almanac*. He published *Observations with the Mural Circle* (1845–49); *Observations on the Total Eclipse of the Sun* (1884); *Navigation and Nautical Astronomy* (7th ed., 1898).

COFFIN, JOSHUA (1792–1864). An American antiquarian, born at Newbury, Mass. He graduated in 1817 at Dartmouth College and afterward became an instructor of the poet Whittier, who paid tribute to his memory in the poem "To My Old Schoolmaster." He was a founder of the New England Antislavery Society, of which he became the first recording secretary. He published a *History of Ancient Newbury* (1845), and *An Account of the Principal Slave Insurrections in the Last Two Centuries* (1860).

COFFIN, LONG TOM. A simple, daring sailor in *The Pilot*, by J. Fenimore Cooper.

COFFIN, LORENZO S. (1823–). An American philanthropist, born in Alton, N. H.

He studied for a few months in the preparatory department of Oberlin College, and for a year taught in Geauga Seminary, Chester, Ohio, where J. A. Garfield and Lucretia Randolph (afterward Mrs. Garfield) were his pupils. Coffin located a homesteader's claim near Fort Dodge, and served with the Thirty-second Iowa Infantry during the Civil War. After the war he was a preacher, and from 1883 to 1888 as a member of the Iowa Board of Railroad Commissioners was prominent in securing legislation for safety appliances on railways. He founded (1893) a Railroad Temperance Association, was one of the incorporators of a Home for Aged and Disabled Railroad Men near Chicago, and was president of the Iowa Anti-Saloon League, and candidate for Governor (1907) on the Prohibition ticket, and for Vice President of the United States (1908) on the United Christian ticket.

COFFIN, William Anderson (1855–). An American landscape painter, born at Allegheny, Pa. He studied at the Yale Art School and afterward in Paris under Bonnat. His work represents the different moods of nature in rural scenery and is characterized by a peculiar personal and uncompromising directness and simplicity. Mr. Coffin was active in the organization of many movements; he was the art director of the Pan-American Exposition of 1901 at Buffalo. At the St. Louis Exposition (1904) he exhibited "Sunrise in Winter" and "Evening, Somerset Valley"; in 1905, "The Last Gleam"; in 1906, "Off New London," "Flame Hill," and "Dawn, October Frost." Other paintings are "Uplands in April" (1911), "Morning" and "Early Autumn" (1912), "A Thunder Shower," "The End of the Storm," and "Early Springtime" (1913). He is represented in the Metropolitan Museum, New York, by "The Rain," and examples of his work are in the museums of Boston, Pittsburgh, Washington, and Buffalo. The Modern Gallery in Venice possesses his "Maple Tree in Spring." Coffin received various medals and is well known as a writer on art. He was elected a member of the National Academy of Design.

COFFINHAL, kō'fē-näl', Jean Baptiste (1754–94). A French Revolutionist. He was born at Aurillac, Cantal, and after studying medicine and law became a lawyer in Paris. He was president of the Jacobin Club, and in 1792 was appointed justice and vice president of the Revolutionary Tribunal. It is related that when Lavoisier was sentenced to death he said, "The Republic has no need of chemists." Later he became implicated in the fall of Robespierre, whom he attempted to rescue, and although he escaped to the Île des Cygnes, he was betrayed, summoned before the Revolutionary Tribunal, condemned, and executed.

COGALNICEANU, kō-gal-nē-chā-än', Michael (1817–91). A Rumanian statesman and historian. He was born at Jassy and was educated at Lunéville (1834) and Berlin. Upon his return he became one of the most active members of the party agitating for the union of Moldavia and Wallachia into a single Rumanian principality, a party which subsequently supported him faithfully. In 1840 he founded the journal *Dacia Literara*, and somewhat later the powerful unionist organ, *Stena Dunărei*. Upon the establishment of the union under Prince Cusa (1859) he was prominent in national affairs, and as Minister of Public Instruction he founded in 1860 the University of Jassy. Under Charles of Hohenzollern, Cogalniceanu was Minister of the Interior from 1868 to 1870; was Minister of Foreign Affairs at the time of the Russo-Turkish War (1877–78), participating in the Congress of Berlin; again Minister of the Interior in 1879–80, and Minister Plenipotentiary at Paris (1880–81). He distinguished himself by his zeal in the cause of educational, legislative, and political reform.

COGHETTI, kō-gĕt'tē, Francesco (1804–75). An Italian historical and religious painter. He was born at Bergamo, and studied there under Diotti di Castalmaggiore and under Camuccini in Rome, where he settled permanently and was for a number of years president of the Academy of San Luca. He was a close student of Raphael, but although a good colorist and much admired in his day, he was never able to free himself from formalism. He painted many altarpieces and frescoes for churches and palaces in Bergamo, Rome, and Savona, notably "The Exploits of Alexander the Great" and the "Parnassus," in the Villa Torlonia, Rome; "The Four Elements" in the Villa Torlonia at Castel Gandolfo. His frescoes and altarpieces in St. Paul's-without-the-walls, Rome, and frescoes in the Basilica at Savona also deserve especial mention.

COGHLAN, kōg'lan, Charles Francis (1841–99). A comedian, of Irish parentage. He was born in Paris, France, and educated for the bar, but adopted the stage, making his first appearance at the Haymarket, London, in April, 1860. After having been leading man of the Prince of Wales's Theatre, he came to America in the autumn of 1876 and played at the Fifth Avenue Theatre, New York City, under Augustin Daly. He was leading man at the Union Square Theatre during the run of *The Celebrated Case*. He appeared at Wallack's Theatre with his sister, Rose; played engagements with Mrs. Langtry (1885–91); created Alec d'Urberville in Mrs. Fiske's production of *Tess of the d'Urbervilles* (1897), and successfully produced (1898) his *The Royal Box*, a version of Dumas's *Kean*. Among his other plays are: *Lady Baxter*, *A Quiet Rubber*, and *Citizen Pierre*. The last he produced without success in the year of his death, which occurred in Galveston, Tex. Coghlan was one of the most graceful yet forceful of modern actors, equally at home in old English comedy and in modern emotional rôles. Consult Clapp and Edgett, "Players of the Present," in the *Dunlap Society Publications* (New York, 1899).

COGHLAN, Rose (1853–). A British-American actress, sister of Charles Coghlan. She was born at Peterborough, England, and her theatrical career began at the Greenock Theatre, Scotland, where she appeared as one of the witches in *Macbeth*. She was first induced to come to America by E. A. Sothern in 1871 and appeared in burlesque at Wallack's Theatre, New York, during the season of 1872–73. From 1873 to 1877 she was again in England, where she played for a time with Barry Sullivan in *Twelfth Night*, and later with Joseph Jefferson in *Rip Van Winkle*. In 1877 she reappeared at Wallack's; the following year she was the Countess Zicka in the first American presentation of *Diplomacy*. In 1880 she made a great hit as Stephanie in *Forget-Me-Not*. She remained at Wallack's Theatre most of the time till 1888, when she played Lady Teazle in *The*

School for Scandal. Her répertoire there included a wide range of characters, which she acted with great resource of feeling and technique. Since then she has starred and has appeared in several large melodramatic productions. In 1909–10 she was with the New Theatre Company, in 1911 she played in *The First Lady in the Land*, and in 1913 she was in the cast of *Fine Feathers*. Consult: McKay, *Famous American Actors of To-day* (New York, 1896); Strang, *Famous Actresses of the Day in America* (Boston, 1899).

COGHLAN, Timothy Augustine (1856–). An Australian statistician, born and educated in Sydney, New South Wales. In 1884 he became assistant government engineer for rivers and harbors, and in 1886–1905 was government statistician of New South Wales. He served also as registrar of friendly societies (1886–1905), member of the Public Service Board (1896–1900), and chairman of the Board of Old-Age Pensions. In 1905 he went to London as Agent General for New South Wales and representative of the Australian Commonwealth on the Pacific Cable Board. Among his important statistical and descriptive works on Australia are: *Wealth and Progress of New South Wales* (1887 et seq.); *Statistics of the Seven Colonies of Australasia* (1897; 1899); *Childbirth: A Study in Statistics* (1900).

COGIA HASSAN ALHABBAL, kō'gyȧ häs'sȧn ȧl-häb'bȧl. One of the tales of the *Arabian Nights.*

COGIA HOUSSAN, hōōs'sȧn. In *The Arabian Nights*, the captain of the Forty Thieves, detected and slain by Morgiana.

COGNAC, kô'nyȧk' (Lat. *Condate*, Gall. *Condate*, confluence, from *con*, Lat. *cum*, together + *de*, Skt. *dhā*, to place). A town in the Department of Charente, south France, picturesquely situated on an old castle-crowned hill overlooking the river Charente, 31 miles west of Angoulême by rail (Map: France, S., D 3). Cognac is celebrated as the place where the famous Cognac brandy is manufactured, and is the centre of that trade in Charente. Champagne is also made extensively in this district. Francis I was born here in 1494. Pop., 1901, 19,483; 1911, 19,188. Consult L. Ravaz, *Le pays du Cognac.*

COG'NATE (Lat. *cognatus*, cognate, from *co-*, together + *gnatus*, born, from *nasci*, to be born; connected with Gk. *γίγνεσθαι, gignesthai*, Skt. *jan*, to be born). A term applied to relatives of the female branch of a family. It is most commonly employed in the civil (Roman) law and in its technical sense did not come into general use in the English law. In many systems of law cognates rank next after agnates in the inheritance of property. The term is not generally used in the United States. See Agnate; Descent; Inheritance.

COGNIARD, kô'nyär', Charles Théodore (1806–72) and Jean Hippolyte (1807–82). Two French dramatists and theatrical managers. They were brothers, and wrote themselves and in collaboration with other dramatists about 200 fairy plays, vaudevilles, and other light pieces, which were unusually successful. Their first success was *La cocarde tricolore* (1831), which was played nearly 200 times. Between 1845 and 1869 they were directors, either together or separately, of the Porte-Saint-Martin, the Vaudeville, and the Théâtre des Variétés. Among their best-known pieces are: *Le pays latin* (1832); *Le royaume des femmes* (1833); *Les Chauffeurs* (1835); *La fille de l'air* (1837); *La chatte blanche* (1852); *Les bibelots du diable* (1858); *Le pied de Manton* (1860).

COGNIET, kô'nyȧ', Léon (1794–1880). A French historical and portrait painter. He was born in Paris, studied under Guérin and at the Ecole des Beaux-Arts, and won the Prix de Rome in 1817. He first attracted attention with "Marius among the Ruins of Carthage" (1824), now in the Museum of Toulouse. His other important works include "The Massacre of the Innocents" and his masterpiece, "Tintoretto Painting the Portrait of his Dead Daughter" (1845), in the Bordeaux Museum. His portraits include those of Maréchal Maison, Louis Philippe, and M. de Crillon. He decorated several ceilings in the Louvre and the Halle de Godiaque in the Hôtel de Ville, Paris, and a chapel in the church of the Madeleine. At first a Classicist, he early joined the Romantic school. His pictures are fine in composition, but lack creative imagination and are weak in color. He was a noted teacher at the Ecole des Beaux-Arts, Bonnat and Meissonier having been among his pupils.

COGNITION. See Knowledge.

COG'NIZANCE, in legal use commonly kŏn'ĭzans (Lat. *cognitio*, investigation, inquiry, from *con*, with, and *nosco*, know). 1. An old term of the common law signifying legal jurisdiction or an acknowledgment of a fact having legal consequences.

Cognizance of Pleas was jurisdiction of causes, a privilege granted by the King to a city or town to institute a tribunal for the trial of suits. Sometimes such a jurisdiction was conferred to the exclusion of that of the regular tribunals of the kingdom. It was by such a grant that the universities of Oxford and Cambridge acquired their legal jurisdiction. It is in this sense that the expression *claim of cognizance* is used, when one court intervenes to assert jurisdiction over a cause which has been wrongfully instituted in another court. The term is not employed in this special signification in the United States, though it occurs in the general sense of jurisdiction, as in the expression "to take cognizance of a cause of action." See Jurisdiction.

In pleading, cognizance signifies a formal acknowledgment of an act alleged, as in replevin, an acknowledgment of the taking of the goods sought to be recovered; and in the fictitious process known as "levying a fine," an acknowledgment by the defendant that the lands claimed are the property of the claimant. See Fine; Replevin; Pleading.

2. A term in heraldry, used in a loose manner, sometimes to signify a crest (q.v.), and sometimes a badge (q.v.) or other distinguishing mark.

COGNO'MEN (Lat., from *co-*, together + *(g)nomen*, name; connected with Lat. *gnoscere*, Gk. *γιγνώσκειν, gignōskein*, Skt. *jñā*, Ger. *kennen*, Eng. *know*). A term used by the ancient Romans for the name by which a *familia* was distinguished from other *familiæ* of a *gens* (q.v.). A Roman of social position ordinarily had three names; of these the last was his cognomen. In *Marcus Tullius Cicero*, e.g., the first name is the *prænomen*, or personal name; the second the *nomen*, or name of the gens; the third is the *cognomen.*

COG'NOSCEN'TI. See Connoisseur.

COGNO'VIT (Lat., he has acknowledged). A written confession of liability by the defendant in an action authorizing the plaintiff to enter judgment for a specified sum, either absolutely or upon terms as to time of entry or payment. It is given only after the action is begun, and before the defendant has answered or otherwise pleaded, and in this respect differs from a confession of judgment, now used in England and in most of the States of the United States, which is given before the action is commenced, but is about the same in form. As originally used, the cognovit is superseded in almost every jurisdiction to-day by an order of the court entered on consent. It is still in use in some of the States of the United States where the forms of common-law pleading are retained.

COGS'WELL, Joseph Green (1786–1871). An American librarian and bibliographer. He was born in Ipswich, Mass., graduated at Harvard in 1806, and studied law, but preferred to teach, and became a tutor at Harvard in 1814. With George Ticknor he spent two years (1816–18) at the University of Göttingen. In 1820 he was made professor of mineralogy and geology and librarian of Harvard College, and in 1823, with George Bancroft, founded the Round Hill School at Northampton, Mass. He removed to New York, to become editor of the *Review* in that city, in 1836; continued in that work until 1842; became a personal friend of John Jacob Astor, and was appointed one of the trustees of the fund to create the Astor Library. He was, besides, the chief adviser of the philanthropist in planning this library. He became superintendent in 1848 and went abroad to purchase volumes for the collection. He also undertook the preparation of an analytical and alphabetical catalogue of the collection. Consult Ticknor (ed.), *Life of Joseph Green Cogswell, as Sketched in his Letters* (Cambridge, Mass., 1874).

COGSWELL, Mason Fitch (1761–1830). An American physician, adopted son of Samuel Huntington, President of the Continental Congress. He was born in Connecticut, graduated at Yale in 1780, and settled in Hartford, where he was instrumental in establishing the first asylum for the deaf and dumb in America. He was also a founder of the Connecticut Retreat for the Insane at Hartford and introduced into America the methods of removing a cataract from the eye and of tying the carotid artery (1803).

COGWHEEL. See Gear Wheel.

COHABITA'TION (from Lat. *cohabitatio,* from *cohabitare,* to dwell together, from *co-,* together + *habitare,* to dwell). The act of a man and woman in living together as husband and wife. Cohabitation does not necessarily involve the notion of sexual intercourse, and in a strict legal sense, as applied to husband and wife, may mean only *consortium,* and not *concubitus;* but the term is commonly held, even in law, to carry with it the latter implication, and this is always so where the parties are unmarried. It raises a legal presumption of marriage between the parties cohabiting, which may, however, be rebutted by other evidence. See Marriage, and the authorities there referred to.

COHAN, George Michael (1878–). An American comedian and playwright, born in Providence, R. I. He first appeared on the stage when nine years old in *Daniel Boone;* later "The Four Cohans" became one of the most popular attractions on the vaudeville stage. Between 1899 and 1914 George M. Cohan wrote and produced a large number of musical comedies and plays, in several of which he himself took leading parts. The list includes: *Little Johnny Jones, The Governor's Son, Forty-five Minutes from Broadway, George Washington, Jr., The Yankee Prince, Get-Rich-Quick Wallingford, The Little Millionaire, Broadway Jones,* and *Seven Keys to Baldpate.* All these plays were very popular, and while not pretentious, had the merit of wholesomeness. Cohan had control of several theatres in New York City until February, 1914, when he retired from business to devote himself to writing and composing.

COHEN, kō'en, Emil (1842–1905). A German mineralogist, born in Jutland. He studied in the universities of Berlin and Heidelberg and from 1867 to 1872 was assistant in mineralogy in the latter university. He then spent a year and a half in South Africa and, after devoting the following years to mineralogical studies and to the preparation of works descriptive of his African explorations, became professor of petrography in Strassburg in 1878. In 1885 he was made professor of mineralogy in Greifswald. His published works include the following: *Geognostisch-petrographische Skizzen aus Südafrika* (1874); *Erläuternde Bemerkungen zu der Routenkarte einer Reise von Lydenburg nach den Goldfeldern und von Lydenburg nach der Delagoabai im östlichen Südafrika* (1875); *Sammlung von Mikrophotographien zur Veranschaulichung der mikroskopischen Struktur von Mineralien und Gesteinen* (1881–83; 3d ed., 1899); *Meteoritenkunde* (2d ed., 1903).

COHEN, Henri (1808–80). A French numismatist and musician, born at Amsterdam, Holland. For a number of years he was curator of the numismatic collection in the National Library in Paris. He wrote the valuable *Description générale des monnaies de la république romaine* (1857) and *Description historique des monnaies frappées sous l'empire romain* (7 vols., 1859–68; 2d ed., prepared by Feuardent, 1880 et seq.). He also wrote an excellent *Guide de l'amateur de livres à vignettes du XVIIIe siècle* (1870; 5th ed., 1886), and was known as a composer and writer on the theory of music.

COHEN, Henry (1863–). An American rabbi, born in London. He was ordained rabbi in 1884, and was pastor at Kingston, Jamaica (1884–85), Woodville, Miss. (1885–88), and Galveston, Tex. (1888–). His publications include *Six Hundred Talmudic Sayings* (1894; 2d ed., 1910) and a translation from the German of Nahida Remy, *Prayer in Bible and Talmud* (1894; 2d ed., 1910).

COHEN, Hermann (1842–1918). A German philosopher, born at Koswig, and educated at Breslau, Berlin, and Halle. In 1875 he became professor at Marburg. As one of the leaders of the Neo-Kantian movement (see Neo-Kantianism), he did perhaps as much as any other follower of Kant to make the Critical Philosophy better known to students. This he has accomplished by banishing the "thing-in-itself" from his system and bringing philosophy into closer connection with the sciences. His contributions to the interpretation of Kant's writings are of permanent value. His works include *Kant's Theorie der Erfahrung* (1871; 2d ed., 1895), which led to the modification of Lange's previously published views of Kant;

Kant's Begründung der Ethik (1877); *Platon's Ideenlehre und die Mathematik* (1879); *Ein Bekenntniss und die Judenfrage* (1880); *Die Nächstenliebe im Talmud* (1884); *Kant's Begründung der Aesthetik* (1889); *System der Philosophie* (1902–06); the 5th–7th eds. of Lange's *Geschichte des Materialismus; Kommentar zu Kants Kritik* (1907); *Religion und Settlichkeit* (1907). Consult Cassirer, in *Kantstudien*, vol. xvii (1912), and *Philosophische Abhandlungen, H. Cohen zum yosten Geburtstag dargebracht* (Berlin, 1912).

COHEN, Jacob (da Silva) Solis (1838–). An American physician, born in New York City, brother of Solomon Solis Cohen. He was educated at the University of Pennsylvania. In 1861, at the outbreak of the Civil War, he became assistant surgeon of the Twenty-sixth Pennsylvania Regiment, and later he was assistant surgeon with Dupont's expedition to Port Royal and with the South Atlantic blockading squadron; from 1864 to the close of the war he served in the army hospitals in Philadelphia. There after 1866 he practiced his profession, giving special attention to diseases of the throat and chest. He also accepted a professorship in the Philadelphia Polyclinic and College for Graduates in Medicine. His publications include: *Inhalation: Its Therapeutics and Practice* (1867; 2d ed., 1876); *Diseases of the Throat* (1872; 2d ed., 1879); *The Throat and the Voice* (1879).

COHEN, Julius Berend (1859–). An English chemist, born at Manchester. He was educated at Owens College, Manchester, and at the University of Munich. From 1884 to 1890 he was demonstrator in chemistry at Victoria University, Manchester, and from 1890 to 1904 was lecturer on organic chemistry at the Yorkshire College. In the latter year he became professor of organic chemistry at the University of Leeds. Besides a number of researches his publications include: *Theoretical Organic Chemistry* (1902); *Practical Organic Chemistry* (1910); *Organic Chemistry for Advanced Students* (2 vols., 1907–13); *Organic Chemistry* (1912); *Smoke: A Study of Town Air* (1912).

COHEN, Katherine M. (1859–1914). An American sculptor and painter. She was born in Philadelphia and studied at the Pennsylvania and New York academies of design under Boyle and Saint-Gaudens, and also in Paris under Mercié and Puech. She is best known for her reliefs and decorative figures of half-legendary personages, such as "Priscilla," "Romola," and "Rabbi-Ben-Ezra." An heroic figure, "The Israelite," was exhibited in the Paris Salon of 1896, and one of her most important works, the statue of General Beaver for the Smith Memorial, is in Fairmount Park, Philadelphia. Among her portrait busts are those of Mayor Sulzberger and Lucien Moss. She is also known as a painter of figures, landscapes, and miniatures. Her work is imaginative and shows delicacy of treatment.

COHEN, Solomon Solis (1857–). An American physician, born in Philadelphia, brother of Jacob (da Silva) Solis Cohen. He was educated at Jefferson Medical College, where he served as lecturer on clinical medicine from 1888 to 1902, and thereafter as professor. From 1887 to 1902 he was also professor of clinical medicine and therapeutics at the Philadelphia Polyclinic and College for Graduates in Medicine; and in 1890–92 he lectured on therapeutics at the Dartmouth Summer School. He was recorder of the Association of American Physicians from 1902 to 1913. He served as physician to the Philadelphia General, Jefferson, Rush, and Jewish hospitals, edited *System of Physiologic Therapeutics* (11 vols., 1901–05), and was for a time editor of the *Philadelphia Polyclinic* and coeditor of the *American Hebrew*. His publications also include: *Therapeutics of Tuberculosis* (1891); *Essentials of Diagnosis* (1892; 2d ed., 1900); *The True Rôle of Drugs in the Management of Tuberculosis* (1901).

COHERER (from *cohere*, from Lat. *cohærere*, to cling together, from *co-*, together + *hærere*, to cling). An instrument invented in 1890 by Professor Branly, of Paris, for the detection of so-called "electrical waves," i.e., of waves in the ether produced by electrical oscillations. (The principle of this action had been discovered before by Munk, Varley, and Calzecchi-Onesti.) The coherer was carefully studied by Lodge in England in 1894 to detect the existence of electric waves created by a spark discharge and by Popoff in Russia in 1896 in investigations on atmospheric electricity. Marconi then adopted the instrument for use in wireless telegraphy, and in an improved form it figured in his patent specifications. It consists essentially of a tube containing minute filings of some metal, into each end of which a wire enters for a sufficient distance. It has been observed that under ordinary conditions such a tube does not allow an electric current to pass; but, if electrical waves fall upon it, a current can be passed most easily, thus affording a simple means of telling when electrical waves are passing. One explanation is that, when put in the tube loosely, the filings do not make electrical connection, owing to thin surface layers of condensed gases, etc.; but under the action of the electrical waves these layers are cleaned off, possibly by minute sparks passing between the filings, and thus establishing metallic connection through the tube. If, after the waves have passed, the tube is tapped forcibly, the filings are knocked apart, and the tube again becomes a nonconductor. The metals whose filings are used ordinarily are silver and nickel. Others might be used, but it has been shown that with some substances the electrical resistance is increased by the waves, not decreased. Consult Fleming, *An Elementary Manual of Wireless Telegraphy and Wireless Telephony* (London, 1908); id., *The Principles of Electric Wave Telegraphy and Telephony* (ib., 1910); Moncton, *Radio-Telegraphy* (New York, 1908). See Wireless Telegraphy.

COHE'SION (Fr. *cohésion*, It. *coesione*, from Lat. *cohærere*, to cling together). The name given to that property of matter observed when two portions of the same matter are brought closely into contact; thus one speaks of the cohesion of water, meaning the forces manifest at any point in water owing to the mutual action of the molecules. Sometimes the word is used to express the phenomenon observed when two pieces of a solid are stuck together, such as two pieces of glass, two pieces of lead, etc. The forces of cohesion in a liquid are greatly affected by having substances dissolved in it, and, in short, by anything which affects the molecules or their arrangements.

COHN, Adolphe (1851–). An American educator, born in Paris and educated at the University of Paris. He served in the Franco-

Prussian War, studied law in Paris, and in 1875 came to the United States. In 1882 he became tutor in French at Columbia University, where, after teaching French at Harvard in 1884–91, he became professor of Romance languages and literatures. He edited many French textbooks and, with Curtis Hidden Page, a series called *French Classics for English Readers*, and delivered the lecture on French literature in the Columbia University *Lectures on Literature* (1911). He contributed to the first edition of the NEW INTERNATIONAL ENCYCLOPÆDIA.

COHN, kōn, FERDINAND JULIUS (1828–98). A German botanist, born at Breslau. He studied at the universities of Berlin and Breslau, became connected with the latter institution in 1850, and was made full professor there in 1871. His investigations concerned chiefly the physiology and morphology of plants, to our knowledge of which he made numerous contributions of the highest importance. He is best known for his careful studies of the life histories of the lowest forms of plant life, of great service in promoting bacteriology. He also studied insect-killing fungi and germ-caused diseases, and made a microscopic analysis of water. Besides a number of papers on special topics of his science, his published works include the following: *Zur Naturgeschichte des Protococcus pluvialis* (1850); *Untersuchungen über die Entwickelungsgeschichte der mikroskopischen Algen und Pilze* (1853); *Die Wunder des Blutes* (1854); *Anthrax* (1876); *Neue Untersuchungen über Bakterien* (1872–75); *Die Pflanze Vorträge aus dem Gebiete der Botanik* (2d ed., 1895–97). He also edited the *Beiträge zur Biologie der Pflanzen* and the *Kryptogamenflora Schlesiens*. One of his best-known contributions to science was the demonstration that bacteria are plants. Consult Pauline Cohn, *Ferdinand Cohn, Blätter der Erinnerung* (Breslau, 1901).

COHN, GUSTAV (1840–). A German economist. He was born at Marienwerder and studied at Berlin and Jena. His tour through England in 1873 gave him the materials for his work, *Untersuchungen über die englische Eisenbahnpolitik* (1874). In 1884 he became professor of political science at Göttingen and in 1892 was a member of the Imperial Commission to investigate the affairs and regulations of the Stock Exchange. His works include: *System der Nationalökonomie* (1885 and 1898; Eng. trans. in the *Economic Studies* of Chicago University); *Zur Geschichte und Politik des Verkehrswesens* (1900); *Zur Politik des deutschen Finanz-Verkehrs- und Verwaltungswesens* (1905); *The Science of Finance* (trans. by T. B. Veblen, 1895); *Ueber die staatswissenschaftliche Vorbildung zum höhern Verwaltungsdienst in Preussen* (1900).

COHNHEIM, kōn'hīm, JULIUS FRIEDRICH (1839–84). A German pathologist, born at Demmin in Pomerania. After studying medicine at several universities, including those of Berlin and Würzburg, he became connected with the pathological institute of the Charité, Berlin. In 1868 he was made professor of pathology at Kiel, from 1872 to 1878 was professor at Breslau, and during the last years of his life held a similar position at Leipzig. His published works include the following: *Untersuchungen über die embolischen Prozesse* (1872); *Neue Untersuchungen über die Entzündung* (1873); *Vorlesungen über allgemeine Pathologie* (1877–80); *Die Tuberkulose vom Standpunkte der Infektionslehre* (1881). Cohnheim was the first to demonstrate that pus consists largely of white blood corpuscles, thus throwing much light on the nature of inflammations. Consult: Ponfick, *Gedächtnisrede auf Cohnheim* (Breslau, 1884); also, Kühne's biographical sketch published with the *Gesammelte Abhandlungen von J. F. Cohnheim* (Breslau, 1885).

CO'HO (American Indian). A local name in Alaska for the silver salmon (*Oncorhynchus kisutch*, or *millstschitsch*). See SALMON.

COHOES, kō-hōz'. A city in Albany Co., N. Y., 9 miles (direct) north of Albany; at the junction of the Mohawk and Hudson rivers, and on the Delaware and Hudson and the New York Central railroads (Map: New York, G 5). The Erie and Champlain canals also pass through the city, uniting a short distance to the south. In this section of the Erie Canal there are several locks which lift the boats from the lower level of the Hudson valley to that above the Mohawk Falls. The city is furnished with abundant water power by the Mohawk, here crossed by a long railroad bridge affording a fine view of the falls, which are 75 feet high and 900 feet wide. A dam above the falls stores the water which is supplied by canals to the mills and factories. Cohoes is noted as a manufacturing centre, its industries including large cotton, woolen, and knitting mills, axe factories, rolling mills, iron foundries, machine shops, furniture, soap, paper-board, sash and door, and shirt and collar factories. Cohoes was for many years a part of the Rensselaer Manor. Its first settlers were Dutch and probably came as early as 1630. It was incorporated as a village in 1848 and in 1870 was chartered as a city. The water works are owned by the municipality. Pop., 1900, 23,910; 1910, 24,709; 1920, 22,987.

CO'HORT (Lat. *cohors*, originally meaning inclosure, connected with Gk. *χορτός*, *chortos*, garden, OIr. *gort*, sedge, Ger. *Garten*, garden, AS. *geard*, Eng. *yard*). A portion of a legion in the ancient Roman armies. Usually there were 600 men to a cohort, and 10 cohorts to a legion (q.v.). (See CENTURION.) The term *Prætoria Cohors* sometimes denoted, under the Republic, the suite of the governor of a province; under the Empire it designated the famous Prætorian Guard, bodyguard of the Emperor, which had so much to do with the making and unmaking of Roman emperors.

CO'HOSH. The American Indian name of black snakeroot (*Cimicifuga racemosa*). It occurs in the United States from Maine to Wisconsin and south to Florida. The rhizomes, which are employed in medicine, contain resin, wax, tannin, and a crystalline principle. Alterative, sedative, and emmenagogue properties are attributed to it. See Plate with article SANGUINARIA.

COIF (from OF. *coife*, Fr. *coiffe*, It. *cuffia*, from ML. *cofia*, coif, from OHG. *chuppa*, cap under the helmet, from *chuph*, Ger. *Kopf;* connected with AS. *cuppe*, Eng. *cup*). 1. Originally a covering for the head, worn by both men and women; later a sort of skullcap, especially the one worn by English serjeants at law. The old idea that the coif was intended to conceal the ecclesiastical tonsure has no foundation. The origin of the legal coif was a black skullcap worn on top of the white coif; when the wigs came into fashion, the coif became the black patch with a white edge, worn on top of the

wig; this is the form used by English serjeants at law.

2. In the armor of the Middle Ages, a defensive hood, usually surmounted by a helmet, sometimes continuous with the hauberk and sometimes separate. Consult Pulling, *Order of the Coif* (London, 1897).

COIMBATORE, kō-īm'bà-tōr', or **KOIMBATUR**, kō-īm'bà-tōōr' (Telugu, also *Koiampadi, Koibmutur, Koiamuturu*). A city in Madras, British India, capital of the district of the same name, situated near the left bank of the Noyil, a tributary of the Kavery (Map: India, C 6). It lies 305 miles by rail southwest of Madras, and is situated 1483 feet above sea level. It is cool and healthful, but the adjacent plains are malarious. It is the seat of French, English, and German missions, and is the educational centre of the district, with Coimbatore and St. Michael's colleges and a college of agriculture. Convicts numbering 1340 are engaged in weaving cotton fabrics; its other chief products are yarn, leather, coffee, sugar, spirits, and saltpetre. The suburban Pagoda of Perur is an important archæological structure. Pop., 1891, 46,400; 1901, 53,080; 1911, 47,007.

COIMBRA, kō-ēm'brà. A city of Portugal, capital of a district of the same name, in Beira, picturesquely situated, partly on a steep rock and partly in a plain, amid vineyards and orange orchards, on the right bank of the river Mondego, 110 miles north-northeast of Lisbon (Map: Portugal, A 2). The upper town is badly built, its streets being steep, narrow, and dirty. Of the public buildings, the most noteworthy are the cathedral, the churches of São Francisco and São Salvador, and the convents of Santa Cruz and Santa Clara. There is here a fine aqueduct of 21 arches, which dates from the sixteenth century. The famous University of Coimbra (q.v.) is the oldest university in Portugal. Coimbra has manufactures of linen, woolen, earthenware, and combs. Pop., 1900, 18,424. The city Coimbra occupies the site of the Roman Æminium, according to a fourth-century Latin inscription, but the name was transferred in the ninth century with the transferal of the bishopric from the neighboring town of Condeixa, which had been called till then Conimbriga, or Conembrica. In 1064 it was taken from the Moors by Ferdinand I, and for 250 years (1129–1383) was the capital of Portugal. It was the scene of prolonged fighting between Masséna and Wellington in the campaigns of 1810 and 1811.

COIMBRA, UNIVERSITY OF. A national university of Portugal and, until the foundation of the University of Lisbon, in 1910, the only university in that kingdom. With some 1400 students in law, medicine, mathematics, and philosophy, its library, hospitals, observatory, museums, and laboratories, it is an institution of great national importance. Its history is long and checkered. Founded about 1290 by the poet king, Diniz, at Lisbon, a supplementary charter was issued in 1308, transferring it, because of dissensions between town and gown, to Coimbra, the first of a long series of migrations which make it unique among universities. From 1308 to 1380 it vibrated between Coimbra and Lisbon, in the latter year being settled at Lisbon. In 1537 it migrated again to Coimbra, where it has since remained. It was at the beginning of this last period that it reckoned Camoëns (see CAMÕES) among its members. Alone among continental universities to-day, it preserves the mediæval academic dress; and in this, as in its architecture, traditions, and customs, it finds its only rivals in picturesque interest in Oxford and Cambridge. Consult Braga, *Historia da Universidade de Coimbra* (Lisbon, 1892).

COIN'AGE (from Eng., OF. *coin*, wedge, piece of money, from Lat. *cuneus*, wedge; connected with Gk. *κῶνος, kōnos*, cone, Skt. *śāna*, whetstone, from *śā*, to sharpen). Coins are pieces of metal designed to circulate as money, whose weight and fineness are certified by the impressions they bear. These impressions are the symbols of the authority by whose orders the coins are issued, but they also bear an important function in maintaining the integrity of the coin. To insure constancy in the weight of the coin it is necessary to protect it against clipping and against unnecessary wear and tear, or abrasion. The form of the coin is, in itself, a guaranty. Convenience of carriage, as well as greater durability, has given the preference to a rounded, generally a circular, coin over other shapes. Where, as in Japan, we find oblong coins, the corners are generally rounded off. The symmetry of outline guarantees the coin. This is heightened by milling the edges. Raised inscriptions served the same purpose and do so better than incised letters, which are also used. The design upon the face of the coin is usually protected by raised edges, which project as much as the highest part of the design.

The importance of these features of modern coins in maintaining intact the weight of the coin by showing at once any attempted clipping, and by preventing the wearing off of surfaces by use, can best be appreciated by comparing them with the crude, irregular disks from which early coins were made, and the high relief of many of the designs upon them.

Gold and silver were used in settling accounts before coins were invented, but scales were a necessary adjunct of such transactions. Just as gold dust is weighed in the mining regions, so all exchanges effected by the metals before the introduction of coinage involved weighing the metal used. The prevalence of exchange by weight is reflected in the correspondence, at least in their origin, between coins and measures of weight. To go back no further than the origin of English money, it is sufficient to recall that the monetary pound was once a pound weight of silver. This system was derived from the money of Charles the Great, and while in the subsequent development they departed widely from the original source, the monetary systems of modern Europe all trace back to the pound of silver.

The invention of coins, which in classical antiquity seem to have been first used in Lydia, did away in a measure with the necessity of weighing. In the multiplicity of Grecian states coins were numerous, and while this was removed by the Roman Empire, it reappeared with the breaking up of the Empire of Charles the Great. Not only did each nation make its own coins, but, with the disintegration of central authority, nobles and cities usurped this right or had it conferred upon them by feeble monarchs. The multiplicity of coins restricted the area within which they were current. Outside of such areas they had no legal validity; they did not pass by count, but, if at all, only by weight. Certain coins, however, bore such an excellent reputation for uniformity and excel-

lence of workmanship that they acquired an international circulation and passed generally by count or tale. As modern centralized states became strongly rooted, a unification of the coinage took place, and the numerous units disappeared. Improvements in the processes of coinage have made effective the certification of weight and fineness which coinage implies.

The right to coin money is a prerogative of the state and one of the foremost marks of sovereignty. The circulation of coins rests, in the first instance, upon the authority of the state, but that authority must be exercised in good faith. Coinage issued by individuals would lack authority and lack also the guaranty of good faith. There have been occasions of great dearth of money where private persons have issued coins. Such issues are known as tokens and gain circulation either from their similarity to legal coins or from the promise of redeeming them. Their total lack of uniformity gives a picture of what might be expected were the issue of coins left wholly to private initiative. Almost equally obvious is the necessity for the manufacture by the state of the coins which it issues. To delegate the manufacture of its coins to a private establishment, as was done in France before 1879, requires such a minute control of all its operations by state officials that the plan has generally been abandoned. The greater integrity of a national mint over a private enterprise is further illustrated by the fact that the mints of the leading nations are frequently called upon to execute the coinage for smaller states which have no mints of their own. Thus, in 1901, the United States Mint executed a gold coinage for Costa Rica.

The metallic circulation of a country usually consists of standard coins and token coins, with respect to whose issue different rules prevail. The first are those of the standard monetary metal, and their coinage is usually free. This means that such coins are freely issued to individuals who bring bullion to the mint for coinage. There may be a coinage charge or this transformation may be made gratuitously by the state. Gratuitous coinage, which prevails in England and the United States, is favored because it promotes the transformation of bullion into coin to meet the demands of trade. A coinage charge, as in France (7 francs 44 centimes per kilogram of gold, or 3437 francs), is justified on the ground that the value of the coin is greater than that of the bullion by the cost of production; and, further, that the policy of the government should be to give reasonable ease to the transformation, but not to favor a constant oscillation between coin and bullion. The English language knows but one name, seigniorage, for such coinage charges, whether they merely cover the cost of coinage (Fr. *brassage*) or are high enough to involve a profit. High seigniorage charges upon the standard money metal defeat the purposes of free coinage and are no longer customary. See SEIGNIORAGE.

Token coins are those whose metallic value is less than their nominal value. As such coinage involves a profit to the state, the state reserves the right of issue to itself. (See MONEY for an exposition of the principles of such issues.) In the United States this applies to the silver, nickel, and bronze coins. The metallic value of the coin is no protection against its unauthorized issue by individuals, but this protection is secured by the laws punishing counterfeiting. The processes of manufacturing a good counterfeit are so complex and require such heavy machinery that the secret manufacture can hardly escape detection.

Important considerations in coinage legislation, apart from the larger monetary aspects, are to secure uniformity in the coin at its manufacture and to maintain the integrity of the coin in circulation. Absolute accuracy in weight and fineness for every coin issued is out of the question. The law therefore allows, in the manufacture of coin, a certain tolerance both of weight and fineness. Variations within these limits, over or under the standard fixed by the law, do not disqualify the piece from issue. In former days these limits were often set quite wide, and by systematically getting under rather than over the average, considerable profits were stolen from the coinage. This was one of the abuses of the old régime in France which awakened the ire of the legislators of the Revolution when they took the reform of the coinage in hand. It should of course be the object to make these limits as narrow as possible, with the idea that the deviations, one side or the other, should balance, so that for the mass of the coinage the legally established standard should prevail. In the United States the standard fineness for both gold and silver is 900, and no gold ingot showing a greater deviation than one-thousandth, or silver ingot with a greater deviation than three-thousandths, can be used in coinage. As to weight, the rule for single pieces prohibits deviations of more than one-half a grain for the double eagle (516 grains legal weight) or eagle, or more than a quarter of a grain for the half eagle. The law also provides that in "weighing a number of pieces together, when delivered by the coiner to the superintendent, and by the superintendent to the depositor, the deviation from the standard weight shall not exceed one-hundredth of an ounce in $5000 in double eagles, eagles, and half eagles."

Every effort is made, by watching the process of manufacture, to insure the observance of these rules. Trial pieces of every lot of coin which passes through the mints must be reserved. Once a year an Assay Commission is appointed for the examination of these sample pieces, which are both weighed and assayed. The accuracy of the work of the United States mints is shown by the report of the Assay Commission for 1901 that the fineness of gold coins varied from 899.5 to 900.2, the legal limits being 899 to 901, while that of silver coins varied from 898.2 to 900.9, the legal limits being 897 to 903.

In the circulation of coins from hand to hand, the friction gradually wears the impressions off and reduces the weight of the coin. It is, therefore, customary for coinage legislation to determine the point at which the coin loses its legal validity. In the United States gold coins which have lost more than one-half of 1 per cent of their weight in 20 years from date of issue, or proportional amounts for less periods, are legal tender only by weight. All such coins received by the government must be recoined. The depreciation of coins by abrasion has, in earlier times, been a serious problem. By a familiar monetary law (Gresham's Law) full-weight money is always preferred for export, while the worn coin remains at home. If the home circulation is much worn, there is a great temptation to "sweat" all the new coins which come

from the mint for the profit of the transaction. Hence the necessity from time to time of general recoinage of the money in circulation. The government calls in all outstanding coins of certain dates and replaces them with new coins, declaring, moreover, that after a certain date the coins not presented shall lose their legal-tender quality.

In England, coining, although a prerogative of the crown, is regulated by Parliament. By the Constitution of the United States the power of coining money, regulating the value thereof, and of foreign coin is granted to Congress, and the several States are prohibited from coining money as well as from making anything but gold and silver coin a tender in payment of debts. The uttering of spurious coin, therefore, is a crime against the United States. It is also punishable by a State government as a cheat. Coin has been judicially defined as "a piece of metal stamped and made legally current as money." A counterfeit coin is one made falsely in imitation of the genuine, and intended to resemble or to pass for it. The mutilation or debasement of United States coin, as well as the fraudulent importation or use of spurious foreign coin, is a crime under Federal statutes. See COUNTERFEITING.

COIR (Tamil *kayiru*, cord), or COCONUT FIBRE. The fibre of the husk of the coconut palm. Coir is a corruption of a word meaning "rope." Its manufacture is an important industry, both in England and America. The fibre of the husk is divided into two classes—the ordinary fibre converted directly into mats, and the so-called brush fibre, which lies just under the skin. The latter is packed under great pressure and then shipped to the manufacturer. It is spun by special machinery and produces a perfectly cabled yarn, which is woven into doormats or ordinary yard matting. In 1913 the coir yarn imported into the United States amounted to 7,322,314 pounds, valued at $312,049. The refuse from coir is used for stuffing mattresses, and also in horticulture as a protection against insects for vines and young trees.

COIRE, kwēr. See CHUR.

COIT, JAMES MILNOR (1845–). An American teacher, born at Harrisburg, Pa. He received his education at Hobart College and was connected for some time with the Cleveland Tube Works. In 1876 he became master in natural sciences at St. Paul's School, Concord, N. H., of which school he was appointed vice rector in 1904. He engaged in research work at the University of Munich in 1909, and later became head of the Coit School for American boys in Munich. His publications include the following works: *A Manual of Chemical Arithmetic* (1886); *Treatise on the X-Rays and their Relation to Medical and Surgical Sciences* (1897); *Liquid Air* (1899).

COIT, STANTON (1857–). An American leader in the Ethical Culture movement, especially in England. He was born in Columbus, Ohio; studied at Amherst, at Columbia, and at Berlin, where he took the degree of Ph.D.; was head worker of the New York University Settlement, and became an *aide* of Felix Adler in the Society for Ethical Culture. In 1888 he went to London as minister of the South Place Ethical Society. He became president of the West London Ethical Society, preached in the Queen's Road (Bayswater) Ethical Church, and in 1910 was a Labor candidate for Parliament from Wakefield. He was editor of the *International Journal of Ethics* in 1893–1905; did much for the organization of the English ethical societies, especially in compiling *The Message of Man: A Book of Ethical Scriptures* (1902), an *Ethical Hymn Book* (1905), *Responsive Services* (1911), and *Social Worship* (1913); and wrote translations of Gizycki's works on ethics. He published: *Die ethische Bewegung in der Religion* (1890); *National Idealism and a State Church* (1907); *National Idealism and the Book of Common Prayer* (1908); *Woman in Church and State* (1910); *The Soul of America* (1913). See SOCIETIES FOR ETHICAL CULTURE.

COI'TER, VOLCHER (1534–90). A Dutch anatomist, born at Groningen. He studied in France and Italy, where he heard the lectures of Fallopius at Pisa, was city physician of Nuremberg, and later was attached as surgeon to the army of Johann Kasimir, Count Palatine of the Rhine. He is considered one of the founders of the science of pathological anatomy. Numerous anatomical discoveries are credited to him, including that of the superior muscles of the nose. His studies in osteology and myology are partially set forth in the volumes *Tabulæ Externarum et Internarum Humani Corporis Partium* (1573) and *Lectiones Gabrielis Fallopii* (1575), which are also interesting as revealing one of the earliest attempts at an examination of the internal structure of birds. Indeed, his table, *De Differentiis Avium*, included in the latter, is among the first ornithological classifications.

COJUTEPEQUE, kō-hoo'tā-pā'kā. The capital of the Department of Cuscatlán, Salvador, about 20 miles east by north of San Salvador (Map: Central America, C 4). It is situated north of the volcano Cojutepeque and near Lake Ilopango. The city has considerable transit trade. Cojutepeque, for a few years after 1854, when San Salvador was destroyed by an earthquake, was the capital of the republic. Pop., about 10,000.

COKE (probably connected with *cake*). A hard, brittle, porous solid, of a blackish-gray color and more or less metallic lustre. It does not soil the fingers when rubbed and gives no smoke when burning. It absorbs moisture from the air to a very great extent. In general, the operation of making coke consists of expelling by heat the volatile elements of bituminous coal. The residue resulting consists chiefly of carbon, mixed with varying amounts of ash containing sulphur and phosphorus, and is known as coke. In the manufacture of illuminating gas coke is produced as a by-product (see GAS, ILLUMINATING); but this method is inadequate to produce the requisite quality and amount, and the manufacture of coke is itself an industry of great and rapidly increasing importance. Coke, charcoal, and anthracite coal are the fuels most used in metallurgy, and of these coke possesses the advantages and is without the disadvantages of the other two. Its hardness enables it to sustain the weight of furnace charges, and its porosity helps to make it readily combustible. Charcoal is too soft, while anthracite coal, which is in reality a natural coke, is hard enough, but is so dense in structure that its combustion is slow and its calo-

rific energy moderate. The superiority of coke is due to its cellular structure. The walls are hard and vitreous, and the tiny passages between afford free course for the oxidizing gases of the blast furnace. Besides its use in metallurgy, coke is an important fuel in other industrial operations, especially in cities where the emission of smoke from the combustion of bituminous coal is prohibited. It is also adapted for the use of locomotives. In 1899 the Boston and Maine Railroad began using coke as a fuel. Its advantages are that it is smokeless and does not produce sparks, thus decreasing the number of fires caused by the locomotives. Coke is also employed as a filtering material in water and sewage purification, being used extensively for the latter purpose, particularly in English practice.

Not all bituminous coals can be made into coke, and much experiment and research on the part of chemists have been devoted to ascertaining the necessary constituents of a good coking coal. It appears that the coking property of coal is independent of the constituents, such as moisture, fixed carbon, ash, and sulphur, which it contains, and depends wholly upon the relations and volumes of the elements composing the *volatile combustible* matters of the coal. Just what these relations and volumes are has not been definitely shown. In continental Europe, where the manufacture of coke has been very highly developed, only a poor quality of coal is available, and much ingenuity has been expended in constructing furnaces suitable for this inferior grade of material. In America there has been as yet an abundant supply of coal of the very best quality for coking purposes, the supply having been drawn chiefly from the Connellsville coal of Pennsylvania, that from the Warrior basin coal beds of Alabama, the Flat Top-Tug River district, and other mines of West Virginia, and the Pocahontas coal of Virginia. But, with the increasing demand for coke for metallurgical and other purposes, poorer grades of coking coal must be drawn upon.

The preliminary preparation of coal for the manufacture of coke is chiefly a cleansing and separating process. Some of the best coking coal requires no special treatment, but is charged into the coke ovens direct from the mines. It is usually found advantageous, however, to break up the coal into small pieces, in order that the volatile matter may be utilized to the utmost extent. When the coal is not uniform in size, it is found that it cokes unevenly, the finer portion fusing much more rapidly. When there is much slate in the coal, it is necessary to wash it; the slate separating itself from the coal in the process of washing, on account of its greater weight. Fire clay also will be separated and washed out. Before washing, however, it is necessary carefully to sort the coal according to size. Various machines of great efficiency have been devised for crushing, sorting, and washing coal ready for the ovens, which are described in great detail, as are also the different forms of coke ovens, by John Fulton in his *Treatise on the Manufacture of Coke* (Scranton, Pa., 1905). Three general methods have been followed in the process of transforming coal into coke. The first was the primitive and wasteful process, borrowed from the charcoal burners, of *open-air burning*. The coal is simply piled in a rectangular heap on the ground, with longitudinal and vertical flues running through it, in which enough wood is placed to ignite the whole mass of coal. The fire is lighted at the base of the vertical flues and gradually extends through the mass. When the mass ceases to flame, it indicates that the gaseous matter has been expelled, and the fire is partially smothered by covering the heap with fine dust. Last of all, the mass is sprinkled with a hose, the water being at once converted into steam, which permeates the whole mass. This process is called *coking in heaps* and requires from five to eight days.

The second method of making coke, and one which is still largely employed, is in the *beehive oven*, many improvements in its construction having been made from time to time. As late as 1893 all of the 44,201 coke ovens in the United States were constructed on the beehive plan. The chief advantage claimed for it is that it produces from prime coking coals the best quality of metallurgical fuel. A minor advantage is that water is applied to cool it, while the coke is still in the oven, after which the oven heat reduces the amount of moisture in the coke. The great disadvantage of the beehive oven is that, as ordinarily constructed, the valuable by-products—gas, ammonia, and tar—contained in the volatile matter are entirely lost, though in rare instances the burning gases are used to generate heat, light, and power. This oven is not adapted to inferior grades of coal. It derives its name from the dome shape of its interior. It is usually built of stone masonry, on a firm foundation, with its interior lined with specially designed fire brick. The beehive oven is usually about 12 feet in diameter and 6 to 7 feet high in the centre. The coal is charged through a hole in the centre of the roof and is leveled off to an even depth of about 23 inches. The fresh charge is fired by the heat remaining in the walls from the previous charge, and the combustion is supported by air admitted through the front door, over the top of the charge. The volatile matter in the coal is driven off by the heat and burned in the top of the oven, along with a portion of the fixed carbon. The source of heat being at the top, the coking process proceeds downward and is effected by the partial combustion of the charge itself. In England, and in a few American plants, the volatile matter is gathered into a conduit, carried under boilers and burned, to raise steam for pumping water and other purposes; but usually the gases escape directly into the open air and are wasted.

A recent type of oven is rectangular instead of circular in form and so built that the coke may be pushed instead of drawn from the coking chambers. The beehive oven with the partial combustion method has long since been abandoned in Belgium and Germany, and coke is made in retorts as outlined below, where various valuable by-products are saved, and an increased yield amounting to about 15 per cent is obtained.

As early as 1766 attempts were made in Germany to save the by-products from coke ovens. It is now accomplished in the *retort oven*, which was devised in Europe for the double purpose of saving the by-products and of utilizing for coke making inferior grades of coal. Very slow progress was made in developing the process, and it was not until 1883

that it was put upon a paying basis. This was due to the unsatisfactory design of the early coke ovens and to the low price of the by-products, on account of the supply from gas works. In 1856 Knab of France built a group of retort coke ovens which had for their object, in addition to the making of coke, the double purpose of separating the tar and ammonia from the gases generated and of then returning these gases to be burned in the flues to heat the ovens. The principal defect of these ovens was the failure to proportion the several parts to the quality of coal to be coked. This mistake was corrected by Carvès of France in the Knab-Carvès oven of 1873, which has proved a model for later ovens. Coke produced in by-product ovens was regarded with disfavor till Dr. Otto introduced improvements which were patented in 1883 and are embodied in the Otto-Hoffmann coke oven, to which the Siemens regenerator is applied. In 1887 the Semet-Solvay oven for coking dry coals, or a mixture of pitchy and dry coals, came into notice, first introduced into the United States in December, 1893. The Belgian ovens, designed for coking poor grades of coal, are also widely used in Europe.

The retort oven used in the Semet-Solvay process, as now built, is a long, narrow chamber 36 feet 3 inches long, 11 feet 10 inches high, and from 17 to 21 inches wide, depending on the quantity of the coal to be coked. The ovens are built in blocks of from 25 to 34, separated by flues in which gas is burned, the heat from which cokes the coal. The charge is introduced through several openings in the top, the ovens are nearly filled, and then tightly sealed. As the heat in these ovens comes from the sides instead of the top, as in the beehive oven, the flow of gases generated is from the sides to the centre, while the free expansion of the coke is somewhat checked. As a result, some coals that in a beehive oven make a coke that is too soft and spongy for blast-furnace use are hardened and strengthened in the retort oven so that they are able to bear the furnace burden. The ovens being so much narrower, the process of coking requires only half as much time as in the beehive furnace. When the charge is coked, it is pushed out by means of rams through doors at each end, the doors are immediately closed, and the oven is ready for a recharge with almost no loss of heat. The coke is quenched as soon as it leaves the oven. The gases are conducted from the oven, through an opening in the top, into a collecting main. This is a hydraulic main, like that used in illuminating-gas works. The gas bubbles through the water, and a part of the tar and ammonia is condensed and separated as the gas cools, and then collected. The gas next passes through tubular condensers, where it is cooled by contact with a series of tubes through which cold water is flowing. During this process more ammonia and tar are condensed. The gas now goes through an exhauster, and, last of all, to a scrubbing apparatus, where the last traces of tar and ammonia are removed. The gas is now returned to be burned in the flues of the coke oven; but as this consumes little more than half of that generated, the rest is available for other purposes. The tar is collected into tanks, and the ammonia is concentrated into a strong crude liquor or into sulphate of ammonia. A ton of coal will yield from 15 to 25 pounds of sulphate and from 5 to 14 gallons of tar.

In Germany 12,000 Otto-Hoffmann coke ovens are in operation, of which 400 save the by-products. The Otto-Hoffmann oven has been even more widely introduced into the United States in recent years. In its most recent form, the Schniewind modification, it combines the regenerative principle of developing the heat with uniform underfiring for distribution of the heat required for the coking of the charge in the oven.

In 1908 the first plant of Koppers's regenerative ovens, where the retorts are heated by vertical flues, were built by the Illinois Steel Company at Joliet, Ill., and in 1911 and 1912 there were installed 560 ovens of this type at the Gary, Ind., plant of the United States Steel Corporation.

In addition to the by-product coke ovens, there are now running in the United States a number of establishments making gas in so-called vertical retorts. In these retorts another type of coke is produced, harder than the old-fashioned gas coke and yet softer than the beehive-oven coke. This is a very desirable coke for domestic fires, such as cooking, furnace, hot-water, and steam-heating.

At the close of 1912 there were in the United States 5211 by-product coke ovens, and 793 were building. These were divided as follows: United-Otto, including Otto-Hoffmann and Schniewind types, 2100; Semet-Solvay, 1443; Rothberg, 287; Koppers, 1215, and Klönne, 22. In 1912 the total production of by-product coke in the United States was 11,115,164 short tons, valued at $42,632,930, while the beehive coke amounted to 32,868,435 short tons, valued at $69,103,766, thus giving a total of 43,983,599 tons, valued at $111,736,696.

The accompanying table gives the yield in coke and other products of certain standard coals:

YIELDS OF VARIOUS COALS IN OTTO-HOFFMANN OVENS

	Coke, per cent.	Tar, per cent.	Sulphate, per cent.	Total gas per 2000 pounds, cubic feet.
AVERAGE OPERATING RESULTS				
Everett, Dominion coal	72.83	4.99	1.010	About 9,000
Glassport, Youghiogheny coal	75.60	5.07	1.100	" 9,000
Germany, Westphalian coal	74.50	3.70	1.280	" 9,600
DISTILLATION TESTS				
Connellsville coking coal	76.34	6.14	1.223	" 8,924
Pittsburgh coking coal	68.25	4.38	.908	" 8,884
Eastern Pennsylvania coking coal	85.00	2.00	.800	" 8,400
Virginia coking coal	66.01	4.70	1.070	" 10,090
Kanawha coking coal	73.60	6.40	1.000	" 10,289

COKE, kŭk *or* kōk, SIR EDWARD (1552–1634). A distinguished English lawyer and judge, born at Mileham, in Norfolk, on Feb. 1, 1552. Educated at the free grammar school at Norwich, and at Trinity College, Cambridge, he passed thence to Clifford's Inn and subsequently to the Inner Temple to study law, and was called to the bar in April, 1578. His great ability, legal learning, and the tact he exhibited in the conduct of his cases, secured him a large practice on the very threshold of his career. In 1586 he was appointed recorder of Norwich, in 1592 recorder of London, a position he resigned the same year for the solicitor-generalship. In the following year he was elected member of Parliament for the County of Norfolk and was chosen Speaker of the House of Commons. In 1594 he was made Attorney-General, and it was in this capacity that he conducted the prosecution in the famous state trials of Southampton and Essex in 1601, of Sir Walter Raleigh in 1603 (in which he exhibited a brutal rancor and bitterness), and of the Gunpowder plotters in 1605. He held this office until 1606, when he was appointed Chief Justice of the Court of Common Pleas, the duties of which position he discharged in a manner that secured for him a great reputation. Upright and independent, with a high notion of the dignity and importance of his office, he did not, in an age of judicial sycophancy, hesitate to oppose any illegal encroachment by royalty. At the suggestion of Bacon (between whom and Coke there was a long-standing hostility), James I, in order to bring him over, appointed Coke, in 1613, Chief Justice of the King's Bench, and shortly afterward Privy Councilor. But here he proved equally incorrigible, among other things maintaining, in the Commendams case, that the King had no power to stay the proceedings in a court of justice, even after his more pliable colleagues had retracted and begged the royal pardon on their knees for having entertained and expressed that opinion. As a consequence of this unflinching assertion of the supremacy of the law of the land, Coke was (November, 1616) relieved from his chief-justiceship. His ardent and unflinching support of liberal measures in Parliament, especially of the right of freedom of debate, soon brought him into further trouble with the court party, and in 1621–22 he suffered nine months' imprisonment in the Tower. In the third Parliament of Charles I (1628) Coke took an active part in framing the celebrated Petition of Right, and it was in a great measure owing to his advocacy that the Lords were induced to agree to it. He died Sept. 3, 1634. He had an extraordinary popularity, and his utterances and courage did much to contribute to the final result in the struggle between the crown and the commons. Yet he was of an intolerant disposition, and in religious matters and in his fear of the growth and influence of the papal power he was fanatical. He is now best known for his law treatise, *Coke upon Littleton; or, the First Institute*, a work of extraordinary learning and of great acumen, which is still, perhaps, the most influential and authoritative treatise on English law. His other works are the *Second, Third, and Fourth Institutes*, *The Complete Copyholder*, and *Reading on Fines;* while his collection of law reports, which made an epoch in the history of law on their appearance, are still of great value to the profession. Consult: Johnson, *Life of Sir Edward Coke* (2d ed., London, 1845), which is somewhat untrustworthy; also Woolrych, *The Life of Sir Edward Coke* (London, 1826); and the sketches of his life in Foss, *Judges of England*, vol. vi (London, 1857), and in Campbell, *The Lives of the Chief Justices of England*, etc., vol. i (London, 1849).

COKE, THOMAS (1747–1814). The first Bishop of the Methodist Episcopal church. He was born at Brecon, Wales, was educated at Oxford, and took orders in the Church of England in 1770. About 1772 he was converted and showed great fervor; in 1776 he met Wesley for the first time and after that began open-air preaching. In consequence of his revivalism he was dismissed from his curacy of South Petherton and attached himself to the Methodist Society. In 1782 he was appointed president of the Irish Conference, and two years later he was made superintendent for America, with power to confer ordination, by the laying on of hands administered by John Wesley and two other clergymen of the Church of England. Charles Wesley, who had not been aware of the ceremony and heartily disapproved of it, wrote the well-known epigram:

> So easily are bishops made
> By man's or woman's whim;
> Wesley his hands on Coke hath laid,
> But who laid his hands on *him?*

In 1787 both Coke and Asbury, whom Coke had ordained, assumed the title of Bishop, much to John Wesley's displeasure. They traveled together among the various conferences until the middle of 1785, when Coke returned to England. He made in all nine visits to America and spent the rest of his life in active missionary work, in personal visitation in the United Kingdom and in America, and in the encouragement of enterprises for the Christianizing of Asia and Africa. After Wesley's death Coke was secretary of the British Conference, and, with Asbury, he edited *The Doctrine and Discipline of the Methodist Episcopal Church of America* (1787). In 1813 he applied unsuccessfully to Lord Liverpool and William Wilberforce to be appointed Bishop for India. He was consumed with a desire to spread Christianity in India, and as the government was unfavorable to missions by Dissenters there, he believed he could work more effectively in connection with the Church of England, to which, like many Methodist ministers, he himself belonged. In the same year (1813) he sailed for Ceylon, but died of apoplexy on the voyage, May 3, 1814. He was of a very energetic disposition and of remarkable executive abilities. He had the advantage of considerable personal means, which he spent freely in the cause. Among his works are a *Life of John Wesley* (1792); a commentary on the Scriptures (6 vols., 1803–08); *History of the West Indies* (3 vols., 1808–11). For his life, consult Etheridge (London, 1860) and Upham (New York, 1910).

COKES, BARTHOLOMEW. A simpleton in Jonson's *Bartholomew Fair.*

COL, kôl (Fr., neck). In geography, a marked depression or pass in a mountain range. In those parts of the Alps where the French language prevails, the passes are usually named *cols;* hence the Col de Balme, the Col du Géant, etc.

COLADA, kô-lä'dâ. One of the two swords of the Cid, taken from the Count of Barcelona.

COLA NUT, or **KOLA NUT**. The seed—not properly the nut—of *Cola acuminata*, a large tree of the family Sterculiaceæ, native to western tropical Africa, cultivated in the West Indies, Brazil, and other tropical countries, where it has to some extent become naturalized. The seeds average about an inch in length, are brown or reddish gray, slightly mottled, have an odor resembling nutmeg, and a bitter flavor when fresh, which becomes mildly aromatic with age. In the tropics, especially in the Sudan, where they are known as guru nuts, they are employed as a stimulant and as a remedy for tropical diarrhœa. The nuts contain from 0.7 per cent to 2 per cent of alkaloid caffeine (q.v.) and small amounts of tannin and theobromine. According to Knebel and to Hilger, fresh cola nut probably contains no caffeine at all, but a glucoside, the fermentative decomposition of which yields caffeine, glucose, and cola red.

COLBAN, kōl'bân, Adolphine Marie (1814–84). A Norwegian novelist, whose literary genius was developed late and by necessity. She was born in Christiania, Dec. 18, 1814. Left a widow without resources in 1850, she went to Paris, where a friend published part of her correspondence as *Lettres d'une barbare*. These were received with such favor that she was led to try fiction, and between 1869 and 1881 published seven volumes of tales, most of which were translated into German. *Jeg lever* ('I live') (1877) is the most characteristic, but nearly all are charming for their sympathetic insight into Norwegian character.

COLBERG, kōl'bĕrk. See Kolberg.

COLBERT, kôl'bâr', Jean Baptiste (1619–83). A French statesman, Minister of Finance under Louis XIV. He was born at Rheims, Aug. 29, 1619, and served his apprenticeship in a woolen draper's shop. He afterward went to Paris and soon obtained a position in the War Office, where his tireless activity brought him into notice. He became secretary to Le Tellier, then at the head of the War Office, and through his influence was made a counselor of the King and introduced to Mazarin, who soon employed him in important affairs of state. On his deathbed Mazarin recommended Colbert to the King, who in 1665 appointed him Comptroller General of the Finances. Colbert found the finances in a ruinous condition and immediately entered upon an elaborate programme of reform. Fouquet, the Superintendent of Buildings under Mazarin, was found guilty of maladministration and was imprisoned for life. The new Comptroller instituted a council of finance and a chamber of justice, to call to account the farmers of the state revenues, who were forced to yield up all the wealth of the crown of which they had fraudulently possessed themselves. In 20 years the revenue rose to 116,000,000 livres, of which but 23,000,000 were spent in collection and administration, whereas before Colbert took the finances in hand the revenue had amounted to only 84,000,000 livres, of which 52,000,000 were absorbed in collection. Colbert did not rest satisfied with being a financial reformer, but in various ways developed the industrial activity of the nation by state support. He was created Minister of Marine in 1669, and shortly afterward he acquired control of commerce, the colonies, and the royal expenditure. French trade was extended, and roads and canals, including the great canal of Languedoc, were built. Certain features of his economic policy, such as a too stringent regulation of commerce, high protective duties, and the maintenance of the corporation system, have been frequently criticized, but they were rather the faults of the age than of the man. He organized anew the colonies in Canada, Martinique, and Haiti, and founded those of Cayenne and Madagascar. To encourage trade in the Levant he granted special privileges to traders in imitation of the East India Company scheme, but, owing to his high protective tariffs and rigid regulations, failure followed his efforts.

Perhaps the most successful of all Colbert's reforms was the creation of a French navy. He found France in 1669 with a few old hulks and provided her in three years with a fleet of 60 ships of the line and 40 frigates. The mercantile marine was also developed, and bounties were given on ships built in France. Colbert revised the Civil Code, introduced a code of marine law, as well as the so-called *Code Noir* for the colonies. Statistical tables of the population were first made out by his orders. Men of learning and genius found in him a generous patron. The academies of inscriptions, science, and architecture were founded by him. In short, he appears as the promoter of industry, commerce, art, science, and literature—the founder of a new epoch in France. Notwithstanding his remarkable ingenuity, the unbounded extravagance of his master forced him to raise money in ways objectionable to his reason, and to maintain war taxes in time of peace. The last years of his life were a constant struggle to find money for Louis's ruinous wars, and he died Sept. 6, 1683, bitterly disappointed because his great services were but ill appreciated by the King, whose confidence in Colbert had been undermined by the favorite Louvois. The people of Paris, enraged at the oppressive taxes, would have torn his dead body to pieces but for the intervention of the military and his burial by night. He left large estates in France, and some of his offices descended to his sons, one of whom became Minister of Marine and another Superintendent of Buildings. A third was made Archbishop of Rouen. It is not the least of Colbert's merits that he saw the wisdom of Richelieu's tolerant course towards the Huguenots and restrained the King from that fatal policy of persecution which began with the revocation of the Edict of Nantes (q.v.) soon after the great Minister's death. Nevertheless, he ruled with an iron hand, and even to his friends he was known as the "man of marble." The coldness of his nature is well caught in the epithet of Madame de Sévigné, who styles him "The North." Among Colbert's posthumous papers were found *Mémoires sur les affaires de France* (c.1663), and a fragment, *Particularités secrètes de la vie du Roy*, which have been published several times.

Consult: Clément, *Vie de Colbert* (Paris, 1846); id., *Lettres, instructions, et mémoires de Colbert* (9 vols., ib., 1861-82); id., *Histoire de Colbert et son administration*, ed. by Mademoiselle Clément (ib., 1874); Gourdault, *Colbert, ministre de Louis XIV* (Tours, 1885);

Lavisse, *Histoire de France*, vol. vii, part i (ib., 1905). Sargent, *Economic Policy of Colbert* (London, 1899), contains a bibliography of works relating to Colbert and his time. See FRANCE; LOUIS XIV.

COLBERT, JEAN BAPTISTE, MARQUIS DE SEIGNELAY (1651–90). A French statesman, Minister of Marine, and son of the famous Minister of Finance. In 1683 he succeeded his father as the head of the navy. He led a naval expedition against Genoa in 1684. If his advice had been taken after the battle of Beachy Head, the French fleet might easily have won control of the channel. Consult Clément, *Le Marquis de Seignelay* (Paris, 1887).

COLBURN, kōl'bûrn, WARREN (1793–1833). An American mathematician, born in Dedham, Mass. He graduated at Harvard in 1820 and in the same year opened a private school in Boston. In 1821 he published *First Lessons in Intellectual Arithmetic*, the sale of which far exceeded that of any previous mathematical work. It was translated into many foreign languages. From teaching, Colburn went into manufacturing and was superintendent of large establishments in Waltham and Lowell; but much of his time was devoted to lecturing on commerce, natural history, physics, and astronomy. He published a *Sequel* to his arithmetic (1822), and an *Algebra* (1827).

COLBY, ALBERT LADD (1860–). An American metallurgist, born in New York City. He was educated at the College of the City of New York and at the Columbia School of Mines. After 1886 he was engaged as a specialist in steel metallurgy. In 1897 he became secretary of the Association of American Steel Manufacturers, and in 1904 he was iron and steel commissioner at the St. Louis Exposition. Besides several technical papers he is author of *American Standard Specifications for Steel* (1902).

COLBY, CHARLES CARROLL (1827–1907). A Canadian statesman. He was born at Derby, Vt., and graduated from Dartmouth College in 1847. He was called to the bar in the Province of Quebec in 1855 and for some years practiced law in Stanstead, but abandoned it for industrial and mining pursuits. In 1867, the year of confederation, he was elected Conservative member for Stanstead in the House of Commons and represented that constituency until 1891. In 1887–89 he was Deputy Speaker of the House, and in 1889–91 he was President of the Privy Council in the administration of Sir John A. Macdonald. During his extended parliamentary term he became one of the ablest debaters in the House and was one of the earliest advocates of the protective or national policy adopted in 1878. He published *Parliamentary Government in Canada* (1886), a work highly praised by Alpheus Todd (q.v.), an authority on British constitutional law. His eldest son, CHARLES WILLIAM COLBY (1867–), was Kingsford professor of history in McGill University in 1895–1910 and published *The Sources of History* (1899) and *Canadian Types of the Old Régime* (1908).

COLBY, EVERETT (1874–). An American lawyer and political leader, born in Milwaukee, Wis. He graduated at Brown University in 1897 and was admitted to the New York bar in 1899. He served in the New Jersey House of Assembly in 1903–05 and, although opposed by the political "machine" of the State, became a member of the State Senate for the term of 1906–09. In 1913 he was the candidate of the Progressive party for Governor of New Jersey.

COLBY, FRANK MOORE (1865–). An American editor and writer, born in Washington, D. C. He graduated from Columbia University in 1888, was acting professor of history at Amherst College in 1890–91, lecturer on history at Columbia and instructor in history and economics at Barnard College from 1891 to 1895, and professor of economics at New York University thereafter until 1900. From 1893 to 1895 he was a member of the editorial staff of *Johnson's Cyclopædia* in the department of history and political science, and in 1898 he became editor of the *International Year Book* and one of the editors of the *International Cyclopædia*. He was one of the editors of the first edition (1900–03) of the NEW INTERNATIONAL ENCYCLOPÆDIA and of the second edition (1913–15); served as American editor of *Nelson's Encyclopædia* (1905–06); and after 1907 edited the *New International Year Book*. His other literary work comprises editorial writing for the New York *Commercial Advertiser* (1900–02), "The Book of the Month" in the *North American Review* (1913–), as well as critical articles for the *Bookman* and other magazines, and *Outlines of General History* (1900), *Imaginary Obligations* (1904), and *Constrained Attitudes* (1910).

COLBY, HARRISON GRAY OTIS (1846–). An American naval officer, born at New Bedford, Mass. After graduating from the United States Naval Academy in 1867 he was promoted through the various grades, becoming captain in 1902 and rear admiral in 1908. He served on the *Dakotah* during the Civil War and commanded the *Hannibal* in the Spanish-American War. In 1904–05 he commanded the European squadron. He retired in 1908.

COLBY, THOMAS FREDERICK (1784–1852). An English engineer connected with the British Ordnance Survey for 45 years. He invented the "compensation bar," used in base measurements. In 1824 he planned, and from then until 1846 supervised, the survey of Ireland. Consult Portlock, *Memoirs of the Life of General Colby* (London, 1869).

COLBY COLLEGE. An institution of higher education, founded by the Baptists of the District of Maine, at Waterville, Me. It was chartered by the Legislature of Massachusetts in 1813 and was known as "The Maine Literary and Theological Institution" until 1820, when its name was changed to Waterville College. In 1867 the name was again changed to Colby University, in honor of Gardiner Colby, whose gifts to the college amounted to $200,000. The name was changed in 1899 to Colby College. The principal college buildings include Memorial Hall, Champlin Hall, Foss Hall, North College, and South College. Colby College offers courses leading to the B.A. degree, without requiring Greek for entrance, and courses leading to the B.S. degree. Men and women are admitted on equal terms and pursue the same studies; in the required courses they recite separately. The courses are largely elective after the first year. The library in 1914 had 50,000 volumes and 20,000 pamphlets. The number of students was 425. The endowment funds amounted to $600,000, and the value of college property to $500,000. The president in 1914 was A. J. Roberts, A.M.

COLCHAGUA, kōl-chä'gwȧ. A province of Chile, bounded on the north by the provinces of Santiago and O'Higgins, on the east by Argentina, on the south by the Chilean Province of Curicó, and on the west by the Pacific (Map: Chile, C 10). Area, 3856 square miles. The eastern and western parts are traversed by the Andes and the Coast Range respectively, while the middle section forms a part of the central valley of Chile, the best-cultivated part of the country. The soil is well watered and of exceptional fertility, yielding corn, wheat, oats, and beans. Cattle raising is carried on extensively. The province is traversed by the Santiago-Valdivia Railway. Pop., 1895, 157,566; 1907, 159,119; 1910, 159,421. Capital, San Fernando.

COLCHESTER, kōl'chĕs-tẽr. A parliamentary and municipal borough and river port of Essex, England, on the south bank of the Colne, 12 miles from the sea and 51 miles northeast of London (Map: England, G 5). It is partly surrounded by the remains of an old Roman wall. The most notable building is the castle erected in the reign of William Rufus, with walls from 10 to 30 feet thick, of which the Norman keep is said to be the largest in England. The ruins of St. Botolph's Priory are also Norman. The streets are well paved and lighted by electricity, supplied by the town, which also owns the water supply. The castle contains a museum of antiquities and a library. A gateway of the former monastery of St. John has been restored. The town maintains baths, recreation grounds, and markets. Its educational institutions include the Albert School of Science and Art and a public library. The city owns the oyster fishery at the mouth of the Colne, and it is a great source of revenue. Its corn markets are important, and its manufactures include boots, shoes, and woolen ware. It has a quay for vessels of 150 tons at the suburb called "Hythe." Pop., 1901, 38,373; 1911, 43,463. Colchester is the *Camulodunum* of the British and Romans and the later *Colneceaster* (Colne Castle) of the Saxons. Many Roman remains have been found here, bushels of coins of many emperors, vases, urns, lamps, pavements, and baths. The town was ravaged by the plague in 1348, 1360, and 1665. In the Civil War, Colchester held out for the King, but was captured by General Fairfax after a three months' siege. Old King Cole, according to the legend, gave the town its modern name. Consult: Cutts, *Colchester* (London, 1889); Round, "Colchester during the Commonwealth," in *English Historical Review*, vol. xv (ib., 1900); Benham, *Red Paper Book of Colchester* (Colchester, 1902); id., *Oath Book of Colchester* (ib., 1907).

COLCHESTER. A town in Chittenden Co., Vt., containing the village of Winooski (Map: Vermont, B 3). Winooski is a manufacturing village, 2 miles from Burlington, on the Central Vermont Railroad. It contains a public library and has a large plant of the American Woolen Company, cotton mills, machine shops, brickworks, large screen works, butter factory, lumber and cider mills, etc. Pop. (Winooski village, 1900, 3783); town, 1900, 5352; 1910, 6450.

COLCHESTER, first Baron. See Abbot, Charles.

COLCHICINE (Fr., from Lat. *colchicum*, Gk. κολχικόν, *kolchikon*, the poisonous meadow saffron, from Gk. Κολχίς, *Kolchis*, a country on the Black Sea), $C_{22}H_{25}NO_6$. A bitter alkaloid, the active principle of colchicum root, the corm of *Colchicum autumnale* (Linné), growing in southern and central Europe. It is a crystalline substance, soluble in water, alcohol, and chloroform. Colchicum preparations are used in medicine to relieve pain in gout. In larger doses colchicine is poisonous, and even in medicinal doses may act as a powerful gastro-intestinal irritant and heart depressant, in which case its administration must be temporarily discontinued. The medicinal dose of colchicum root, which contains about 0.5 per cent of colchicine, is from 2 to 8 grains, in powder. The dose of colchicum seed, which contains less of the alkaloid than the corm, is from 1 to 5 grains. Colchicine itself may be extracted from colchicum seed, with water, alcohol, and chloroform, by a somewhat lengthy process. It is a bitter, yellow, rubber-like substance, very soluble in cold water, but less readily in hot water, and extremely soluble in alcohol and chloroform. With chloroform it also forms a fairly stable chemical compound. It is optically active, turning the plane of polarized light to the left. See Alkaloids.

COLCHICUM, kōl'kĭ-kŭm (Lat., from Gk. κολχικόν, *kolchikon*, the poisonous meadow saffron). A genus of plants of the family Liliaceæ, native to Europe and to the Mediterranean region. The species, of which there are about 30, are stemless, with flowers half subterranean like the crocus, only the limb of the perianth and part of the tube rising above ground. The flowers much resemble crocus flowers. The only British species is *Colchicum autumnale*, the meadow saffron, sometimes also, but incorrectly, named "autumn crocus," which is plentiful in meadows and pastures in some parts of England and of the continent of Europe. The flowers are pale purple; they appear in autumn unaccompanied by any leaves; the leaves, which are large and broadly lanceolate, appear in spring, when the stalk which bears the ripening fruit rises among them. The whole plant is very acrid and poisonous, chiefly owing to the presence of colchicine. Cattle are not infrequently injured by it in pastures where it abounds. It is, however, not difficult to extirpate, the repeated pulling of it by hand, as it appears above ground, being sufficient for this purpose; the roots soon become exhausted and die. It is a valuable medicinal plant, the parts chiefly used for medicinal purposes being the corm (popularly called the root) and the seeds. The seeds are round, brown, and rather larger than mustard seed; and fatal accidents have occurred from their poisonous nature. Other species of *Colchicum* appear to possess similar properties. (See Colchicine.) *Colchicum autumnale* is common in flower borders, and a number of other species are employed in the same manner. Most of the species are autumn blooming, a few flowering in spring along with the crocuses, snowdrops, etc. *Colchicum luteum* is one of the finest of spring-flowering species, and *Colchicum parkinsoni*, *Colchicum speciosum*, and *Colchicum autumnale* of autumn-blooming species. For illustration, see Plate of Cornflower.

COLCHIS, kōl'kĭs (Lat., from Gk. Κολχίς, *Kolchis*). In ancient geography, a region on the east coast of the Pontus Euxinus, or Black Sea, situated north of Armenia and south of the Caucasus. It corresponded very nearly to the Russian Province of Kutais. It was celebrated in the very earliest times as the country of

Medea (q.v.), and was the goal of the Argonauts (q.v.). It was afterward better known to the Greeks as the seat of some colonies of the Milesians. It was noted for its wine and fruits. The Colchians seem to have differed ethnologically from their neighbors, which led Herodotus to argue that they were descended from the Egyptian invaders under Sesostris (q.v.). Darius Hystaspes made them tributary to Persia; subsequently they threw off their allegiance and were ruled by kings of their own; the country then came, nominally, under the dominion of Mithridates, King of Pontus; after Mithridates was defeated by Pompeius, there were princes of Colchis dependent on the Romans. The principal town was Dioscurias (called under the Romans Sebastopolis and now Iskuriah); the principal river was the Phasis, now the Rion.

COL'COTHAR. See IRON, *the Oxides of.*

COLD. See CATARRH.

COLDBATH FIELDS PRISON (named from *Coldbath Fields*, Middlesex). A London jail, erected in the time of James I and sometimes referred to as the English Bastille. It is mentioned as the meeting place of the rioters in Dickens's *Barnaby Rudge.* The prison became inadequate and was closed in 1886.

COLD CREAM. A term applied to preparations of fatty substances, which are used as mild and cooling dressings for the skin. The composition of an excellent cold cream is as follows: spermaceti (125 parts); white wax (120 parts); expressed oil of almonds (600 parts); strong rose water (190 parts); and sodium borate (5 parts). Cold cream softens the skin and promotes the healing of wounds and of chapped hands.

COLDEN, kōl'den, CADWALLADER (1688–1776). A Scottish-American naturalist and politician, born at Duns, Scotland. He graduated at the University of Edinburgh in 1705, came to America in 1708, practiced medicine for 10 years in Philadelphia, and then, in 1718, settled in New York City. He was the first surveyor-general of the Colony of New York, was a member of the Provincial Council, and in 1761 was appointed Lieutenant Governor, which office he held until his death. As the governors were often changed, Colden was frequently called upon to act as chief executive and in this capacity came into conflict upon many occasions with the radical element of the "patriot" party, and in 1765 he was burned in effigy by an angry mob because of his support of the Stamp Act. He devoted much attention to the study of the sciences, especially botany, furnished Linnæus with descriptions of several hundred American plants, and was the first to introduce the Linnæan system of classification into America. He published a *History of the Five Indian Nations of Canada* (1727; reprinted, 1905), a work of great value, and a less important work on *The Principles of Action in Matter* (1752). Consult Alice M. Keys, *Cadwallader Colden, a Representative Eighteenth-Century Official* (New York, 1906).

COLDEN, CADWALLADER DAVID (1769–1834). An American lawyer and politician. He was born near Flushing, L. I., and was a grandson of Cadwallader Colden. He studied law and attained considerable eminence at the New York bar. In the War of 1812 he was a colonel of volunteers. In 1818 he was chosen to the State Assembly and in the same year succeeded De Witt Clinton as mayor of New York City. He was elected to Congress in 1821 and from 1824 to 1827 was a member of the State Senate. Colden was one of Clinton's strongest supporters in the work of internal improvements and was conspicuous in the cause of public education, the reformation of juvenile offenders, and other matters of moral and social betterment. He wrote a *Life of Robert Fulton* (1817); *Vindication of the Steamboat Right Granted by the State of New York* (1819); *Memoir of the Celebration of the Completion of the New York Canals* (1825).

COLD FRAME. See FRAME.

COLD HARBOR, BATTLE OF. One of the most sanguinary battles of the Civil War in America, fought June 1 and 3, 1864, at Cold Harbor, Va., about 10 miles northeast of Richmond, between the Federal Army of the Potomac, numbering about 102,000, under General Grant, and the Confederate Army of Northern Virginia, numbering about 65,000 under General Lee. After fighting the battles of the Wilderness and Spottsylvania (qq.v.), Grant proceeded towards Richmond, crossed the Pamunkey on May 28, and on June 1 found himself again face to face with General Lee. On the afternoon of May 31 the Federal general, Sheridan, with his cavalry, carried a position known as Old Cold Harbor, and held it, in spite of the stubborn attacks of the Confederate general, Fitzhugh Lee, until night. On the following day he was relieved by General Wright with the Sixth Corps of the Army of the Potomac and Gen. W. F. Smith with the Eighteenth Corps of the Army of the James, who at 6 P.M. attacked Lee with great vigor in face of a terrible fire and, with a loss of about 2000, succeeded in capturing a large part of the first line, the Confederates making a counter assault, but with little effect, on the position of the Federal Fifth Army Corps under General Warren. Confederate attacks during the night failed to alter the relative positions of the two armies, and the following day was spent in readjusting the Federal lines, Warren remaining on the right, Hancock moving to the left of the Sixth Corps, and Burnside taking up a position in reserve at Bethesda Church. At about 4.30 A.M. on the 3d an assault was made "all along the line," the Federals fiercely attacking the impregnable intrenchments of the Confederates, but being driven back with terrific loss in less than 30 minutes. Most of the fighting ceased within an hour, the Federals having made comparatively little impression on the defenses, but having advanced their lines somewhat closer to the Confederate works. In their brief charge the Federals lost in killed, wounded, and missing fully 7000 men, more probably falling in the first 10 minutes than in any other similar period throughout the war. General Hancock's corps suffered most severely. The two armies remained in their positions until the 12th, when Grant began his march for the James River. (See PETERSBURG.) The total loss sustained by the Federals during these 12 days, but chiefly on the first and third, was fully 12,700; while that of the Confederates, though never accurately ascertained, probably did not exceed 2500. For several days after the attack of June 3 great numbers of dead and wounded lay wholly unattended to between the two lines, Grant and Lee being unable to agree upon any plan for furnishing the needed relief. The battle con-

siderably discouraged the Army of the Potomac, whose loss had not been atoned for by any corresponding gain; and military critics are almost unanimous in the verdict that the assault was the great mistake of Grant's career. General Grant himself afterward said of it: "Cold Harbor is, I think, the only battle I ever fought that I would not fight over under the circumstances" (Young, *Around the World with Grant*, vol. ii, p. 304, New York, 1879), and, "I have always regretted that the last assault at Cold Harbor was ever made" (*Memoirs*, last ed., vol. ii, p. 171). The battle of Gaines's Mill (q.v.) was fought in 1862 nearly on the site of that of Cold Harbor. Consult: *Personal Memoirs of U. S. Grant* (last ed., New York, 1895); Humphreys, *The Virginia Campaign of 1864 and 1865* (New York, 1883); Johnson and Buel (eds.), *The Battles and Leaders of the Civil War*, vol. iv (New York, 1887).

COLD HARBOUR. An old London edifice near the Thames, once the property of a line of wealthy merchants, purchased about the middle of the sixteenth century by the Earl of Shrewsbury and renamed Shrewsbury House. It was soon afterward torn down, and the small buildings erected on its site became a place of refuge for debtors and bad characters.

COLDING, kōl'dĭng, Ludwig August (1815–88). A Danish engineer and physicist. He was born at Arnakke, studied at the Polytechnic Institute of Copenhagen, and was appointed a professor there in 1865. He also became connected with the water system of Copenhagen, in 1847 as inspector and in 1858 as an engineer, and in 1865 was appointed professor in a polytechnic school. In addition to many contributions to the *Reports* of the Scientific Society of Copenhagen and to scientific journals, he published *Tropical Cyclones* (1871) and other works.

COLD LIGHT. A term applied to the illumination produced by apparatus, invented by C. F. Dussaud, whereby a rapid succession of illuminated incandescent lamps takes the place of a single source of light. It consisted essentially of a wheel on the circumference of which a number of tungsten lamps were placed, connected, each one in turn, to a source of electricity. By the rotation of the wheel each lamp at a particular point on the wheel was in turn illuminated and cut off from the supply, the speed of rotation of the wheel making it possible to light any one lamp for an exceedingly short interval, the succeeding lamps furnishing, in turn, a source of illumination. There was produced on the retina of the eye of the observer the impression of a continuous luminous source. This being so, Dussaud operated his machine at such a rate that the period of darkness for any lamp was more than twice the duration of its brightness, and it was possible, therefore, he found, to apply a much higher voltage than that at which the lamp was rated. Furthermore, the short period of time during which the lamp is luminous allowed the development of a very small amount of heat, measurable, of course, yet so small as to be unobjectionable; hence the title "cold light." Tests have shown that with from 50 to 160 watts applied to 16 lamps ranging from 25 to 80 candle power, there was obtained a brightness equal to from 250 to 800 candle power for several hours continuously. It will be at once understood that such an arrangement, in connection with a moving-picture machine, allows the latter to be run at any desired speed and even to be stopped without danger of igniting the film; and as regards the intrinsic brightness of the source of light, it has been shown that pictures projected on a screen 15 feet square in a perfectly satisfactory manner involve the consumption of only 150 watts of energy.

COLD SPRING. A village in Putnam Co., N. Y., 6 miles south of Newburgh, on the New York Central and Hudson River Railroad, and on the Hudson River opposite West Point (Map: New York, A 2). It has two foundries and embroidery works. Pop., 1900, 2067; 1910, 2549.

COLD SPRING. A village and summer resort in Suffolk County, New York, 32 miles by rail east of New York City, on Cold Spring Harbor, an inlet of Long Island Sound and on the Long Island Railroad. It is noted for its fine scenery and contains an extensive trout hatchery; public library, station for experimental evolution of the Carnegie Institution of Washington, and laboratories of the Brooklyn Institute. Pop., 1914, about 750.

COLD'STREAM. An historical border village of Berwickshire, Scotland, on the left bank of the Tweed, 15 miles southwest of Berwick (Map: Scotland, F 4). Pop., 1901, 1482; 1911, 1375. Near Coldstream is the famous ford of the Tweed, where the English made famous crossings, once in the thirteenth century under Edward I, and again in the seventeenth century under Montrose. Here General Monk, 1659–60, raised the regiment still known as the Coldstream Guards (q.v.). Being a border town, Coldstream, like Gretna Green, was formerly celebrated for its clandestine marriages, and the Marriage House still remains. About 4 miles to the south of Coldstream is Flodden Field (q.v.).

COLDSTREAM, Lady Catharine. A Scotchwoman in Foote's *The Maid of Bath*.

COLDSTREAM GUARDS. A regiment of foot guards in the British army, forming part of the Royal Household Brigade. It is one of the oldest regiments in the British service, dating from 1660. In that year General Monk, who after the death of Cromwell took sides with the Parliament and the army, organized the regiment at Coldstream, a border town of Berwickshire, Scotland, whence the name of the regiment, and marched with it into England. It has seen service in every British campaign of any magnitude and has emblazoned on its regimental colors the names of many of the most brilliant victories of British arms. It was first known as Monk's Regiment, but when Charles II ascended the throne, Parliament gave the regiment to him as part of his Household Brigade, and it has since borne its present name. See Foot Guards; Household Troops.

COLD'WATER. A city and the county seat of Branch Co., Mich., 125 miles (direct) west-southwest of Detroit, on the Lake Shore and Michigan Southern Railroad (Map: Michigan, D 7). It is the seat of the State School for Dependent Children and has a public library and several fine lakes and parks. It has manufactories of shoes, sporting goods, Portland cement, flour, marine engines, condensed milk, liniment, and machine-shop products, and contains the Bromo-Hygia Mineral Wells. The city owns and operates its water works and electric-light plant. Settled in 1830, Coldwater was incorporated in 1862. It is governed by a mayor, elected annually, and a city council. Pop., 1890, 5247; 1900, 6216; 1910, 5946.

COLD WAVE. A term first applied by the United States Weather Bureau in 1872 to the areas of cold, clear, dry air that flow near the ground from Canada southward over the United States and become the so-called "northers" when they reach the Gulf States, or "Nortes" when they reach the Gulf coast of Mexico and Yucatan. The northers of Colon may possibly have a different origin. The cold stratum of air, being quite shallow, keeps to the lowlands and rarely rises to the 5000-foot level; there are but one or two cases on record in which it attained the altitude of Cheyenne or Santa Fe; often it is not deep enough to overflow the 3000-foot level of the Appalachian Range. The cold wave advances with a well-defined front, marked by a sudden fall of temperature and an outflowing wind that undoubtedly curls upward and overflows backward, forming an advancing border of clouds with spits of rain or snow. The barometric pressure underneath this cloud is a few hundredths of an inch higher than in front of it, and it is this difference of pressure that causes the mass of cold air to underflow and lift up the warmer air as it spreads southward towards the equator. This excess of pressure is in part caused by gravity or the hydrostatic pressure due to the weight of the air in the rear, and is also in part the result of the diurnal rotation of the earth on its axis, giving a centrifugal force to the denser cold air greater than that of the neighboring warm air. The progress southward or southeastward of the front of a cold wave is so steady that, having charted its position at several successive moments by means of telegraphic reports, the Weather Bureau has almost always been able to forecast its future progress with satisfactory accuracy, thereby enabling all interested in the matter to make provision against sudden drops in temperature, which often exceed 30° in 24 hours. According to the technical definition adopted by the Weather Bureau, the forecast of a cold wave (as made by hoisting the cold-wave flag) implies that there will be a drop of at least 20° within 24 hours, and that the temperature will go below freezing. Similar sudden changes in the warmer half of the year, when temperatures do not go below freezing, are simply cool waves.

COLDWELL, George Robson (1858–). A Canadian lawyer and statesman. He was born in Durham Co., Ontario, and was educated there and at Trinity University, Toronto, where he graduated in 1880. Removing to Manitoba, he was admitted to the bar of that province in 1882. He practiced his profession at Winnipeg and afterward at Brandon, where he entered municipal life, serving as alderman. He was elected a Conservative member of the Manitoba Legislature, and in 1907 was appointed Provincial Secretary, Municipal Commissioner, and Minister of Education in the administration of Sir Rodmond Palen Roblin (q.v.), later resigning the provincial secretaryship. He was elected a councilor of Manitoba University and in 1910 became a member of the Royal Commission to inquire into the Manitoba system of technical schools.

COLE. See Rape.

COLE, Alfred Dodge (1861–). An American physicist, born at Rutland, Vt. He was educated at Brown University and also studied at Johns Hopkins, Harvard, Berlin, Cornell, and Chicago universities. Between 1885 and 1901 he was instructor in chemistry and physics, acting professor, and professor at Denison University. In 1901–07 he was professor of physics at Ohio State University, to which, after a year at Vassar College, he returned as head of the physics department. He served as trustee of Denison University in 1901–07 and again in 1911– . In 1911 he was elected secretary of the American Physical Society. His publications include researches on electric oscillations, electric waves, and the capillary electrometer.

COLE, Frank Nelson (1861–). An American mathematician, born at Ashland, Mass. He was educated at Harvard University, where in 1885–87 he lectured on mathematics. Between 1888 and 1895 he was instructor and assistant professor of mathematics at the University of Michigan; he was then appointed professor of mathematics at Columbia University. He became secretary of the American Mathematical Society in 1895 and an editor of its *Bulletin* in 1897. He published *The Diurnal Variation of Barometric Pressure* (1892) and contributed to the second edition of the New International Encyclopædia.

COLE, George Watson (1850–). An American bibliographer, born in Warren, Conn., and educated at Phillips (Andover) Academy. He studied law and practiced from 1876 to 1885, when he became cataloguer of the Fitchburg (Mass.) Public Library. He was librarian of the Jersey City Free Public Library in 1891–95 and then gave himself up entirely to bibliographical work. He published the valuable *Catalogue* (5 vols., Americana, 1907; 2 vols., English Literature and Miscellanea, 1909) of the E. Dwight Church library; *Bermuda in Periodical Literature* (1898; rev. ed., 1907); and *First Folio of Shakespeare* (1909).

COLE, Sir Henry (1808–82). An English official, art critic, editor, and etcher. He was born at Bath and was educated at Christ's Hospital. Appointed assistant keeper of the records by Lord Langdale in 1838, he contributed by his writings to the erection of a general-record office. In 1845 he won the prize offered by the Society of Arts for a tea service, and the design submitted by him afterward became exceedingly popular. In 1846 he became a member of the Society of Arts, and by his efforts promoted those exhibitions of art manufactures (1847–48–49) which led to the great Crystal Palace Exhibition in 1851. He played an important part in the erection and organization of the South Kensington Museum and was also one of the principal founders of the National Training School (1876), which was subsequently (1882) reorganized as the Royal College of Music. Under the pseudonym of Felix Summerly he wrote *The Home Treasury* (1841) and other works. His etchings, published 1860–66, have little artistic value.

COLE, King. A British king of the third century, who is said to have taken Camulodunum from the Romans and to have named it after himself, Colchester. According to some of the old chroniclers, he was the father of the Empress Helena, mother of the Emperor Constantine. He is the subject of the well-known nursery rhyme, "Old King Cole was a merry old soul."

COLE, Mrs. In Foote's play *The Minor*, a character modeled on Mrs. Douglass, a notorious woman of the eighteenth century.

COLE, Thomas (1801–48). An American

landscape painter. He was born in Lancashire, England, Feb. 1, 1801, and came to America at the age of 19. He had learned wood engraving in Liverpool and practiced it a short time in Philadelphia. His love for painting was awakened by an itinerant portrait painter, who, passing through the village of Steubenville, Ohio, gave him some instruction in the rudiments. After a few years of varied success at landscape work and two years' study at the Philadelphia Academy, Cole reached New York in 1825, where he received counsel and encouragement from Durand and Trumbull, and his success began. He traveled three years in Europe and visited Italy again in 1841, but preferred the scenery of America to that of the Old World. He was the founder of the Hudson River school (q.v.) of landscape painting, from which American landscape art has developed. In his large allegorical pictures, such as the "Expulsion from Eden," and in the series of the "Course of Empire," in the New York Historical Society, and the series of "The Voyage of Life," he endeavored to achieve a moral object, but to the detriment of the landscape, which is very artificial. His small paintings of the wild scenery of New York State and New England, however, show truer feeling, and though his color is always thin and dry, he was the first to give the real character of American landscape. Some of his larger canvases, which are panoramic in character, are original and impressive, as, e.g., "Oxbow," a scene on the Connecticut River, in the Metropolitan Museum, New York, which possesses five of his paintings. He died near Catskill, N. Y., Feb. 11, 1848. Consult: Tuckerman, *Book of the Artists* (New York, 1827); his biography by Noble (ib., 1853); Isham, *History of American Painting* (ib., 1905).

COLE, Timothy (1852–). An American wood engraver, born in London. He came to the United States when very young, studied under Bond and Chandler, and in 1875 began to illustrate for the Century Publishing Company in New York City. His first series, "The Old Italian Masters," was finished in 1892. This was followed by the Dutch and Flemish series in 1896 and the English in 1900. The "Old Spanish Masters" was begun in 1902 and completed in 1907; the French series followed in 1910. He is now engaged on the old masters in American public and private galleries. By many critics Mr. Cole is considered the best of modern engravers. Several of the French engravers may be his equals, or technically cleverer than he, but there is none whose work is more substantial. He is especially effective in his use of the white line and in reproducing textures; his results in general are produced by conservative methods, in the employment of which he has gained breadth and power and appreciation of light and of the personality of his subject. He gives the intimate qualities of each school, so that there is no mistaking one for another, and yet he retains his own individuality. Consult Weitenkampf, *American Graphic Art* (New York, 1912).

COLE'BROOKE. See Grand Falls.

COLEBROOKE, Henry Thomas (1765–1837). An eminent English Orientalist. He was born in London, June 15, 1765. From the age of 12 to 16 he resided in France, and in 1782 he went out to India, where, after serving in various civil capacities under the East India Company, he was appointed professor of Sanskrit in the newly founded college at Fort William. Afterward he became a judge at Mirzapur, and subsequently held the appointment of President of the Board of Revenue. During his residence in India he gained an extensive knowledge of the literature of the Vedas and of the Sanskrit grammarians, metaphysicians, and mathematicians. A sound critical judgment marks all his writings. He was a director of the Royal Asiatic Society of Bengal; and many of the most valuable essays in the *Asiatic Researches* were contributed by him. These, with other papers of his, were republished as his *Miscellaneous Essays*, in 2 vols. (1837). The translation of the great *Digest of Hindu Laws*, left unfinished by Sir William Jones, was intrusted to him. He likewise made translations from Sanskrit works on mathematics, religion, and philosophy, which have remained as important contributions to our knowledge of India. (Consult his *Miscellaneous Essays*, London, 1837; new ed., 1873.) Colebrooke wrote a Sanskrit Grammar (1805) and contributed to Sanskrit lexicography by his edition of the *Amarakośa* (Serampur, 1808). His *Essay on the Vedas* (1805) was for many years the standard work on the subject. After his return to England he was made director of the Royal Asiatic Society. He died in London. Consult his *Life* by Sir T. E. Colebrooke (London, 1873).

COLE'MAN. A town on Old Man River, in the Macleod district, Alberta, Canada, and on the Canadian Pacific Railway, 10 miles from Crow's Nest Pass. It has banking facilities and an electric-light system and water works. It is a coal and coke centre, where two companies give employment to about 1000 men. Good fishing and hunting are to be had in the vicinity. Pop., 1911, 1557.

COLEMAN. A city and the county seat of Coleman Co., Texas, 120 miles (direct) southwest of Fort Worth, on the Gulf, Colorado, and Santa Fe Railroad (Map: Texas, C 4). It has beef, cotton, grain, and brick interests, and there are some deposits of coal and oil gas. The water works and electric-light plant are owned by the city. Pop., 1900, 1362; 1910, 3046.

COLEMAN, Arthur Philemon (1852–). A Canadian educator. He was born at Lachute, Province of Quebec, but removed to Ontario in his youth and was educated at the Cobourg Collegiate Institute and Victoria University, where he graduated with high honors in 1876. He afterward studied natural science at the University of Breslau, Germany, paying special attention to geology and undertaking numerous geological expeditions in different parts of Europe. He was professor of geology in Victoria University (1881–90), professor of assaying and metallurgy in the School of Practical Science, Toronto (1891–95), acting professor of geology in Toronto University (1895–1901), and after 1901 professor of geology. In 1893–1909 he was geologist to the Ontario Bureau of Mines. In 1910 he was awarded the Murchison medal for distinguished geological investigation. He was elected a fellow of the Royal Society of Canada, and in 1910 a fellow of the Royal Society. Besides numerous scientific papers, he published *Reports on the Economic Geology of Ontario* (1903) and *The Canadian Rockies: New and Old Trails* (1911).

COLEMAN, John (1803–69). An American editor and clergyman of the Protestant Episcopal

church, born in Baltimore, Md. He was ordained priest in 1836, and from 1836 to 1856 was rector of Trinity Church, Philadelphia, Pa. For a time he was associated with the Rev. F. Ogilby in the editorship of the *Banner of the Cross*, published in Philadelphia. He prepared an edition (1840; with an introduction) of George S. Faber's *Difficulties of Romanism* (1826), and one (1840) of Dr. W. H. Wilmer's *Episcopal Manual* (1815; 2d ed., 1822).

COLE'MAN, JOHN (1832–1904). An English actor and theatrical manager. He won distinction as an actor, but his career was chiefly that of a manager. During the last half of the nineteenth century he was lessee and manager of various theatres, including the Olympic and Drury Lane.

COLEMAN, LEIGHTON (1837–1907). An American clergyman of the Protestant Episcopal church. He was born in Philadelphia, Pa., graduated in 1861 at the General Theological Seminary (New York City), took orders as deacon in 1860, and as priest in 1862, and from 1861 to 1879 was rector of churches successively at Bustleton, Pa., Wilmington, Del., Mauch Chunk, Pa., and Toledo, Ohio. After residence in England from 1879 to 1887, he was rector at Sayre, Pa., and in 1888 was consecrated Bishop of Delaware. His publications include *A History of the Lehigh Valley* (1872); *The Church in America* (1895); and *A History of the Church in the United States* (1901, in the "Oxford Church Text Series"). He contributed to the first edition of the NEW INTERNATIONAL ENCYCLOPÆDIA.

COLEMAN, LYMAN (1796–1882). An American educator and author, born at Middlefield, Mass. He graduated at Yale in 1817, was tutor there from 1820 to 1825, and later studied in Germany, and taught German at Princeton. From 1861 to 1868 he was professor of Greek and Latin at Lafayette College, and from 1868 until his death professor of the Latin language and literature. He published *The Apostolical and Primitive Church* (1844); *Ancient Christianity* (1852); *Historical Text-Book and Atlas of Biblical Geography* (1854; revised, 1859); *Prelacy and Ritualism* (1869).

COLEMAN, WILLIAM TELL (1824–93). An American pioneer. He was born in Cynthiana, Harrison Co., Ky., and was educated at St. Louis University. In 1849 he went to California and eventually settled in San Francisco, where he engaged in the shipping and commission business. After opening a branch in New York, he established a steamship line between that city and San Francisco in 1856. He was president of the vigilance committees (1851 and 1856) in San Francisco. In 1857 he removed to New York and conducted his business from that city until 1864. During the labor troubles of 1877 in San Francisco he again organized a force of several thousand men to preserve order. One of his most noteworthy achievements was the embellishment and extension of the town of San Rafael, Cal. See VIGILANCE COMMITTEE.

COLENSO, BATTLE OF. See SOUTH AFRICAN WAR.

COLEN'SO, JOHN WILLIAM (1814–83). An English bishop, born in St. Austell, Cornwall. He was educated at Cambridge, was fellow and tutor in St. John's College; became rector of Forncett St. Mary, in Norfolk, in 1846, and in 1853 was appointed first Anglican Bishop of Natal, South Africa. In England he had edited mathematical textbooks. The first of his works that attracted especial attention was *A Translation of the Epistle to the Romans, Commented on from a Missionary Point of View* (1861). The *Pentateuch and Book of Joshua Critically Examined* (7 vols.), in which the authorship of Moses and the accuracy of many statements in the books were questioned, and the inspiration of the Old Testament denied, appeared in 1862–79. His views were the result of study undertaken to answer questions on biblical chronology put by native converts. Especially through Kuenen (q.v.), his influence on biblical criticism was large. Colenso had already roused ecclesiastical opposition for permitting polygamy among his converts. He was deposed by his Metropolitan, the Bishop of Cape Town, but the deposition was declared void by the Privy Council. The trustees of the Colonial Bishoprics Fund then stopped his income, but the Court of Chancery ordered it to be paid, with arrears and interest. The see of Grahamstown was erected in place of that of Natal, in order to carry out the effect of the spiritual sentence without conflict with the state; and for the rest of his life Colenso occupied a schismatic position. He strongly favored the natives in their quarrels with the Boers. He published *Ten Weeks in Natal* (1855), a Zulu grammar (1859) and dictionary (1861), and translated the New Testament and part of the Old into the Zulu language. Consult Cox, *Life of Bishop Colenso* (2 vols., London, 1888).

CO'LEOP'TERA (Neo-Lat. nom. pl., from Gk. κολεόπτερος, *koleopteros*, sheath-winged, from κολεός, *koleos*, sheath + πτερόν, *pteron*, wing). An order of insects, comprising beetles, and characterized primarily by the possession of wing covers. See BEETLE.

COLEPEPER, kōl'pĕp-ēr, JOHN, LORD (?–1660). An English politician, prominent as a supporter of the Stuart kings against the Parliament. He was born at Wigsell, in Sussex, and after traveling abroad began to play an active part in county politics. In 1640 he became a member of the Long Parliament and, a zealous adherent at first of the popular party, gradually passed over to the side of the King, who in 1642 made him Chancellor of the Exchequer. With Falkland and Hyde, he played an important part in the negotiations between King and Parliament, preceding the outbreak of hostilities. He fought in the battle of Edgehill (Oct. 23, 1642) and in January of the following year was made Master of the Rolls, leaving the chancellorship to Hyde, of whose influence he was exceedingly jealous. On the downfall of the Royalist fortunes in 1645 Charles I intrusted Colepeper with the care of the person of the Prince of Wales, with whom in the following year he went to France. Later he lived with Prince Charles in the Netherlands and remained one of his principal advisers, going in his behalf on a mission to Russia (1650) and accompanying him to the Peace Congress of the Pyrenees in 1659. He returned to England after the Restoration, but died soon after. Colepeper was one of the ablest debaters and politicians of his time in England, but his influence suffered from his having a certain lack of confidence in his own opinions. He was given, too, to violent outbursts of temper.

COLEPEPPER, kōl'pĕp-ēr, CAPTAIN JOHN. A bully and murderer, nicknamed "Poppercul," in Scott's *Fortunes of Nigel*.

CO'LER, ALWIN GUSTAV EDMUND VON, 1831–

1901). A German physician, born in Groningen. He studied medicine in Berlin, entered the Prussian army in 1856, was made surgeon-general in 1874, and head surgeon of the general staff in 1889. General Coler's activity resulted in improvements of the highest importance in army hygiene, reforms in the military hospital service, the establishment of corps of sanitary officers, and the introduction of antiseptics into military surgical practice. He was also largely instrumental in formulating medical regulations for the German army, which have since been adopted by the armies of all civilized nations. In 1892 he was made professor at the University of Berlin. His writings include: *Sanitatsbericht über die deutschen Heere im Kriege 1870–71; Veröffentlichungen aus dem Gebiete des Militärsänitswesens* (1892); *Die transportable Lazarettbaracke* (with Langenbeck and Werner, 1890).

COLER, Bird Sim (1868–). An American politician, born in Illinois. He established himself as a stockbroker in New York City, became prominent in municipal and State politics, and served as first comptroller of Greater New York in 1897–1902. In 1902 he was the Democratic nominee for Governor of New York, but was defeated by a small plurality in spite of his enormous vote in New York City. In 1905 he was elected president of the Borough of Brooklyn, on the Municipal Ownership ticket. His publications include: *Municipal Government as Illustrated by the Charter, Finances, and Public Charities of New York* (1900); *Socialism in the Schools* (1911); *Two and Two Make Four* (1912).

COLERAINE, kôl-rān'. A parliamentary and municipal borough and seaport, in the County of Londonderry, Ireland, on the Bann, 4 miles from the sea, and 47 miles by rail north-northwest of Belfast (Map: Ireland, E 1). It is built on both sides of the river, the main town being on the east bank. Its best-known foundation is the Academical Institution. The town is known on account of its linen manufactures, one brand of cloth being called "Coleraines." Other products include soap, pork, whisky, paper, and leather. Its port is accessible to ships of 200 tons. Salmon and eel fishing flourishes on the Bann. Pop., 1901, 6958; 1911, 7785.

COLERIDGE, Ernest Hartley (1846–1920). An English author, grandson of S. T. Coleridge. He was graduated from Balliol College, Oxford, in 1870. He became secretary to the Lord Chief Justice of England in 1894. He edited *Letters of S. T. Coleridge* (1895); *Anima Poetæ* (1895); *Poetical Works of Byron* (1898–1901); *Life and Correspondence of John Duke, Lord Coleridge* (1904); a one-volume edition of Byron (1905); *Poems of Coleridge* (1907), and the *Complete Poetical Works of Samuel Taylor Coleridge* (2 vols., 1912).

COLERIDGE, Hartley (1796–1849). An English poet, born at Clevedon, Somersetshire, the eldest son of S. T. Coleridge. He studied at Oxford and was elected to a fellowship at Oriel College, from which he was removed by the authorities in 1826 on the charge of intemperance. For two years he resided in London. Then he returned to the Lake Country and, after having twice attempted school teaching, first privately at Ambleside and later at the grammar school of Sedbergh as an assistant in 1837 and 1838, settled at Grasmere. An almost constant wanderer about the vales, this diminutive figure, prematurely gray and old, became familiar to the peasantry as "Little Hartley." He was a scholar of rare attainment, a poet of exquisite taste and easy felicity, to whom, in the words of Dowden, "good thoughts came as of free grace." But, lacking will and the capacity for sustained application, he remained despondent, fragmentary, ineffectual. His longest literary work was in the preparation of an edition of the dramas of Massinger and Ford, with biographies of those authors (1840). He also wrote a series of lives of the *Worthies of Yorkshire and Lancashire* (1836; originally as *Biographia Borealis*, 1833). He is best known, however, for his verse, which, though it is distinctly lacking in power, is singularly fine in mood and happy in expression. Of the sonnet, a form, as Dr. Garnett observes, "which precisely suited both his strength and his limitations," he composed some of the finest examples in English. Such are "Whither," "To Shakespeare," "Prayer," "May, 1840," "Regrets," and "Ideality." His brother, Derwent, edited, with a memoir, his *Essays and Marginalia* and *Poems* (London, 1851). Selections are to be found in all important anthologies. His *Complete Poetical Works*, ed. by R. Calles, appeared in New York (1908). Hartley Coleridge was, his life long, a friend of Wordsworth, whose "To H. C.: Six Years Old" seems strangely prophetic.

COLERIDGE, Henry Nelson (1798–43). An English man of letters, nephew of Samuel Taylor Coleridge. He was born at Ottery St. Mary, Devonshire, graduated at Cambridge, and studied law. Soon afterward he made a trip to the Barbados, which he describes in *Six Months in the West Indies* (1825; 4th ed., 1841). In 1829 he married his cousin, Sara Coleridge. He was his uncle's literary executor and prepared the second edition of the latter's political and dramatic works (1834). He edited *Literary Remains* (1836–39); *Confessions of an Inquiring Spirit* (1840, with notes by Sara Coleridge, 1849); and published *Table Talk* (1835), notes which he had collected during several successive years and gathered into a volume. His son, Herbert Coleridge (1830–61), born at Hampstead, was a philologist. He was appointed secretary of a special committee of the Philological Society for the purpose of collecting material for a dictionary which was expanded into the *New English Dictionary*, published by the Clarendon Press under the editorship of Dr. J. A. H. Murray.

COLERIDGE, John Duke, Baron (1820–94). An English jurist, son of Sir John Taylor Coleridge (q.v.). He was born in London, graduated at Oxford in 1842, was called to the bar in 1846, and soon ranked high in his profession. He was a member of the House of Commons from 1865 to 1873, was knighted in 1868, became Attorney-General in 1871, was appointed Chief Justice of the Court of Common Pleas in 1873, and in the same year was raised to the peerage as Baron Coleridge of Ottery St. Mary. On the death of Sir Alexander Cockburn in 1880, he succeeded him as Lord Chief Justice of England. In 1883 he visited the United States. Consult E. H. Coleridge, *Life and Correspondence of John Duke, Lord Coleridge* (2 vols., London, 1904), and C. Yarnall, *Forty Years of Friendship* (ib., 1911).

COLERIDGE, Sir John Taylor (1790–1876). An English judge and author, a nephew of Samuel Taylor Coleridge. He was born at

Tiverton, graduated at Oxford in 1812, was called to the bar in 1819, and was made a judge of the King's Bench in 1835 and a privy councilor in 1858. On the retirement of Gifford in 1834 he became for a short period editor of the *Quarterly Review*. He published an annotated edition of Blackstone's *Commentaries* (1825); *Public School Education* (2d ed., 1860); *Life of Keble* (1869). He was a friend of the latter as well as of Wordsworth, Pusey, and Newman.

COLERIDGE, Samuel Taylor (1772–1834). An English poet, philosopher, and critic. He was born at Ottery St. Mary, Devonshire, and educated at Christ's Hospital, where Charles Lamb was a schoolfellow. He was an omnivorous reader, even as a boy, and, gaining access to a library through a chance acquaintance, he read "right through the catalogue." He soon gained a remarkable knowledge of Greek, and before he was 15 plunged boldly into the sea of metaphysics. The sonnets of W. L. Bowles, which fell into his hands at this time, gave him his first impulse towards poetry. In 1791 he entered Jesus College, Cambridge. At the university his whole mind was given to classics, and he obtained a prize for a Greek ode. During his second year there, in a fit of despondency, he went up to London and enlisted in the Fifteenth Dragoons, under the name of Silas Tomkyn Comberback, or Cumberbatch—remaining faithful to the initials S. T. C., which were afterward to be so familiar among the readers of his period. His identity was discovered through an accident, and his friends intervened to procure his discharge. He returned to Cambridge in 1794, but never took a degree. During a visit to Oxford he became acquainted with Southey, and in the same year, after a trip through Wales, visited him at Bristol. The two young men and some of their friends now formed a scheme for emigrating to the United States, where, on the banks of the Susquehanna (the melody of the name seems to have been one of the inducements), they were to found a colony where the laws of equality and fraternity were to prevail, and the golden age was to be ushered in. They, with Wordsworth and other generous youth of the time, were deeply impressed with the proclamation of liberal principles in the French Revolution, though they afterward drew back, alarmed by its excesses, some into extreme Toryism. The establishment of their ideal "Pantisocracy" was delayed by the lack of capital; and a year or two later the dream faded away.

At Bristol, Coleridge became acquainted with his future wife, Sara Fricker, to whose sister Southey was engaged. Joseph Cottle, a bookseller in Bristol, had offered Coleridge 30 guineas for a volume of his poems and promised him a guinea and a half for every 100 lines he should write after finishing it. On this prospect he married in October, 1795, and settled in a cottage at Clevedon. After many delays his volume of *Juvenile Poems* appeared in April, 1796. His earlier work is all in the stereotyped style of the eighteenth century and shows little trace of the powers which were to make him famous. In the early part of 1796 he began the publication of a weekly review, the *Watchman*, devoted to literature and politics, but met with little success, and abandoned the undertaking after the tenth issue. In the winter of 1796 he settled at Nether Stowey, near Bridgewater, whither Wordsworth removed in the following year. He was freed from the material cares of life by the generosity of Charles Lloyd, the son of a Birmingham banker, who had become a devoted disciple of Coleridge, and Thomas Poole, who conferred on him a small annuity. At Nether Stowey, inspired perhaps partly by the beautiful scenery and still more by the strengthening companionship of his friend, he composed his finest poems, including the "Ancient Mariner" and the first part of "Christabel" and "Kubla Khan," though the two latter were not published until 18 years afterward. The two authors had many discussions on the principles of their art, which resulted in the publication, in 1798, of their epoch-making *Lyrical Ballads*. This little book, published anonymously, though a total failure at the time, was decisive in its influence on the future of nineteenth-century poetry, freeing it finally from the conventional trammels which had long bound it. The work of the two poets is singularly complementary—Coleridge treating supernatural subjects in such a way as to give a strong impression of their reality, while Wordsworth so handled the simplest themes as to disclose unsuspected elements of mystery and awe. Coleridge's contribution to the *Ballads* comprised the "Ancient Mariner," the "Nightingale," and two scenes from his play *Osorio*. In the edition of 1800 there was added "Introduction to the Tale of the Dark Ladie."

Coleridge, who had become a Unitarian at Cambridge, preached frequently during this period in the chapels of that body and had thoughts of becoming a regular minister. To deliver him from this necessity, two brothers named Wedgwood settled on him an annuity of £150, and this enabled him to carry out the long-cherished plan of going to Germany to study. In September, 1798, he sailed for Hamburg with Wordsworth, and after acquiring the language went to Göttingen, remaining, in all, nearly a year. This was a period of vast importance in his development, and he said himself that there was no time of his life to which he looked back with such unmingled satisfaction. He came under the influence of what Shairp calls "an impulse, the most original, the most far-reaching, and the most profound which Europe has seen since the Reformation." The first result of his new knowledge of German thought was not in philosophy, but in poetry; on his return to England he published his noble translation of Schiller's *Wallenstein*. He also contributed fitfully to the *Morning Post* to the end of 1802. Before that time, however, he had settled at Greta Hall, Keswick, in the Lake District, attracted by the proximity of Wordsworth and Southey, who were to share with him the designation of Lake Poets, given in derision by the *Edinburgh Review*. Here, in 1800, he wrote the second part of "Christabel." Driven from the North by rheumatism in 1804, he went to the Mediterranean, acting for some months as secretary to the Governor of Malta and spending several more at Rome.

On his return to England he delivered some lectures on poetry and the fine arts at the Royal Institution, London, and began the publication of the *Friend*, a periodical which contained too much abstruse philosophy to be popular and lived less than a year. During part of 1811 he was connected with the *Courier*, contributing articles of a general political nature. In 1813 his play *Remorse* was successfully produced at the Drury Lane Theatre and helped to relieve his

distressed financial condition. His enslavement to opium, which he had begun to take as a relief from his rheumatic pains, was now increasing and, in De Quincey's opinion, "killed him as a poet." His constitutional indolence and dislike for steady application completed his unfitness for meeting the demands of life. Roving between London and the Lakes, where his family was generally under Southey's care, he spent a number of baffled and disappointed years.

From 1816 until his death, July 25, 1834, he lived in the house of Mr. Gillman, at Highgate in London, where he received the kindest and most judicious care and at least to some extent mastered his craving for opium. Though he projected far more than his habits ever allowed him to accomplish, he left as the result of those years no inconsiderable bulk of critical and philosophic writing; the *Biographia Literaria* (1817, and, with annotations and biographical supplement by Sara Coleridge, 1847) is especially noteworthy. It was, however, as a talker, discoursing with an inexhaustible flow of ideas to admiring visitors, that he shone most brilliantly in his latter years. Talk was his best medium for showing himself to others. His style in prose writing was cumbrous and his matter involved. In reading his written work of this class we feel instinctively that the critic was greater than the criticism.

No man had ever appeared in England who united in so eminent a degree the three functions of critic, philosopher, and poet. With all his defects Coleridge must be recognized as being, in Mill's phrase, the greatest "seminal mind" of his time. The present generation does not realize how much it owes to him in many fields of thought—how many impulses, still powerful, he set in motion. In criticism he was the father of modern Shakespearean study, laying in a few pregnant sentences a broad basis for criticism in contrast to the narrow canons of Johnson and the eighteenth-century school. His *Aids to Reflection* and some of his other theological writing inspired Maurice and Stanley and the Broad Church movement as a whole. His aphorisms are often decisive—it is to him we owe what are now commonplaces, the distinction between genius and talent, fancy and imagination, wit and humor. Detached phrases of his are still upon the lips of many who do not remember their source—like "Every man is born either an Aristotelian or a Platonist," or "Prose is words in their best order; poetry is the best words in the best order." In philosophy, originally a fervent disciple of Hartley (q.v.), who had been a member of his own college, he passed on through the theories of Berkeley and Leibnitz, and, after falling under the influence of the German and other mystics, came to a point where, he says, the works of Kant took hold of him as with a giant's hand. He adopted and based all his teachings on Kant's distinction between the Understanding and the Reason; and while he has not as a philosopher left any complete system, yet he rendered excellent service by his insistence, in such a period as his, on the reality and preëminence of the spiritual verities. His introduction into England of German literature and philosophy, so powerfully seconded by Carlyle, is alone enough to give him a high place among the forces that determined the course of nineteenth-century thought among English-speaking people. But it is as a poet that he must hold the highest rank, though no other poet has ever attained such a place on so small a volume of first-class work. "Christabel," "The Rime of the Ancient Mariner," and "Kubla Khan" (which so good a judge as Swinburne has called "for absolute melody and splendor the first poem in the language") cannot be put in any but the highest class. Moreover, his influence on his successors must be taken into account. The Pre-Raphaelite movement, which Theodore Watts-Dunton defines as "the Renaissance of the Spirit of Wonder in poetry and art," owes more to him than to any other English poet. One can only regret that so much was wasted of the greatest powers which for generations had been granted to any Englishman.

Consult also: E. H. Coleridge, *Letters of Samuel Taylor Coleridge* (London, 1895); Beers, *English Romanticism in the Nineteenth Century* (New York, 1900); Barnett, *Coleridge* (ib., 1904).

COLERIDGE, Sara (1802–52). An English author, born at Greta Hall, near Keswick. She was the only daughter of Samuel Taylor Coleridge and married her cousin, Henry Nelson Coleridge (1829). The early part of her life was spent with her uncle, Robert Southey. After the death of her husband she continued the editing of her father's works, and this was her principal literary work. Her intelligence and learning are shown in various translations and some original work, of which the tale *Phantasmion* (1837) is the most important. Consult her *Memoirs and Letters*, ed. by her daughter (London, 1873).

COLERIDGE-TAYLOR, Samuel (1875–1912). An English composer of music, born in London, Aug. 15, 1875. He was of African descent through his father, who was a native of Sierra Leone. His mother was an Englishwoman, and he himself was brought up under English influences. After a distinguished career at the Royal Academy—which he entered at 15, winning the composition scholarship in 1893, and studying under Villiers-Stanford until 1896—he devoted himself entirely to composition. In 1903 he organized a series of successful orchestral concerts at Croydon. His reputation as a composer grew rapidly, so that he was commissioned to contribute works to three different English festivals in one year. He made three visits, in 1904, 1906, and 1910, to the United States, where his works made a decided impression. His early death, on

Sept. 1, 1912, in London, cut short a career that had held out great promise for the future. His principal works are a *Symphony* in A minor, a *Ballad* for violin and orchestra, a *Ballad* for orchestra in A minor, a *Solemn Prelude*, an orchestral rhapsody *Endymion*, *Four Waltzes* for orchestra, *Bamboula Rhapsody Dance*, a *Concerto* for violin and orchestra, incidental music to *Nero*, *Herod*, *Ulysses*, *Faust;* an operetta *Dream-Lovers*, an oratorio *The Atonement*, five choral works with orchestra, of which *Hiawatha's Wedding* is the best known, chamber-music works of a high order of excellence, piano pieces, and songs.

COLES, kōlz, Cowper Phipps (1819–70). An English naval officer. He served as flag lieutenant to Sir Edmund Lyons in the Mediterranean (1853) and at the bombardment of Sebastopol (Oct. 17, 1854). In 1856 the plan of defensive armor for battleships began to engage his attention. The idea originally proposed had been that of a raft and shield, and this idea was modified by Coles into that of a vessel with a low freeboard surmounted by a series of turrets equipped with heavy guns. His plan for such a ship in a paper read in June, 1860, is so like the monitor type elaborated by Ericsson that the respective claims of the two men led to a bitter controversy. In 1864 the *Royal Sovereign*, a wooden ship built in 1857, was cut down and armored after Coles's plans. A vessel, constructed in accordance with Coles's specifications, was launched under the name of *The Captain*, in 1869, and on Sept. 7, 1870, capsized in a gale off Cape Finisterre, and almost everybody on board, including Coles, was drowned.

COLESEED. See Rape.

COL'ET, John (c.1467–1519). An English theologian, born probably in London. He studied at Oxford, traveled in Paris and Italy (1493–96), and became acquainted with Budæus and Erasmus. Returning to England, he took up his residence at Oxford and there lectured upon the Epistle to the Romans, displaying originality and independence of the schoolmen. The next year he lectured in the same fashion on 1 Corinthians, and so upon other New Testament books, until in 1505 he was appointed dean of St. Paul's, London. Having inherited from his father a large fortune in 1509, he founded St. Paul's School in London, of which William Lilly was the first master. His religious opinions were so much more liberal than was common at the time that he was subjected to considerable persecution. As dean of St. Paul's he lectured much on the Bible, disapproved of auricular confession and the enforced celibacy of the clergy, denied the efficacy of pilgrimages and the worship of images, and denounced corruption in the Church. His influence is traceable as paving the way for the Reformation, although it is probable that, like other humanists, he would not have left the old Church. Erasmus was much influenced by his emphasis on the study of Scripture. He died in London (or at Sheen, a few miles southwest of London), Sept. 16, 1519. Aside from his *Latin Grammar* and his *Daily Devotions*, his works did not appear until the nineteenth century, edited by Rev. J. H. Lupton, with English translations. Consult his biography by J. H. Lupton (2d ed., 1909), and F. Seebohm, *Three Oxford Reformers: Erasmus, Colet, and More* (3d ed., London, 1887).

COLET, kô'lā', Louise Révoil (1810–76). A French poet and novelist, of the Neo-Romanticist school. Among her verses are *Les fleurs du midi* and *Penserosa*. The *Musée de Versailles* and *Les funérailles de Napoléon* are more sustained flights, the former crowned by the Institute. A comedy, *La jeunesse de Goethe* (1839), and two novels, *La jeunesse de Mirabeau* (1841) and *Les cœurs brisés* (1843), deserve mention, but nothing that she composed equals in interest her publication, in defiance of a legal injunction, of the correspondence of Madame Récamier with Benjamin Constant (1849). She enjoyed the friendship and admiration of the greatest littérateurs of her time. Two famous men, Victor Cousin, the philosopher, and Gustave Flaubert, the novelist, figure most prominently in her life. *Lui, roman contemporain* (1859), her most important novel, is a biased account of her relations with the latter. Her salon became in 1849 the continuation of the brilliant Récamier salon.

COLEWORT, (from *cole*, AS. *cāwel*, *cāul*, OHG. *kōl*, Ger. *Kohl*, cabbage, from Lat. *caulis*, cabbage, Gk. καυλός, *kaulos*, stalk + *wort*, AS. *wyrt*, plant, Ger. *Wurz*, root; ultimately connected with Lat. *radix*, root). A name given to some of the many cultivated varieties of *Brassica oleracea*, and applied, like the names "borecole" and "kale," to varieties differing from the cabbage (q.v.) in their open heads of leaves, which are used as greens, especially in the winter months. The same name is also given to cabbages cut for use before their leaves have fully closed into heads.

COLEY, William Bradley (1862–). An American surgeon, born at Westport, Conn. He was educated at Harvard and Yale universities and entered upon the practice of medicine in 1888. He became attending surgeon at the General Memorial Hospital and the Hospital for Ruptured and Crippled, and also professor of clinical surgery at the Cornell University Medical School. His publications include the topic of "Hernia" in *Dennis's System of Surgery* (1896), *Warren and Gould's International Text-Book of Surgery* (1898), *Progressive Medicine* (1898), and *Keen's Surgery* (1907); and that of "Cancer" in *Twentieth-Century Practice of Medicine* (1897).

COLFAX, kōl'fāks. A city in Jasper Co., Iowa, 23 miles east of Des Moines, on the Chicago, Rock Island, and Pacific Railroad (Map: Iowa, D 3). Colfax contains a public library and mineral springs of note. The chief industries are coal mining and the bottling of the spring water. The water works are owned by the city. Pop., 1900, 2053; 1910, 2524.

COLFAX, kōl'fāks. A city and the county seat of Whitman Co., Wash., 55 miles (direct) south of Spokane, on the Palouse River, and on the line of the Oregon Railroad and Navigation Company (Map: Washington, H 4). The centre of a fertile agricultural country, it controls a considerable trade in live stock, grain, fruits, and lumber. The city contains a hospital and fine courthouse and owns its water works. Pop., 1900, 2121; 1910, 2783.

COLFAX, Schuyler (1823–85). An American statesman, born in New York City. He removed to Indiana in 1836, where he studied law, and in 1845 became editor of the *Register*, a Whig newspaper at South Bend, which under his management became the most powerful organ of its kind in that part of the State. He

was a delegate to the Whig conventions of 1848 and 1852, and in 1850 he was a member of the State convention to revise the constitution. After a defeat in 1851 he was elected to Congress in 1854, served seven consecutive terms, and was Speaker from 1863 to 1869. He was Vice President of the United States from 1869 to 1873. In the John C. Frémont campaign of 1856 a speech made by him was used for party purposes, and half a million copies were distributed over the country. He introduced several important acts for the reform of the postal system, in which he took an especial interest, and in 1862 framed the law which made fraudulent contractors felons. Charges of corruption were brought against him at the time of the Crédit Mobilier (q.v.) scandal, in 1873, but the charges were never conclusively substantiated. His reputation suffered, however, and he retired from public life. Consult Hollister, *Life of Schuyler Colfax* (New York, 1886).

COLGATE, kōl'gât, JAMES BOORMAN (1818–1904). An American financier. He was born in New York City and received his first commercial training in the house of Boorman, Johnston and Company. He later established the banking house of Trevor and Colgate, afterward known as J. B. Colgate and Company. His extensive loans to the government and sound financial policy during the financial crisis of 1873 contributed materially to the reëstablishment of confidence both in the United States and in the markets of Europe. He was one of the founders of the New York Gold Exchange and was for several years its president. As trustee of Colgate (formerly Madison) University, he for 30 years made almost annual donations to that institution, the development of which is due chiefly to his constant care and valuable advice.

COLGATE, SAMUEL (1822–97). An American manufacturer and philanthropist, born in New York City. He became widely known as a soap maker, and the manufactory he built in Jersey City has developed into one of the largest establishments of the kind in the world. He was also prominent in philanthropical work. For more than 30 years he was trustee of Colgate University, and for many years he was president of the New York Baptist Education Society, president of the Society for the Suppression of Vice, and a member of the executive committee of the American Baptist Missionary Union and of the American Tract Society. One of his most noteworthy achievements was the collection of 30,000 volumes of reports (now in the Colgate University Library), comprising the documentary records of the Baptist denomination. Conjointly with his brother, James B. Colgate, he gave large sums to Colgate (formerly Madison) University, which in 1890 was named in honor of the Colgate family.

COLGATE (kōl'gât) **UNIVERSITY.** An institution for higher education, situated at Hamilton, N. Y. It was founded in 1819. It has two departments, the College and the Theological Seminary. Colgate Academy was discontinued in 1912. The institution was incorporated in 1846 under the name of Madison University. In 1850 occurred a migration of a large number of the students and faculty to Rochester, N. Y., thereby founding the University of Rochester. The presidents of the university have been Nathaniel Kendrick, D.D., president in reality but not in name; Stephen W. Taylor, LL.D.; George W. Eaton, D.D., LL.D.; Ebenezer Dodge, D.D., LL.D.; George W. Smith, LL.D.; George E. Merrill, D.D., LL.D.; and the present incumbent, Elmer Burritt Bryan, LL.D. In 1890 the name of the institution was changed to Colgate University, in honor of William Colgate and his sons, one of whom, J. B. Colgate, established the Dodge Memorial Fund of $1,000,000. In 1893 Hamilton Theological Seminary became part of Colgate University. The attendance in 1914 was about 500. The faculty numbered 46. The library in 1914 had about 65,000 volumes, including the Samuel Colgate Historical Collection. Colgate University offers courses leading to the bachelor's and master's degrees in arts and science and to the bachelor's degree in divinity. It offers also courses in education which enable students to obtain college graduates' professional certificates. The university endowments in 1914 amounted to over $2,000,000, and the total value of the university property was estimated at over $3,000,000.

COLIC (from OF., Fr. *colique*, ML. *colica*, colic, from Gk. *κωλική, kōlikē*, colic, from *κῶλον, kōlon*, colon). A severe pain in the bowels or adjacent organs. When arising in the bowel, it is spasmodic in character and is dependent upon irregular contraction of the muscular coat of the intestines. Intestinal colic is a symptom of neuralgia of the intestines, caused by cold; of mild enteritis, caused by irritating food or purgative medicine; of toxic conditions such as lead poisoning, poisoning by the bacterial toxins of shellfish, etc.; of peritonitis, appendicitis, and other diseases. Infantile colic, common in the first six months of life, is caused usually by overfeeding, either of proteids or carbohydrates, which cause flatulence and distention. The infant is restless, draws up its legs, and has paroxysms of crying. Relief comes from vomiting or the passage of flatus. Infantile colic may be merely the result of enfeebled digestion, and careful modification of the food is the only remedy. If warmth, an aperient (such as castor oil), or peppermint, or tincture of ginger fails to give relief, a physician should be summoned. Renal colic is pain over the kidney and through the abdominal wall, due to passage of a calculus, or stone, from the kidney through the ureter into the urinary bladder. Biliary colic is caused by the passage of a gallstone from the gall bladder into the intestines.

COLIC IN ANIMALS. Colic (enteralgia) is a term usually applied to various morbid conditions of the stomach and intestines, particularly of the horse and mule, of which pain is the chief symptom; this does not signify a specific disease. Of the various forms of true colic, flatulent, or wind, colic and spasmodic, or cramp, colic are those more commonly met with. Spasmodic, or cramp, colic is caused by spasm of the small intestines and is due to the presence of foreign bodies in the intestines, such as undigested food, to large drafts of cold water, to exposure to cold, or to hard work too soon after eating. It is most frequent in high-bred horses. This form of colic always begins suddenly. The horse looks backward, shows acute pain, paws, lies down and gets up frequently. As the pain becomes more intense, the animal throws himself down with great violence and strikes with the feet.

These spasms are interrupted by intervals of quiet, but the intervals become shorter and shorter. This form of colic ordinarily yields promptly to appropriate treatment. Perhaps the best remedy is one ounce of chloral hydrate in a pint of water given as a drench. *Cannabis indica* gives good results, as also ether and laudanum. Flatulent, or wind, colic is sometimes used as synonymous with bloat (q.v.). Turpentine in doses of one ounce in a pint of linseed oil is a good remedy. Any alkaline substance neutralizes the acid fermentation and should be administered at once. In severe cases the bowels may be punctured at the most distended part by means of a trochar and cannula. Enemas of lukewarm water, to which a little soap has been added, are useful in both forms of colic, as are also cathartics, such as aloes in full doses. Consult H. C. Reeks, *The Common Colics of the Horse*, and M. H. Hayes, *Friedberger and Fröhner's Veterinary Pathology*, vol. i.

COLIGNY, kô'lē'nyē', or **COLIGNI,** GASPARD DE (1517–72). Admiral of France and Huguenot leader, born at Châtillon-sur-Loing, Feb. 16, 1517. He came of a noble family, his father having been Marshal Gaspard de Coligny, his mother Louise de Montmorency. He was introduced at court at the age of 22 and served under Francis I in Italy, where he evinced great bravery, especially at the battle of Ceresole (1544). Under Henry II he was made colonel general of the infantry, and in 1552 he became Admiral of France. In all the wars in which he took part he showed himself a born general and leader, his most noted exploit being the defense of Saint-Quentin (1557) against an overwhelming force of Spanish and English troops. He was finally forced to surrender and spent the next two years in a Spanish prison. On the death of Henry II, 1559, Coligny, who had previously adopted the Reformed faith, became, with the Prince of Condé, one of the great leaders of the Huguenots. In this capacity he was remarkable alike for his prudence and his bravery. Opposed to the Huguenot chiefs was the powerful Catholic party headed by the Duke of Guise and the Constable de Montmorency. At the disastrous battles of Dreux (1562) and Jarnac (1569), Coligny's skill saved the remnants of the Protestant army. Condé was slain on the field of Jarnac, and Coligny assumed the sole leadership until he gave way to the young Prince of Navarre. (See HENRY IV.) Together they besieged Poitiers, but the Huguenot forces were again routed on the bloody field of Moncontour (Oct. 3, 1569). When peace was concluded in 1570, Coligny went to court and was apparently well received by Charles IX, whose ardor he aroused by the plan of a national war against Spain, in which Coligny hoped to sink all religious differences. His projects and his favor with the King aroused the enmity of the Catholic party, whose leader, the Duke of Guise, always suspected the Admiral of having caused the death of his father at the siege of Orléans. Guise and the Catholics formed a plot to murder Coligny, which narrowly failed, and after their lack of success in this passed to a more general plot which resulted in the Massacre of St. Bartholomew (Aug. 24, 1572) in which Coligny perished. While upholding the Huguenot cause at home, Coligny exerted himself to secure a safe asylum for his coreligionists in the New World and sent repeatedly expeditions (Ribault in 1562, Laudonnière in 1564) to colonize what is now the southeastern part of the United States. Among his papers, burned by order of Catharine de'Medici, was his *History of the Wars of Religion in France.* Consult: Tessier, *L'Amiral Coligny* (Paris, 1872); Delaborde, *Gaspard de Coligny* (3 vols., ib., 1879–82); Bersier, *The Early Life of Coligny* (London, 1884); Blackburn, *Life of Coligny* (Philadelphia, 1869); Besant, *Life of Coligny* (London, 1892); Whitehead, *Gaspard de Coligny* (ib., 1905); Erich Marcks, *Gaspard von Coligny* (Stuttgart, 1892; vol. i (to 1560) is all that has so far appeared).

COLIMA, kô-lē'mȧ. The capital of the state of the same name, Mexico, on the Colima River, about 40 miles from the Pacific coast (Map: Mexico, G 8). It is situated at an altitude of 1476 feet, is generally well built, and has fine plazas and a number of pretentious buildings, among which are the government building and town hall, the Hospital de San Juan, and the market. The town has connections by rail and water with the port, Manzanillo, and is the seat of considerable trade. Colima was founded in 1523 by Gonzalo de Sandoval. Pop., 1900, 20,698; 1910, 25,148. About 40 miles to the northeast of the town, in the State of Jalisco, is the volcano of Colima (nearly 13,000 feet), which is constantly in a state of eruption.

COL'IN CLOUT. 1. A poetical satire on the clergy by John Skelton. 2. The nom de plume adopted by Spenser, suggested by the above. 3. A shepherd in Gay's pastoral, *The Shepherd's Week.*

COLIN CLOUT'S COME HOME AGAIN. A pastoral poem by Edmund Spenser, dedicated to Sir Walter Raleigh in a letter dated Kilkolman, Dec. 27, "1591" (probably 1595). In it he thanks that knight for sundry "favors and good turnes done to me at my late being in England."

COLINS (COLIN, COLYN), ALEXANDER (1527 or 1529–1612). A Flemish sculptor, born at Mechlin. Nothing is known of his artistic training, but in 1558 he was charged with the sculptural decorations of the castle of Heidelberg by the Elector Otto Heinrich, and in 1563, at the summons of Emperor Ferdinand I, he went to Innsbruck, where he modeled, after designs by Florian Abel, 20 reliefs on the tomb of Maximilian, in the Hofkirche. They represent scenes from the life of the Emperor; they show great technical ability and have been called "paintings in plastic form." Subsequently he was appointed court sculptor to the Emperor. Among his other works is the fine monument to the Archduke Ferdinand of Tirol, in the Silver Chapel of the Hofkirche and the mausoleum of Emperor Ferdinand II, his wife, and his son Maximilian II, in the cathedral at Prague. Consult *Gesammelte Schriften*, vol. i.

COL'ISE'UM. See AMPHITHEATRE.

COLL, kŏl. One of the Inner Hebrides, or western isles of Scotland, situated 7 miles northwest of the Island of Mull, Argyllshire. It is 14 miles long from northeast to southwest, with an average breadth of 2½ miles (Map: Scotland, B 3). More than a third of it is cultivated or in pasture. The isle is low and rocky and composed of gneiss. The highest point is 350 feet. It exports dairy produce, sheep, and cattle. Pop., 1901, 432; 1911, 389, engaged in agriculture and fishing. Chief place, Arinagour, which has a steamship service to Oban on the coast.

COLLAB'ORA'TION (Fr., from Lat. *collaborare*, to work together, from *con-*, together + *laborare*, to labor, from *labor*, work). The united labor of two or more persons on a literary production, as in the arrangement of a drama, or the compilation of a book requiring knowledge from different sources. Thus, Charles Reade and Dion Boucicault wrote *Foul Play;* Charles Dudley Warner and Mark Twain, *The Gilded Age.* Walter Besant and James Rice also long worked in collaboration upon numerous novels. The collaboration of Messrs. Erckmann and Chatrian (q.v.), in French, produced many delightful works. Perhaps most famous of all is the literary partnership of Beaumont and Fletcher (q.v.).

COL'LAMER, JACOB (1791–1865). An American lawyer and politician, born in Troy, N. Y. He removed when very young to Vermont, graduated at the university of that State in 1810, was admitted to the bar in 1813, and soon became one of the leading lawyers of the State. From 1833 to 1842 he was associate justice of the State Supreme Court. He was a member of Congress from 1843 to 1849, and in President Taylor's cabinet was Postmaster-General, which position, however, he resigned on the death of the President. In 1850 he was again elected judge of the Supreme Court of Vermont, and four years later was elected to the United States Senate, where he was chairman of committees on post offices, post roads, and the library. He remained in the Senate until his death.

COLLAPSE. See SHOCK.

COL'LAR (OF. *coler, colier*, Fr. *collier*, from Lat. *collare*, collar, from *collum*, neck; ultimately connected with AS. *heals*, with OHG. *hals*, Ger. *Hals*, neck). In architecture, a band around a column or other architectural member; the necking of the capital in the Doric, Ionic, and Tuscan orders. In mechanical work and engineering, a collar is any projecting band or flange shrunk on or otherwise applied so as to encircle a structural or mechanical member. For the collar as an article of apparel, see COSTUME.

COLLAR BONE. See CLAVICLE.

COL'LARED LIZARD. One of a genus (*Crotaphytus*) of iguanid lizards, characteristic of the dry, open regions of the southwestern United States. They are often called "collared" or "ring-necked" lizards, because of the double black collar around the wrinkled neck of the common Texan species (*Crotaphytus collaris*). This species is found from the Ozark Mountains to Nevada and southern California and is entirely insectivorous. Although it is stout of body, it can

HEAD OF COLLARED LIZARD, SLIGHTLY ENLARGED.

run very rapidly, and very often runs upon the hind legs alone. In the deserts of the Colorado valley there lives a second species, called "leopard lizard" (*Crotaphytus wislizenii*), which is larger, has no collar, and is noted for its fierce and greedy disposition. It eats not only blossoms, leaves, and insects, but also young horned toads, and all sorts of smaller lizards, killing and swallowing some two-thirds its own size. It will even kill and devour smaller individuals of its own species. This lizard is remarkable for the fact that not only the male, as is usual among lizards, but the female as well, undergoes a change of color in the breeding season (midsummer), the latter becoming salmon red on the whole abdominal region. Consult Merriam and Stejneger, *Death Valley Expedition* (Department of Agriculture, Washington, 1893), and Ditmars, *The Reptile Book* (New York, 1907).

COLLAT'ERAL (Fr. *collatéral*, It. *collaterale*, from ML. *collateralis*, collateral, from ML. *con-*, together + *lateralis*, relating to a side, from *latus*, side). In law, supplemental or related to the principal thing in consideration, especially, (*a*) given by way of security in addition to a principal obligation; (*b*) descended from a common ancestor but not from one another—a sense used to describe the character of relationship of individuals for legal purposes.

Collateral Security is either (*a*) something of intrinsic value actually delivered over and pledged to the creditor, the value of which is to be applied on the debt in case of default; or (*b*) an additional obligation, given to guarantee performance of a debt or duty. The term is more frequently used to designate a pledge of stocks, bonds, negotiable paper, or other evidences of obligation, as distinguished from a pledge of chattels. The practice in case of a default is for the creditor, upon notice to the debtor, to sell the securities and apply the amount received therefrom towards the satisfaction of his claim and charge the debtor with the deficiency, or credit him with the surplus, if any. See MORTGAGE; PLEDGE; FORECLOSURE; and consult the authorities cited under PLEDGE.

Collateral Relatives, more frequently spoken of as "collaterals," are those who are descended from the same common ancestor, but not one from the other, as lineal descendants are. Thus, an uncle is a collateral relative of a nephew, both being descended from a common ancestor, but the nephew not being a lineal descendant of the uncle. The term includes those in the relationship of brothers and sisters, aunts and uncles, nephews and nieces, and cousins. Collateral relatives are included in the term "heir," real property descending in the first instance to lineal descendants, if any, and then to collaterals in the order of their relationship or as prescribed by statutes. See CONSANGUINITY; DESCENDANTS; HEIR; LINEAL; DECEDENT; and consult the authorities referred to under DESCENT.

COLLATERAL WARRANTY. See WARRANTY.

COLLA'TION (OF. *collacion*, from Lat. *collatio*, collection, from *con-*, together + *latus*, borne, connected with *tolerare*, Gk. τλῆναι, *tlēnai*, OHG. *dulten*, Ger. *dulden*, to endure). In law, a collecting or bringing together of all the assets of an estate into one common fund for distribution among the heirs or next of kin; a term more particularly used where heirs who have received property from the deceased ancestor by way of advancement return it to the estate in order that a more equitable division of the whole may be made. The term is used in the civil law, and in England it is called *hotchpot* (q.v.). The term is not in general use in the United States, but the law in most States provides that advancements made to a legatee or devisee shall be considered as a part of the decedent's estate

and as such applied in satisfaction of the legacy or devise. See ADVANCEMENT.

In English ecclesiastical law, the term *collation* is used to denote the presentation of a clergyman to a benefice by the patron and bishop. See BENEFICE.

In maritime law, *collation* is sometimes employed in the sense of contribution or average (q.v.).

COLLATION OF MANUSCRIPTS. See BIBLE, *Textual Criticism.*

COLLÉ, kôl'lā', CHARLES (1709–83). A French dramatic author and song writer, born in Paris. He became the secretary of the Duke of Orleans, the grandfather of Louis Philippe, and wrote plays for the theatre of the Palais Royal and for the Comédie Française, of which several are still produced. "Soldat de fortune dans les lettres," as he has been called, he declined to become a member of the Academy, though his songs have made him famous in French literature. His plays have been collected under the title *Théâtre de société*, and his verses as *Les chansons de Collé*. Among the best plays are: *La vérité dans le vin* (1747); *Dupuis et Desronais* (1763); and *La partie de chasse de Henri IV* (1774). His interesting *Journal historique* was edited by Barbier (Paris, 1807), and his *Correspondance inédite* by Bonhomme (ib., 1864).

COLLE, kôl'lā, RAFFAELLO DAL (c.1490–1566), usually called RAFFAELLINO. An Italian painter, born at Colle, near Borgo San Sepolcro (Tuscany). He was a pupil of Raphael, whom he assisted in frescoing the Loggie of the Vatican, where portions of the story of Moses are from his brush. He is supposed also to have assisted Raphael in the Farnesina, and after his master's death to have worked with Giulio Romano in Rome and in the Palazzo del Te at Mantua. Still later he was employed to fresco several churches in the Duchy of Urbino, and the Villa Imperiale at Pesaro, the last after the cartoons of Bronzino and Gengas. He likewise assisted Vasari in various decorative schemes, and finally settled at Borgo San Sepolcro, where he founded a school. He painted in the manner of Raphael, without being a servile imitator. His principal paintings in oil are "The Resurrection," in the church of San Rocco, Borgo San Sepolcro; the same subject in the cathedral; the beautiful "Assumption" and an "Annunciation" now in the Gallery of Città di Castello; and several pictures in the chapel of the Olivet monks at Gubbio. Consult Patzak, *Die Villa Imperiale in Pesaro*, with biographical sketch of Colle (Leipzig, 1908).

COL'LECT. A brief, comprehensive prayer varying (like the epistle and gospel, which it immediately precedes) with the season of the Church year. Such prayers are found in all the earlier Christian liturgies, and most of those now used come from the sacramentaries of St. Leo, Gelasius, and St. Gregory. The name (which, however, does not occur in the Roman missal, where the word *oratio*, prayer, is used) is also of great antiquity. It probably comes from *collecta*, in the sense of *collectio*, a gathering, the prayer being originally designated *oratio ad collectam*. It may have originated as the prayer of a gathering of people at a church before starting in procession to some other station. In the oldest liturgies only a single collect was used, but with the growth of the calendar it became customary to "commemorate" a festival which was displaced by one of greater importance with the use of its collect; the sacred number of seven, however, might never be exceeded. In the Roman missal two other prayers, the *secreta* and the *communio*, are of similar structure to that of the collect, and, like it, vary with the day. These were not retained in the Anglican Prayer Book, which has almost literal translations of the Latin collects for nearly all its services. The structure of the collect is simple and uniform. It begins with a form of address nearly always to God the Father, generally including a commemoration of the special event celebrated, then offers as a rule a single petition for some grace or blessing, and ends normally "through Jesus Christ our Lord, who with Thee and the Holy Ghost liveth and reigneth, one God, world without end."

COLLECT, THE, or **COLLECT POND.** Formerly a large pond in the city of New York, part of whose site is now occupied by the Tombs prison. It drained the district later known as the Five Points and discharged into the Hudson River by a channel through the present Canal Street. The name "Collect" was a corruption of the Dutch "Kolch Hoek," meaning 'shell point' (Fiske, *Dutch and Quaker Colonies*, 1899).

COL'LECTA'NEA (Lat. nom. pl., collected sc. *dicta*, sayings). A name given to literary collections of any description, such as sayings of noted men, aphorisms, jests, miscellaneous anthologies, and chrestomathies.

COLLECTIVE PSYCHOLOGY. A term used to include all those subdivisions of "general psychology" which treat of the collective mind as opposed to the individual mind. For example, social psychology (q.v.), which treats of the social consciousness, ethnic psychology (q.v.), or the differential psychology of nations and races, and class psychology, the differential psychology of classes, professions, etc., are all subheadings of collective psychology. Consult: W. Wundt, *Völkerpsychologie* (Leipzig, 1904 and later); G. Le Bon, *The Psychology of Peoples* (New York, 1898); E. Tardieu, *Psychologie militaire* (Brussels, 1898); L. Dauriac, *Essai sur l'esprit musical* (Paris, 1904).

COLLECTIVISM (Fr. *collectivisme*, from *collecter*, ML. *collectare*, to collect, from Lat. *collecta*, collection, assembly, from *colligere*, to collect, from *con-*, together + *legere*, to gather). The vesting in the community, or collectivity, of all the means of production. Collectivism is the economic basis of both Socialism and Anarchism. Modern Socialism contemplates, as a rule, the vesting of property in the centralized state; Anarchists, especially the earlier school, held as their ideal the vesting of property in the local commune; Syndicalists would vest the property in groups organized on an industrial basis. See SOCIALISM; ANARCHISM; SYNDICALISM.

COL'LEEN BAWN, THE (Ir. *cailin*, girl, dim. of *caile*, girl, and Ir. *babhun*, Gael. *babhunn*, bawn, inclosure of a castle, barnyard), or THE BRIDES OF GARRY-OWEN. A play by Dion Boucicault, produced Sept. 10, 1860, based on Griffin's *The Collegians*. It was republished in the form of a novel in 1861.

COL'LEGE (Fr. *collège*, Lat. *collegium*, assembly, from *collega*, associate, from *con-*, with + *legare*, to send on an embassy, from *lex*, law. In its early Roman use "college" signified any association of persons having a common purpose or performing a specific function. In some respects it was synonymous with *corpus*,

a corporation or body of members, with *universitas*, a whole as contrasted with its parts, and with *societas*, a partnership. The Roman college was required to be incorporated by public authority, could possess common property, and could sue or be sued in the name of its manager. Many of these colleges were mercantile in character or were organizations of artisans similar to the mediæval guilds; but there were others having religious or political objects, such as the college of augurs, pontiffs, etc. In modern usage the term has similar applications, as college of cardinals, college of bishops, college of presidential electors, etc. It is also, especially in Great Britain, applied to associations of scientific or literary purposes, such as college of physicians, college of surgeons, college of heraldry.

In American usage the term "college" commonly indicates a stage of instruction intermediate between the high school or preparatory school and the university; but in Europe and, especially in Great Britain, the term is almost entirely confined to institutions of university rank. In France "collège" is, as a rule, a municipal institution equivalent to lycée and gymnasium, but there are some noteworthy exceptions, especially the Collège de France in Paris. The early colleges grew out of the monastic care of the indigent, sick, and feeble, and were at first, in connection with *hospitia*, established by the various orders. In 1180 a foundation for eighteen "scholar clerks" was made in the "Hospital of the Blessed Mary of Paris," commonly known as the Hôtel-Dieu. Other foundations devoted solely to this purpose soon followed. During the same period it was customary for groups of students to organize for the purpose of renting rooms, providing board, etc. Such organizations were self-governing, though ordinarily, and soon by compulsion, their governors were masters in the university. Sometimes, too, as at Bologna, alien needy students had national boarding houses under this name, as the College of Spain, etc. Under the influence of the mendicant orders and the example of Robert de Sorbonne, who about 1255 founded the college which bears his name for students who had already taken the earlier degree, colleges became more numerous, assumed the teaching function within their own walls, and tended to become coextensive with the university. In time, both in Paris and in the English universities, every member of the university had to attach himself to some college, and every person admitted to college had to matriculate at the university. In this way the colleges became the constituent members of the university, supporting not only the students and fellows, but the professors as well. For a more detailed account, see CAMBRIDGE, UNIVERSITY OF; OXFORD UNIVERSITY; PARIS, UNIVERSITY OF, ETC.

In this relation the college becomes a subcorporation. The English universities hold the examination and grant the degrees, while the colleges provide for the lodging of the students, to a certain extent for their support, and for their instruction. Students in one college may receive instruction in other colleges. In Scotland and in America the distinction between the college as the member and the university as the body has been neglected; and we consequently hear of the one and the other indiscriminately granting degrees, a function which in the English and in the original European view of the matter belonged exclusively to the university. Barnard College, Columbia, and Sibley College, Cornell, however, besides many correlated professional colleges, may be said to illustrate the older usage. Where there is but one college in a university, as is the case in the universities of Scotland, the two bodies are of course identical, though the functions which they perform are different. The University of Dublin and Trinity College are also virtually the same. In Germany there are no colleges in the English sense; and the verbal confusion between the college and the university is avoided by the latter's performing the functions of both in its own name, as two separate parts of its proper duties. See also COEDUCATION; COLLEGES, AMERICAN; COLLEGIATE EDUCATION FOR WOMEN; DEGREE; DUBLIN, UNIVERSITY OF; EDINBURGH UNIVERSITY; HARVARD UNIVERSITY; SORBONNE; YALE UNIVERSITY; and the names of individual colleges, universities, and other higher institutions.

COLLÈGE DE FRANCE, kô'lĕzh' de fräns (Fr., College of France). A college in Paris, founded between 1518 and 1545 by Francis I, who tried in vain to secure Erasmus for its head. From the beginning it has been autonomous. The successive kings upheld its independence, notwithstanding the vigorous efforts of the University of Paris to secure control; this independence has been maintained, and though now under the charge of the Minister of Public Instruction, it has no connection with the University of France. From this has resulted its distinguishing characteristic: freedom of teaching and the encouragement of scientific research. The collège has had varying fortunes, but its activity has been continuous; even during the Revolution, although it had been the royal college, its reputation saved it from suspension. Originally founded for the teaching of Hebrew, Greek, and Latin only, it has now 40 different chairs. Instruction is gratuitous, no examinations are held, no diplomas given. The collège is specially designed to attract scholars other than the ordinary university students. In its long roll of illustrious teachers are included the names of Ramus, Gassendi, Rollin, Sylvestre de Sacy, Barthélemy Saint-Hilaire, Laboulaye, Renan, Michelet, and Gaston. Consult Goujet, *Le Collège Royal de France* (Paris, 1758); Bouchon-Brandely, *Le Collège de France* (ib., 1873); Lefranc, *Histoire de Collège de France* (ib., 1892); Renan, *Questions contemporaines* (ib., 1868).

COLLEGE JOURNALISM. See JOURNALISM, COLLEGE.

COLLEGE OF ARMS. See HERALDS' COLLEGE.

COLLEGE OF ELECTORS. See ELECTORAL COLLEGE.

COLLEGE OF HERALDS. See HERALDS' COLLEGE.

COLLEGE OF THE FOUR NATIONS (Fr. *Collège des Quatre Nations*). An appellation given to the Collège Mazarin, founded 1661, from the fact that that university was founded for the free education and support of 60 sons of gentlemen residing in the provinces of Pignerol, Alsace, Flanders, and Roussillon.

COLLEGE PARK. A village in Prince Georges Co., Md., 8 miles northeast of Washington, D. C., on the Baltimore and Ohio Railroad. It has a fine situation, as a suburb of the capital, and is the seat of the Maryland Agricultural College and Experiment Station,

established 1850. There are also aëroplane factories. Pop., 1913, about 350.

COLLEGES, AMERICAN. The offspring of European colleges, and possessing at first the same general form of organization, American colleges have gradually undergone changes which make them distinctive. Harvard (q.v.), the oldest, was founded in 1636, under the influence of men who for the most part had received their education at Emmanuel College, Cambridge University. The second American college, William and Mary (q.v.), founded in 1693, and the third, Yale (q.v.), founded in 1701, were modeled on similar lines. The numerous institutions founded since then have followed very closely the same traditions. During the eighteenth century there were 21 such institutions founded, 9 before the Revolution and 12 afterward. From 1800 to 1830 there were 33 such foundations; from 1830 to 1863 there were 180; from 1865 to 1900 there were 244; in 1911–12 the United States Bureau of Education received reports from 596 degree-conferring institutions of college rank, a number which represents perhaps but two-thirds of the total number of institutions in the country claiming such rank.

The early colleges were separate institutions of learning, each offering a single prescribed course of study leading to the degree of A.B. and, with some additional work, to that of A.M. This course was intended to furnish a liberal education and to prepare the student for the Christian ministry or other learned profession. Both Harvard and Yale came under the control of self-perpetuating corporations and relied for their support on tuition and private endowments. Most of the earlier and many of the later colleges were controlled in the interest of certain religious denominations, it being frequently part of the organic law of such institutions that the president and trustees should be members of the church that dominated the school.

The leading changes in the early college system have been the outcome of a demand for a wider circle of studies in the liberal programme; the development of better systems of secondary instruction, to which could be intrusted a large part of the work formerly done by the college; the growth of specialized instruction preparatory to the various professions not only of law, medicine, and theology, but also of the various fields of applied science; and the appearance of higher institutions under the support and control of the States, notably in the West and the South. In many of the colleges, also, e.g., Harvard, Yale, and Columbia, the influence of the sectarian element in control has largely disappeared. The development about the nucleus of a college of liberal arts of colleges for special professional instruction has led to the university, so called, although many institutions bearing that name give very little attention to graduate instruction of the true university character.

At first the Colonial colleges took from the grammar schools students who had barely attained a fair knowledge of Latin. As the character of secondary instruction grew better, the entrance requirements of the colleges grew severer. As a result, the average age of entrance of students increased, until at Harvard it is at present over 19, an age at which students were commonly graduated in the earlier history of the institution. The curriculum, originally limited to Latin, Greek, a little mathematics, logic, metaphysics, rhetoric, and theology, was extended by the introduction, in the latter part of the eighteenth century, of astronomy and natural philosophy and, early in the nineteenth century, of modern languages and the elements of the natural and political sciences. This process of expansion led, by the middle of the nineteenth century, to the elective system (see ELECTIVE COURSES), fostered by President Wayland of Brown University, and later by President Eliot of Harvard, President Barnard of Columbia, and President Tappan of Michigan. Certain work was still prescribed to the student, but new work was offered from which he was allowed to make a choice. Then, at many colleges, various courses were established, among which election could be made. The required subjects in each course were from some general field, as science, literature, modern languages, or classics, and distinct degrees, as B.S., Ph.B., B.L., etc., were bestowed upon the graduates of the different courses. Brown, Michigan, and Western institutions generally, illustrate this plan. Finally, at Harvard in 1894, the right of election, permitted in 1872 in the senior year, was extended to all subjects, except English A, in the first year, the degree of A.B. being given to all graduates of the college of liberal arts. To emphasize the equality of different lines of work thus elected, the Stanford University has adopted the policy of granting this degree even to those whose work has been almost entirely in the sciences. Cornell, too, has in this, as in many other respects, assumed the most liberal attitude in its educational aims. Few institutions remain where the whole course is prescribed; the rest either permit complete election, or prescribe certain studies, or leave the rest to be elected by the student.

Along with the development of broader curricula, and elective subjects and courses, has come the establishment of special professional colleges and colleges of applied science. Medical schools had appeared at the University of Pennsylvania and at Columbia and Harvard in the eighteenth century. Law schools were founded early in the nineteenth century, and scientific schools soon after. Some of these institutions were affiliated with older colleges, others were established independently. The year 1846 saw the foundation of the Union College of Civil Engineering, the Sheffield Scientific School, Yale; and the next year the Lawrence Scientific School at Harvard was established. Finally, there appeared the extension of the work of the liberal-arts college into further fields of scholarship and research, the organization of which has given rise to the graduate departments, the universities proper of the United States. (See UNIVERSITY.) But the distinction of the university from the college or group of colleges for undergraduates has not yet been clearly made. Some institutions calling themselves universities are merely colleges; others consist of several undergraduate colleges; in a few cases the name "university" is restricted to purely graduate departments.

It must be added that the professional colleges of law, medicine, and theology are coming to have more and more the character of graduate schools. In 1896 Harvard required all students entering the law school to be college graduates. A similar requirement exists in its medical school, and practically in its divinity school as well. Like steps have been taken at Columbia, where a combined collegiate and professional

course can be taken in six years, and the matter is being agitated generally throughout the country. It must be noted, however, that so far no important movement has been set on foot to make the colleges of applied science graduate schools. In case they follow in the path of the schools of law, etc., the special preparation for the higher professions, together with higher training in research and scholarship, will be left to the university, while the college will represent a higher liberal course preparatory to these. As it is, the word "college" is applied either to (1) liberal-arts colleges, or (2) professional colleges admitting undergraduates; and colleges of either type may be parts of universities or separate institutions.

The character of the influences and the life surrounding the student in the college which has grown into a large university is essentially different from that to be met with in the smaller colleges which have continued to work in the spirit of the old Colonial institutions. The smaller college affords less opportunity for election, thus bringing about greater uniformity in the work pursued. While it does not allow so much for individual peculiarities, it provides greater chance for intimate social intercourse among students and between them and the faculty, and for a firmer grip of the latter in discipline. The educational aim is frankly liberal and social rather than special and individual. Fraternities are an important feature in the social life, athletics prosper, and college spirit is strong. The faculty is even more a teaching body than a learned one, the reverse of which tends to be the case in the larger universities. Many believe that the smaller college affords a better liberal education for one who will later take up a profession or pursue special lines of research at a university. On the other hand, the attendance at the smaller college is not increasing in proportion to that in the collegiate departments of the universities. The length of the liberal-college course has been a matter of much agitation. Many advocate its reduction to three years; and President Butler, of Columbia, in his first annual report to the trustees of that university, proposed to award the B.A. degree at the end of the second year of undergraduate study. According to the present system, a student, beginning at six years of age, and progressing at the normal rate, will enter the college at 18, and not until 22 begin his special professional training. To gain time, in many universities, the senior collegiate year is allowed to be partly spent in professional work. At Chicago and Columbia the specialized work may begin in the junior year. The system of credits, too, generally in vogue, by which the satisfactory completion of a certain amount of work entitles a student to his degree, without regard to the time required to accomplish it, often renders graduation possible in less than four years.

The entrance requirements and curricula of the colleges have varied widely. Many colleges, especially in the West and the South, are yet little more than high schools. Some of the States have, however, interfered to determine what institutions shall be authorized to grant degrees, and it is highly desirable that this example should be universally followed. Attempts have also been made among the better colleges to insure greater uniformity in entrance requirements. In addition to numerous examination boards for different sections of the country, the greatest influences in raising the standards of entrance have been exercised by the Carnegie Foundation for the Advancement of Teaching, the National Conference Committee on Standards of Colleges and Secondary Schools, and the College Entrance Examination Board. In the West the State universities set the standard for collegiate entrance requirements within their several commonwealths.

It remains to mention a few new methods of control that have come to prevail over American colleges. Originally they were all governed by corporations or boards of trustees and were chartered either by the King or by Colonial legislatures. The older institutions have retained these charters, with the obvious modifications necessary after the Revolution. A little later, a movement was set on foot to take the colleges under State supervision and control, but it was checked by the decision in the Dartmouth College case, by which States were prevented from assuming control over the property of corporations existing by virtue of a charter sanctioned by their legislatures. The result was that the older Eastern foundations remained under private management, while in the West and the South the system of State universities—usually merely colleges—grew up. These institutions are controlled by regents appointed in various ways, often by the Governor of the State, although in Michigan they are elected by the people. In some of the Eastern institutions also the State has come to exercise a voice in the governing board. Ordinarily, the control of these private colleges is in the hands of a self-perpetuating board, which controls the finances, appoints the instructors, makes laws for the government of the institution, and confers degrees. The instruction and discipline of the students, their admission and dismissal, and the recommendations for degrees are left in the hands of the faculty as a matter of immemorial custom. Much general power is lodged in the hands of the president, and in the university colleges the deans are intrusted to a large extent with the control and direction of the students. In 1911–12 the number of students (men and women) in institutions of higher learning, including technical and professional schools, was 255,673. This is an increase of over 100 per cent in actual attendance within the period of 10 years, and of over 100 per cent in the ratio of students to population within the period of 10 years. The ratio of increase is highest with graduate students and with women. The total number of professors and instructors in the same institutions amounted at the given date, in round numbers, to about 25,000. The value of their productive property was estimated at $357,048,919, and the annual income was $104,514,095 from all sources. Consult Thwing, *College Administration* (New York, 1900); Harper, *The Trend in Higher Education* (Chicago, 1905); Flexner, *The American College* (New York, 1908); also the *Annual Reports* of the Carnegie Foundation for the Advancement of Teaching. See COLLEGIATE EDUCATION FOR WOMEN; ELECTIVE COURSES; UNIVERSITY; and the various colleges.

COLLEGE VIEW. A village in Lancaster Co., Neb., a few miles southeast of Lincoln, the State capital. It is the seat of Union College (Seventh-Day Adventist), opened in 1891. There is a manufactory of health-food products, and

a large printing and publishing house. The village owns its water works and electric-light plant. Pop., 1900, 865; 1910, 1508.

COL'LEGEVILLE. A village in Stearns Co., Minn., 10 miles (direct) west by north of St. Cloud, on the Great Northern Railroad (Map: Minnesota, C 5). It is the seat of St. John's University (Roman Catholic), opened in 1857. Pop., 1910, 606.

COLLEGEVILLE. A borough in Montgomery Co., Pa., 25 miles (direct) northwest of Philadelphia, on the Perkiomen River and on the Perkiomen Railroad (Map: Pennsylvania, L 7). It is the seat of Ursinus College (German Reformed), opened in 1870, and has a bridge over 100 years old. There are manufactures of steam and hot-water heaters. Collegeville was incorporated as a borough in 1895. Pop., 1910, 621.

COLLE'GIAN. See CLUB; COLLEGE (at the beginning).

COLLE'GIANS, THE. A novel by Gerald Griffin (1829). See COLLEEN BAWN.

COLLE'GIANTS (from Lat. *collegium*, assembly). A branch of the Dutch Arminians, who called their assemblies for worship "colleges." The sect was founded in 1619 by the brothers John, Adrian, and Gilbert van der Codde, at Rijnsburg, a couple of miles north of Leyden; hence they were also called the Rijnsburgers. They rejected creeds, and had no regular ministry, nor any form of church government. They adopted baptism by immersion, but their communion was open to all. They were not unlike the Plymouth Brethren of the present day. They opposed war and office holding by Christians. For a time they spread rapidly, but became extinct in the eighteenth century.

COLLE'GIATE CHURCHES (from Lat. *collegiatus*, member of a college, from *collegium*, assembly). A title applied to certain churches other than cathedrals to which is attached a body of clergy living in community, but having no voice in the government of the diocese. (See CANON; CHAPTER.) Of the numerous collegiate churches which flourished in Germany as early as the time of Charlemagne, that of Aix-la-Chapelle was especially famous. In England after the Reformation the title was retained, without much of the organization, as in the cases of Westminster, Windsor, Wolverhampton, Heytesbury, Southwell, Middleton; also Brecon in Wales, and Galway in Ireland. Ripon and Manchester have been constituted the cathedrals of new dioceses. The term is also applied to churches with an associated body of clergy without episcopal supervision. The best-known instance is the Collegiate Reformed Dutch Church of New York City.

COLLEGIATE EDUCATION FOR WOMEN. A system of education which originated in the United States and may be said to have sprung from the seminaries for young women. Although at first these were frequently concerned with somewhat superficial accomplishments, the trend was rapidly towards a sounder and broader scholarship. Their development, and, later, that of the coeducational public high schools, led to the establishment of women's colleges and to the admission of women to colleges for men.

In 1808 Mrs. Emma Willard (q.v.) opened a school for young women at Middlebury, Vt. In 1819 she removed by invitation to Waterford, N. Y., and 10 years later founded the celebrated Troy Female Seminary. By earnest and effective advocacy, notably by the publication of her *Plan for Improving Female Education*, she succeeded in getting the recognition and to some extent the aid of the State of New York in her efforts to give to women the same educational opportunities as to men. In 1819 Rev. Joseph Emerson opened a female seminary at Byfield, Mass., where such instruction was given as is done in academies for men. One of his students, Miss Zilpah P. Grant, became in 1824 the first preceptress of Adams's Female Academy at Derry, N. H. In 1828 she became the principal of a seminary at Ipswich, Mass., associating with her her fellow pupil at Byfield and assistant at Derry, Mary Lyon (q.v.). It was the latter's efforts, aided by the advice and plans of Miss Grant, that led to the founding and endowment in 1837 of Mount Holyoke College (q.v.) at South Hadley, Mass. This institution gave a three years' course nearly equivalent to that of the better colleges for men. Another prominent woman in the early history of advanced education for women was Miss Catherine E. Beecher (q.v.), who opened in 1827 a seminary for girls at Hartford, Conn., and in 1829 published an influential pamphlet on *Suggestions Respecting the Improvement of Female Education*. Later she turned her attention to the West, and through a national board and society did much for improving the facilities as well as for developing a sentiment for the higher education of her sex. In 1821 Wesleyan Seminary and Female College was founded at Kent's Hill, Me., and in 1834 a similar institution was established at Granville, Ohio. Georgia Female Seminary at Macon (now Wesleyan Female College) was chartered with collegiate powers in 1836, and in 1839 it was opened, offering a four years' course. Monticello Female Seminary, at Godfrey, Ill., was opened in 1838 on the plan of colleges for men, and it soon gained great reputation and influence. Elmira College, at Elmira, N. Y., claims to be the first women's college in the United States, and, with the exception of Queen's College, London (1848), probably in the world, to establish the same standard as in colleges for men. It was founded in 1855 and offered a four years' course. Vassar College (q.v.) was opened in 1865 at Poughkeepsie, N. Y.; Wellesley College (q.v.) at Wellesley, Mass., and Smith College (q.v.) at Northampton, Mass., in 1875; and Bryn Mawr College at Bryn Mawr, Pa., in 1885. These four, with the Goucher College (q.v.), Baltimore, are to-day the wealthiest of the female colleges in the United States. In 1888 Mount Holyoke College established a full collegiate department, and in 1893 the seminary was dropped. Wells College (q.v.) opened at Aurora, N. Y., in 1868 as a seminary, became a college in 1870, and in 1896 dropped the preparatory department. During the last 20 years several new institutions for women have been added. Among these are Randolph-Macon Women's College (1893), Simmons College, Boston (1902), Wheaton College, Norton, Mass. (1912), and Connecticut College for Women (1914). Among the several Catholic colleges for women are New Rochelle College, New Rochelle, N. Y.; Trinity College, Washington, D. C.; St. Elizabeth's, Madison, N. J.; Mt. St. Vincent's on Hudson; Notre Dame, Maryland; and D'Youville College, N. Y. Besides these institutions there were in 1911–12, 108 institutions for women in the United States call-

ing themselves with more or less correctness "colleges." This represents a decline in number as compared with the preceding 10 years, but it has been far more than made up by the increased attendance at the better women's colleges and the coeducational institutions. The latter are discussed in the article on COEDUCATION.

An additional class of schools offering higher instruction to women are the colleges affiliated with institutions for men. Of these the earliest to be established in the United States was Radcliffe College (q.v.), instruction in which is carried on by certain members of the Harvard faculty. It was founded by the Society for the Collegiate Instruction of Women in 1879 and assumed its present name with power to grant degrees in 1894. Barnard College (q.v.), founded in 1889, and at first affiliated with Columbia as Radcliffe is with Harvard, was made in 1900 an undergraduate college of the university, graduate work in that institution being thrown open to women. Brown University has a women's college that began work in 1892. The College for Women of Western Reserve University, at Cleveland, Ohio, was established in 1888, and in connection with Tulane University at New Orleans, La., there was opened in 1886 the H. Sophie Newcomb Memorial College for Women. Evelyn College, connected with Princeton University, was opened in 1887, but ceased to exist in 1897.

The attitude of the universities of Europe towards the admission of women is described in the article on COEDUCATION. In Great Britain there are many women's colleges connected with the great universities. At Cambridge Girton College was opened in 1869 and Newnham College in 1871. At Oxford Somerville Hall and Lady Margaret Hall were opened in 1879, and St. Hugh's Hall in 1886. At the University of London, University College and King's College have departments for women. Queen's College, London, was opened in 1848, Bedford College for Women in 1849, and Royal Holloway College in 1886. There are also numerous local universities and university colleges in England and Wales. In Ireland Belfast University, Dublin University, and the National University of Ireland (University College, Dublin, University College, Cork, and University College, Galway) admit women. In Scotland University College at Dundee is a college for women affiliated with the universities of London, St. Andrews, Edinburgh, and Glasgow. At Glasgow Queen Margaret College was in 1892 affiliated with the university at that place. On the Continent, however, women's colleges have not been established, but separate university courses for women are in existence in Russia. The Victoria Lyceum in Berlin, established in 1869, is probably the only institution in Germany giving higher courses for women, but no degrees. Private training and "finishing" schools suffice for those who do not enter the universities. In the various professions women find no chance for instruction to any extent in separate institutions except in the case of medicine. In the United States there is at present one medical school of repute for women. In London there is one, and Edinburgh has two; several are in Canada, and there is one at St. Petersburg.

The development of opportunities for the higher education of women has been actively promoted by a number of organizations, prominent among which are, in the United States, the Massachusetts Society for the University Education of Women, founded in 1877, and the Association of Collegiate Alumnæ, founded in 1882; and in England the Girls' Public Day School Company, founded in 1874, and the Cambridge Association for the Promotion of the Higher Education of Women, established in 1879. An organization for similar purposes was in 1898 formed in Berlin. The development of opportunities for the university education of women has also had a favorable reaction upon facilities for their secondary instruction, not only in the United States, but also in England and France, and to-day the system of girls' gymnasia in Germany shows the influence of the demand that women shall be prepared for the universities. Much progress has been made since 1898, when the Prussian Minister of Education refused an application for the establishment of a girl's school in Breslau, saying that university education for women is only for exceptional cases, and that the government will not undertake to prepare them for this. Since that date the whole system has been reorganized, and practically the same opportunities are open for higher education of girls and women in Germany.

Three statistical investigations into the health of college women have been undertaken—two in America by the Association of Collegiate Alumnæ in 1885 and 1900, and one in England by Mrs. Henry Sidgwick in 1897. In America the health of the college women compared favorably with that of working women, and in England with that of noncollege sisters and cousins. Nor does the marriage rate of college women seem to be less than that of their sisters. On the other hand, a large proportion of them are self-supporting, the principal occupation being teaching. Several recent studies indicate the following conditions: of 1076 graduates of Bryn Mawr up to Jan. 1, 1911, 28.5 per cent were teachers; 9.2 per cent were in other occupations; 5.5 per cent were engaged in study; 25.6 per cent were unmarried and without paid occupation; 27 per cent were married. Of the graduates of Mount Holyoke College from 1890 to 1909 about 65 per cent joined the teaching profession. Of the women graduates of the University of Wisconsin 88 per cent become teachers and 3.3 per cent engage in library work.

Consult: Thomas, "Education of Women," in Butler, *Monographs on Education in the United States* (New York, 1900); Fitch, "Women and Universities," in *Educational Aims and Methods* (ib., 1900); Lange, *The Higher Education of Women* (ib., 1900); French, "Educational Status of Women in Different Countries," in *Report of Commissioner of Education* (Washington, 1894–95); Crawford, *The College Girl of America* (Boston, 1905); Talbot, *The Education of Women* (Chicago, 1910). See COEDUCATION.

COLLENCHYMA, kŏl-lĕŋ'kĭ-mȧ (Neo-Lat., from Gk. *κόλλα, kolla*, glue + *ἔγχυμα, enchyma*, infusion, from *ἐν, en*, in + *χεῖν, chein*, to pour). A supporting tissue in certain plants, usually developed just beneath the epidermis, and recognized by the prominent thickenings in the angles of the cells. See HISTOLOGY (OF PLANTS).

COLLEONI, kŏl'lā-ō'nē, or **COLEONE**, kō'lā-ō'nā, BARTOLOMMEO (1400–75). An Italian general, born at the castle of Solza, near Bergamo. At the age of 32 he fought in the Venetian army and distinguished himself in the war against the Milanese. He was a condottiere, and when Venice made peace with Milan he entered the

service of the latter. Finally he returned to Venice and was rewarded with large estates, upon which, during periods of peace, he introduced agricultural improvements. During the last 30 years of his life he was generalissimo of the Venetian state, in which capacity he is reputed to have displayed much strategical ability. A fine equestrian statue, executed by Andrea del Verrochio, was erected to his memory out of funds which he had left for that purpose.

COL'LES, Christopher (1738–1821). An Irish engineer, the pupil of Pococke. He was born in Ireland, but came to America before the Revolution and delivered lectures in New York on pneumatics, gunnery, and inland navigation. One of the first steam engines made in America was designed by him; and he was among the first to propose water supply by reservoirs for the city of New York. As early as 1784 he presented to the New York Legislature a plan to connect Lake Ontario with the Hudson River by canals and such natural channels as could be used, and with this purpose in view he surveyed the Mohawk River. He published *Inland Navigable Communications* (1808).

COL'LETT, Jakobine Camilla (1813–95). A Norwegian novelist. The keynote of her work is the emancipation of woman. In addition to her first and most popular novel, *The Magistrate's Daughters* (1855), she wrote *Tales* (1861); *In the Long Nights* (1863); *Against the Stream* (1879; 2d series, 1885); *Last Leaves, Recollections, and Confessions* (1868; 1872; and 1873).

COLLET'TA, Pietro (1775–1831). An Italian Minister of War and historian. He served with distinction in the army under Joseph Bonaparte upon the latter's accession to the throne of Naples in 1806 and was retained in his military dignities by Ferdinand I. In 1820 he was dispatched to suppress the insurrection in Sicily. Appointed Neapolitan Minister of War in 1821, he was afterward imprisoned by the Austrians, but was finally permitted to reside in Florence, where he wrote his well-known historical work, *Storia del reame di Napoli, 1734–1825* (first published in 1834; Ger. trans. by Leber, 8 vols., Grimma, 1849–50). For his biography, see Gino Capponi's memoir of him published in the *Storia del reame di Napoli* (2d ed., Florence, 1848).

COL'LEY, Sir George Pomeroy (1835–81). An English soldier. He was educated at the Royal Military College, Sandhurst; served in Cape Colony as a lieutenant, and was a border magistrate there in 1857–58; was ordered to China, and as captain participated in the taking of the Taku forts in 1860. He was professor of military administration and law at the Staff College, Sandhurst (1871–73). In 1875 he was promoted to a colonelcy for efficient service in Ashanti, and from 1876 to 1880 he was private secretary to Lord Lytton, at that time Viceroy of India. He was sent to succeed Sir Garnet Wolseley as Governor and commander in chief of Natal in 1880. In January, 1881, he commanded against the Boers at Laing's Nek and Ingogo, and on February 27 his detachment was annihilated at Majuba Hill (q.v.), and he himself fell. He was a good water-colorist, contributed to periodicals, and wrote the article "Army" for the 9th edition of the *Encyclopædia Britannica*. Consult Butler's biography (London, 1899).

COLLIBERTS, kŏl'ī-bērts; *Fr. pron.* kô'lē'-bâr'. See Cagot.

COL'LIE. The Scotch shepherd dog. See Sheep Dog and Plate of Dogs.

COLLIE, Sir John. A British physician. He was educated at Aberdeen University. For many years he served the London County Council, first as assistant medical officer, then as medical superintendent of several classes, and finally as medical examiner and member of the Insurance Committee for London; for a time he was also examiner in physiology and hygiene at the British College of Physical Education and house surgeon at the Royal Maternity Hospital, Edinburgh, besides holding various other appointments. In 1912 he was knighted. His publications include: *The Emergency Book* (1899); *Schemes of Instruction in First Aid to the Injured, Home Nursing, and Hygiene* (1908); *Medical Evidence in the Laws Relating to Compensation for Injury* (1909); *A Simple Remedy for Grave Abuse* (1909); *Sidelights on Medical Technicalities from an Insurance Point of View* (1911); *Fraud and its Detection in Accident Insurance Claims* (1912); *Medico-Legal Examinations and the Workmen's Compensation Act, 1906* (1912); *Malingering and Feigned Sickness* (1913); *The Psychology of the Fraudulent Mind* (1913).

COLLIER, kŏl'yĕr, Constance (1878–). An English actress, born at Windsor, Eng. In 1901 she was engaged by Beerbohm Tree, and for nearly six years she played in His Majesty's Theatre. She made her first trip to America in 1908, when she appeared at the Garrick Theatre (New York) as Charlotte in *The Latch*. She made return trips to the United States in 1909 and 1911, and in 1912 she toured in *Thais*. She also appeared in a revival of *Oliver Twist* (1912) in both New York and London. In 1914 she played with distinction the part of Emilia in Faversham's production of *Othello*.

COLLIER, Jeremy (1650–1726). A nonjuring English clergyman, born at Stow Qui, or Quire, in Cambridgeshire, Sept. 23, 1650. He went to Cambridge in 1669, took his degree of M.A. in 1676, and entered the ministry. At the revolution of 1688 he plunged into the stormy waters of controversy, his foeman being Gilbert Burnet, afterward Bishop of Salisbury. For a publication of his at this time, entitled *The Desertion Discussed* (1688), which maintained the invalidity of King William's regal authority and gave offense to the government, he was sent to Newgate, where he remained several months. On his release he rushed anew into party contentions and distinguished himself by the publication of several controversial works. Suspected of being a partisan of the Stuarts, he was again arrested in 1692 and imprisoned for a short time in the King's Bench. From this period his life was a perpetual literary strife, the government being the principal object of his attack. In 1713 he was consecrated a bishop among the nonjurors, and was their leading man after the death of Hickes in 1715. He died in London, April 26, 1726. Collier wrote many books, including the *Great Historical, Geographical, Genealogical, and Poetical Dictionary* (4 vols., 1701–21), founded on Moreri's, and *Ecclesiastical History of Great Britain to the End of the Reign of Charles II* (2 vols., 1708–14). The best edition of the latter work is by T. Lathbury (9 vols., London, 1852). It is a work of great learning, the first of its kind except Fuller's that had appeared. But the work by which he is best known is his *Short View of the Im-*

morality and Profaneness of the English Stage (1698), in which he attacked Dryden and Congreve as vigorously as D'Urfey, and which had a marvelous success. For his life, consult the *Ecclesiastical History*, edited by Lathbury (London, 1852).

COLLIER, JOHN PAYNE (1789–1883). An English Shakespearean critic and commentator. He was born in London. In 1820 he published *The Poetical Decameron*. From 1825 to 1827 he superintended a new edition of Dodsley's *Old Plays;* and in 1831 appeared his best work, a *History of English Dramatic Poetry, and Annals of the Stage*. From 1835 to 1839 he published three volumes on Shakespeare entitled *New Facts, New Particulars*, and *Further Particulars*, followed by an edition of Shakespeare in 8 vols. (1842–44). Not content with these efforts for the illustration of his favorite author, Collier, in 1852, published a volume entitled *Notes and Emendations to the Text of Shakespeare's Plays, from Early Manuscript Corrections in a Copy of the Folio of 1632, in the Possession of J. P. Collier*. This volume is now known as the Perkins Folio, as "Tho. Perkins his Booke" is inscribed on the cover. The publication excited great commotion in the literary world; opinion was divided, and the *Emendations* were furiously applauded or furiously assailed. It has since been proved that all the marginal notes are forgeries. In 1862 he published an excellent edition of Spenser; and the next year he began a series of reprints of our early poets and pamphleteers. Of his later publications, the most interesting is *An Old Man's Diary* (1871–72). For a list of Collier's forgeries, and the bibliography of the subject, consult Lee, *A Life of Shakespeare* (3d ed., London, 1900); and Warner, *Catalogue of MSS. of Dulwich College* (London, 1881). The question of Collier's emendations is fully considered in C. M. Ingleby, *Complete View of the Shakespeare Controversy* (1861).

COLLIER, PRICE (1860–1913). An American author. He was educated in Geneva and Leipzig, graduated from the Harvard Divinity School in 1882, and entered the ministry of the Unitarian church. For two years he was European editor of the *Forum*. He served in the navy during the Spanish-American War, and wrote a volume on "Driving" (1903) in Macmillan's *Sportsman's Library*. But he attained celebrity as the writer of essays on national characteristics, which were marked by much insight and real literary quality. In this field, in which he followed his father, Robert Laird Collier, he wrote *America and the Americans from the French Point of View* (1897), *England and the English from an American Point of View* (1909), *The West in the East, from an American Point of View* (1911), and *Germany and the Germans from an American Point of View* (1913), which was less sympathetic than some of his earlier works. At the time of his sudden death he was preparing a similar discussion of Norway and Sweden.

COLLIER, ROBERT JOSEPH (1876–1918). An American editor and publisher, born in New York City. He graduated from Georgetown University in 1894, and following this studied a year each at Oxford and Harvard universities. He became associated in the publishing business of his father, P. F. Collier, and on the death of the latter in 1909 succeeded him as head of the firm of P. F. Collier and Son, becoming editor and publisher of *Collier's Weekly*. He initiated the Lincoln Farm Association, which raised by popular subscription funds for purchasing the old Lincoln farm in Kentucky and erecting thereon a granite memorial at the log cabin in which Lincoln was born.

COLLIER, WILLIAM (1868–). An American actor and playwright. He made his first appearance in a children's company in 1879. From 1883 to 1888 he was a member of the Daly Theatre Company. *On the Quiet*, in which he starred in 1901–02, and *The Dictator*, in which, as Robert Travers, he had a great London success in 1905, were taken on an Australian tour (1906). Later he appeared in *A Lucky Star* (1909); *Bunty Pulls the Strings* (1912–13); *A Little Water on the Side* (1914). He also played rôles in the following plays of which he is part author: *I'll be Hanged if I Do* (1910); *Take my Advice* (1911); *Never Say Die* (1912); and he is sole author of *Caught in the Rain* (1906) and *The Patriot* (1908). Collier came to be known as a comedian with a large following.

COLLIER, WILLIAM MILLER (1867–). An American diplomat and commerce expert, born at Lodi, N. Y. He was educated at Hamilton College and Columbia College Law School, and was admitted to the bar in 1892; served as referee in bankruptcy of the northern district of New York State in 1898; was president of the New York State Service Commission from 1899 to 1903, and during the next two years lectured in the New York Law School. President Roosevelt appointed him special assistant Attorney-General in 1903, and in 1904 solicitor in the United States Department of Commerce and Labor. He was United States Minister to Spain from 1905 to 1909, when he became general legal counsel and special agent for various American corporations in Europe. His publications include: *The Law and Practice in Bankruptcy under the National Bankruptcy Act of 1898* (1898; 4th ed., revised by William H. Hotchkiss, 1903; 9th ed., 1912); *The Trusts* (1900); *The Civil Service Law of the State of New York* (1901); *At the Court of His Catholic Majesty* (1912).

COL'LIMA'TION. See MERIDIAN CIRCLE; TRANSIT INSTRUMENT.

COLLIN, kô'lăn', LOUIS JOSEPH RAPHAEL (1850–1916). A French figure and portrait painter. He was born in Paris and studied there at the Ecole des Beaux-Arts under Bouguereau and Cabanel. In 1873 he obtained a medal with "Sleep" (Museum, Rouen), and in 1889 the Grand Prix at the Paris Exposition. In 1902 he was appointed professor at the Ecole des Beaux-Arts. He is perhaps best known for such works as the decorations in the Sorbonne, and the ceilings of the Odéon and the Opéra Comique, Paris. He also decorated several ceilings in the United States. The most noted of his easel pictures are those of nudes in the open air, such as an "Idyll" (Arras), "Daphne and Chloe" (Alençon); "Floral" (1886, Luxembourg); "Eveil et Primerose" (1894, Bucharest), and many others in private collections, including the Anderson collection, New York. Collin is also a portrait painter, illustrator, and painter on faïence. His work is in the classical style of his masters Bouguereau and Cabanel, and in his decorative work the nude plays a conspicuous part.

COLLIN D'HARLEVILLE, kô'lăn' dăr'l'-

vĕl′, JEAN FRANÇOIS (1755–1806). A French dramatist. He was born at Mévoisins, near Maintenon, and after studying law devoted himself entirely to literature. His numerous character plays, which occasionally suggest the influence of Regnard, are noted for their gayety, wit, and comic episodes. The more popular are *L'Inconstant* (1780; played at the Comédie Française in 1786); *L'Optimiste* (1788); *M. de Crac dans son petit castel* (1791); *Le vieux célibataire* (1793), usually considered his best production; *Les châteaux en Espagne* (1803). He was an original member of the Institute. His theatrical works were edited by Moland (1876) and Thierry (1882). Consult the memoir by Andrieux in his complete edition of Collin (Paris, 1822).

COLLIN'EAR'ITY. See CONCURRENCE.

COLLINE (kŏl'lĭn). **GATE, THE** (Lat. *Porta Collina*, hill gate, from *porta*, gate, and *collinus*, hilly, from *collis*, hill). An important gate of ancient Rome, on the Quirinal, at the point where Rome was most exposed to attack, at the north end of the Servian Wall (q.v.). According to Ovid, Hannibal rode up to it and hurled a spear into the city. The victory won here by Sulla over the Marian forces (mainly Samnites), in 82 B.C., made his power supreme in Rome. The remains of the gate were discovered (and destroyed) during the building of the Treasury (1872–73).

COLLINGSWOOD. A borough in Camden Co., N. J., adjoining Camden, on the Pennsylvania Railroad and on Cooper River (Map: New Jersey, B 4). It is beautifully laid out and contains a fine park. Collingswood is in an agricultural region and has manufactories of wagons and wall paper. Pop., 1900, 1633; 1910, 4795.

COL'LINGWOOD. A city and a suburb of Melbourne (q.v.), Victoria, Australia.

COLLINGWOOD. A town and port in Simcoe Co., Ontario, Canada, on Georgian Bay, Lake Huron, 70 miles (direct) northwest of Toronto (Map: Ontario, D 3). It is important as the terminus of the northern division of the Grand Trunk Railway, and is the starting point for steamers to Owen Sound, Sault Ste. Marie, and Parry Sound. Its harbor, which is well protected, has a depth of 20 feet. Among the public buildings and institutions are the collegiate institute, Carnegie library, Young Men's Christian Association building, and an armory. There are also two parks, two skating and curling rinks, a government rifle range, and a government fish hatchery. The manufacturing industries and establishments include the most extensive steel-shipbuilding yards and dry docks in Canada, where some of the largest freight ships in the British Empire have been built; a large meat-packing and canning establishment, wire-nail and fence factories, grain elevator, planing mills, foundries, machine shops, saw mills, fruit and vegetable canneries. The town owns its water works, electric lighting, sewerage, and hydro-electric power plants. It has a United States consulate. Pop., 1901, 5755; 1911, 7090.

COLLINGWOOD, CUTHBERT, LORD (1750–1810). A British admiral, born at Newcastle-upon-Tyne. He went to sea on the *Shannon* at the age of 11 and in 1775 took part in the battle of Bunker Hill and was made a lieutenant for his services. He became a commander in 1779 and a rear admiral in 1799. Among the great naval victories in which he bore a prominent part were those of Lord Howe off Brest in June, 1794; of Lord Jervis off Cape St. Vincent in 1797; and of Nelson at Trafalgar in 1805, where his ship was the first to break through the line of French and Spanish vessels, and after Nelson had received his death wound he assumed the chief command. For his conduct in this battle he was raised to the peerage. There is a monument to him at Tynemouth. He is buried in St. Paul's. See the life, *A Fine Old English Gentleman* (London, 1875), by Davies; and Collingwood's *Memoirs and Correspondence* (2 vols., 1828), with a memoir by his son-in-law.

COL'LINS, ANTHONY (1676–1729). An English author, a noted deist writer. He was born at Isleworth or at Heston, near Hounslow, in Middlesex, June 21, 1676. He studied at Eton, and King's College, Cambridge, and in the Temple in London. In 1707 he published his *Essay Concerning the Use of Reason;* and in 1709 his *Priestcraft in Perfection*, which disturbed the churchmen of that time exceedingly. The controversy excited by this last work induced Collins to sum up several previous pamphlets in his *Historical and Critical Essays on the Thirty-nine Articles* (1724). He had published a *Defense of the Divine Attributes* (1710), in reply to the Archbishop of Dublin, who asserted the compatibility of divine predestination and human freedom. Collins was a philosophical necessitarian and afterward advocated his opinions more fully in his *Philosophical Inquiry Concerning Liberty and Necessity* (1715). In 1711 he went to Holland, where he made the friendship of Le Clerc and other eminent literati. On his return to England he published his *Discourse of Freethinking* (1713), the best known and the most important of all his works, which Swift assailed in one of his best pieces of irony, while Bentley disposed of its pretensions to scholarship. In 1718 he was made treasurer for the county of Essex; and in 1724 appeared his *Grounds and Reasons of the Christian Religion*, which gave occasion to no less than 35 replies. He defended himself in his *Literal Scheme of Prophecy;* and in 1727 published his last work, *A Letter to the Rev. Dr. Rogers on Occasion of his Eight Sermons on the Necessity of Revelation and the Truth of Christianity.* Collins died Dec. 13, 1729. He was a friend and correspondent of Locke, who declared that Collins had as much love of the truth for the truth's sake as ever he had met in anybody. His character for integrity and benevolence stood very high. For an estimate of Collins, consult Stephen, *English Thought in the Eighteenth Century* (London, 1881). See DEISM.

COLLINS, ARTHUR (1863–). An English theatre manager, born in London. He was apprenticed with a scenic artist, Henry Emden, at the Theatre Royal, Drury Lane, in 1881. From 1887 to 1896 he was stage manager at that theatre, and in 1897 he obtained a lease of Drury Lane and formed a managing company with himself as director. Under his management were produced: *Hearts are Trumps* (1899); *Ben Hur* (1902); *The Prodigal Son* (1905); *The Bondman* (1906); *The Sins of Society* (1907); *Marriages of Mayfair* (1908); *The Whip* (1909); *Everywoman* (1912).

COLLINS, FRANK SHIPLEY (1848–). An American botanist, born at Charlestown, Mass. He entered business in 1864 and later became connected with the Boston Rubber Shoe

Company at Malden, Mass. He early began research work in botany and became an active member of various botanical societies. Besides his contributions to botanical journals, he is author of *Flora of Middlesex County* (1888); *Phyotheca Boreali Americana* (1894–1911); "The Green Algæ of North America," in *Tufts College Studies* (1912).

COLLINS, JOHN (1625–83). An English mathematician, born at Wood Eaton, in Oxfordshire. He was a member (1667) of the Royal Society of London and wrote a number of works on algebra and dialing. Writers are much indebted to his *Commercium Epistolicum* (published by the Royal Society in 1712) for information on contemporary discoveries, as well as on the great controversy relating to the priority of Newton or Leibnitz in the invention of the calculus. Consult Rigaud, *Correspondence of Scientific Men of the Seventeenth Century* (Oxford, 1862).

COLLINS, JOHN CHURTON (1848–1908). An English educator and author. He was born at Bourton-on-the-Water, Gloucestershire, and graduated at Balliol College, Oxford, in 1872. He contributed largely to the reviews, strenuously opposing the philological method of literary study. In 1904 he became professor of English literature at the University of Birmingham. He is a writer of force, wit, and scholarship, with a lucid literary style. In 1908, while staying with a doctor to care for his broken health, he was found dead in a ditch, the verdict at the consequent inquest being that he died by accident. Besides editions of Cyril Tourneur (1878), Lord Herbert of Cherbury (1881), Robert Greene (1899), he published *Sir Joshua Reynolds as a Portrait Painter* (1874); *Bolingbroke and Voltaire in England* (1886); *Study of English Literature* (1891); *Dean Swift* (1893); *Essays and Studies* (1895); *Ephemera Critica* (1901); *Studies in Shakespeare* (1903); *Essays in Poetry and Criticism* (1905); *Rousseau and Voltaire* (1908). Consult L. C. Collins, *Life and Memoirs of J. Churton Collins* (1911).

COLLINS, MICHAEL (1892 ?–1922). Irish patriot and soldier, born at Woodfield, Klonakilty, Ireland. He was a clerk in the civil service and afterwards in a London bank. He took part in the Easter rebellion of 1916, and was captured. After his release he became one of the chief workers for Irish freedom. In 1918 he was again in jail, and after that in spite of persistent attempts to arrest him, he succeeded always in eluding the police, effecting many remarkable escapes. While still a fugitive, he was elected to the revolutionary parliament. He was prominent in the party councils of Sinn Fein and was finance minister in the new government, and afterwards commander-in-chief of the Free State forces. On Aug. 22, 1922, he was ambushed and killed near the village of Crookstown.

COLLINS, MORTIMER (1827–76). An English poet and miscellaneous writer, born at Plymouth. He was master of mathematics for a time at Queen Elizabeth's College, Guernsey, but resigned in 1856 and devoted himself thereafter wholly to literature. His publications include: *Idyls and Rhymes* (1865); *Who is the Heir?* (1865); *Sweet Anne Page* (1868); *The Secret of Long Life* (1871); *The British Birds, from the Ghost of Aristophanes* (1872); *Sweet and Twenty* (1875); *Fight with Fortune* (1875). His wife, Frances, published *Letters and Friendships of Mortimer Collins, with Some Account of his Life* (London, 1877).

COLLINS, PATRICK ANDREW (1844–1905). An American lawyer and politician, born in Fermoy, Ireland. He was brought to the United States in 1848 and settled in Chelsea, Mass., where he prepared himself for the study of the law. In 1871 he graduated at the Harvard Law School and was admitted to the bar. He was a member of the State Legislature in 1868–69 and State Senator 1870–71, served three terms in Congress (1883–89), and from 1893 to 1897 was Consul General at London. He was an active Fenian and was made first president of the Land League in 1884. He was elected mayor of Boston in 1901, was reëlected in 1902, and was serving at the time of his death.

COLLINS, REV. MR. A character in Jane Austen's *Pride and Prejudice*.

COLLINS, WILLIAM (1721–59). An English poet. He was born at Chichester, where his father was a hatter, and received his education at Winchester College and at Oxford. In 1742 he published a small volume containing the *Persian Eclogues*, in which he failed to escape from the poetical commonplace of his time, and in 1743 the *Epistle to Sir Thomas Hanmer*. Leaving Oxford, probably early in 1744, he went to London, resolved upon a literary career. Here, from time to time, he published other poems, consisting chiefly of odes; but misfortunes, occasioned by his indolence and irresolution, finally induced melancholy, which at times deepened into insanity. The poems which Collins left are comparatively few; but they entitle him to high rank among the poets of the eighteenth century. He was essentially a lyrist, and it is upon his odes that his reputation is principally founded. His most popular ode is *The Passions*. The personification of the passions is true and striking, and the variation of the measure is well adapted to the various emotions to be expressed. Among his poems may be mentioned the odes, *To Liberty, To Mercy, To Evening, On the Death of Mr. Thomson*, the ode, written in 1746, beginning, "How sleep the brave who sink to rest," and the *Song from Cymbeline*. Not only is much of Collins's poetry exquisite, but it is important as one of the early landmarks of English romanticism. This is particularly true of the *Ode on the Popular Superstitions of the Highlands of Scotland*, completed in 1749, but not published until 1788. Consult: Johnson, sketch of Collins in *Lives of the Poets* (Oxford, 1781); *Poems*, ed. Bronson (Boston, 1898), and ed. Stone (Oxford, 1907); Beers, *English Romanticism in the Eighteenth Century* (New York, 1899) and Millar, J. H., *The Mid-Eighteenth Century* (Edinburgh, 1902).

COLLINS, WILLIAM (1788–1847). An English genre painter and etcher. He was born in London and as a boy studied with Morland and later at the Royal Academy. Subsequently he went to Italy, where he painted Italian landscapes. His predilection, however, was for child life, which he painted in every phase and introduced into picturesque and minutely but somewhat weakly executed landscapes of village and beach. In the course of 40 years he exhibited 121 pictures at the Academy. The chief criticism against Collins's children is that they lack the unconscious air of childhood; their sweetness and charm too often degenerate into sentimentality. In later years he attempted
